Being intensively discussed in scientific communities, psychological changes are associated with recent sociocultural transformations (J. Palfrey, U. Gasser, A. Asmolov, A. Mudrik, S. Poliakov, G. Soldatova, V. Sobkin, etc.) The research is focused on: features of modern youth subcultures; impact of social networks, online games and Internet activities; factor analysis of social differentiation of childhood and adolescence; problems of sociocultural identity of the youth; pedagogical influence on these phenomena. These issues are studied in the context of “theory of generations” (N. Howe, W. Strauss; E. Shamis; M. Miroshkina). Special attention is paid to “Generation Z”, whose values in Russia are shaped by such statements as “the Internet has always existed”, “Putin has always governed”, “The Crimea is ours”. Following Howe and Strauss we state that analyzing generations is worthwhile to single out intergenerational border groups. Empirical studies analyzing sociocultural and psychological phenomena characteristic of this social community are completely inadequate. Our study involves certain steps in concretization and refinement of data on “Generation Z”. The study involved 86 schoolchildren (aged 14-15), referred to as "Generation Z", and 90 students (aged 18-19), assigned to the border generation group ("Generation Y-Z"). Research method is questionnaire. Mann-Whitney test was used to process the data. Significant differences were found (at the level of 0.01) for the following statements: “I started using the Internet before school”, “I started using a cell phone before school”, “I have more friends in the net than in the real life”, “I spend free time talking on a cell phone or texting” (14-15-year-old schoolchildren); “Parents are the authority for me, they have more knowledge and experience”, “I usually get answers to my questions from parents”, “I spend my free time with friends or family” (18-19-year-old students). The results give grounds for several variants of data interpretation: the study reflects typical features of the selected generation groups – results express features of only a certain part of the studied generation groups – the obtained data reflects the "classical" features of adolescence and schoolchildren Verifying these scientific ideas is a key point of our future research.
THE IMPACT OF TEAM DIVERSITY ON DESIGN PERFORMANCE

An-Yu Liu  
Ching-Wen Wang  
National Chung Hsing University (Taichung, Taiwan)  
(Taoyuan, Taiwan)

Today's works are often completed in a team, organizational performance can be improved through team cooperation, communication and coordination. However, the diversity of team members will affect team performance and may have positive or negative impacts. Team diversity refers to the degree of distribution and differentiate of team members in demographic attributes or potential characteristics, that is, the degree of heterogeneity. This study investigated the effects of team diversity on design performance. In this research, the variables that measure the demographic attributes of team diversity include gender diversity, diversification of ranked at home, and diversification of family socioeconomic status, the potential related attributes are measured by the diversity of the five personality traits of the team members (neuroticism, conscientiousness, openness to experience, extraversion and agreeableness). The dependent variable, the performance of the design team, was measured by whether the teams advance to the semifinals or not. In this research, online questionnaires were used to collect valuable data from the engineering design competition when registration. After sorting the data, there are 319 people grouping into 171 teams, deleting the invalid questionnaire and single participants, there are 148 teams was composed of 296 team members, the valid response rate is 92.7%. After logistic regression statistical analysis, we found that gender diversity of team members has a negative impact on design performance. In other words, team members have a better design performance with the same gender. The diversification of family socioeconomic status was positively related to the design performance, means that members from different growth backgrounds can improve design performance. However, the diversity of the five personality traits has no significant impact on design performance. The results of the study have some implications for the recruitment of members of the design team. When forming a team, the gender, education, experience and personality traits of the members are often the main considerations. However, according to the results of this study, gender and family socioeconomic status can be regarded as an indicator for organizations’ recruitment or allocation.
SELF PORTRAIT AS A WAY OF PROFESSIONAL SELF-KNOWLEDGE

Tatiana Gudkova
Lomonosov Moscow State University (Moscow, Russia)

Kriulina Alexandra
FGBOU VO Kursk State University (Kursk, Russia)

Idiographic approach to professional training of bachelors, allowing each student to speak his own language; the concept of self-images by O.I. Genisaretsky, considering them as a subjective condition of high professionalism; the concept of socialization, understood as social reality constructed by a human construction. Subject matter: identification of the main functions of psychological self-portrait. Projective techniques in the form of verbal self-portraits "My personality", "I am a professional"; drawing techniques; role-playing and group discussion. Sampling consisted of 95 bachelor students (36 male and 59 female) of the first, third and fourth years of education of Industrial-and-Pedagogical Faculty and Faculty of Physics, Mathematics and Computer Science, majoring in Professional Education. The main analytically identified functions of self-portraits are grouped into two subsets: 1) self-portrait functions for university teacher: a way to motivate students to study a psychological discipline; a means to control the completeness of psychological information assimilation; a source for a teacher to get aware of psychological problems having increased subjective significance for students. 2) self-portrait functions implemented by students in their professional development: a source of awareness of mistakes in choosing a profession; a means of fixing conscious and accumulated information on their personality; indicators of the ability to correlate the content of self-portrait with the components of professional self-consciousness; a means of activating reflective processes. The use of projective techniques (self-portraits and drawings) and active teaching methods (role-plays and group discussion) stimulate reconstruction of relations: 1) between a university teacher and students— potential teachers of vocational training, in the direction of constructive dialogue; 2) students’ attitude to the psychological information which is subjectively valuable material of construction a number of self-images— regulators of educational and professional activity; 3) university teachers’ priorities in the formation of professional skills: in the era of digital economy development of soft skills or universal skills becomes essential. Conclusion: stimulation of reflexive processes should be considered a fundamental function of self-portraits as these processes provide psychological information with the status of "living" knowledge according to V.P. Zinchenko. At the same time "living" knowledge can become a trigger for the formation of universal skills.
The current empirical study (ongoing from 1992) is aimed at analyzing the influence of the socio-political events in Russia (primarily of the 'perestroika' crisis of 1985-2000) on the formation of the basic psychological characteristics of the youngsters. Two groups are compared. For the first — participants born in 1973 — personality formation took place during "pre-perestroika" period. Testing — 1992 (150 persons). Participants of the second group — born in 1992 — belong to "post-perestroika" generation. Testing — 2016 (150 persons). Both groups are composed of medical students (sophomores) from a university in central Russia. The report gives generalized data from three psychodiagnostic tests: 16-PF, Intelligence Structure Assessment (R. Amthauer), MMI (J. Nuttin). The most important are two results obtainable only in the course of complex data processing (taking into account parameters of all three main psychodiagnostic tests). First, the index of structural integration has grown considerably (almost one and a half times: from 209 for the subjects of the first group to 293 for the subjects in the second), as well as the index of structural organization (from 30 to 122, four times). Second, the most significant changes in the index of structural integration took place for the following particular characteristics: category C (MMI test, "social motivation" — quintuple growth in the second group); factor B (16 PF, "abstract thinking", triple growth in the second group), factor C (16 PF, "emotional stability" — more than quadruple growth in the second group) and more than triple growth in five parameters in Intelligence Assessment subtests ("oddball task", "search for analogies", "arithmetic operations", "figure selection", "spacial perception"). Defining parameters of behavior of the "post-perestroika" youth are primarily systemic variables uniting values from separate tests. The main particular changes are: growing interest in social life, rationality in the regulation of behavior and intensification of intellectual development (with a slant towards "analogous" thinking). The research have been supported by RSF grant (project N 18-18-00157)
THE ARMENIAN JOURNEY ON THE ROAD OF UNCONSCIOUS

Deniz Okay
TED University (Ankara, Turkey)

Mustafa Çevrim
Ufuk University (Ankara, Turkey)

Deniz Canel Çınarbaş
Middle East Technical University (Ankara, Turkey)

1915 events, where 1.5 million Armenians died during relocation, are experiences of massive cultural trauma for Armenians. The effects of such massive cultural traumas are known to be transmitted to the next generations (Auerhahn & Laub, 1998). The aim of the current study is to explore trauma transmission in a sample of third generation Armenians in Turkey. In order to explore these experiences, interpretative phenomenological analysis was used. In line with its principles, a small and homogeneous sample of five participants was formed. Analysis revealed four superordinate themes: routes of transmission, psychological repercussions, revival of the transmitted, coping with the emotional inheritance. The first superordinate theme represented that this trauma transmission occurred mostly through unconscious ways. The second superordinate theme represented psychological impacts of this transmission, which were fear from the outside world, feeling of being the undesirable one within the society, anger, and an inner sense of bereavement. The third theme was reflecting how this past trauma is revived today with new events. This revival happened both through direct (anniversaries) and indirect reminders (being exposed to discrimination) of the 1915 events. Final superordinate theme represented how participants coped with these intense experiences. It was found out that they were mostly hiding themselves within the Turkish society, staying silent and repressing their histories. These results showed overall that ancestors’ traumatic histories and intense feelings were mostly unconsciously transmitted to the third generation Armenians. Since there is a silence concerning 1915 events in Turkish society, it was not possible for them to process, and integrate these traumatic experiences. These results may provide some suggestions to clinicians who work with this cultural group. Special importance should be to help clients verbalize these experiences in order to heal psychological scars of the past (Danieli, 1998).

A STUDY ON THE SUPPORT OF ELEMENTARY SCHOOL COUNSELORS FOR CHILDREN WITH NEURODEVELOPMENTAL DISORDERS

Hirata Yutaro  
Kagoshima University (Kagohsima, Japan)  
Ozawa Eiji  
Kyushu University (Fukuoka, Japan)  
Fukudome Rumi  
Fukuoka Jo Gakuin University (Fukuoka, Japan)

In Japan, about half of elementary school counselors (ESCs) consult on neurodevelopmental disorders. The Japanese school counseling system was introduced in response to school refusal and bulling, and full-fledged deployment of school counselors to all public elementary schools began in 2018. One problem is that the education and training system for ESCs, especially in working with children with developmental disabilities, is insufficient. There is no standard form of support, and ESCs provide support through their efforts and ingenuity. The purpose of this study was to survey how ESCs support children with neurodevelopmental disorders and to consider which knowledge and skills are necessary to do so. In total, 17 ESCs with experience supporting children with neurodevelopmental disorders were interviewed. The data included 27 cases examined in seven areas, including 1. the way of obtaining consultation with the ESC; 2. the children’s main problems; 3. time to ESC intervention; 4. form of support; 5. the children’s diagnoses; 6. use of other forms of support; and 7. ESC connection to other institutions. The results found that 70% of cases made their way to consultation with the ESC through teacher referrals. One teacher, in describing “how to connect specialized institution and how to explain to their guardian,” said that ESCs are expected to connect with other institutions and to explain the necessity of using special institutions for children. Actually, 67% of the cases already had some kind of involvement with other institutions. The time leading up to ESC involvement led to some school maladjustment for the children. Also, about 85% of the cases did not have any diagnosis at the stage involving the ESC. During the course of support, 22% of the cases were diagnosed. The results indicated that the role of the ESC is as an early-stage supporter of children, their guardians, and their teachers. As a result, ESCs must know about the assessment of neurodevelopmental disorders and regional specialized institutions. In particular, consultation and support to guardians are very important factors in each case. Going forward, we must consider differences in various areas and difference in school systems and special education.
PROFESSIONAL LONGEVITY AS A PROBLEM OF THE VALUE-SEMANTIC REGULATION OF THE TEACHER’S ACTIVITY

Natalya Zotova
Svetlana Peredelskaya
Mikhail Tikhomirov
Volgograd State Socio-Pedagogical University (Volgograd, Russia)

The problem of rendering psychological help for teachers is relevant to modern educational practice in Russia. It is not only about prevention of negative phenomena (for example, burn-out), but also about preservation of teachers installation on professional longevity. The project participants were school and preschool teachers of Volgograd region (n=247) aged 22-65. We explored individual psychological characteristics, which could determine a specialist’s desire to prolong his professional life. The results of the research claim that in educational institutions work conscious teachers of post-retirement period, who are satisfied with labour and have active life position. Moreover we have established that material motive does not play a significant role in deciding to continue working till retirement age. This is confirmed by the data of R. Engelhard: material values are important for respondents with 16-30 years’ experience, meanwhile 31-35-year-old teachers focus on the values of individualization. The analysis of the received data shows that crisis trends like concern about material problems, reduction of self-confidence, expressed tendency of passive life position, increased burn-out symptoms, are typical for teachers with 16-30 years’ experience. This prepares the ground for attitude towards the retirement age as a desirable period of rest, given the cumulative nature burn-out. Consequently, the aspiration to professional teachers’ longevity can be considered to a greater extent as a result of value-semantic mechanisms human work: professional activity is full of new meanings, it is connected with the nearest future. Undoubtedly the social environment plays a big role, first of all — the organizational culture of the educational institution, stimulating a teacher to constant professional growth against the background of beneficial psycho-emotional climate with colleagues. Thus, we have found that the proximity of the value orientations of school teachers positively correlates with the degree of satisfaction with labour. Continuation of our research is connected with revealing of psychological criteria and conditions for professional longevity on the basis of analysis of value-semantic mechanisms regulating reliability and efficiency of teachers’ work at the completion career stage.

This work was supported by Russian Foundation for Basic Research 18-013-00712A.
THE EFFECT OF ETHICAL LEADERSHIP ON PRO-SOCIAL RULE BREAKING: LINEAR OR CURVILINEAR?

Jianan Zhong
Yufang Ding
Zhijun Zhang
Zhejiang University (Hangzhou, China)

Yujian Ye
Electronic University Of Science &Technology Of Hangzhou (Hangzhou, China)

Pro-social rule breaking, rule-breaking to promote the organization, is a paradox regard of morality. Ethical leadership is a moral person and a moral manager. In Chinese organizational context, exploring how ethical leadership influence employees’ pro-social rule breaking, and what the mechanism and boundary conditions are, is full of theoretical and practical significance. From the view of supervisor-subordinate relationship, this research aimed to investigate the curvilinear effect of ethical leadership on pro-social rule breaking, examine the parallel multiple mediating effects of leader-member relationship (LMX) and supervisor-subordinate guanxi (SSG), and examine the moderating effect of regulatory focus in the specific Chinese cultural context. We collected data from 303 employees in China with questionnaire. The questionnaire included 6 parts, ethical leadership, pro-social rule breaking, LMX, SSG, regulatory focus and control variables. Data were analyzed using correlation analysis, regression analysis and factor analysis. According to the results of data analysis, we found that: (1) the relationship between ethical leadership and pro-social rule breaking is curvilinear. (2) Considering the parallel multiple mediating effects, SSG mediates the effect of ethical leadership on pro-social rule breaking, while LMX doesn’t play a mediator between ethical leadership on pro-social rule breaking. And the instantaneous indirect effect of SSG increases with the growth of ethical leadership. (3) Regulatory focus moderates the effect of ethical leadership on pro-social rule breaking. For people with high prevention focus, the inverted U curve is sharper. (4) Regulatory focus moderates the mediating effect of SSG between ethical leadership and pro-social rule breaking. For people with high prevention focus, the mediating effect is more obvious. These conclusions will contribute to the literature and management practices in three aspects. First, this study reveals the curvilinear effect of ethical leadership on pro-social rule breaking in Chinese organizational context, highlighting the double-edged sword feature of ethical leadership. Second, this research examines the parallel multiple mediating effects of LMX and SSG, extending the black-box research on curvilinear effect. Finally, the conclusions mentioned above can help managers guide employees’ pro-social behavior more rationally and efficiently.
USE “MUST BUY” WITH CAUTION: THE EFFECTS OF ASSERTIVE ADS ON AD LIKING AND PURCHASE INTENTION

Jianan Zhong
Jiayao Liu
Chuncao Yang
Shulin Chen
Zhejiang University (Hangzhou, China)
Li Li
Shaoxing University (Shaoxing, China)

Assertive ads are widely used both online and offline, which directly ask consumers to take specific actions (e.g., Buy now!). However, assertive ads may have negative effect on ad liking and purchase intention. According to psychological reactance theory and compensation control theory, assertive languages may be ineffective due to reactance. The research conducted five experiments. Experiment 1 examined the effect on ad liking of photo assertive ads among 60 students. Experiment 2 collected data from 131 students to test the mediating effect of threat-to-choice perceptions and the moderating effects of product attributes on relationships above. Experiment 3 explored that product attributes which were primed moderated relationship between assertive ads and ad liking and purchase intention among 125 students. Experiment 4 examined the moderating effects of dispositional desire for control on the relationships above, as well as tested the mediating effect of threat-to-choice perceptions and the moderating effects of product attributes among 160 students. Experiment 5 tested the moderating effects of priming desire for control by depriving their control among 124 students. Based on the results of five experiments, the results show that: (1) Ad liking and purchase intention were decreased when consumers were exposed to assertive ads (vs. nonassertive ads). (2) Threat-to-choice perceptions mediated the effect of assertive ads on ad liking and purchase intention. (3) Product attributes (hedonic/utilitarian) moderated the effect of assertive ads on threat-to-choice perceptions. Consumers’ freedom to choice was less threatened by assertive ads when products were hedonic or advertised hedonically. (4) As a dispositional trait, desire for control moderated the effect of assertive ads on threat-to-choice perceptions, such that consumers with high desire for control were more threatened by assertive ads. (5) But when desire for control was situationally induced, desire for control didn’t moderate the effect of assertive ads on threat-to-choice perceptions. According to the result, we found the negative effect of assertive ads and its mechanism. The research enriches the psychological reactance theory and compensatory control theory, which is also helpful to understand the difference between hedonic and utilitarian products. What’s more, these results offer some advice for companies to advertise effectively.
PSYCHOLOGICAL PROBLEMS AND NEEDS IN SCHOOL PSYCHOLOGIST’S CONSULTATION IN RUSSIAN MIDDLE AND HIGH SCHOOL PUPILS

Anton Esterle  
Regional Centre for Social Work and School Psychology (Samara, Russia)

Irina Savenkova  
Orel State University (Orel, Russia)

Elena Ovsyanikova  
Maya Khudaeva  
Belgorod National Research University (Belgorod, Russia)

Savina Elena  
James Madison University (Harrisonburg, USA)

Adolescence is characterized by growing academic and societal demands, greater responsibilities, and emerging identity. It is an age of increased vulnerability to mental health problems. Knowledge of adolescents’ socio-emotional and learning problems as well as their readiness to receive psychological services are essential for school psychology practice. This study investigated adolescents’ psychological problems and needs in school psychologist’s consultation. Seventh-, ninth- and eleventh-grade pupils (N = 594) from three cities in Russia filled out a survey where they rated the degree of their test anxiety, negative mood, learning problems, problems with parents, and suicidal ideation. They also indicated their desire to receive a consultation with the school psychologist about existing or potential problems. In addition, the pupils were asked about receiving school psychologist consultation in the past and the degree of satisfaction after the consultation. Regardless of age, pupils gave the highest ratings to test anxiety and negative mood. Females demonstrated higher levels of problems with parents and greater test anxiety and negative mood compared to males. Seventh-graders reported higher test anxiety than their older peers; while ninth-graders reported higher levels of learning problems than eleventh-graders. About 7% of pupils reported frequent suicidal ideation. However, the majority of participants (80%) from the total sample did not consider consulting the school psychologist regarding suicidality. Even fewer pupils were willing to consult with the school psychologist about test anxiety, mood, and learning problems. Some participants reported that they were reluctant to contact a school psychologist because of fear of stigmatization and potential lack of confidentiality. Nevertheless, there was a positive correlation between the degree of problem intensity and a desire to consult with a school psychologist. The majority of pupils knew that their school has a school psychologist; however, only 15% received a consultation. Overall satisfaction from consultation was relatively high. Obtained data will be interpreted in light of contextual factors that play a role in pupils’ socialization and school education in Russia. The findings can be used to improve school psychology services, design interventions, and provide psychoeducation to pupils.
A FACILITATING DEVELOPMENTAL PROGRAM OF COMMUNICATION FOR CHILDREN WITH DEVELOPMENTAL DISORDERS USING CO-COOKING ACTIVITIES

Tsutomu Nagasaki  
Jissen Women’s University (Narashino, Japan)

Sadahito Yoshii  
University of Yamanashi (Yamanashi, Japan)

Mizuho Hyodo  
Jissen Women’s University (Hino, Japan)

Mio Amano  
Jissen Women’s University (Tama, Japan)

Recently, several studies in the brain science have suggested that the activity observed in the children’s co-preparing and taking foods with adults, have effects on the activation of their prefrontal cortex of the brain and also on their communication development (Kawashima, 2016). And several observational studies of parent-child interaction on making concentrated beverage with water showed that parent-child interactions provides the child with opportunities to foster abilities to think independently and to interact with others (Kotani, 2016). Depends on these researches, a facilitating developmental program of communication for children with developmental disorders using co-cooking by making concentrated beverage with water activities was developed. This program is consisted of seven steps. The children make concentrated beverages for their own, for their parents and asking others for their preferences of kinds of concentrated beverage and tint of concentrated beverage. This program was adapted for one 2 years old Down’s syndrome child. In early period, by repeating actions of routine of making concentrated beverage, he could learn the script (GER) and increase spontaneous behaviors. Observing the sub-teacher to make concentrated beverage for him, he gradually could make concentrated beverage for himself and for his mother, namely the role-reverse imitations (Tomassello et al., 2005) occurred. When he was 4 years old, he could watch his mother when main-teacher asked her preference of kind of concentrated beverages. After this, he got to be able to ask other’s preferences of kind of concentrated beverages and tint of concentrated beverages by using a wh-question sentence at 5 years old: “Which do you like, orange or grape taste of concentrated beverage?” These results showed possibility of facilitating communication skill, understanding other intention of desire and language acquisition, using co-cooking context of making concentrated beverage for the children with developmental disorders. These are owned by the characteristics of concentrated beverage, which include plasticity of activities.
ASSESSMENTS OF SATISFACTION WITH LIFE: PSYCHOMETRIC PROPERTIES OF SWLS IN YOUNG CHILEANS

Karla Tay Karapas
Universidad del País Vasco, Spain / Universidad Católica del Norte, Chile

Sagrario Yáñez-Yaben
Universidad del País Vasco (Donostia – San Sebastián, Spain)

One of the significant constructs when assessing people’s well-being is their satisfaction with life, defined as the positive assessment that the person makes of his life in general or of specific aspects such as family, studies, health, friends, among others (Diener, Suh, Lucas & Smith, 1999). The most well-known instrument for measuring the cognitive component of subjective well-being is the Satisfaction with Life Scale (SWLS) developed by Diener, Emmons, Larsen and Griffin (1985); adapted and validated in Chile by Vera-Villarroel, Urzúa, Celis-Atenas, Pavez and Silva (2012). However, as with other psychological constructs, both research and validation of instruments in Chile has mainly focused on the adult population. The present research puts the interest in the youth stage, with the purpose of having a valid and reliable instrument to evaluate the life satisfaction of young Chileans. The objective was to examine the factor structure, internal consistency and concurrent validity of the Chilean version of the Life Satisfaction Scale (SWLS). The design of the study was non-experimental and cross-sectional. The sample was non-probabilistic and consisted of 421 participants between 12 and 17 years old (M = 14.55, SD = 1.62), of whom 49% were men and 51% were women. For the SWLS factor structure examination, a confirmatory factorial analysis (CFA) using Mplus 7.4 statistical software (Muthén & Muthén, 2016), with maximum likelihood as an estimation method. Subsequently, the internal consistency index of the scale of the questionnaire was calculated. Finally, for the assessment of concurrent validity, the SPSS 24 program was used, with which the association of the SWLS with theoretically related variables was examined. Results from our confirmatory factor analysis corroborate the one-dimensional factor structure of the scale. The internal consistency index was adequate (α=.83). Regarding concurrent validity, statistically significant associations were found between satisfaction with life and positive and negative affectivity (PNA-10), attachment (IPPA short), and self-esteem (Rosenberg). Finally, we conclude that the SWLS is a valid measure to be used among young Chileans.
Subjective well-being is defined as the evaluation that a person makes about their situation at a given moment (Kuppens, Realo & Diener, 2008), this evaluation includes both cognitive judgments and emotional reactions (Luhmann, Hawkley, Eid & Cacioppo, 2012). The cognitive component is a global assessment of the life trajectory carried out at a given time. The emotional component consists of two elements: positive affect and negative affect, which reflect the emotional state at a given moment (Larsen, 2009). This emotional component has been evaluated by means of various instruments, one of them is the Brief Scale to evaluate the positive and negative effect of PNA-10 (Yárnoz-Yaben, Comino & Sansinenea, 2014), adapted to Spanish from the original scale Positive and Negative Affect, PNA (Warr, Barter & Brownbridge, 1983). In Chile, there are instruments that assess positive and negative affect. However, these are aimed at the adult population; Thus, arises the need to have a valid and reliable instrument for evaluation in young people. The objective of this paper was to examine the factor structure, internal consistency and concurrent validity of the Chilean version of the PNA-10. The design of the study was non-experimental and cross-sectional. The sample was non-probabilistic and consisted of 421 participants between 12 and 17 years old (M = 14.55, SD = 1.62), 206 men and 215 women. In order to evaluate the factorial structure of the PNA-10, a confirmatory factorial analysis was carried out with the Mplus 7.4 statistical software. Then was proceeded to calculate the internal consistency indices of the subscales of the questionnaire. To Finally, the concurrent validity was evaluated, to examine the association of the PNA-10 with theoretically related variables. Results from our confirmatory analysis corroborate the two-dimensional factorial structure of the scale. Internal consistency indices were adequate, $\alpha=.86$ and $\alpha=.79$ for positive and negative affectivity respectively. Regarding concurrent validity, statistically significant associations were found between positive affectivity and negative affectivity and attachment (abbreviated IPPA), self-esteem (Rosenberg) and Satisfaction with Life (SWLS). Finally, the validity of the PNA-10 scores for use in young Chileans is concluded.
Employees are the main asset in the organization. Employees are expected to work happily to avoid the occurrence of stress in doing work that can interfere with and threaten their health. Job stress can lead to physical ailments (such as coronary heart disease, hypertension, gastric wounds, menstrual disorders, digestive disorders), workplace accidents, employee absences, lethargic work (loss of work motivation), and mental disorders that have mild effects weight.

The purpose of this study was to determine the relationship between Internal Locus of Control and Social Support with Job Stress of Public Servant in Banjar District. The results of the regression analysis obtained a value of $F = 63.269$ ($p < 0.05$), which means that internal locus of control ($X_1$) and social support ($X_2$) have correlation with job stress ($Y$); internal locus of control has a negative correlation with job stress; and social support has a negative correlation with job stress.
INTERACTIONS BETWEEN INSTRUCTIONAL CONTENTS AND FEEDBACK FREQUENCY ON HUMAN PERFORMANCE

Concepción Serrador Diez  
Centro de Estudios e Investigaciones en Comportamiento Universidad de Guadalajara (Madrid, Spain)

Paula Cecilia Cuevas Lopez
Gerardo Ortiz Rueda  
Centro de Estudios e Investigaciones en Comportamiento, Universidad de Guadalajara (Guadalajara, Mexico)

Some authors suggest that rules and instructions are different because of their function. In this sense, it is suggested that a function of an instruction is to restrict the individual's range of responses in order to prevent the participants from making mistakes. The acquisition of this function is related to variables such as the type of the instructions, the feedback frequency received and the correspondence between descriptions and contingencies. In the present study we assessed one variable that has not been systematically explored, the description's contents (i.e. instantial and dimensional). Thirty-two experimentally naive undergraduate students participated in the study. A first-order matching-to-sample task was carried out. In Experiment 1, sixteen students were assigned to groups that received an instruction qualified as Generic differing in the contents of the description; the feedback received was continuous. The Experiment 2 followed the previous logic, differing only in the frequency of feedback that was intermittent (each third response). Experiment 1 results showed high percentage of correct responses in training sessions since the beginning of this phase for all the groups, regardless the contents of the description. In Experiment 2, only the group with dimensional description content showed high percentage of correct responses in training session. The findings of Experiment 1 supports the data obtained in different studies in the area about the effects of type of descriptions and frequency feedback. Nevertheless, the data obtained in Experiment 2 differ from the data in the area; this could suggest that the variable content of description has a differential effect on the participant perform, when interact with some values of other variables, such as feedback. Results are discussed in terms of the quantity of information about properties of the contingency which is required in order to acquire the matching criteria. In this sense, results suggest that the content of the description is more relevant when interacts with feedback that give less quantity of information about the performances of the participant (i.e. intermittent feedback).
TYPE OF EVALUATION AND TEMPORARY DELAY IN CORRESPONDENCE SAY-DO-REPORT IN ADULTS

Concepción Serrador Diez
Centro de Estudios e Investigaciones en Comportamiento Universidad de Guadalajara (Madrid, Spain)

Gerardo Ortiz Rueda
Centro de Estudios e Investigaciones en Comportamiento, Universidad de Guadalajara (Guadalajara, Mexico)

María Xesús Froxán-Parga
Universidad Autónoma de Madrid (Madrid, Spain)

Correspondence implies the relationship between say and do in temporarily differentiated moments (contiguous or delayed); usually the work in the area is focused on the direct evaluation of correspondence. Thus, most of the experiments use continuous reinforcement procedures in the training of the Say-Do chain with no delay between the correspondence moments, showing high percentages of correspondence. In the present study we assessed the effect of the type of evaluation (direct, explicit target behavior both in Say and Report moments, correspondent to the behavior measured in the Do moment, or indirect) on the correspondence establishment, as well as the delay (0 or 24 hours) between the correspondence moments (Say-Do, Do-Report, Say-Report). 8 adults participated in each experiment. Task was divided in three moments: 1) Say (answer questions), 2) Do (perform different actions) and, 3) Report (answer a question about the previous moment). Experiment 1 had 2 groups (n = 4) differentiated by the values of the type of evaluation (direct or indirect) without delay between moments. In Experiment 2, we included a delay between moments (24 hours). Comparisons were made between individuals of each group thru nonparametric test for two independent groups (U Mann-Whitney). The data was analyzed in terms of: a) relationship between the type of evaluation and the correspondence at the different moments and, b) the relationship between the delay and the establishment of correspondence. In general, it is observed: a) lower percentage of correspondence with an indirect evaluation and, b) less correspondence with higher delay between moments. Data suggest that the type of evaluation (direct or indirect) could be one of the factors that promote the high percentages of correspondence observed in typical procedures of the area, where there is a direct evaluation, unlike what is found in applied areas of therapy in which there is an indirect evaluation (i.e. no relation between Say and Report moments related to the Do moment). The low correspondence showed when delay between moments was introduced, suggest that this variable could modulate the break of correspondence. These findings are relevant in applied scenarios, as therapeutic procedures.
FAMILY AND ALZHEIMER’S DISEASE: MULTICENTRE RESEARCH-INTERVENTION ON THE EFFICACY OF THE ABC GROUPS (SELF-HELP — BALINT — CONVERSATIONALISM)

Angelida Ullo
Sergio Oteri
“Centro Agape” Clinical Psychology and Psychotherapy (Messina, Italy)

Rosalba Larcan
Graziella Arena
University of Messina (Messina, Italy)

Recent studies have shown that more than 25% of the European population with age greater than 85 years suffers from Alzheimer’s Disease. The intervention on the family is essential for patients care. This multicentre evidence based research-intervention on the ABC Groups (Self help-Balint-Conversationalism), created by P. Vigorelli, had the aim of verifying the efficacy of the ABC Groups methodology by focusing on the verbal and relational changes of the caregivers after attending them. We also investigated the variations in the mood and workload of the caregivers and the QoL of the patients suffering of dementia. We recruited 103 caregivers (70 women and 22 men), 52 from the Policlinico of Messina and 40 from I.R.C.C.S. Santa Maria Nascente — Fondazione Don Gnocchi Milan. We lead 14 ABC Groups of 13 people max. The Groups met for 2 hours each time, 6 times in total. The evaluation of the efficacy of the ABC Groups methodology was based on measuring the changes in the verbal and relational behaviour of the caregiver, verbal behaviour of the patient, reduction of the negative mood and workload of the caregivers, QoL of the patients. We used pre and post treatment QUAV 1 and 6, CBI, POMS and CBS tests on the caregivers and MMSE, ADL, IADL and CDR tests on the patients. The ABC Groups resulted to be more effective on the treatment of caregivers of patients in advanced stage of dementia. The POMS results showed that after attending the Groups the level of anxiety and tension, depression and dejection, anger decreased for the caregivers. Improvements were also seen on the caregivers’ perception of the workload (Lower scores on CBI). Our study confirms the importance of working with the caregivers not only to improve their psychological wellbeing, but even for the effects in term of patients’ QoL. The variance’s analysis shows that, despite having been created as specific intervention for caregivers dealing with AD patients, the ABC Groups were effective on any type of dementia present in the sample.
ANTIFAT ATTITUDES AMONG YOUNG WOMEN IN MEXICO

Dagmara Wrzecionkowska
Rolando Díaz-Loving
Universidad Nacional Autonoma de Mexico (Mexico City, Mexico)

Background: In Mexico overweight prevalence among adults reached 72.5%, among women 75.6%. Historically Mexicans associated a “larger body figure” with abundance, protection, material wealth, strength, or in reference to women with sexual attraction. Crandall et al (2006) proposes that one of the bases for antifat attitudes (AFA) to arise is a culture preference towards a thin figure. The objective of this study was to understand associations with a “rounder figure” in relation to BMI, weight dissatisfaction and appearance self-esteem.

Method: Weight-height data, desired weight and appearance self-esteem were obtained from 134 female students. BMIs were calculated. Weight dissatisfaction was measured as desired body weight minus measured weight. Semantic differential with 12 pairs of adjectives presented with (1) an obese body image and (2) normal-weight body image was applied to measure AFA. 5-item scale from State self-esteem scale was applied to assess appearance self-esteem. Correlations and moderation analysis were performed.

Finding: The obese figure relative to normal-weight figure was perceived more negatively, except for faithfulness & there was no significant difference for intelligence. No differences in AFA were found with respect to BMI or weight dissatisfaction. Both BMI groups expressed similar bias and no significant differences were found between the groups, except for familiarity. The group with normal BMI had significantly higher appearance self-esteem. BMI moderated the relationship between appearance self-esteem and AFA: in the group with BMI≥25 the lower appearance self-esteem was associated with higher AFA. Weight dissatisfaction was a better moderator than BMI.

Discussion: Despite some historical preference for a rounder figure, nowadays in Mexico an obese silhouette was perceived more negatively relative to an average-weight silhouette, closer to its perception in the USA (Bacardi-Gascón et al, 2015). Except for intelligence current findings are consistent with other studies, e.g. Puhl and Brownell (2001) reported that the overweight were perceived to lack self-discipline, be lazy, less conscientious, less competent, sloppy, disagreeable, and to think slower. Understanding AFA, and what constitutes them is key with regard to stereotyping and discrimination, and finding the adequate intervention strategies.
TRANSFORMATIONAL LEADERSHIP: A MUST IN THE TRANSFER OF MANAGERIAL KNOWLEDGE AND PERFORMANCE

Natalie Rinfret
Miché Ouédraogo
Daniel Maltais
Lilly Lemay
ENAP (Québec, Canada)

Francine Tougas
ENAP (Montréal, Canada)

Massive baby-boomer retirements have changed the face of public and private organisations. For example, the Quebec Civil Service has undergone major transformations in the last years if only for the departure of a large number of its senior managers. How to avoid a knowledge gap, a loss of corporate memory and a decline in organisational performance following such massive departures? This issue is particularly important in times of fast and significant developments in information technology. In general, knowledge management and transfer (KMT) are considered as generators of innovation and economic value. In periods of massive departures of senior staff, they are vital. This study contributes to the advancement of knowledge by proposing and validating a theoretical model of antecedents and consequences of KMT. The identification and selection of variables was inspired by previous studies with one exception that is, the recognition of the contribution of senior workers. Without this recognition, we indubitably cannot talk about knowledge management and transfer. The predictive model includes 7 variables. According to our model, Transformational leadership promotes KMT and constitutes the point of departure for the implementation of related factors that is, Support of information technology and a Culture of collaboration and trust. This type of culture is favorably associated with Knowledge creation process and Recognition of the contribution of senior workers. The latter has a positive influence on KMT. Transformational leadership directly and indirectly (via KMT and its other consequences) stimulates Organisational performance. The model was tested among 236 Quebec Civil Service managers. Structural equation analyses confirmed the adequacy of the model to the data. In conclusion, this study confirms the importance of Transformational leadership of senior executives in Knowledge management and transfer and the increase of Organisational performance. Theoretical and practical implications are discussed.
WELL-BEING OF WORKERS IN HAZARDOUS OCCUPATIONS

Yulia Bessonova
Alexander Oboznov
Daria Petrovich
Institute of Psychology, Russian Academy of Sciences
(Moscow, Russia)

In recent years there had been an expanding conceptual field of psychological well-being in various spheres of human activities — economic, familial, occupational life. Focusing on the interrelationships among occupational well-being and professional efficiency has become particularly urgent for hazardous occupations paying special attention to the key role of work life for the sustenance and development of human society. Methods: BMSII-B by Plath, Richter; The Ryff Scales of Psychological Well-Being; professional efficiency expert estimation; health assessment (medical commission examination). Participants: 285 rescuers, 122 firemen, 415 train drivers, 115 pilots. The results of comparative analysis confirmed the absence of a direct relationship between professional efficiency and well-being. On the surface, this result is due mainly to the fact that objective performance indicators were taken into account by experts ignoring subjective indicators of well-being. Experts assessing the professional efficiency are guided by process-related and quantitative performance indicators. By contrast, objective performance assessments weren’t taken into account in measurement of well-being. On deeper examination in the long run, however, there were grounds for believing that work-related psychological well-being is a factor in the success as well as occupational health, professional experience and competencies. Well-being scores correlated highly with professional self-image, including self-assessment of employability, professional credibility, qualifications, self-realization. Thus, employees with high well-being scores had the sense of personal empowerment necessary to success of hazardous occupations. The direct interrelations between somatic status and work-related psychological well-being were found. On the one hand, well-being was a factor in somatic disorders prevention. On the other hand, any diagnosis gives rise to decreasing well-being especially Autonomy and Self-acceptance scales in well-being structure. Cardiovascular disease have an effect on decreasing Environmental mastery and Purpose in Life scores. Any trauma in medical history is associated with decreased Personal growth and Positive relations scores. Any illnesses that are contraindications for taking up work dramatically reduced all scales of occupational well-being. Consequently, well-being along with maintenance of the requisite somatic health can be seen as interlinked factors of occupational longevity. This research was sponsored by grant from the Russian Foundation for Basic Research (RFBR) according to the research project № 18-013-01021.
WAT-DUD: A NEW IMPLICIT TASK IN DRUG USE DISORDER

Pedro Juan Pérez Moreno
Jesús Gómez
Fermín Fernández-Calderón
Javier Romero Guzmán
University of Huelva (Huelva, Spain)

Pilar Cáceres-Pachón
Universidad Nacional de Educación a Distancia (Huelva, Spain)

In the field of addiction research, a usual aim is to predict the outcome of a treatment. Interpretation bias tasks, and especially word association tasks, have shown a moderate relationship with the use of substances. But these studies have at least two limitations. On one hand, most word association studies have been done with non-clinical samples, and therefore more research is necessary in clinical samples. On the other hand, word association tasks require the categorization of the responses by independent raters, making them difficult to evaluate. The objectives of this work are: 1) to provide evidence of the reliability of a new, computerized interpretation bias task that is easy to evaluate; 2) to provide evidence of validity based on the relationship with patterns of substance use and treatment outcomes. For this, 186 patients (90% men, 67 outpatients and 119 users of therapeutic communities) participated in this study. The task consisted of a conditional discrimination where an image (explicit or ambiguous in its relation with the drug) worked as a pattern, and two words (one drug-related and another non-drug-related) worked as comparisons. The Substance Dependence Severity Scale, the Cocaine Craving Questionnaire-Now and the Multidimensional Craving Scale were also used. The results showed an adequate reliability, in terms of internal consistency, for ambiguous images (Alpha = .80) and test – retest reliability (79.7% on average). The interpretation of ambiguous images as drug-related correlated positively with cocaine craving ($r = .20; p = .029$), alcohol craving ($r = .30; p = .01$), and with the symptoms of alcohol abstinence ($r = .31; p = .01$), in addition to the severity of the dependence ($r = .23; p = .04$). No correlation was found with the severity of cocaine dependence or with its withdrawal symptoms. In conclusion, the psychometric properties of the task support, in a preliminary way, its validity in research contexts on the use of substances. This work was supported by the Ministerio de Economía y Competitividad (Spain) under Grant "PSI2016-79368-R".
DIFFERENCES IN EMOTIONAL PROCESSING AMONG SUBSTANCE USE DISORDER PATIENTS USING STIMULANTS

Pedro Juan Pérez Moreno
Elena Delgado-Rico
University of Huelva (Huelva, Spain)
Daniel Dacosta-Sánchez
Bella María González-Ponce
University of Almería (Almería, Spain)
María Paz Guil-Bozal
Agencia de Servicios Sociales y Dependencia de Andalucía (Huelva, Spain)

Empirical evidence suggest the existence of alterations in the emotional response of people with substance use disorder (SUB) (Aguilar de Arcos et al., 2005, Villalba and Verdejo-Garcia, 2012). Overall, the data indicate that stimulating substances could promote a sensitization in the pleasant-unpleasant assessment, while the sedative or depressant substances would favor assessments with a tendency toward neutrality (Kemmis et al., 2017). Recent studies indicate that these alterations could chronify the disorder and/or favor high relapses rates (Dingle et al., 2017). This study analyzes the differences in the emotional processing of SUD patients with stimulant consumption compared to patients consuming other substances. 80 patients participated in the study. First block required to discriminate which of the two images was more pleasant. Condition 1 compared a high-valence image with a neutral one. In condition 2, a low-valence image is presented compared to a neutral. Second block asked to discriminate which of the image presented was more relaxing: high-activated image compared to a neutral image (condition 3) or low-activating image compared to neutral image (condition 4). The consumption of the last month was also recorded. Findings: SUD patients with cocaine use during the past 30 days have shorter reaction time when comparing of negative versus neutral stimuli than the rest of patients (t(78, 2-tailed) = 2.03, p = .046; d = 0.46). This trend is similar when patients compare high activating versus neutral stimuli (t(78, 2-tailed) = 2.26, p = .026; d = 0.51). A higher proportion of correct responses in the group of patients with cocaine use is also observed in this condition compared to the rest of the patients (t(78, 2-tailed) = 2.87, p = 0.005; d=0.65). SUD patients who use cocaine have a response pattern compatible with a sensitization of negative valence stimuli and high activating stimuli, compared to patients consuming other substances. This work was supported by the Ministerio de Economía y Competitividad (Spain) under Grant "PSI2016-79368-R".
RELATIONSHIP BETWEEN PERCEIVED EMPATHY AND PERCEIVED GOAL SUPPORT FOR CHILDHOOD

Haruka Koike
Tokai University Junior College (Shizuoka, Japan)

In previous studies (Barrett-Lennard, 1962, 1981; Greenberg, Elliot, Watson, & Bohart, 2001) that examined perceived empathy in therapeutic interpersonal relationships, it is clear that the treatment effect will be enhanced if the client perceives empathy. Even in daily interpersonal scenes, perceived empathy is expected to work effectively. In this study, we examined the influence of perceived empathy on perceived social support for childhood. A questionnaire survey was conducted with 255 junior college students (of whom 28 were males and 226 females). The survey was conducted in multiple classrooms with students taking psychology-related classes. They answered, respectively, self-reported questionnaires regarding their relationships during elementary school days with their parents, close friends of the same gender, and teachers: (1) the Japanese version of the Perceived Goal Support Scale (Asano & Yoshida, 2014), (2) Perceived Empathy Scale in Daily Interpersonal Relationships (Koike, 2018). Our analysis showed that the Japanese version of the Perceived Goal Support Scale comprised two factors: (a) support for promotion-focused goals and (b) support for prevention-focused goals. Further, a correlation coefficient of .70 was found between perceived empathy and support for promotion-focused goals in the relationship with parents during elementary school days. A correlation coefficient of .71 was found between perceived empathy and support for prevention-focused goals in the relationship with parents during elementary school days. A correlation coefficient of .75 was found between perceived empathy and perceived goal support in the relationships with friends and teachers during elementary school days. Based on the above results, it is suggested that the perception of social support could be amplified by thinking that one is "being empathized" by one's parents, friends, and teachers.
THE EFFECT OF HUMOROUS COMMUNICATION ON THE PERCEPTION OF ORGAN DONATION

Nora Katharina Kuepke
Leonie Otten
Cornelia Betsch
University of Erfurt (Erfurt, Germany)

Increasing people’s willingness to donate organs after their death (OD) is a major social goal to save lives globally (WHO, 2018). This requires effective communication to increase positive attitudes, knowledge, reduce fear and, at the same time, hinder defensive psychological reactions like reactance. Humorous communication about OD may help reaching these goal (Eisend, 2011). The Elaboration Likelihood Model (Petty & Cacioppo, 1986) assumes that humour as a heuristic cue may reduce reactance— and can subsequently improve attitudes and intentions. A systematic literature search done prior to this study, however, showed inconsistent evidence about the effects of humorous communication. Therefore, two preregistered studies aimed to assess whether humorous messages about OD can positively influence people’s attitudes, fears, knowledge and behavioural intentions related to OD and which processes mediate these effects.

In Study 1 (N = 2920), a German medical cabaret live show included a humorous stand-up on OD and was compared to a control show (2 [intervention: humour vs. control, between] x 3 [time: before and after the intervention and after four weeks, within]). Study 2 assessed the causal effect of humour in a lab setting (N = 144) where two informative podcasts delivered the same information about OD either humorously or neutrally (2 [podcast: humorous vs. neutral, between] x 3 [time: before and after the podcast, after four weeks, within]). Both interventions increased knowledge and attitudes towards OD. It is noteworthy that the humorous communication in Study 2 had no general positive effect as both podcasts improved knowledge and attitudes. Both studies, however, showed that humorous communication had a positive effect on attitudes when participants indeed perceived the content as humorous (b = 0.044, [0.033, 0.054]; Study 1); parallel effects occurred for intentions, knowledge and reduction of fear in both studies. Mediation analyses in Study 1 further showed that humorous communication improved attitudes by reducing psychological reactance (indirect effect b = -0.0798, [-0.1029, -0.0585], parallel results for knowledge and intention). In sum, we conclude that humorous education about OD should be chosen more frequently due to its potential to reduce defensive reactions like reactance in sensitive topics like OD.
MINDFULNESS-BASED COGNITIVE THERAPY REDUCES ANXIETY, DEPRESSION AND PERCEIVED STRESS IN SOCIALLY ANXIOUS PEOPLE

Melanie Kowalczyk
Izabela Krejtz
Katarzyna Wisiecka
SWPS University of Social Sciences and Humanities (Warsaw, Poland)

Tomasz Jankowski
John Paul II Catholic University of Lublin (Lublin, Poland)

Pawel Holas
University of Warsaw (Warsaw, Poland)

The aim of the study was to evaluate the impact of an 8-week Mindfulness-based cognitive therapy (MBCT) training on anxiety, depression and perceived stress (PS) in socially anxious people. MBCT has already been proven efficient in preventing relapse in depression [1] and reducing anxiety in individuals with generalized anxiety disorder (GAD) [2]. Our hypothesis was that MBCT would lower levels of anxiety, depression and perceived stress in socially anxious people. From the group of people who responded to an advertisement offering a free 8-week MBCT group training, 58 individuals with social anxiety (SA) were selected and randomly assigned to two groups: an experimental group which would take part in the MBCT training and a control group (waiting list). Both groups were asked to fill in the Liebowitz Social Anxiety Scale [LSAS], the Center for Epidemiological Studies Depression [CESD] and the Perceived Stress Scale [PSS] pre and post 8 weeks of MBCT. Among those participants, 20 persons (17 women) remained until the end of the study: 11 in the experimental group and 9 in the control group. A repeated measures ANOVA determined that there was a significant mean difference before and after the training in levels of SA (p = 0,05, \( \eta^2 = 0,2 \)), depression (p < 0,05, \( \eta^2 = 0,30 \)) and PS (p < 0,05, \( \eta^2 = 0,25 \)). Post hoc tests using the Bonferroni correction showed that the MBCT training significantly reduced SA, depression and PS from pre-training to post-training, compared to the control group where there were no such changes. Although this pilot study was done on a small sample and further research on a larger groups are needed, the present results suggest that MBCT is a promising intervention for socially anxious individuals.

SELF-REGULATION AND TEST ANXIETY AS PREDICTORS OF STUDENTS’ ACTION RELIABILITY IN EXAM SITUATION

Elena Filippova
Varvara Morosanova
Psychological Institute of the Russian Academy of Education (Moscow, Russia)

The Unified State Examination grades are not only the result of education in high school, but are also the indicators taken into account when entering higher education institutes. This fact significantly increases their value and leads to the situation when some students, having good knowledge of a subject, do not always show them in examination setup. To investigate this problem we introduced the concept of the students’ action reliability (AR) in exam situation which is considered as the ability of a student to implement the obtained knowledge to the full in the exam situation and get an exam result not lower than the annual grade on the subject. The study is aimed at identifying the regulatory and personal predictors of students’ action reliability in situation of the final exam. We describe conscious self-regulation (SR) as a cognitive-personal system of setting educational goals and organizing their achievement (Morosanova). Stability of SR is considered as a key regulatory predictor which is understood as maintaining the quality of activity regulation in tense, difficult conditions (Morosanova). The sample consisted of 231 Russian schools students (48% girls, average age = 17.5). Methods were: 1. Morosanova’s «Style of SR of educational activities». 2. Spielberger’s «Test Anxiety Inventory». 3. Metric indicator of the students’ AR in exam situation based on the student's marks in the subject, marks for the test exam and final exam (mathematics). The data analysis revealed statistically reliable positive interrelations of the students’ AR and SR indicators of planning, evaluating results, SR stability. High negative correlations revealed between the indicators of AR and Test Anxiety. Multiple regression analysis was performed to identify significant predictors of the students’ AR in exam situation, where AR indicator served as dependent variable while regulatory and anxiety indicators were considered as predictors. Regression model of the dependent variable AR describes 55% of the variance and shows that students’ AR in exam situation is provided by a high level of SR stability, a low level of anxiety and a high level of emotionality. The obtained results confirmed the importance of regulatory mechanisms, foremost SR stability, in ensuring the reliability of students’ actions in the final examinations.
PROLONGED AUTOAGGRESSION IN THE CONTEXT OF ADOLESCENTS’ RESILIENCE, FAMILY VICTIMIZATION AND STRESSFUL LIFE EVENTS

Linda Rajhvajn Bulat
Nika Sušac
Ines Rezo
University of Zagreb (Zagreb, Croatia)

Problems of adolescents’ suicidal behaviour and non-suicidal self-injury behaviour are in the focus of most contemporary prevention programs and social policies aimed at promoting youth mental health. The aim of this study was to explore the interplay of risk and resilience factors in prediction of prolonged adolescents’ suicidal ideation and self-injury behaviour. A longitudinal three-wave study (with a one-year interval) was conducted using a two-stage stratified cluster sample of 1st grade pupils from 29 secondary schools in Croatia. Data were collected within the project "Family economic hardship, psychosocial problems and educational outcomes of adolescents in the time of economic crisis", financed by the Croatian Science Foundation. Initial sample in the first wave included 1101 pupils, but the analysis presented in this paper included only the data collected from 181 adolescents who had some non-suicidal self-injury behaviour and/or thoughts about committing suicide in the first grade, and who participated in all three waves of the study. Mean age of these students (71.3% females) in the first wave was 15.22 (SD=0.561). The questionnaire used in this study consisted of two criteria questions regarding non-suicidal self-injury behaviour and thoughts about committing suicide, Resilience scale for adolescents, The stressful life events scale and Parental violence questionnaire. Out of the initial sample of 181 adolescents with autoaggressive behaviour/thoughts, 50.3% also reported non-suicidal self-injury behaviour and/or thoughts about committing suicide in the third wave. We further studied the differences between those adolescents who stopped behaving autoaggressively and those who showed prolonged autoaggression (according to their data in the third wave). For this purpose, we used the data from the second wave. Discriminant analysis showed that the chosen set of discriminant variables (experienced parental violence, stressful life events and resilience factors) predict prolonged autoaggression with 76% of accuracy (Canonical correlation 0.517, Wilks’ Lambda 0.732). The most important predictors are personal competence, family cohesion, structured style, social competence and experience of parental psychological violence. The significance of these specific predictors will be discussed in the context of practical implications and development of suicide prevention and intervention programs.
THE MEANING OF THE PROFESSIONAL FORMATIVE PROCESS FOR STUDENTS IN PSYCHOLOGY CAREER

Miguel Angel Martinez  
National University Autonomous of Mexico (UNAM)  
(Atizipan, Mexico)

Ana Elena Del Bosque  
National University of Mexico (Tlanepantla, Mexico)

Professional formation is an educational and social process that occurs in higher educational institutions and it is oriented toward the appropriation of knowledge, skills, attitudes, and cultural and ethical values, within a professional context. In these formative processes, students sustain some beliefs about the discipline’s concept that evolve progressively in interaction with their peers, which allow them to analyse and propose different ways of problem solving and decision making into their social historical context according to their professional practice. The primary objective of this research report was to understand and analyse the meanings psychology students provide to the professional formation process. It is important to state that this research was part of a greater project with a qualitative methodology and hermeneutical approach (symbolic interactionism). Our participants were 38 students from different semesters in the psychology career at the National University of Mexico campus Iztacala. We employed the biographical narrative approach through brief written life stories which allowed us to explore the meanings they gave to their professional formative process in several stages. Data reflect that while first semesters students (beginners) express ideas related to the image that psychologists usually project in our social context, the ones at the advanced semesters (seniors), showed knowledge and abilities acquired during their formation process, which denote changes in the meaning of professional practice according to the formation trajec they follow. This view of professional formation considered as a part of life, we relate it with that derived from symbolic interactionism, that points out that profession is an important part of people’s biography; furthermore meanings are constructing and reconstructing through social interaction with teachers, peers and other people in our social context, considering that people is an important part of the context. Our conclusions is simple: students develop different meanings that change as the objects and elements that constitute them do so, such as knowledge, activities and interaction, all along the trajec of life.
UNIVERSITY’S ATTITUDES TO REASONABLE ACCOMMODATION FOR STUDENTS WITH DEVELOPMENTAL DISORDERS IN JAPAN

Matsushita Tomoko
Kira Yasuyuki
Kyushu University (Fukuoka, Japan)

Takaishi Kyoko
Konan University (Kobe, Japan)

Uchino Teiji
Hiroshima Shudo University (Hiroshima, Japan)

Kikuchi Teiichiro
Kyushu Institute of Technology (Fukuoka, Japan)

In Japan, reasonable accommodation for students with disabilities has been mandatory at public universities from 2016. Besides that, supporting students with developmental disorders is an urgent issue for higher education. However, most universities are not familiar with reasonable accommodation and they are confused about what they should do for students with disabilities. The purpose of this study is to reveal the universities’ attitudes to reasonable accommodation. Questionnaires were collected from 430 students at three public universities. Statistical analysis was examined in regard to their specialized fields and experiences of teaching students with developmental disorders. The results of the analysis revealed that about 60% of universities have had educational experiences for students with developmental disorders, they were likely to offer more supports than those who had no experiences for teaching them. In addition, the most universities felt unsure about fairness among students and adequate balance between reasonable accommodation and education philosophy/purposes, especially in the fields of science and technology. This indicates that student counseling center should give universities more information and opportunities for discussing about reasonable accommodation according to the students’ situations.
CONCEPTUAL COMBINATION THEORY AND TECHNOLOGICAL IMAGINATION COGNITION: TECHNOLOGICAL IMAGINATION TEST CONSTRUCTION

Yung-Chieh Yen
Ching-Wen Wang
National Chung Hsing University (Taichung, Taiwan)

Ruey-Yun Horng
National Chiao Tung University (Hsinchu, Taiwan)

Based on the conceptual combination theory, a test on technological imagination is developed. The test includes two parts: conceptual combination and sleep device design. In the conceptual combination part, the testing time is ten minutes and the subjects are asked to write down their associations while two nouns are connected. The subjects are also asked to write down the procedures or reasons for their associations. In the sleep device design, there are two types of test items. The first type is experience association, in which the subjects are asked to write down their ideas based on the following three hints 'Sleep is like....., Sleep is ......, Sleep is not .....'. The second type is sleep device design, in which the subjects are given twenty minutes to write down their imagination about the ideal devices for sleep, then describe and picture them in detail. Based on the definition by Torrance (1966) and the responses of the 717 subjects from 17 colleges nationwide, norms and scores of the test are found and established. In this study, 32 questionnaires from college graduates who participate in the pretest and posttests are received, and the correlation coefficient between pretest and posttest is .495 (p<.01). Two raters are trained to do the rating job, and the result for raters’ reliability is .723 (p<.001). The findings from both participants and raters prove that the reliability of the test is strong. In another study, 145 college design majors are involved, and criterion-related validity is checked by using students’ mid-term scores. The findings show the correlation coefficient is .475, which indicates strong validity. The purposes of this study were to explore the connotation of cognitive work contained in technological creativity and imagination, and to design a test to measure the technology imagination based on the cognitive work of technology imagination.
ORTHOREXIA NERVOSA SYMPTOMS IN CHINESE UNIVERSITY STUDENTS: PHENOMENOLOGY AND CLINICAL CORRELATES

Xiaolu Zhou  
Shanghai Normal University (Shanghai, China)

Eric Storch  
Baylor College of Medicine (Houston, USA)

Orthorexia nervosa, characterized by pathological preoccupation with healthy eating, has received growing interest in Western cultures. However, the question of whether the orthorexia nervosa phenomenon is present among Chinese individuals remains unexplored. This study aimed to explore the phenomenology and the clinical correlates of orthorexia nervosa symptoms in a Chinese university student sample. A total of 418 undergraduate students completed self-report questionnaires assessing symptoms of orthorexia nervosa, anxiety, depression, obsessive-compulsive disorder, and fear of negative evaluation. The most endorsed orthorexia nervosa symptoms were thinking about “healthy” foods, preparing food in a certain “healthy” way, and making up for food transgressions. Orthorexia nervosa symptoms were moderately associated with obsessive-compulsive disorder symptoms, were weakly associated with anxiety, depression symptoms, and fear of negative evaluation, and were not correlated with gender. Mean differences were observed on obsessive-compulsive disorder and anxiety symptoms between individuals with and without elevated orthorexia nervosa symptoms. No group differences were displayed on depressive symptoms and fear of negative evaluation. Collectively, these findings confirmed the correlation between orthorexia nervosa and obsessive-compulsive disorder symptoms in a non-clinical sample. Future studies are encouraged to examine orthorexia nervosa with different measures and methods.
THE OTHER-NEGATIVITY BIAS AND THE SELF-POSITIVITY BIAS: EVIDENCE FROM OLD/NEW EFFECTS OF SOURCE MEMORY AND DESTINATION MEMORY

Mengsi Li
Aiqing Nie
Zhejiang University (Hangzhou, China)

During social interaction, source memory enables us to remember by whom what have been done while destination memory involves remembering to whom what we have done. Neural mechanism difference between them has not yet been clarified. Social dilemma games, including dual players cooperating with or cheating each other, provide a proper way to explore these two kinds of memory simultaneously. For source memory, previous behavioral research has identified enhanced memory for cheaters versus cooperators (i.e., a negativity bias). Despite no former evidence for the modulation of cooperation and cheating on destination memory, a positivity bias might be expected, due to the fact that people tend to recollect more positive versus negative information within self-referent conditions. To compare the neural mechanisms underpinning source memory and destination memory, and further investigate the modulation of cooperation and cheating on them, a social dilemma game with facial images of celebrities serving as the participants’ virtual interactive partners was applied in two ERP experiments, testing source memory and destination memory respectively. Both experiments contained 30 effective participants.

ERP waveforms for faces with successful source or destination retrieval were compared with those of the correctly rejected new faces (i.e., old/new effects), separately for cooperative and cheating cases. Four components of old/new effects, FN400, LPC, LPN and RFE, were recorded in both experiments. FN400, LPN and RFE were insensitive to cooperation and cheating, while the recollection-based LPC was asymmetrically modulated. A negativity bias was identified in source memory, as the LPC appeared only under the cheating case. While for destination memory, a positivity bias was observed due to enhanced LPC for the cooperative versus the cheating cases. The asymmetric modulations of cooperation and cheating on the recollection-based LPC in source memory and destination memory suggest an other-negativity bias and a self-positivity bias. The other-negativity bias could result from people’s intent to avoid suffering from negative information and consisted with the social contract theory suggesting a highly specialized cognitive module to detect cheaters during social cooperation. While the self-positivity effect could be due to one’s will to construct a more positive self-schema.
DISCUSSION ON THE GENDER EQUALITY WORK ENVIRONMENT OF FEMALE SOLDIERS

Pei-Shan Lee
Chia-Chun Wu
Institute of Education, National Sun Yat-sen University
(Kaohsiung, Taiwan)

Gender equality in the work environment has been the subject of much discussion in the past three decades. In the past, the military was dominated by men. In recent years, the proportion of female soldiers in Taiwan has been rising. The situation of female soldiers in the workplace and the gender equality of the military deserve attention. This study investigated the sexual harassment and response patterns of female soldiers in their workplace (N=281). In the department’s sexual harassment prevention, only three-quarters of participants’ units have been trained in "gender mainstreaming", "gender equality", or "sexual harassment prevention" in the past two years. 84.7% trainees indicated that their gender equality awareness is raised; however, more than 90% of participants’ units have implemented gender equality” related articles, regulations, concepts and other propaganda announcements, of which 87.6% of the trainees indicated that can achieve the effect of propaganda. As a female soldier, only 41.3% have read or contacted the CEDAW in their service units; Overall, only 37% understand CEDAW. In the part of work equality, some respondents indicated that the current service unit’s promotion operation (2.9%), work distribution (2.8%) and non-supporting for applying parental leave (3.9%) are not in line with gender equality principle. Although 93.3% of them indicated that parental leave is beneficial to family care and support, 6% is still experienced or witness discrimination against women because of pregnancy. In the past two years, 17.8% of those have heard (or actually contacted) sexual harassment cases, 20.7% have heard of rumours or insulting female metaphors and other insults, 7.5% know forced female colleagues to participate in meal entertainment and drinking situation. The results show that we should pay more attention to gender equality in the military and change the hostile environment.
EXPLORING ALLOCENTRIC AND EGOCENTRIC SPATIAL REPRESENTATIONS USING THE CAVE TECHNIQUE

Galina Menshikova
Olga Saveleva
Boris Velichkovsky
Grigory Bugriy
Lomonosov Moscow State University (Moscow, Russia)

Currently in psychological rehabilitation the necessity of developing innovative methods for testing cognitive disorders is becoming increasingly important. One of the urgent requests is associated with developing a new therapeutic tool for spatial cognition disorders, which, in particular, are manifested in decreasing the accuracy of mental spatial representations (SR) of the environment. In the scientific literature two types of spatial representations are highlighted: egocentric representations (ESR), encoding object locations relative to the observer and allocentric representations (ASR), specifying the relative positions between objects. There is very little data on the accuracy of ESR and ASR processing in working memory. To study this issue, the method was developed testing the ability to memorize 3D complex scenes. Six unique virtual scenes were constructed each consisted of seven objects located in different 3D positions. Each scene was shown for 25 seconds using the CAVE virtual reality system. Thirty six participants (22F, 14M, age range 18—26) were tested. The participant’s task was to remember the scene and then to reproduce it in a virtual space using the given viewpoint: «the front» viewpoint (to reproduce the memorized scene from the egocentric position), «the left» and «the above» viewpoints (to reproduce the scene from the left or above imaginary allocentric positions, respectively). To perform the task, the participants chose objects from the library of virtual objects and placed them in virtual space using the flystick. The object locations in virtual space were recorded. Then, the accuracy of ESR and ASR cording in terms of metric, topology and depth parameters was calculated. The results showed that the ESR cording ("the front" viewpoint) was more accurate in comparison with the ASR cording ("the left" and "the above" viewpoints). The comparison of two allocentric representations revealed greater accuracy of restoring the scene from "the above" viewpoint. The topological accuracy was much better than the metric and depth accuracy regardless of the viewpoints. The developed method revealed the features of ESR and ASR coding. It may be required in clinical psychological rehabilitation of spatial cognition disorders. The study was supported by RFBR grant, project № 17-29-02169.
THE ROLE OF INDIVIDUAL CORRELATES AND CLASSROOM CLIMATE IN PASSIVE BYSTANDING BEHAVIOR IN BULLYING: A MULTILEVEL ANALYSIS

Yasuyo Nishino
Hiroshima Shudo University (Hiroshima, Japan)

When bullying occurs in school, most students are not only aware of it, but are also present and witness bullying. Many of them, however, are often reluctant to intervene or to inform adults. From a social-ecological perspective, bullying is not just the result of individual characteristics, but is influenced by multiple relationships, that is, bidirectional interaction between individuals and the multiple systems in which they operate. Bullying exists within the larger context of school climate, but there is a lack of empirical studies examining interactions between school climate and the personal correlates of bystanders. The purpose of this study was to investigate how personal correlates and school climate were related to bystander behaviors (remaining passively aside and not intervening) in bullying. Therefore, this study examined pathways that linked moral disengagement, low empathy and classroom climate to passive bystanding behavior in bullying. In addition to examining the pathways to passive bystanding behavior, we also tested the hypothesis that middle school students have different pathways from those of primary school students. Classroom climate was assessed using the measure of perceived satisfaction with the class. Two hundred and eighty-seven Japanese primary school (16 classes, mean age=10.6 years, 54.7% girls) and five hundred and thirteen middle school (20 classes, mean age=13.6 years, 50.1% girls) students participated in our questionnaire survey. T-test showed that compared with primary school students, middle school students significantly expressed higher moral disengagement, lower empathy and more negative school climate. The estimated class variance of classroom climate was statistically significant. Multilevel analyses were performed to examine the cross-level interactions between individual-level and classroom-level factors. Results showed that passive bystanding behavior was positively predicted by moral disengagement and only for middle school students by low empathy, and that classroom climate might buffer the influence of those negative individual characteristics on passive bystanding behavior only among middle school students. The results also showed that the effect of moral disengagement and low empathy on passive bystanding behavior varied between classrooms only in middle school, indicating the effects of risk factors depend on the characteristics of the classroom. Implications of these findings are discussed.
INTENSE STRESS AS MOTHER’S COMPLEX RESPONSE TO HER CHILD’S SERIOUS ILLNESS

Marina Dan
Natalia Kharlamenkova
Elena Nikitina
Galina Vilenksaya
Institute of Psychology Russian Academy of Science (Moscow, Russia)

Serious illness of a child requiring surgical intervention is a stressor of high intensity for the child himself and his mother. It has been repeatedly shown that a life-threatening diagnosis is accompanied by changes in family roles and responsibilities (Long & Marsland, 2011; Mu et al., 2015 etc.). Mother’s intense stress associated with musculoskeletal system surgery in her teenage child is studied. Child’s experience of pain correlates with mother’s emotional and psychological state (Evans et al., 2016). However, the complex medical and psychological study of the mother-child dyad in the situation of the forthcoming surgical intervention and its consequences has not been conducted yet. The present study examines the psychological peculiarities and relationship of mother’s and child’s response to the threat of surgery, perioperative analgesia and surgical anesthesia type, the traumatism of the operation and the localization of surgical manipulations. The purpose of the study: to differentiate mother’s understanding of the child’s disease, about the consequences of anesthesia and the type of operation in relation to the level of her intense stress. Hypothesis: the level of mother’s stress intensity depends on the degree of generalization of her representations of the child’s disease, on kind of information about preoperative anesthesia and surgical analgesia, as well as on an adequate assessment of the operation traumatism degree. Methods: Perceived Stress Scale – 10 (PSS-10) validated by Ababkov et al., 2016; Author’s questionnaire for evaluation of mother’s representations about the disease and forthcoming medical interventions (Dan M., Kharlamenkova N., Kazymova N.), semi-structured interview (Tarabrina N. et al.). Sample: mothers (n=40, 30-55 years) of 12-16-year-olds diagnosed with benign tumors of the musculoskeletal system. Results: stress ratings are different (p<0.05) between mothers with sufficient and insufficient information about the used anesthesia, regardless of the type of anesthesia (general, epidural or nerve block). It is shown that the level of stress is higher in mothers with more detailed and less generalized understanding of the child’s disease. The correlation between the degree of traumatism of the surgery and perceived stress was also revealed. The reported study was funded by RFBR according to the research project 18-00-00393 (project № 18-00-00049).
MAKE — ME -UP
Agata Romeo
Domenico Trimarchi (Catania, Italy)

The scientific literature shows that improving the physical appearance helps to improve the quality of life. Our project has been started by the “Voglia di Vivere” Association of Catania and it’s aimed only for women with spinal cord injuries. The observational study examined the association between body image and life satisfaction of women with physical disabilities. Through the offer of a make-up course, we want to promote the regaining of one’s own femininity and increase the integration with able-bodied people. A group of 12 women aged 19 to 55, suffering from tetra and paraplegia, attended a make-up course in a professional school. The meetings were introduced by the peer counselor. There is always a psychologist, a teacher and three school students as tutors. Makeup artists have taught strategies to improve facial features. The lessons included theoretical insights on basic makeup, brush and color analysis. Women who attended the course have proceeded with the make-up on themselves first and later, with the supervision of the tutors, on other people (a caregiver or a tutor). Keeping the brush in the hands is often difficult, in fact, Enza, did not put on makeup anymore, had abandoned makeup because it made her nervous and other girls did not look anymore in the mirror. Every young woman experimented using the materials that were available to them. Every day they have improved their technique and the use of the materials, finding each one, after various trials, the modality commensurate with their own abilities. Enrolled women have visibly improved self-esteem, well-being and self-confidence even if the body still bears the marks of an experience of rupture and loss. The make-up classes allowed the teachers to understand that, even if a person has experienced a loss, she is able to integrate completely with able-bodied people without feeling different. The construction of a new experience outside the health environment, has allowed the construction of new relationships. The makeup lessons have become places of “taking care” but also of comparison where, the re-discovering has also become a re-discovery of the other in all directions.
Coping with mental challenges is vital to everyday functioning. In accordance with prominent theories, the adaptive and flexible adjustment of the organism to daily demands is well expressed in task-related changes of cardiac vagal control. While many mental challenges were found to be associated with increased effort and associated decreased task-related heart rate variability (HRV), some cognitive challenges were found to go along with HRV increases. Especially creativity represents a complex cognitive process, which not only results from mental effort but also from more spontaneous and free-associative modes of thinking. Critically, both creativity and HRV are associated with physical fitness. Furthermore, the cross-stressor adaptation theory suggests that changes in cardiac reactions to physical challenges (through training) may generalize to mental challenges. In line with this idea physical fitness was hypothesized to moderate the association between task-related HRV changes and creative ideation performance. In a sample of 97 participants, an association between task-related HRV changes and originality as a function of participants’ fitness was found. Participants with higher fitness levels produced more original ideas when they had higher HRV increases during the task. Participants with lower fitness levels showed the opposite association. Results suggest that physically fit people achieve higher originality probably via the engagement in more flexible and spontaneous modes of thinking, while less fit people may primarily benefit from increased mental effort. This supports the conclusion that higher creativity can be achieved by different strategies, the effectiveness of which seems to depend in part on the individual’s fitness.

TASK-RELATED HEART RATE VARIABILITY IS DIFFERENTIALLY ASSOCIATED WITH CREATIVE POTENTIAL DEPENDING ON PHYSICAL FITNESS

THE SATISFACTION LEVEL OF THE PAIN TREATMENT WITH THE AMERICA PAIN SOCIETY — PATIENT OUTCOME QUESTIONNAIRE

Agata Romeo
ASP Siracusa (Catania, Italy)
Roberto Risicato
ASP Siracusa — Augusta Hospital (Siracusa, Italy)

For some time now we have been talking about hospital without pain, and there are various scales used to evaluate it. The aim of the study is to evaluate the patient's perceived satisfaction with the treatment of pain in relation to the care received. We used the American Pain Society — Patient Outcome Questionnaire (APS-POQ) proved valid and reliable even in Italian. An easy-to-impart tool consisting of 16 items provided by the psychologist to the patients through an interview. This project analyzed a sample of 46 hospitalized patients, aged between 45-82 years. Patients with cognitive deficits, psychiatric or psychophysical that do not allow the questionnaire completion were excluded. The aim was to verify the presence of pain in its intensity and impact in different areas of activity; patient satisfaction for pain management and reasons for satisfaction/dissatisfaction; the presence of erroneous pain management beliefs. The reported average intensity of pain was 6/10. The highest pain intensity of hospitalization was 8/10. Patients reported the highest level of pain impact on general activities while the lowest level on walking. The satisfaction with the treatment of pain was positive both for the modalities with which the nurses and the doctors responded. In the future it would be advisable not only to check the effectiveness of the treatment of pain but also the patient’s perception. It would be a further indicator of the quality of treatment as a feedback of the interventions carried out.

THE PERCEPTION OF THE HEALTH WORKER IN THE RELATIONSHIP WITH THE PATIENT: OUR EXPERIENCE IN A U.O. OF INTERNAL MEDICINE

Agata Romeo
ASP Siracusa (Catania, Italy)
Roberto Risicato
ASP Siracusa — Augusta Hospital (Siracusa, Italy)

The health worker every day deal with the disease but also with emotions, feelings, experiences that belong to the "sick" person. The process of treatment inevitably activates various mechanisms in the operators that arise from the observation, from listening, from the physical and emotional proximity of the patient. The objective of the survey is to study the perception of nurses, doctors and O.S.A. when they come into contact with the suffering of the patient taken care of. A All U.O staff. of Internal Medicine was provided a self-imparted questionnaire. The sample of audience consists of 23 health workers (6 doctors, 13 nurses, 4 O.S.A.) for each person have been found role, age, sex, years the role. There are three main aspects considered: 1. emotional breakdown / satisfaction deriving from the work done 2. feelings in the interaction with the patient 3. feeling related to their competence and to the work done in the team. The aim of the research was to detect the attitude of the individual to work, the operators shown emotional involvement with the patient; the sense of self-efficacy perceived together with the perception of the functioning of the working environment is good. Suffering represents a condition of crisis that determines a "cost" in terms of operator stress. In addition to diagnosis and treatment it is necessary to "approach" the emotional dimension. This is an approach still difficult to be implemented despite several years of service.
RELATIONSHIP OF WORK ENGAGEMENT AND ORGANIZATIONAL IDENTIFICATION WITH EMPLOYEES’ EXTRAROLE BEHAVIOR

Sergei Lipatov  
Lomonosov Moscow State University (Moscow, Russia)

Stanislav Ilichev  
(Moscow, Russia)

Group and organizational identification, and work engagement are the important motivators for employee work attitude and performance. This research examines how employee organizational identification and work engagement affects his (or her) workplace extra-role behavior. In line with Group Engagement Model and Job Demands-Resources Model, we hypothesized that group and organizational identification positively affects work engagement, and this constructs positively related with employee extra-role behavior. In addition, social identity, perceived procedural justice and perceived outcome favorability positively correlate with work engagement and extra-role behavior. An online survey was created and posted on the Internet with 618 usable responses. Participants were 387 females and 231 males from different cities of Russia. Work engagement was measured by The Utrecht Work Engagement Scale (UWES-9), extra-role behavior was measured by Extrarole Workplace Behavior Scale (Rebzuev, 2009), group and organizational identification was measured by Social Identity Scale, procedural justice was measured by Procedural Justice Scale, outcome judgements was measured by Outcome Evaluations Scale (Blader, Tyler, 2009). All variables were measured by seven-point Likert-type scales (1 means 'strongly disagree' and 7 means 'strongly agree'). Correlational analyses and structural equation modelling analysis was used to test our research hypotheses. Research findings provide partial support for the above propositions: • An employee group identity positively correlates with work engagement ($\beta = 0.67$) and both constructs positively correlate with an individual's extra-role behavior ($\beta = 0.17$ for work engagement and $\beta = 0.45$ for group identity). • An organizational identification positively correlates with work engagement ($\beta = 0.56$) and both constructs positively correlate with an individual's extra role behavior ($\beta = 0.23$ for work engagement, and $\beta = 0.29$ for organizational identification). • An employee social identity, perceived procedural justice and perceived outcome favorability positively correlate with work engagement, that in turn along with social identity positively correlate with employee’s extra-role behavior. However, there have not been found statistically meaningful correlations between work engagement and perceived procedural justice and perceived outcome favorability. Results of our research confirmed Group Engagement Model.
DIRECTED FORGETTING MITIGATES THE EMOTION IMPAIRMENT IN ASSOCIATIVE MEMORY

Guimei Jiang
Aiqing Nie
Zhejiang University (Hangzhou, China)

Associative memory, defined as memory for two or more items encoded together, could be either impaired or enhanced by emotion. For negative emotion, dual representation theory supports a weakening effect while the model of consolidation process and binding hypothesis support a facilitating effect. Turning to positive emotion, a facilitation of it for associative memory was expected by the broaden-and-build theory. However, existing studies have focused only on the influence of emotional valences on old and rearranged pairs in associative memory, while its effect on "old+new" pairs has still been neglected. Moreover, studies concerning item memory have revealed various degree of directed forgetting effect between negative and positive stimuli. Inspired by this, we wonder whether the emotion effect in associative memory can be modulated by directed forgetting. Combined with a directed forgetting paradigm and an associative recognition paradigm, the current study aimed to investigate the interacted effect of emotion and directed forgetting on associative memory. Thirty-two participants studied negative, positive and neutral word pairs with a "to-be-remembered" (TBR) or a "to-be-forgotten" (TBF) cue, followed by an associative recognition test. Hit rates for old, rearranged and "old+new" word pairs were compared through different emotion and cue conditions. Generally, an emotion impairment was observed as hit rate for neutral word pairs was higher than that of negative and positive word pairs, with no significant difference between negative and positive word pairs. To be specific, this emotion impairment survived under the "TBR" instead of the "TBF" condition for "old+new" pairs, while emotion exerted no significant influence on hit rates for old and rearranged pairs, either under the "TBR" or the "TBF" condition. Current data suggested that both positive and negative valence impeded associative memory and directed forgetting mitigated such impairment. For negative valence, this consisted with the dual representation theory. As to the positive valence, the results conflicted with the broaden-and-build theory. This could be explained as the emotion impairment existed only under the "TBR" condition which tended to elicit rehearsal, rather than the "TBF" condition, where inhibitory control tended to distract attention from emotional information.
ART THERAPY AND SUCCESSFUL AGING

Valentina Naumova
Vitus Bering Kamchatka State University (Petropavlovsk-Kamchatsky, Russia)

Glozman Zhanna
Lomonosov Moscow State University (Moscow, Russia)

Among the features of modern society the increase of life expectancy and human global ageing phenomenon are evident. At the same time, many scientific researches underline that the chronological life extension is not supported by the preservation of its quality. This reality necessitates searching for resource abilities of the aging person and the mechanisms of their implementation as an essential condition of life quality improvement and successful ageing.

Many papers reporting the variability of human evolution vectors during gerontogenesis, with preserved cognitive sphere. This allows to understand the functional behavior of changing mental functions during normal ageing as possessing resources and potential for mobilization. Many researchers consider education, active life-style, aiming at emotionally significant tasks as favorable factors for preserving stable cognitive abilities during gerontogenesis. Another base-point is the hypothesis that the creative activity stimulates the subject to use actual and potential experience thus triggering the person’s evolution. Our goal was to realize the program of psychological intervention using art-therapy for effective prevention of elderly dementia. Our research lasted for 12 months and involved 130 respondents aged 56-84. The intellectual activity dynamics after art-therapy was assessed using “Express method for evaluating cognitive functions during normal ageing” (Korsakova, Balashova, Roshina, 2009), based upon A.R. Luria’s structural-functional brain model. The content analysis of personal activity was performed using the Questionnaire “Subjective impression of life” (Naumova, 2014). Research results show that being involved in creative activities allows to mobilize cognitive processes, that is of vital importance for aged people to keep them self-sustainable and preserving their lifestyle standards and dignity. The role of the structured and purposeful creative activity in the life experience potential implementation for the successful ageing is highlighted. We assumed that intentional creative activity stimulates the participants’ mediated experience of reality and triggers the mechanisms of transforming cognitive experience into potential one.
PSYCHOLOGICAL RISK FACTORS FOR PREGNANCY TERMINATION IN WOMEN WITH SOMATIC PREGNANCY COMPLICATIONS

Anna Ulyanich
Svetkana Leshichinskaia
Tatiana Ivanova
National Research Tomsk State University (Tomsk, Russia)

Lubov Agarkova
Tomsk National Research Medical Center of the Russian Academy of Sciences (Tomsk, Russia)

Pregnancy is often a crisis period for women, that is associated with big physiological and psychological changes. Psychological changes are necessary for women in order to return to a state of psychological stability and preserve their health. Women with a somatically complicated pregnancy need to have particular psychological factors that prevent the risk of pregnancy termination. This study is aimed at identifying both positive psychological factors, that help to maintain a healthy pregnancy, and negative psychological factors contributing to a risk for pregnancy termination in women from 3 groups with different somatic status: healthy pregnant women (control group), women with extragenital pathology and women who are pregnant after in vitro fertilization (IVF). 294 pregnant women participated in the study. Methods: Questionnaire of reproductive motives «My Pregnancy», «Self-evaluation of Psychological States» (H. Eysenck), semantic differential scale (C. Osgud), picture test «Me And My Child» (G.G. Philippova).

Common positive factors, contributing to the maintaining of healthy pregnancy in women from all groups: desire to realize the need for motherhood; readiness to interact with the child even during the pregnancy were identified. Common negative factor, contributing to a risk of pregnancy termination in all women: high anxiety level throughout the pregnancy was discovered. Psychological risk factors for pregnancy termination in women from each group of pregnant women were determined. In women with healthy pregnancy these were: unmet need for love and care and perception of pregnancy as a means to improve the financial situation; in women with extragenital pathology: loneliness and a desire to give their lives meaning by a childbirth; in women with IVF pregnancy: loneliness and perception of pregnancy as the only reason to change the life, go away from past failures and begin a new life stage. The reported study was funded by RFBR according to the research project № 18-313-00155
The limitations of test inventories have necessitated objective measure techniques based on psychophysiological correlates to improve the validity of psychological assessment. Improvement of equipment for eye-movements recording and its significant advantages had led the way by using eyetracking in psychodiagnostics. Eye-tracking is increasingly being used in lie detection: accuracy is comparable to the polygraph testing (86-95%), but technologies are based on a different markers of deception, set of markers and their variability in lying are highly controversial. This study encompassed two goals: eye movement markers that distinguish value-driven attention from attention to a neutral stimulus or composition-enhanced stimulus (size, color, etc.); eye-movement markers of deception and testing of the hypothesis that stimulus configuration (choices to answer), type (text/image), relevance (positive/ negative) and types of deception have an impact on lie detection’s efficiency. The procedure included presentation of neutral, meaningful and composition-enhanced stimuli; text/image presentation with true-or-false answer in various testing situations; control in-blank testing. Hardware: SMI Red-M 250Hz. Participants: N=108. The complex of oculomotor markers that statistically reliably distinguishes value-driven attention was found. The stable general complex of deception markers was revealed, which is common to all type of stimulus and all type of deception. The true answer is accompanied by a predominance of focal attention indicators, while random choice of false answer or active lying are manifested in increased ambient attention. The features of stimulus have an impact on the set and discriminating fineness of eye movement markers of deception. Dichotomous-choice answers are the most preferable. The type of stimulus is not decisive for deception detection. The markers of deception are depended on stimulus emotional valence. The discriminating fineness is maximal for stimulus having negative valence. Each type of deception also has a unique set of markers, that distinguishes it from other deception and could identify it. Selected markers formed the basis of truth-or-lie detection technology. Eye-tracking testing data has a significantly higher correlation with in-blank test results and multichannel polygraph recording data. The special software has been developed to assess background of individual response rate and set flexible criteria for marker-assisted selection of meaningful stimuli and false responses.
Psychopathy is a theoretical construct of personality disorder, commonly defined as a social maladjustment and emotional deficits. In historical theories, the psychopath was described in different ways. According to the contemporary triarchic model, psychopathy is treated as a three distinct but interrelated components: boldness, meanness and disinhibition. Boldness is described as a tendency for social dominance, which is accompanied by low anxiety and emotional resiliency. Meanness is a phenotypic manifestation of the lack of empathy, exploitativeness, cruelty, callousness, and thrill seeking. Disinhibition is related to irresponsibility, impulsiveness and hostility. The aim of this study was to measure level of midwives psychopathy and compare it to general population. Research question was posed: is there difference in level of psychopathy and its components between occupational groups of midwives and general population? This study was conducted in hospitals in Szczecin, Poland using paper-and-pencil method on n=30 midwives (100% woman, aged 23-60 M=40,17; SD=13,34). Control group of general population n=89 (100% woman, aged 18-45 M=28,02; SD=6,96) were examined using online survey. The applied tool was TriMP-41 in Polish adaptation of Pilch and a self-designed questionnaire collecting sociodemographic data and information concerning the participants’ professional activity. Results of the analysis revealed significant differences between midwives group and control group in each aspect of psychopathy. The strongest effect can be observed in total level of psychopathy \[ t(34,1)=6,883; \ p<0,001; \ d=1,77; \ CI95=(1,15;2,37) \], and the weakest effect can be observed in boldness \[ t(36,8)=1,883; \ p=0,075; \ d=0,48; \ CI95=(0,05;0,91) \]. Every comparison revealed higher level of psychopathy and its components observed in control group than levels obtained by midwives group. In summary, there are significant differences of psychopathy level and its components between midwives and control group. Results of this research lead to very important conclusion about health care — newborns and women in postpartum period are generally cared by midwives who are tend to more emphatic behaviors and with less hostile, callous attitude than general population. On the other hand, midwives level of boldness is similar to general population. There should be considered continuing research on other occupational groups working in health care.
If the quality of the relationship between a mother and her child and the parents’ attitudes doesn’t meet the psychic needs of the child, this would cause anxieties and an inner conflict which will generate a psychopathological symptom. That’s why it is aimed to develop a scale for supporting clinical studies, that facilitates evaluating the relationship between the mother and her child, the quality of parental attitudes and the understanding of the source of relational conflicts. The scale’s items are formed on the basis of parent-child clinical observations and Bion’s concept of containing function. When the mother's containing function is weak, which means that the parent can’t identify, give a meaning and transform the baby’s needs, this will cause an inner tension and some psychopathological symptoms as a consequence. In the clinical situations, when faced with a child having a psychopathological symptom, it is quite important to adopt an integrated approach, thus to evaluate also the quality of the parental attitudes, which may be on
THE MEANING OF LIFE IN THE REPRESENTATION OF WOMEN ENGAGED
IN EDUCATION SPHERE

Svyatoslav Pozharskij
Smolny Institute of the Russian Academy of Education
(St-Petersburg, Russia)

Olga Skrjabina
Kirov State Medical University (Kirov, Russia)

The problem of the meaning of life is one of the central in the personal development and its self-realization. V.P. Bransky summarizes 5 approaches in the solving of the life purpose problems, one of them is the formation of an ideal. In this regard, the purpose of the study was to analyses the perception of the life individual ideal. The object of study was 35 women working in the education (teachers and psychologists from Kirov, average age – 36 years). The women were passed through the depth interview, which included the essay writing on the theme “My life ideal”. The data were processed by the content analysis. The predominant life-theme is a family (14.4% of the nouns). This concept is occurred in the opposite types of context: “the most important thing in life” or “one of the spheres of life”, “source of wealth” or “opportunity to create wealth”. The next category is “life” (13.4%). In the contexts of its frequency we can distinguish such groups as spheres of life, goal of life, length of life, quality of life, the ability to give the birth. The category “people” also occupies an important place (8.3%). The contexts include: the individual actions in relation to other people; the other people actions in relation to the individual; properties of people. The category of “work” is relatively rare met (2.9%). In the interview subjects issues the verbs “want” (20.2%), “have” (16.7%), “live” (11.9%) prevail. The category “want” expresses the desire and the activity motive. The present situation of the interview subjects is expressed by the verb “have. The life conditions and qualities are connected with the verb “to live”. The most common adverb is “always” (37.0%), through which certain constants of the desired things are established. In general, it can be noted that ideas about the meaning of life include the fundamental human values such as — a family, a preservation and enhancement of life, a transfer of moral qualities. The intention to participate actively in wide social life is mentioned rather rare in the essays.
CINEMA AS A FACTOR OF INFORMATION AND PSYCHOLOGICAL SECURITY

Tina Kubrak
Institute of Psychology, Russian Academy of Sciences
(Moscow, Russia)

Mediatization of modern society and globalization of information space raise the problem of information and psychological security, which is related directly to the impact of the mass media. Nowadays, mass media defines the vision of the surrounding reality. Cinema, as one of the mass media, affects the public consciousness and human psyche and can play a role in ensuring the psychological security of the individual and society. Movies impact on the audience’s values, stereotypes, attitudes, and mental representations. We develop the problem of information and psychological security in cinema discourse: analyze its various aspects and the ways of security at the level of the individual and society. I present two empirical studies conducted in the context of this problem. The aim of the first one was to identify the value orientations and broadcast images in the current Russian cinema discourse. Content and discourse analysis and Schwartz’s questionnaire scales were used. The object of the analysis was 10 the most visited Russian movies. It was determined that they transmit the values of Dominance (power, influence, authority), reflecting hierarchical relations in both public and personal spheres, Spirituality (courage, loyalty, sense of life), and Stability of life (national security, protection of the family). Values of Equality and Self-Realization are much less represented. In addition, patriotic values are determined. The aim of another study was to identify differences in the perception and understanding of movies by Russian-and English-speaking audiences, and to determine the effectiveness of the impact of a non-Russian film about seniors on Russian viewers. A total of 100 texts, which are film’s reviews of Russian- and English-speaking viewers, were examined using the content and discourse analysis. The study revealed features of the perception of the film and its impact depending on the cultural specifics of the viewer. The Russian audience showed a greater impact of the foreign movie, primarily in a positive change in attitudes towards the elderly people. We discuss the possibility of cinema in ensuring information and psychological security through the formation of certain values, and threats associated with its negative impact.
The study had its task to identify the differences in conscious self-regulation and its reliability among extreme and mass professions. We consider conscious self-regulation based on the approach proposed in the works of V. Morosanova, who defined it as the human ability for setting the goals and managing their achievement. The structure of conscious self-regulation consists of the functional cognitive-regulatory processes (Goal planning, Modeling of significant conditions, Programming of actions, Results evaluation) and instrumental personal-regulatory features (Flexibility, Independence, Reliability). According to numerous studies, the fault-free operation and effectiveness of human activity in the goal achievement under stressful conditions are associated with reliability of conscious self-regulation as sustainability of self-organization of mental and practical activity in stress situations. We supposed that there are significant differences in self-regulation reliability depending on the specifics of activity. Research sample included 378 participants from different professional groups (teachers, social workers, rescuers, pilots, and sailors) aged 20 to 61. Participants filled in Self-Regulation Profile Questionnaire — SRPQ (Morosanova, 2011), Chronic Stress Manifestation Scale and Acute Stress Manifestation Scale — MMS (Leonova, 2007), Eysenck Personality Profile - Short — EEPS (Russian adaptation, 2000). We found significant differences between groups of teachers and social workers vs rescuers, pilots, and sailors in all cognitive-regulatory processes (goal planning, modeling significant conditions, programming actions, evaluating result) as well as in the instrumental personal-regulatory feature — reliability of self-regulation. Moreover, the study revealed that reliability of self-regulation in stressful conditions is significantly higher in extreme professions rather than mass ones. Based on our findings, we plan to further investigate the importance of self-regulation reliability in the professional fields with different demands for stress sustainability.
THE EFFECT OF PARENTS’S FULFILLMENT OF ROLE OBLIGATION ON CHILDREN’S GRATITUDE: FILIAL BELIEF AS MODERATORS

Chih-Fen Wei
Szu-Yu Chen
University of Taipei (Taipei, Taiwan)

Although filial piety to parents was regarded as unconditional positive duties in Chinese parents’ fulfillment of role obligation (taking care of children) on children’s gratitude to parents (Hwang, 1998, 2005), there were little empirical evidence. Previous studies showed that Chinese interpersonal duties for family members were not affected by the affective quality of relationships (Wei, 2001a; Wei, 2001b). But when parents violated their role obligation, they were less likely to be perceived as good parents and received children’s help (Wei, 2011). This study aimed to investigate the effect of fulfillment of parental duties on children’s gratitude. It was inferred that those who fulfilled parental duties received more gratitude from their children. Furthermore, filial beliefs moderated the relationship between parents’ fulfillment of role obligation and children’s gratitude to parents. Furthermore, filial beliefs moderated the relationship between parents’ fulfillment of role obligation and children’s gratitude to parents. College students and adults were recruited as participants through internet survey. Participants had to read simulated scenarios describing how parents took care of their children, then rated the degree of gratitude children felt toward parents. Filial belief scale (Chen, 2018) measured participants’ belief of life origin (one’s life originating from parents) and unity view of life (one’s life uniting with parents’ life). The results indicated that parents who fulfilled parental duties received more gratitude from their children. For people with high belief of life origin and low unity view of life, there were stronger positive relationship between parents’ fulfillment of role obligation and children’s gratitude to parents. Filial piety is based reciprocity. As parents get older and ask children to take care of them, those who took good care of children would be reciprocated with good care. Therefore, children would not respect and help parents unconditionally.
DIFFERENCES IN THE PERSPECTIVE OF ADOLESCENTS AND THEIR FAMILIES

Elif Erol
Arel Üniversitesi (Istanbul, Turkey)

Özge Buran
Cagev (Istanbul, Turkey)

This study determines the emotional problems of adolescents and on the other hand measures their satisfaction with their lives. In parallel, the same subjects were screened with their families and the differences between adolescent and family forms were statistically analyzed. So, possible solutions will be discussed by drawing attention to the differences between child and family forms of measurement tools subject to research. The population of this study consisted of adolescents and their families aged between 10 and 18 who studied at High School. The sample consisted of 109 participants selected randomly from these students. In this study was used to Child-Adolescent Symptom Assessment Inventory, Psychological Well-being Scale, Subjective Well-being Scale and demographic information form. All participants were randomly selected. Total (N = 109) adolescents and their families participated in the study. Descriptive statistics and Wilcoxin Marked Sequence test techniques were used to analyze the data obtained from the study. Most of the participants were male (65%) and 16-18 years of age. Their parent education level was at primary and high school level. There is a significant difference between adolescent’ forms and parent forms in terms of their economic status and motherhood type (anxious, irritable, etc.). As well as somatization, anxiety, behavior problems and separation anxiety subscales which of the Child Adolescent Symptom Assessment Inventory are significantly different in adolescent and their parent forms. Also there are a significant difference between adolescent and their parent forms of Psychological Well-being and Subjective Well-being. Their scores are higher in parent than in adolescent. In this study shown that adolescents’ perception of emotional and behavioral states and their parents’ perception of them were different. Families tend to be more optimistic when evaluating adolescents’ problems.
THE FACTOR STRUCTURE OF PEDIATRIC CANCER-RELATED FATIGUE

Alena Deviaterikova
Vladimir Kasatkin
Dmitry Rogachev National Research Center of Pediatric Hematology (Moscow, Russia)

Boris Velichkovsky
Lomonosov Moscow State University (Moscow, Russia)

Worldwide, over 175000 children are diagnosed with cancer yearly. An important effect of cancer and its therapy is cancer-related fatigue. It seriously affects the quality of life in pediatric cancer patients and their caregivers. It is important to assess the level of cancer-related fatigue in children with cancer. 140 pediatric cancer patients aged 7-18 (40% with acute lymphoblastic leukemia, 60% with posterior fossa tumors) and their parents took part in the study. A Russian version of the Scale for the Assessment of Fatigue in Pediatric Cancer Patients (the child and the parent version) was prepared. The scale comprises 27 items with three subscales: General Symptoms, Sleep Symptoms, and Treatment-Related Symptoms. The items were translated into Russian by five experts in the field of linguistics, psychology, and medicine. For children aged 7-12 only the General Symptoms subscale was used. Factor analysis was conducted (principal components with Varimax rotation, in all analyses KMO > 0.8, Bartlett sphericity tests significant at <0.001). In children aged 7-12, a one factor solution was found (41% explained variance). In children aged 13-18, a four-factor solution was obtained (60% explained variance). The Sleep Symptoms and the Treatment-related Symptoms subscales loaded on separate factors. The General Symptoms subscale was divided into two factors — general fatigue and apathy. In parents, a four-factor solution was obtained (58% explained variance). Again, the Sleep Symptoms and Treatment-related Symptoms subscales loaded on separate factors, while the General Symptoms subscale loaded on two factors — general fatigue and excessive fatigue during daily routines (meals, hygiene, walks etc). Sleep- and treatment-related fatigue symptoms are separate manifestations of pediatric cancer-related fatigue. However, the general fatigue factor requires further differentiation. In children, it may be divided into a general feeling of tiredness and into a feeling of loss of energy and apathy. In parents, it may be divided into a general effect of tiredness and a sense of child’s inability to perform daily routines. Pediatric cancer-related fatigue is a multi-faceted phenomenon with different aspects reflecting the viewpoints of the child and the parent.
PsychoLological aspects of training of Digital curators for working with older people

Larisa Darinskaia
Natalia Moskvicheva
Galina Molodtsova
Saint Petersburg State University (Saint Petersburg, Russia)

The rapid development of digital technologies has put the problems associated with the need to involve people of different ages and professions in the digital environment. The issue is so important that Russia has adopted a new professional standard — a digital curator. A significant part of the clients with whom digital curators will work are older people, whose proportion is increasing every year in many countries of the world. In the literature, in the context of support of older people in mastering digital space, their cognitive capabilities, motivation, activity in the digital sphere, experiences, social and psychological aspects are considered (Hernandez-Encuentra et al., 2009; Senecka, 2014). However, the problem of psychological readiness of curators to work with older people is new. The aim of the study is to select the content of the psychological component of digital curators’ training. The construct that includes information about the specifics of interaction with older people (cognitive component), formation of a positive attitude to them (motivational component), training in special methods of communication (behavioural component) is proposed. Sample consisted of 68 older respondents of four age subgroups (age from 58 to 91 years) and 163 young people (age from 15 to 19 years). Methods were: semi-structured interviews, questionnaires, analysis of results of the training programmes developed by authors for older and young people for cooperation in the field of digital technologies. The results of the study showed that the cognitive component of training of curators, in addition to well-known data on typical difficulties and cognitive decline in older people, should include data on the nature of using the Internet in different age subgroups (information search, communication, entertainment, choice of services, display of creative activity, etc.). Respondents’ interviewing revealed intergenerational problems in interaction in mastering the digital environment: intolerance of the younger generation; exaggeration of their health problems; conservatism of older people, etc. The results of training sessions for different generations showed the possibility of convergence of their attitudes and identified the most successful ways of learning (discussions, enacting problem situations), which can be used for motivational and behavioural training of digital curators.
SELF-CONTROL DEMANDS AT WORK AND JOB-RELATED EMOTIONAL EXHAUSTION IN SPORTS SERVICE INDUSTRY: THE MODERATING ROLE OF JOB CONTROL

Ying-Lien Ni
Wen Xuan Lu
National Chiayi University (Chiayi Taiwan)

Che-Chun Kuo
Tunghai University (Taichung, Taiwan)

Lung Hung Chen
National Taiwan Sport University (Taoyuanm, Taiwan)

In sports service industry, employees need to make contact with customers to meet their demands and fulfill managers’ expectations for their work tasks. According to Schmidt and Neubach (2007), those service-oriented employees are increasingly exposed to self-control demands at work which urge an employee to consume one’s limited self-control resources. Based on the Conservation of Resources Theory (Hobfoll, 1989), we expected employees might experience emotional exhaustion when they are in the self-control demands context because employees are required to exert their resources to respond those requirements are more likely to run out personal resources. Moreover, we argue job control as a potential moderator that may enhance the effect of self-control demands in shaping employees’ emotional exhaustion over time. We collected participants from sports service industry through Amazon Mechanical Turk. For the cross-lagged panel design, 177 employees (male = 50) with a mean age of 30.20 years (SD = 6.25) were recruited as participants in the current study. Their average tenure in the present sports service company was 4.52 years (SD = 3.11) and their average daily working hours was 7.60 (SD = 1.73). Self-control demands (independent variable), job control (moderator), and job related emotional exhaustion (control variable) are collected at Time 1. One month later, participants were asked to complete the measurements assessing job related emotional exhaustion (dependent variable) again at Time 2. The results indicate that self-control demands has no significant negatively correlated with employees’ job related emotional exhaustion. However, the effect of self-control demands on job related emotional exhaustion varies based on job control. Specifically, only employees who are in the self-control demands context and have job control at the same time would lead to a higher change in job related emotional exhaustion. These results explained that job control might be a stressor for self-control demands employees in sports service industry because those employees would constantly invest in their limited control resource to respond self-control demands context and experience more job related emotional exhaustion. Our results contribute to the field of work stress and mental health of employees in sports service industry.
A STUDY ON PARENTAL PSYCHOLOGICAL CONTROL, EMOTION REGULATION AND FEELINGS OF BULLYING VICTIMIZATION AMONG ADOLESCENTS

Shu-Hua Yu
Tainan University of Technology (Tainan, Taiwan)

This study aimed to investigate parental psychological control, and to understand its correlation with children’s emotion regulation and feelings of bullying victimization. The study used questionnaires, and the subjects were 859 (393 males and 466 females) junior high school students in Tainan, Taiwan. The research instruments used were “psychological control scale”, “emotion regulation scale” and “feelings of bullying victimization scale.” The results include: 1) Boys perceived parental psychological control more than girls do; 2) Girls had stronger emotional awareness and greater emotional introspection compared to boys; 3) Boys felt more victimized than girls did when verbally and physically bullied; 4) The subjects from a family of single parent perceived mothers’ psychological control more than those from a family of both mother and father do; 5) The subjects whose fathers had a college degree or higher education level perceived their fathers’ psychological control of diminishing thought more than those whose fathers had a degree of junior high school do; 6) The subjects whose mothers had a degree of junior high school or high school/vocational school perceived their mothers’ psychological control of limiting expression more than those whose mothers had a college degree or higher education level do; 7) There was a positive correlation between emotional expression and the guilt arising from perceiving father’s psychological control among the students, whereas self-deprecation and emotion regulation were negatively correlated; 8) There were negative correlations between perceiving mothers’ psychological control of diminishing thought and the awareness in emotional regulation among the students; 9) There were negative correlations between perceiving mother’s psychological control of restricting expression and the awareness, expression, adjustment, and introspection in emotional regulation among the students; 10) The more the students perceived parental psychological control, the stronger feelings of bullying victimization they had; 11) Parental psychological control and emotion regulation could predict the feelings of bullying victimization among the students. Finally, this study puts forward suggestions for parenting education, guidance and counseling, and bullying prevention.
“EMERGING PRECARIOUSNESS” FROM THE INSIDE: LOW QUALIFIED YOUNG ADULTS’ NARRATIVES ABOUT JOB INSECURITY

Valérie Cohen-Scali  
Conservatoire National des Arts et Métiers (Paris, France)

Jonas Masdonati  
Jérome Rossier  
Laurence Fedrigo  
Robin Suffrey  
University of Lausanne (Lausanne, Switzerland)

In a labor market increasingly composed of high skilled jobs, low qualified young adults often have to face job insecurity and arduous transitions from school to work. Our communication is based on a qualitative thematic analysis of semi-structured interviews with 15 low qualified and precarious young workers in Switzerland. More specifically, it focuses on how they narrate their subjective experience of job insecurity. Results showed that job insecurity was associated with poor work conditions and the feeling of benefiting of limited career perspectives. Participants also attributed their precarious situation to difficulties in the economic, physical and psychological health, migration, or family spheres. The study suggests that career counseling with emerging adults entering the labor market should focus both on the individual and the contextual levels, and aim to prevent a sort of “emerging precariousness”.
SELF-MONITORING AND REGULATORY FIT IN INTERNSHIP

Shin-Huei Lin  
Southern Taiwan University of Science and Technology  
(Tainan, Taiwan)

Wan Chen Lu  
National Taiwan University (Taipei, Taiwan)

Trait activation theory indicates that when the feature of environment cue is similar to an individual’s attribute, the trait would be activated to express. Combined personal traits with goal framing, by stressing profit or loss, contextual information usually be delivered with specific orientation after designing. In addition, some personal attributes, such as self-monitoring, would push individuals to minimize the difference between the role they played and social expected. Therefore, this study aimed to examine the moderating effects of the orientation of goal framing (promotion/prevention) and self-monitoring between individuals’ regulatory focus and cognitions. A total of 250 students were recruited from the universities and colleges in Taiwan. The mean age of participants was 21, and 55% were female. Participants in this study were informed of the oncoming internship and volunteered to participate in this study. Participants’ demographics, regulatory focus, self-monitoring, and goal orientation (the context of internship hiring, promotion: personal growth; prevention: faults intolerance), internship self-efficacy, and well-being were measured with a questionnaire. Before the questionnaire was filled out, a consent form was obtained from all participants. To test whether self-monitoring and goal orientation would moderate the relationship between individuals’ regulatory focus and internship self-efficacy and well-being, hierarchical regression analyses were used. The results showed that self-monitoring would only strengthen the relationship between individuals’ prevention focus and well-being, relative to the relationship between individuals’ promotion focus and well-being. In addition, individuals would have higher internship self-efficacy only when their regulatory focus are consistent with goal orientation in prevention, relative to the fit between promotion focus and promotion goal orientation. In sum, when the hiring context of internship stresses on faults intolerance and students are prevention focus, they would have higher internship self-efficacy. In addition, when prevention-focused students with higher self-monitoring degree, they would have higher well-being.
PRODUCTIVE AND UNPRODUCTIVE PATTERNS OF METACOGNITIVE REGULATION OF INTELLECTUAL PERFORMANCE

Daria Makarova
Saint Petersburg State University (Saint Petersburg, Russia)

Intellectual performance is influenced by a great number of factors besides intelligence and skills: type of motivation (Busato et al., 2000; Gagne, Deci, 2005), self-efficacy (Zuffianò et al., 2013; Judge, Jackson, 2007), etc. Metacognition is one of such factors (Van der Stel, Veenman, 2008; Young, Fry, 2008). We studied patterns of metacognitive regulation (PMR) which are regularly recurring stable mental programs aimed at achieving high levels of intellectual performance manifesting themselves as particular behavior patterns which can be observed. Hypotheses: 1) PMRs exist across different samples; 2) PMRs can be divided into productive and unproductive using special criteria; 3) productive PMRs have an association with high levels of self-efficacy and approach achievement motivation; 4) unproductive PMRs have an association with low levels of self-efficacy and avoidance achievement motivation.

Methods were: 1) “Picture Arrangement” subtest of WAIS followed by in-depth semi-structured interviews; 2) “Features of intellectual performance” questionnaire (by D.N. Makarova, M.V. Osorina); 3) “Emotional profile of intellectual performance” questionnaire (by A.A. Zhukova, M.V. Osorina); 4) “Approach and avoidance achievement motivation” questionnaire (by A.A. Rean); 5) “Generalized Self-Efficacy Scale” questionnaire (by R. Schwarzer, M. Jerusalem, adapted by V.G. Romek). Sample consisted of students and graduates of Russian colleges and universities (N=246, 51 men, mean age: 24). Statistical methods used: factor analysis (maximum likelihood method with varimax rotation), Kruskal-Wallis test. Results showed: 1) PMRs of intellectual performance, observed in subjects at the pilot stage of research, were also found in behavior of other participants from two different samples, recurring with different frequencies; 2) the classification criteria for dividing PMRs into productive and unproductive were defined; 3) 8 factors incorporating alike PMRs were extracted; 4) significant differences between distributions of factor scores of participants with different levels of self-efficacy were revealed (for 3 factors); 5) significant differences between distributions of factor scores of participants with different types of motivation were found (for 2 factors). The association between different patterns of metacognitive regulation with the level of self-efficacy and the type of motivation requires further research. The results of this study are essential for diagnostics of intellectual efficacy of young adults, consulting and creating training programs on this subject.
HOW DOES FLUENCY BASED ON SEMANTIC RELATIONS CONTRIBUTE TO RECOGNITION MEMORY? AN ERP STUDY

Ru Pan
Aiqing Nie
Zhejiang University Department of Psychology and Behavior Science (Hangzhou, China)

Some recent studies have found that processing fluency which refers to the subjective experience of ease or difficulty with cognitive processing can influence recognition memory. Participants tend to endorse fluently processed items to be old. Earlier studies applying R/K paradigm revealed that fluency induced by masked repetition priming increased familiarity not recollection. However, the results by conceptual fluency in masked conceptual priming paradigm are controversial. Studies using primes that were conceptually related showed that conceptual fluency can affect familiarity and recollection. In that studies when conceptual primes lexically associated, researchers found that only familiarity was influenced. One possible source for the discrepancy may be the different semantic relations of primes. So we wonder how conceptual fluency base on different semantic relations influence familiarity and recollection and the difference between the modulation on recognition by perceptual and conceptual fluency. The present study used event-related potentials to investigate how conceptual (thematic/taxonomic relation) and perceptual fluency separately induced by masked conceptual and repetition priming paradigm differently contribute to recognition memory. In study phase, participants were required to judge whether the content of the picture displayed was nature or artificial. Then a recognition test in which participants make R/K/New judgment after a 1min distraction task. Behavioural results revealed that repetition and thematic primes increased K hits, whereas taxonomic primes increased more R hits. ERP results showed repetition, all primes are all associated with FN400 old/new effect. And LPC old/new effect were significant larger in taxonomic primes than others. These results suggest that perceptual and thematic conceptual fluency strengthen familiarity and taxonomic fluency increased both familiarity and recollection. Thematic conceptual fluency is more similarity to perceptual fluency and can contribute to familiarity, whereas taxonomic conceptual fluency strengthen recollection. For thematic and repetition primes, the high associated relation make target easier to come to mind. With less cognition resource involved they increased familiarity. In contrast, taxonomic prime increase the fluency with which participants re-retreive information about old item. Thus, taxonomic conceptual fluency makes more successful recollection. In conclusion, fluency based on different semantic relations can modulate familiarity and recollection.
ATTITUDES TOWARDS ONLINE PSYCHOLOGICAL COUNSELING IN HEALTHY AND PSYCHIATRIC PATIENT POPULATIONS

Magdalena Chęć
Agnieszka Samochowiec
Karol Karasiewicz
Krystian Konieczny
Maria Ligocka

University of Szczecin (Szczecin, Poland)

Continuous development of modern information technologies has made the Internet a place offering various services, including psychological assistance. Based on the theoretical framework concerning psychological help and the construct of attitudes, as well as evidence from previous research, the main goal of this work was to determine the attitudes towards online psychological counseling in healthy population and psychiatric patients. We formulated the following hypotheses: H1: Psychiatric patients have more positive attitudes toward online psychological help than healthy controls. H2: Sex moderates the differences in attitudes toward psychological help between psychiatric patients and healthy controls. The study sample comprised 315 persons (66% women and 34% men), aged 18 to 68 years, including 215 psychiatric patients and 100 healthy controls. The study was conducted in north-western Poland, using a self-constructed Attitude Scale for Online Psychological Assistance – 2 and a socio-demographic survey. In order to verify the hypotheses, an independent samples t test and 2x2 between-subject ANOVA were performed. The first hypothesis has not been confirmed. Our analyses suggest that psychiatric patients are more skeptical than controls when online psychological help is provided via chat (t=3.182; p<.001), it assumes the form of psychotherapy (t=3.259; p<.001) and is used to treat mental illness (t=1.678; p=.048). There are no significant differences between the two samples in their attitudes towards other forms and communication in online psychological help (p>.05). Our results do not support the hypothesis that sex is a significant moderator of the relationship between participants’ mental state (psychiatric patients vs. controls) and their attitudes toward online psychological help (p>.05). Furthermore, analyses revealed no significant effects of sex on attitudes towards online psychological help (p>.05). Our results suggest an important need for social psychoeducation concerning online psychological help, which could promote this method of counseling and increase the quality of service provided in this area in Central and Eastern Europe.
COGNITIVE AND PERSONAL REGULATION OF PROFESSIONAL MEDICAL DECISION-MAKING

Nataliya Bogacheva
I.M. Sechenov First Moscow State Medical University (Moscow, Russia)

Tatiana Kornilova
Lomonosov Moscow State University (Moscow, Russia)

In this study, we implemented an integrated approach based on the concept of unified cognitive and personal human potential (Kornilova, 2016). The study aimed to identify the relationship between cognitive characteristics, personality, medical risks evaluation, and decision-making. We suppose that depending on the risk source and the subjective riskiness of the situation, decision making is associated with different personality traits and cognitive framing susceptibility. Sample: doctors (N=62; 42% male) aged 24-73 years. Methods: Melbourne Decision Making Questionnaire, evaluating Vigilance, Avoidance, Procrastination, and Hypervigilance; Ten Item Personality Measure; Budner’s Tolerance of Ambiguity Scale; Kahneman’s Asian Disease task to assess cognitive framing; Medical Risk Scale (SHMR), developed by our group. The task is to evaluate riskiness and choose the best way to solve 10 verbal tasks. Doctors, prone to cognitive framing showed no personal specifics. However, they rated SHMR tasks where the doctor’s personality and condition (p=0.031) and the doctor’s lack of knowledge (p=0.041) were the risk sources riskier comparing to the non-framed doctors and preferred standard actions in high-risk situations (p=0.033). Decision making involved personality specifics: in the task where risk was based on the doctor’s personality and condition, intuitive decisions were made by more emotionally stable participants than those who prefer standard actions (p=0.037); in social risk situation, intuitive decisions were associated with lower procrastination than transferring the decision-making (p=0.035) and standard actions (p=0.003); in the task involving the lack of knowledge situation, intuitive decisions were chosen by less conscientious doctors than those who postponed decision-making (p=0.058). Correlations (p<0.05 for all mentioned) showed that the average riskiness in SHMR was positively associated with Vigilance, Conscientiousness, and Openness. Those also correlated with postponing decisions and search for information in risky situations. Intuitive decisions in risky situations were positively associated with Agreeableness. Uncertainty tolerance correlated negatively with the following standards and decision transferring, the latter also positively correlated with Vigilance. Riskiness evaluation and decisions in risky situations associated with the doctor him/herself (personality, skills) seem to be more determined by cognitive-personal characteristics than external risks related to equipment or management. Supported by the Russian Foundation for Basic Research, project 17-06-00130.
COOKING THERAPY: POSSIBLE TOOL FOR PSYCHOLOGICAL WELL-BEING? A YEAR OF EXPERIMENTAL ACTIVITY

Sebastiana Roccaro
(Siracusa, Italy)

Cooking therapy is a new methodology that uses the art of cooking. The basic assumption is "I'm sick so I cook" different from "I'm sick so I eat". The psychological reinterpretation of the phases of preparation of some dishes, acquire a therapeutic, physical, cognitive, social and intrapersonal value, smells and flavors recall traditions and family ties. The primary objective of the study is to evaluate the response of participation in the laboratories of this experimental project and possible effectiveness of the tool for psychological well-being. Methodos: the study is qualitative. Observation is the technique used. The total sample consists of three small groups open and organized by age groups. 37 subjects were involved: 12 adults, 6 adolescents and 19 children. The laboratories had a fortnightly frequency and a duration of about 90 minutes each. Each workshop includes some main stages of preparation: wearing the apron, reading the recipe, weighing the ingredients, kneading, seasoning or decorating, sharing. In one year, 35 laboratories were conducted: 11 for adults, 10 for teenagers and 13 for children. 81% of the participants were women. 58% of the total sample participated constantly. The laboratory with more turnout and more consistency was that of children. Average turnout and average constancy for adults. Reduced turnout but fair consistency for teenagers. 13 different dishes were prepared; 6 desserts and 7 salty. In the adult group it was mainly observed a recovery of traditions, family ties and cognitive functions. From the group of adolescents emerges a marked need to discharge anger and tension, recovery of self-esteem and belonging to the group. In the group of children there are difficulties in respecting the rules, respect for the times and the spaces of the other. In conclusion, considering the number of the sample, the results and the adherence of the users to the laboratories, in this preliminary phase, it could be considered cooking therapy as an effective tool for psychological well-being. Further in-depth studies will be conducted.
THE RELATIONSHIP AMONG EMPLOYEE DEMAND-ABILITY FIT, TASK PERFORMANCE AND PROMOTABILITY RATINGS

Hsien Chun Chen
Yi-Ting Chen
I-heng Chen
Wen-Chuan Hung
Shu-Chen Lee
National Sun Yat-sen University (Kaoshiung, Taiwan)

Promotability ratings is the subjective judgement of supervisors toward the future performance of employees in higher positions; therefore, the past performance of employees is usually used by supervisors to predict their future performance. Employees with higher job performance are more likely to receive higher promotability ratings. Meanwhile, employees are more likely to have better performance, then be promoted, when their abilities match with job demands. In this case, present study dedicates to find out the relationship among employee demand-ability fit, task performance and promotability ratings. On the other hand, as organization is a political arena, political skill is vital for individuals to survive and be effective in organizations. Hence, we also examine whether political skill has moderating effect on the relationship above. Present study received 260 effective supervisor-rated questionnaires from various industries in Taiwan. The analysis results reveal that employee demand-ability fit will positively relate to promotability ratings; meanwhile, task performance will partially mediate the relationship above. Besides, political skill will positively moderate the relationship between employee demand-ability fit and task performance as well as the relationship between employee demand-ability fit and promotability ratings. Furthermore, it will moderate the mediated relationship above. In sum, present study provides some managerial implications to organizations and individuals as references.
GENDER PERFORMATIVITY IN CHILDHOOD MEMORY AMONG ELDERLY WOMEN: AN ATTEMPT AT PICTORIAL ANALYSIS

Shu-Hua Yu
Tainan University of Technology (Tainan, Taiwan)

This study used the theory of gender performativity as its basis and analyzed and investigated the connotation of gender performativity in childhood among elderly women. The study chose Tainan, Taiwan, as the location and interviewed 16 elderly women 70 years old and above. After each interview, the results were rendered into “gender event pictures”, and then a pictorial analysis was conducted. The analytic materials include interviews, gender event pictures and generation-related literature, while the analytic elements include information of characters, scenarios, texts and generations. The results include: 1) The interviewees could describe the details of gender discrimination they experienced during childhood, which seemed to leave indelible memories; 2) “gender event pictures” served as testimony for the interviewees to obtain comfort and respect; 3) The dichotomous views about men and women, such as “men eat rice/women eat sweet potatoes”, “men learn to do crafts/women learn to do chores”, or “men go to school/women stay home”, were a basic means to practice gender discrimination; 4) The interviewees would proactively look for opportunities to break gender stereotypes and gain enhanced agency; 5) In terms of gender norms, there were counterexamples existing in life; for example, an older brother took care of his younger sister by preparing a meal, or a younger sister took charge of the family matters when her older brother was away for military services. Furthermore, this study found that, through facial expressions, the surroundings, and objects, pictorial analysis could decipher many messages that could not be presented through words, together with repetitive comparisons of the pictures. Accordingly, this study gave the following suggestions: 1) pictorial analysis could effectively reveal the female experience in a patriarchal system; 2) The course of gender equality education should include the actual living cases of “performing”; 3) The teaching materials of gender education should adopt local experiences or stories to help understand more about the details and processes of gender performativity from life; 4) The future studies can include the male seniors’ gender experiences to facilitate the deeper understanding of local gender connotation in Taiwan.
This presentation reports the results of an organizational climate study, carried out in an engineering enterprise devoted to remote mineral extraction in the biggest underground copper Chilean mine. Organizational climate is conceived as a set of attitudes and beliefs related to the organization that is shared and collectively held by organization members (Fink & Chen, 1995). According to this, the general objective of this study was to establish and measure the main workers’ attitudes and beliefs about that organizational condition. Previously, to know the particular constitutive attributes of their own reality was considered as a specific objective. Ad-hoc questionnaires constructed on a real numbers scale (138) were applied to get the first objective and in depth-interviews (16) were developed for the second one. Following Galileo System, a quali-quantitative methodology software and cognitive perspective (Woelfel & Stoyanoff, 2008) this study takes organizational climate as the sum of individual visions of his/her organizational space, which consists of concepts representing “attributes” and “objects”. The first ones describe the organization in general or some of its practices and procedures, whereas the second ones include a point of perspective (Yourself) and a referent point for the focus of the investigation (the studied Organization). The distance from the self-point to each of the climate concepts is defined as the individual’s attitude toward each of them. Distance between each pair of non-perspective concept points (attributes) is defined as a belief. With an attitude average distance = 38.21 and standard deviation = 8.86, statistically significant positive attitudes were found in relation with: 1) continual technical training, 2) partnership and work team, 3) organizational compromise and, 4) coherence between tasks and contract. In the same statistical terms (beliefs average distance = 47.14 and standard deviation = 8.86, the more positive relationships in beliefs were found between: 1) recognition of expertise and partnership, 2) organizational compromise and partnership, 3) salary and recognition. On the bases of these results and others close, but not statically significant distances, “partnership and work team” as well as “organizational compromise” constitutes a relevant cluster around which workers of this organizations seem to experience a positive work environment.
INFLUENCE OF EATING ENVIRONMENT ON LONELINESS AND SUBJECTIVE WELL-BEING AMONG JAPANESE UNIVERSITY STUDENTS

Moegi Takahashi
Shukutoku University (Tokyo, Japan)

The everyday act of eating with others may impact loneliness and subjective well-being, both of which are clinically important. However, no research has examined in detail which aspects of eating with others have impacts. Therefore, this study aimed to examine specific aspects of eating with friends that affect loneliness and subjective well-being among Japanese university students. This study hypothesized that reducing loneliness and increasing subjective well-being could be accomplished by eating frequently with friends, having fun, and conversing while eating. We conducted a survey of 173 university students (64 males, 106 females, three unknown) using the Revised UCLA Loneliness Scale (Moroi, 1991), Subjective Well-Being Scale (Ito et al., 2003), and questions about the environments in which students ate with friends. A multiple regression analysis was performed using the scores obtained, with eating environment as the independent variable and the loneliness and subjective well-being scores as the dependent variables. In addition, a similar multiple regression analysis was conducted using reasons for eating with friends as the independent variables. The results showed that greater enjoyment when eating with friends positively impacted subjective well-being. However, this did not seem to affect loneliness. Reasons such as "I can talk with friends" and "I feel meals are more delicious" were found to positively impact subjective well-being. Clearly, subjective well-being increased with enjoyment, but not with frequency of eating or conversation. With conversation and delicious food, subjective well-being increased. Subjective well-being thus seems affected by qualitative, rather than quantitative, factors. A qualitative analysis of conversation could clarify what kinds of conversation during eating affect subjective well-being. In future studies, it is necessary to conduct a qualitative analysis of conversation in order to clarify what type of conversation during eating influences.
WORK MOTIVATION AT DIFFERENT STAGES OF ORGANIZATIONAL DEVELOPMENT. GENERAL AND SPECIAL ASPECTS

Maria Prokhorova
Lobachevsky University of Nizhny Novgorod (Nizhniy Novgorod, Russia)

During its development an organization undergoes several stages (formation, intensive growth, stability, decline). The organizational development goals change from one stage to the other, to achieve which an effective system of employees’ work motivation should be promoted. This stipulates the aim of this investigation: to reveal the respondents’ willingness to work at different stages of business and to identify common and special aspects of employees’ motivation. The methodological basement of the research is: A. Maslow’s hierarchy of needs, F. Herzberg’s two-factor theory, Sh. Richi’s and P. Martin’s multifactor work motivation concept, differentiation of motives into intrinsic and extrinsic, positive and negative. The selection and diagnostics of organizations, the employees of which took part in further investigation was conducted. To assess the organizational development stage with application of eponymously-named inventory, the owners of 16 commercial companies were surveyed. 194 employees (91 women and 103 men) fell into 4 samples of respondents: employees of 7 forming companies, 3 intensively growing, 3 stable, 3 regressing ones. To diagnose work motivation, the following tools were used: “SIM” situational interview, questionnaire “Ranking of work positive and negative motives” questionnaire (RPOM-14). The data processing was carried out via 2x2 cross-tables with Pearson’s criterion 2, Mann’s-Whitney’s criterion U and cluster analysis. Most of the employees of three types of companies (intensively developing, stable and regressing) prefer to work in organizations at the stages of intensive growth and stability. Personnel of forming organizations tend to work at stability and formation stages. For each stage of organizational development, integral structures of positive and negative work motivation (complex, many-component units) were elicited. For personnel of all types of organizations, the integral structures of positive labor motivation are more complex entities than negative ones. The motives of internal orientation prevail in the employees of intensively developing organizations, while employees of forming, stable and regressive companies value external orientation. Personnel recruitment, designing and implementing the system of work motivation, taking into consideration its general and specific aspects at different stages of organizational development, allow leaders to more effectively manage employees ensuring their work satisfaction, and to achieve corporate goals.
Self-awareness is the ability of an individual to separate the ‘self-entity’ from the ‘other entity’ and oppose the self to the objects of the outside world, become the object of one’s own attention (Gallup et al., 2002). Self-awareness is a key component of consciousness (Leontiev, 1972). The most frequently used method for detecting self-awareness is the mirror self-recognition test first proposed by Gallup (1970). Alternatively, it is proposed to study body-awareness, the ability of animals to take into account the physical parameters of their bodies. We tried to find out how animals take into account the limits of their bodies when solving experimental problems. An experimental box with two compartments was separated by a septum with openings of various sizes. An animal was placed in one compartment and sought to get into another one, where there was either a shelter or bait. To solve the problem, it had to choose a hole large enough to pass through. The independent variables were the size and position of the holes in the wall and the natural or enlarged limits of the body. To enlarge the body limits, we attached foreign objects to the animals. We used small holes, through which an animal could not pass to the goal compartment, medium ones, through which only an animal with natural body could pass, and large ones, through which an animal with the enlarged body could pass. We studied representatives of arthropods, mollusks, amphibians, reptiles, and mammals. The animals representing each species were divided into two groups: for one group only the sizes of the holes varied, for the second group both holes and body sizes varied. A comparative analysis of the experimental results shows significant interspecies differences in body-awareness. Mammals and reptiles produce a generalized rule for choosing certain holes, taking into account both natural and enlarged limits of their bodies. Amphibians are able to take into account only the natural boundaries of the body. Mollusks and arthropods do not form generalized rules either for natural or increased body limits. The study opens a new prospect for research into evolutionary variability of self-awareness.
PECULIARITIES OF PERSONAL SPACE, LIFE STYLE AND VITAL CAPACITY IN EARLY ADOLESCENT AGE

Natalya Mozgovaya  
Yuzhnyy fedarelnyy universitet (Rostov-on-Don, Russia)

Life style (mechanisms of protection), vital capacity (Leontiev D.A., 2011) help the person to preserve the stability of self esteem, the understanding of the self and the world around. These phenomena perform a function of a buffer attempting not to let deep dissatisfaction and life threats get close to our consciousness, they keep away the violation or blurring of the psychological or personal space’s boundaries (Nartova-Bochaver S.K., 2005). That is why the objective of our investigation was to study the peculiarities found within the mechanisms of psychological protection and vital capacity of the schoolchildren that have different levels of sovereignty of personal psychological space. Questionnaire “Sovereignty of psychological space” of S.K. Nartova-Bochaver; Life style index (R. Plutchek, G. Kellerman, G. Konte); “Vital capacity test. Methodology of S. Maddi” adapted by D.A. Leontiev were used. 71 respondents (schoolchildren of Rostov-on-Don high school) participated in the research. Results: among the studied high school children two levels of personal space sovereignty were found out – quasi sovereign (middle level) and deprived (low level); schoolchildren with low level of space sovereignty demonstrate vital capacity and its components (involvement and taking a risk are more obvious than compared with the schoolchildren with quasi sovereign space); important reverse interrelation of the personal space sovereignty and vital capacity with its components is established: the higher a level of space sovereignty of high school children, the less vital capacity and its components (involvement, taking a risk, control) are shown, and vice versa; psychological space sovereignty and protection mechanisms are interrelated: the higher the space sovereignty, the higher the overall level of tension of protective mechanisms. Relation between the vital capacity and its components and the mechanisms of psychological protection has been discovered. Moreover, this relation proves to be reverse – high level of vital capacity and its components contributes to making the overall tension of protective mechanisms lower. Investigating the phenomenon of high schoolchild personal space we can contribute to his conscious understanding of a decisive moment in making a career and a spouse choice, in his building up mature relations with the people around.
THE CONTENT ANALYSIS OF HIROSHIMA A-BOMB SURVIVOR’S PSYCHOLOGICAL MEANINGS OF TELLING A-BOMB EXPERIENCE THROUGHOUT THEIR LIVES

Midori Nakajima
Sendai Shirayuri Women’s College (Sendai, Japan)

On August 6 1945, the devastating effect of the atomic bombing in Hiroshima caused an estimated casualty of 140,000 by end of that year. Hiroshima A-bomb survivors faced hideous sights, and many of them injured and lost their family members. For many years, less attention has been paid to the psychological consequences among Hiroshima A-bomb survivors. In 2008, Hiroshima City commissioned the study team to perform a large-scale survey on long-term health effects among the survivors. Hiroshima City delivered a questionnaire by mail to all subjects who were living in Hiroshima City and adjacent towns before the atomic bombing until the study was implemented. The statistical analysis administrated a subsample of subjects \( n=14,373 \) whose age at that event was 8 or above. Hibakusha (A-bomb survivors) and those who were exposed to the Black Rain (fall-out) group revealed poor mental health (ex. CAPS, IES-R, SF-8, K6) compared group. Next year, the study team also administrated CAPS (Clinician Administered PTSD Scale) for subsamples of Hibakusha (N=486), Black Rain group (N=222) and non-Hibakusha (N=161). The CAPS results revealed 22.6% of Hibakusha assessed lifetime PTSD and 5.4% of Hibakusha assessed current PTSD even 64 years after the event. The purpose of this study was to explore Hiroshima A-bomb survivor’s psychological meanings of telling A-bomb experience. Research1 focused telling about A-bomb experience story from free descriptive answer sentences which were gotten by questionnaire survey (5927 papers). Research 2 focused how did Hibakusha who lived except for Hiroshima City feel the action of talking about one’s experience. The most impressive result was that telling someone who would dearly love to know about their experience made almost all Hibakusha felt relived and positive. And Hibakusha who lived except for Hiroshima City for a long time hesitated to talk about it, but the older they got, they had to leave the message about that experience to new generations strongly. In conclusion, A-bomb experiences still affected their mental state, and if there were the place which they talk about A-bomb experience safely, and someone who would like to know Hibakusha’s talk. But we shouldn’t force Hibakusha to talk if they weren’t willing to talk.
LONGITUDINAL STUDY OF SUBJECTIVE WELL-BEING OF MEDICAL STUDENTS

Vladimir Uryvaev
Yaroslavl State Medical University (Yaroslavl, Russia)

Characteristic feature of this study of dynamics of subjective well-being of students was the usage of longitudinal method during their full course of higher education (6 years). 104 persons participated in the research (therapeutic faculty students of a medical university in central Russia). Every year during 6 years of their education assessment of subjective well-being was performed, using technique of French psychologists Perrudent-Badox, Mendelsohn and Chiche. The method gives general quantitative evaluation of the parameter as well as particular values on its six subscales. In addition to that multiple-factor personality analysis was performed (using NEO-PR method). Among obtained results three are the most important. First, the aggregate subjective well-being coefficient (which is very low for the first-year students due to high level of entrance examination distress) grows considerably from the first to the sixth year of education (p<0.001). Second, subscales of subjective well-being bring distinctive input to the dynamics of the states. Subscales “tension” and “factors, concomitant to the main psychiatric symptomatic” reach maximum at the third year of education. The scales “health-related anxiety” and “satisfaction with day-to-day activity” arrive at the maximum at the second year of education. Other two scales do not demonstrate statistically significant changes. Third, out of five main NEO-PR scales only one — “neurotism (N)” — demonstrates high correlation (from min r=0.40 (p<0.001) up to max r=0.71 (p<0.001)) for all years of education with sighs of subjective ill-being. Individual characteristics of personalities of medical students can be safely assessed only against the background of “patterns of group-dynamics of personal well-being” of the body of students as a whole. Consultative work providing support and help in mobilizing inner adaptational resources of students of medical institutions of higher learning is more effective if detailed characteristics of personality are related to the yearly dynamics of subjective well-being in the course of successive years of education.
THE PROBLEM OF THEORETICAL APPROACHES FOR THE ANALYSIS OF VIRTUAL INTERACTION

Anfisa Chuganskaya
Institute of problems of artificial intelligence (Moscow, Russia)

In social psychology there is a set of various approaches and theories of communication. Communication is understood as "the difficult process of interaction between people consisting in exchange of information and also in perception and understanding by partners of each other" [Andreeva, 2003]. In the structure of communication three main components are allocated: communicative, perceptual and interaction parties. The component of interaction expresses an active behavioral process of communication and is closely connected with how the person acts, what strategy of behavior chooses.

The system of Internet communication, the use of various messengers transposes habitual mechanisms of interaction in new reality. For more detailed studying of theoretical approaches of the interaction in communication we addressed several methodological groups of researches. These are foreign theories of interactions, behavioral approach of B.F. Skinner, Russian activity approach by A.N.Leontiev and the social concept of R. Beylz.

The system of the analysis of interactions SYMLOG developed by R. Beylz, uniting various methodological principles, is the most developed instrumentally and allows to investigate ways of interaction in the virtual environment. At the same time the first type of the analysis in Beylz system – division of interactions on realized and extramental – is not relevant to the problem of the automatic analysis of texts of network discussions. However, other types of the analysis – the orientation of interactions, the focus of attention, the images – can be useful at establishment of frustration in the network polylogue. The reported study was partially supported by RFBR, research project No. 17-29-02247.
SERVICE LEARNING AS A BRIDGE TO PROMOTE ACTIVE CITIZENSHIP

Antonella Guarino
Cinzia Albanesi
University of Bologna (Bologna, Italy)

Service Learning (S-L) is a new teaching methodology in Europe. It is described as promoting students’ learning through active participation in experiences of community service (Folgueiras, et al., 2018; Zani & Guarino, in press). It is coherent with the educational priorities of the EU policy statements, that emphasize “active citizenship” and the development of “civic competences” at all levels of education. Moreover, S-L allows to create collaborative partnerships between university and community organisations, that is between students and social workers. The Council of Europe, in particular, developed the “Competences for Democratic Culture and Intercultural Dialogue” project to identify the skills and knowledge that students at different levels of formal education should develop in order to promote democratic, active, and responsible citizenship (Council of Europe, 2016). Among these competences, the openness to cultural otherness and to other beliefs, respect, civic mindedness, responsibility and critical thinking skills are in line with the main characteristics of a S-L initiative that are respect, reciprocity, relevance and reflexivity. Is service learning an effective tool to support the promotion of active citizenship? Quantitative (survey) and qualitative (reflective journals/diaries) data were collected from 167 students who attended Service Learning program offered by the Community Psychology Lab of the University of Bologna (Bologna, Italy). The analysis of the data collected shows that S-L contributes in particular to the development of openness to cultural otherness and to other beliefs, critical skills and empathy, with some variation depending on the different experiences offered within community organizations. These results show a preliminary basis to develop community-oriented service learning and to improve the partnership between university and community services. Folgueiras, P., Aramburuzabala, P., Opazo, H., Mugarra, A., & Ruiz, A. (2018). Service-learning: A survey of experiences in Spain. Education, Citizenship and Social Justice, 1746197918803857. Zani, B. and Guarino, A. (in press) Promoting civic engagement through Service Learning at Bologna University: a case study. In Aramburuzabala, P., MacIlrath, L. & Opazo, H. (Eds.) (in press). Embedding Service-Learning in Higher Education. Developing a Culture of Civic Engagement in Europe. Oxon: Taylor & Francis.
The main goal of the current study is to investigate a connection between dispositional sovereignty and birth order moderated by gender. Dispositional sovereignty is a personality trait of the lower level (situational trait) (Allport, 2002) that manifests in certain potentially depriving a person circumstances related to the restriction or denial of access to all everyday resources (food, personal belongings, territory, etc.). In other words, it is a person's ability to control, protect and develop their psychological space; the boundaries of the empiric Self; a mechanism of establishing a balance between one's own needs and others' needs (Nartova-Bochaver, 2017). Dispositional sovereignty as a trait strongly contributes to many parameters of well-being; thus, all studies are welcome that shed light on its predictors. Since it is developing throughout a person's childhood, there is a reason to believe that the main source of its development is the family, including relations with siblings (proximal relationships) (Bronfenbrenner, 1986; Kağıtçibaşı, 2013). The study involved 187 respondents: 131 females and 56 males, aged 17 to 19 years (Mage = 17.8, SDage = 3.8), students from various faculties of the Higher School of Economics, 39 — the only children, 148 have brothers or sisters, 85 of them — the first children, 48 — the second, 10 — the third and 5 — the fourth. The questionnaire Sovereignty of the personal space (SPP-2010, Nartova-Bochaver, 2014) was used. It is found that the number of siblings is not predictive for the dispositional sovereignty level in youth, while the order of birth is predictive; moreover, this relationship is mediated by sex. In female group, the sovereignty was increasing depending on birth order: the youngest daughters of three children have highest scores. In young men, there is an inverse relationship: the most sovereign is a first-born child; further, the level of dispositional sovereignty is decreasing. Perhaps these effects are associated with different attitudes to privacy and psychological boundaries in boys and girls. The “farther” a girl from her parents is, so she is freer; the “farther” a boy is, the more he defenseless is. The results are discussed in terms of gender stereotypes and systemic family theory.
IMPLICIT BIAS: THE EFFECT OF SEX, SKIN COLOR AND ETHNICITY ON DECISION-MAKING IN MEXICO

Melissa García-Meraz
Michelle Jazmín Pastrana-Espinoza
National Autonomous University of Mexico (Mexico, Mexico)

Human beings make decisions concerning their environment, always consciously and through a strong process of reasoning. However, and despite the idealization of this statement, this is not always true; evidence has proved that many human cognitions occur unconsciously and beyond our reasoning (Nosek et al., 2009). Implicitly, there are processes that influence our judgment, social perception and have a direct effect on our behavior (Stepanova & Strube, 2012). Through Implicit Association Test (TAI), relevant biases have been found through young people, Western cultures, men and Caucasian people; among many others (Bongers, Jansen, Houben, & Roefs, 2013, Stepanova & Strube, 2012, Wilson & Scior, 2015). In Mexico, evidence related to implicit biases are based on stimulus of pictures with no indigenous physiognomy. This research reports implicit biases or preferences in the Mexican population by measuring the time of association and the analysis of facial microexpressions for the sex, skin color and ethnic physiognomy variables in a decision-making situation (N = 400, psychology students age 20 to 25 years old). The objectives were: 1) test TAI format to the Mexican context in order to know the implicit biases towards the physiognomy of the face (Indigenous, mestizo and Caucasian characteristics), the skin color (three shades from darkest to lightest) and the sex (men and women), 2) determine the relative weight of these variations in decision-making (choose the best candidate for a position in a company) and 3) link emotional reactions to implicit biases and decision making. Three ways ANOVA model was tested: gender, ethnic and skin color (2 × 3 × 3). Results show that people have strong biases towards people with lighter skin tones, men and caucasians characteristics. People with these biases also showed a preference to give work to people with a caucasian characteristics and clear skin tone. The findings have implication for implicit bias research, discrimination, stereotypes and labor policies in our country.
SOME TENDENCIES AND TRENDS IN STUDYING PHENOMENA CONNECTED WITH PHYSICAL ATTRACTIVE APPEARANCE PERCEPTION

Gennady Serikov  
Southern Federal University (Rostov-on-Don, Russia)

The aim of this article is to analyze some tendencies and trends in studying phenomena connected with physical attractive appearance perception. Researches of human appearance are not new to Russian social psychology. Their main directions were discussed by A.A. Bodalev (1965, 1995) and his followers within the framework of social-perceptive approach in the late 60’s and early 70’s. Physical appearance was considered as a system of signs (hints) that served as the basis for interpretations concerning professional affiliation, status, age and sex, and the most importantly — personal traits. These works were joined by the studies that considered the problem of constructing the appearance of a movie character for the mass audience (Kuznetsova, 1978). They traced the movement from the offering to viewer «simple», typical images of heroes based on stereotypes to the images of «complex» movie characters the understanding of which requires interpretative activity. At the same time in Western psychology appeared papers devoted to the phenomenon called «What is beautiful is good» (Dion et al., 1972). These works were the impetus for a large number of studies carried out in this direction which were focused mainly on various aspects of stereotypes perception, halo effect, the attributive processes or discriminatory practices concerning people with unattractive or ordinary appearance, the practice of providing physically attractive persons with a range of advantages. The results of numerous studies proved the trend for a number of respondents to follow stereotyped combination of external and internal when they perceive attractive people. Scientists also studied factors influencing the weakening, limiting the impact of the stereotype «What is beautiful is good», pointed to the peculiarities of its functioning in different cultures, analyzed the methodological problems associated with the stimulus material, conducting longitudinal studies etc. At the same time the role of the interpretative activity of the subject of perception was minimized. The characteristics of the subjects of perception allowing them to resist to the stereotype influence, on the basis of their life experience, common sense, rationality, were not sufficiently studied and described. This study was supported by Russian Scientific Foundation (research project №17-18-01260).
Differences in toy preferences of boys and girls have been demonstrated consistently and constitute one of the most robust behavioural sex differences. However, most research on toy preferences in infancy has employed a similar set of toys, particularly a doll with female characteristics and a vehicle. Other research suggests that children between the age of ten and 14 months may prefer pictures of individuals of the same over the other sex. Therefore, in studies measuring toy preferences, infant girls may prefer dolls more than boys do simply because these dolls look like girls. Moreover, prior research on gender-typed toy preferences has been confined to Western Europe and North America and therefore it is not known if children in other cultural settings show similar sex differences. The aim of this study was to investigate sex differences in infants’ toy preferences in a new cultural context, rural Poland, and in the UK, while introducing a new stimulus — a male doll. 28 Polish and 33 British children ages 14 to 24 months participated in the study together with their parents. Their toy preferences were assessed in a visual preference paradigm and in a free play session. The results showed that girls were more likely than boys to look at and play with both female and male dolls, whereas boys were more likely than girls to look at and play with cars. Regarding within-sex differences, in the visual preference paradigm, girls preferred both male and female dolls over cars, whereas no significant differences were observed for boys. In the free play session, both boys and girls preferred the car over the other toys. The observed sex differences were consistent across both national samples. These results suggest that girls’ preference for dolls cannot be explained by the stimuli being female, rather than male, dolls. On the contrary, girls seem to like male dolls as much as they like female dolls. In addition, sex differences in toy preferences appear to be similar in an Eastern and a Western European setting.
FEATURES OF THE DEVELOPMENT OF GIFTED CHILDREN AT THE INITIAL SCHOOL STAGE

Elena Belova
Russian Academy of Education (Moscow, Russia)

The change in the social situation of a child’s development after entering school, the restructuring of his entire lifestyle are associated with great mental stress, creating risks in revealing his abilities and talents. Prevention and overcoming risks in the development of gifted first-graders are possible only by creating a developing educational environment that provides safe conditions for the development and creative self-realization of gifted students. An analysis of Russian and foreign studies has shown that socio-psychological factors (features of the relationship with the participants of the educational process), characteristics of the educational process (goals, tasks, workload), and internal risk factors have the greatest impact on the psychological safety of the younger student.

On the grounds of revealed insufficient scientific investigation of the internal risk factors problem of the educational environment in the first class, the study was aimed at analyzing the characteristics of the emotional and motivational sphere of children with signs of giftedness at the initial school stage. 59 children of 7-8 years old were examined. They studied in classes, where the program of creative interdisciplinary education (N.B.Shumakova) was implemented. Methods: survey, observation, expert assessment, methods of express-diagnostics of intellectual abilities, modification of the method of L.A.Yasyukova “Color Associations”, et al. More than 80% of children revealed a high / above average level of intellectual development, signs of general mental giftedness. It was found that they have a positive attitude towards school and a desire to learn. At the same time, many of them need emotional support from adults, which makes them calm and balanced. Development difficulties have been identified in some first-graders (difficulties of correct speech, attention, self-organization, signs of self-doubt, anxiety). It was found that the high cognitive motivation of first-graders with signs of giftedness is combined with a declared interest in playing. Providing an opportunity to realize high cognitive activity and creative potential of gifted first-graders not only in learning, but also in playing games, as well as psychological and pedagogical support of their learning and development process are necessary conditions for successful disclosure of their giftedness, overcoming difficulties and risks.
SELF-REGULATION AND INDIVIDUAL PSYCHOLOGICAL CHARACTERISTICS OF PERSONS SUFFERING FROM ARTHROSIS

Irina Vec
Varvara Morosanova
Russian Academy of Education (Moscow, Russia)

Self-regulation and individual psychological characteristics of persons suffering from arthrosis. Self-regulation of the person is connected with his individual features. The aim of the study is to identify the individual psychological characteristics of people suffering from arthrosis, affecting self-regulation. The sample consisted of 69 people aged 25 to 69 years (35 men and 34 women), including an experimental group: 37 patients (18 men, 19 women). Methods: methods of determination of temperament (Aizen, 1963); symptomatic questionnaire SCL-90-R (Derogatis, 1976); "methods of coping" (Lazar, 1988); "lifestyle index" (Plutchik, 1979); "type of attitude to disease" (lychko, 1980); brief form of health assessment MOS questionnaire SF-36 (Author J. E. Ware, 1980). The experimental group demonstrated somatic equivalents of anxiety. In patients revealed: interpersonal sensitivity, neuroticism and introversion. Sick men tend to interpersonal isolation: if women are equally important and social, and physical aspects of health, for men only physical. Analysis of the attitude to the disease of patients showed the presence of harmonious, alopaticos, anozognoziya and sensitive type, ie the desire to defeat the disease, the rejection of the" role " of the patient, the preservation of the value structure and social functioning without clear manifestations of mental and social maladjustment. Sick men more often than healthy, use such types of psychological protection as compensation and projection, and less often suppression, prefer a constructive strategy of "self — control", and less often-non-constructive "escape-avoidance". Sick women are less likely than healthy to turn to the "search for social support"strategy. Sexual differences in the internal picture of the disease were revealed: women had a high degree of neuroticism, intolerance to pain, anxiety, with its somatic manifestations. At the level of psychological protection, regression and compensation are more pronounced. A direct relationship between the age of patients and behavioral manifestations such as "irritable weakness", increased symptoms of somatization, introversion, the desire to avoid problems, the transmission of suppressed negative emotions weaker, lower quality of life. The results of the study allow us to hypothesize the need to use conscious self-regulation of the behavior of persons suffering from arthrosis in order to achieve a full quality of life.
CAN FAMILIARITY BE A CUE FOR THE PERCEPTION OF DEPTH?

Elizaveta Mischenko
Elena Gorbunova
Tadamasa Sawada
University Higher School of Economics (Moscow, Russia)

Ippei Negishi
Kanazawa Institute of Technology (Kanazawa, Japan)

It is theoretically possible to estimate the distance of an object, whose size is familiar to an observer, by computing the ratio between the size of the retinal image of the object to the memorized size of the object. It has been suggested that we can perceive the distance of the object using such “familiarity” information. Prior experiments testing this familiarity effect were not designed to minimize, or to eliminate, potential influences of higher cognitive factors on the subjects’ responses or the influences of low-level image factors (e.g. spatial frequency). We tested the familiarity effect in two psychophysical experiments that were conducted both in Russia and in Japan. The visual stimuli used in these experiments were images of three coins in Russia and in Japan. Forty Russian students and 23 Japanese students participated in these experiments. The images of the 3 coins were aligned horizontally, and presented for 300 ms in Experiment 1. They were shown sequentially for 250 ms in Experiment 2. The participants reported the perceived depth-order of the coins in a 4-alternative forced choice task. Any effect of “familiarity” would have been observed as an interaction between the types of the coins (Russian and Japanese) and the countries of the participants (Russia and Japan). The size of this familiarity effect was predicted to be substantial on the basis of a meta-analysis of the familiarity effects observed in the prior studies. But, our results in both experiments showed that the familiarity effect on depth perception was virtually zero (p = 0.853, BF = 2.76 in Experiment 1; p = 0.754, BF = 3.01 in Experiment 2. Clearly, any effect of Familiarity on depth perception is zero or, at most, very small.

PSYCHOLOGY OF TOURISM: RELATIONAL WELCOMING BETWEEN IDENTITY AND COMMODIFICATION

Graziella Zitelli
Order of Psychologists (Catania, Italy)

Giovanni Ruggeri
OTIE (Palermo, Italy)

Tourism is a convergent and comparison area of phenomena regarding men, their experiences, their needs and eventually the economy of the country (Brewster, 1996). All that is compared with the self-concept theory (Mead, 1934 Markus, 1977) and the social representation theory (S. Moscovici, 1976). To activate interventions aimed at improving the accommodation services in Sicily it has been thought about correlating its traditions, thus the authenticity of the islanders, and the possible improvement of the touristic flux. Despite the touristic fluxes, do the islanders stay faithful to their “Sicilianity”? Is the Sicilian tradition an islander balance? A purposive sample of 70 interviews has been involved, so as to give more relevance to psychometry, 10 elderly 20 university students 12 business people 5 craftsmen 15 tourists 3 travel agencies 5 taxi
drivers have been conducted: questionnaire written ad hoc for the information purpose, the questionnaire “Foster a good impression, the questionnaire on self-perception. It has been noted a relevant participation of business people and craftsmen in showing their islander identity. The answers given have highlighted that the island still has a strong identity and that the higher spirit of belonging has been noticed in the category of workers (thus who contribute to the economy). This is probably connected to the real or perceived economy which, both with crafts and commercial activities contribute to help the Sicilian knowledge and features.

CHESS AND DISABILITY

Graziella Zitelli
Order of Psychologists (Catania, Italy)

Letteria Tomasello
(Messina, Italy)

The game of chess helps identification of the self in relation to the others and the acquisition of rules. The project was based on these premises and was organized in the form of “competition, and the participation of “special Athletes” (differently abled: medium-light disability) and "Partners", the latter as a support, according to the regulation. Partner role is to supervise and they cannot give suggestions or intercept the pawn in their direction. Main parameters: the participation of the athletes shall be kept proportional so as to guarantee equal difficulty; the teams will be formed by athletes and partners as much homogeneous as possible according to their age and ability; the tournaments and divisions shall be organized according to the level of abilities relating to ICF codes; the trainers shall not be admitted to the game. Technical, Tactical and Motor aims: domain of expertise, leadership, sensitivity, combined abilities; keeping their area of competence, moving forward to checkmate, moving backward to defend their pawns, do not miss the turn-development of the concept of time, development of attention; keeping and consolidating the acquired psycho-motor abilities, visual-spatial scheme under continuous control, axial and distal laterality, special-temporal orientation, general coordination, motor, concepitive and postural praxia. Psycho-social aims: self-esteem, confidence, motivation, acceptance of the rules, cooperation, technical and cultural exchange. Shall be introduced in the style of a game by gradually going from "easy to difficult", varying the forms and contents according to the real technical and motor capacities of the students. One and a half hours structured as it follows: welcoming, warm-up with the explanation of the basic technique, theme game to promote techno-tactical learning, free game, final salutation in group. It is suggested that regular meetings are held to let each athlete express him/herself and to better feel part in the team. It was executed into 3 years and involved 27 disables. We could note that the participants were able to overcome their motor and psychological limits, to develop a better self-knowledge, to highlight their special qualities and, above all, to get socially integrated.
DO MENTAL HEALTH PROFESSIONALS HAVE A DOMINANT RISK TYPE, AND IS THERE A LINK WITH RESILIENCE?

Sonia Shah
University of East London (London, United Kingdom)

On too many wards, the combination of a concentration of detained patients with very serious mental health conditions, old and unsuitable buildings that reduce lines of sight and increase ligature anchor points, staff shortages, and lack of basic training, make it more likely that patients and staff are at risk of suffering harm. These daily challenges of mental health professionals are common stressors, and they not only impact their own wellbeing but also the care they provide to service users. Resilience has not only been said to be a supportive factor that enables these professionals to adapt to the physical, mental and emotional nature of their roles, but is also seen as a protective factor against, for example, emotional exhaustion and depersonalisation. In this way, there is potential to reduce the risk of burnout and staff attrition, and promote staff retention and occupational mental health. Risk assessment and management are at the core of mental health treatment in order to mitigate harm and provide the best possible care to service users, whilst also incorporating the risk they pose to themselves and others. However, service user recovery is about potential and expectation, not just keeping everyone safe and taking no risks for fear of failure. The most consistent finding from research on the Five Factor Model is that risky situations are likely to invoke minimal anxiety for risk tolerant and resilient individuals (low Neuroticism). The risk tolerant individual is also likely to avoid conformity and control, preferring flexibility and spontaneity (low Conscientiousness), contradictory to resilient individuals. The risk tolerant and resilient individual will tend to actively seek high levels of excitement through social interaction and activity (high Extraversion). While there is inconsistent literature regarding resilience and Openness to Experience, risk tolerant individuals desire variety and adventurous activities (high Openness to Experience). There is inconsistent literature regarding Agreeableness across both risk-taking tendencies and resilience.
BALANCE AND ORIENTATION: MONITORED TRAINING TO FAVOUR PERFORMANCE IN FOOTBALL

Graziella Zitelli  
Order of Psychologists (Catania, Italy)

Paolo Scuderi  
FIGC (Catania, Italy)

"Speed is one of the most important gifts of the footballer and it is always conditioned by the game situation and by the technical ability" (Rovida); moreover, football is a balance sport! The aim of this modest search-action has the objective of modelling the methodological side of football training. Objectives of the study: allow the growth of young players (footballers) with a higher meta-cognitive awareness. The method used, a part from the observation, will be the participatory one; the group will also be another aim to reach as well as a tool to focus on motivation. 6 groups of 12 children from 3 different football academies will be selected. In each football academy a group will serve as a sample, the other as performer in the project "Balance and Orientation". The intervention will be performed with preliminary meetings with the trainers (the same for each football academy not to add more variables and changeable aspects), observation of the training methodology, games chosen ad hoc to speed training and attention capacities measurement with specific tools (for example TOL). Expected results: improvement of the attentive capacity (by putting in sequence some behaviours according to time and space), higher stimulation of concentration and higher speed in choosing the sport moves. Conclusions at the end of the project: through crossed competitions thus with sport methodology, it have been measured: attention, concentration, speed and improved visual-spatial orientation and balance.
Goal of the study was to reveal interrelations between self-attitude as to a homosexual and belief in a competitive world in gays. In the beginning, the respondents were asked to answer the questions of the questionnaire: age, sex and sexual orientation. 29 homosexuals aged 18-55 years old took part in the research. W. Mayfield’s homonegativity diagnostic technique in modification of A. Yanykin and A. Nasledov was used to reveal internalized homophobia. J. Duckitt’s technique adapted by O. A. Gulevich et al. was used to assess belief in a competitive world. In the course of our research it was determined that the respondents have low personal homonegativity (M=11,33), i.e. positive emotions prevail, the respondents are not ashamed and consider their sexual orientation positively. We have found out that the respondents have accepted their sexual orientation, consider it to be normal and to be an important part of their life, evidence of which is scale «Acceptance of own homosexuality» (M=21,23). Then we considered belief in a competitive world. Our respondents do not tend to think, that more successful in the world are those who are able to manage others, i.e. do not tend to perceive social world as competitive (M=26,30). Correlation analysis showed that there are no interrelations between scales of internalized homophobia and belief in a competitive world. Then the respondents were divided into two groups, depending on the results of belief in a competitive world, for further analysis of internalized homophobia in gays. We have found out that 11 respondents believe in a competitive world. These respondents are prone to display personal homonegativity (M=14,54), unlike respondents who do not believe in a competitive world (M=9,47 with p≤0,029). However we did not determine reliable differences in scale «Acceptance of own homosexuality» between believing and not believing in a competitive world. Our analysis of the obtained results of the Russian sample shows, that self-attitude to oneself as to a homosexual reveals itself positively, i.e. internalized homophobia does not reveal itself, and neither does perception of social world as competitive. At the same time perception of social world as competitive may become a factor of negative experience of one’s homosexuality.
STUDY ON PROCESS ANALYSIS OF GROUP PLAY THERAPY FOR ADOPTED CHILDREN

Li-Yun Wu
National University of Tainan (Tainan, Taiwan)

Adoption was one of major loss to children. Children felt lost and confused from separation with parents, and suffering from uncontrollable situation (Schneider & Phares, 2010). The purpose of this study was to comprehend the interaction, themes of play and the process of change for children in the group play therapy. Process analysis on 5 of 6-10 years old children who were ready to be adopted abroad, via 12-hour group play therapy, with video recording and social worker’s feedback. Results showed that

1. Interactions: (1) Invited the therapist and other children to play. (2) Children were from the control, leadership and competition to cooperation.

2. Themes and behavior of play: (1) The image of the family: Most adopted children had been placed in the foster family since birth. Adopted children expressed that family members were interdependent, support each other and live together. The composition of family members didn’t necessarily have birth parents or sibling and blood relation. But “home” is still a safe haven for them. (2) Expectations for adoptive families: Most members were optimistic about their cross-border adoption. They were gradually familiar with future adoptive parents through video. They felt the care from adoptive parents and understood even if each other’s skin color was different, the transmission of love were regardless of race. They expected to get along with new family members in the future. (3) Connection with adoptive family was often demonstrated through play. (4) Constructed firm and secure houses, expressed desire for a sense of security.

3. Emotions: (1) From foster to adoptive home, children’s emotion swung between excited and reluctant. (2) Expression of separated anxiety, expectation for future life during discussions about adoption. (3) The sibling were adopted by different families let children feel sad.

Following conclusions were made: 1. Following the progress of the play, children were increasingly aware of negative emotions and expressed more genuine emotions. 2. Children could release negative emotions and deal with separation with the foster parents via group play therapy.
Psychopathy is a serious personality disorder connected with antisocial and criminal behavior. However, psychopathy has been also investigated in non-clinical populations. Most of the studies examined sub-clinical psychopathy as a unitary construct using a variable-centered approach. In our study we utilized the triarchic conceptualization of psychopathy, which proposes three distinct but interrelated psychopathy domains i.e. disinhibition, meanness, and boldness (Patrick, Fowles, Krueger, 2009). The first aim of the current study was to explore relationships between the three psychopathy domains, sexual functioning and quality of romantic relationships in women and men. As certain configurations of psychopathy domains may be more frequent than others, we also used cluster analysis to distinguish natural sub-groups of participants with similar psychopathy profiles. The second aim of our study was to investigate differences between these sub-groups of persons related to sexual functioning and quality of romantic relationships. This person-centered approach was used to capture sex differences in the effects of psychopathy domains on features of sexual and romantic relationships. The sample consisted of 1291 persons (817 women and 475 men), who participated in an on-line study. Psychopathy was assessed using the TriPM-41, a Polish adaptation of the Triarchic Psychopathy Measure (TriPM; Patrick, 2010). Sexuality-related measures included, among others, the Sociosexual Orientation Inventory (SOI-R; Penke & Asendorpf, 2010), the scales from the Multidimensional Sexual Self-Concept Questionnaire (MSSCQ; Snell, 2001), and a number of questions regarding current sexual and romantic relationships. The study was accepted by a local ethical committee. The results showed that psychopathy domains had different associations with the study variables. The sub-groups of men and women that were identified via cluster analysis also differed significantly in terms of sexual and close relationship functioning. These results can be interpreted within an evolutionary approach, which enables analyzing potential benefits and costs of social strategy associated with psychopathic traits. Additionally, the findings provided some arguments supporting the idea that boldness may be treated as a relatively adaptive domain of psychopathy.
SELF-REGULATION, EMOTIONAL INTELLIGENCE AND PROCRASTINATION AMONG ADULTS

Elena Zarubko
Olga Shashkova
Tyumen State University (Tyumen, Russia)

Procrastination has been examined predominantly among college students, investigations on adult samples are less numerous, especially in Russia. This study is aimed to compare high, moderate, and low procrastinators on self-regulation and on emotional intelligence. Participants were 82 adults, average age 32.66 years old. Participants were classified by level of procrastination based on the scores on General Procrastination Scale by C. Lay in adaptation of O. Vindeker and N. Ostanin. Volitional aspect of self-regulation was measured by Scale of Action Control in Planning by J. Kuhl in adaptation of S. Shapkin. Cognitive aspect of self-regulation was assessed using Self-Regulation Profile Questionnaire by V. Morosanova. Emotional intelligence was assessed using Emotional Intelligence Inventory by D. Lusin. Kruskal-Wallis H test revealed significant differences in self-regulation and in emotional intelligence between low, medium and high procrastinators. Low and medium procrastinators significantly exceeded high procrastinators on general level of cognitive control, modelling and programming. High procrastinators tend to evaluate inadequately the time required to fulfil the task and act impulsively, without thinking of the consequences of delay. High and medium procrastinators were significantly lower than low procrastinators on understanding the emotions and on emotional management. High procrastinators were prone to state orientation, low procrastinators were prone to action orientation.
THE STUDY OF PSYCHOLOGICAL PORTRAIT OF PERSON WITH MASOCHISTIC CHARACTER

Zhanna Kara
South Federal University (Rostov-on-Don, Russia)

Recently, there has been a significant increase in public interest in the subject of sadism and masochism in the context of contractual partner sadomasochistic relations (consensual sadomasochism), as it is indicated by the popularity of literature and cinema works with corresponding orientation. This topic was covered in the theoretical works of foreign and domestic scientists. Modern research points out the lack of elaboration of this subject, especially in the context of the development of digitalization, rapid inflow of information from the Internet, an increase in the manifestation of suicidal behavior. In the study we relied on the following basic forms of masochistic demonstrations: primary masochism is displayed in the trends of physical self-destruction, the desire for death; secondary masochism, is characterized by the exacerbation of sexual sensations from physical and moral pain emanating from the object of attachment; tertiary masochism, which manifests itself in self-abasement and self-sacrifice. The designated goal is to form an extended psychological portrait of a person with a masochistic character. As a hypothesis of the study, the following assumption was made: people with a masochistic character are likely to have a high level of self-aggression and self-accusation; therefore, it is possible to conclude that there is a high level of disposition toward the development of depression. As the object of the study were 60 people: the respondents of the main group were selected on the basis of the author’s questionnaire aimed at identifying the presence of masochistic manifestations (30 people involved in the testing of the Internet communities of BDSM theme; the control group included 30 people-students of the Southern Federal University (Rostov-on-Don, Russia)). Theoretical, empirical methods and methods of mathematical statistics were used. Thus, there was an attempt of a general analysis of the origin of masochistic trends, it was found out that masochism is a personal trait characteristic of both sexes, masochists have a high level of depression, self-aggression, self-accusation and a disposition toward deviant behavior, which indicates the necessity for timely detection of inclinations to provide preventive help that increases the relevance of the study of this phenomenon.
A NEW TOOL TO MEASURE THE CAREGIVER ADJUSTMENT: THE VAMA SCALE

Emilie Wawrziczny
Clotilde Larochette
University of Lille (Villeneuve D'ascq, France)

Florence Pasquier
University Hospital of Lille (Lille, France)

Pascal Antoine
University of Lille (Villeneuve D'ascq, France)

The disease and its progression will have an impact on both the couple and the dyadic relationship. With the evolution of the disease, caregivers are more and more protective with the person with dementia until they develop more rigid control behaviors. These patterns of control behavior impact at short and long-term the quality of dyadic relationship. There are no studies in the literature that have attempted to quantify this phenomenon. The objective of this study was to develop a tool for assessing the control behaviors that account for the interactions between the person with dementia and the caregiver. Traditional scale development methods were used to generate items and evaluate their psychometric properties. Confirmatory factor analysis (CFA) was used to examine factor structure then convergent and external validities were evaluated. The final 22-item scale takes approximately 10 min to complete. CFA supported a four-factor model including four domain-specific factors: lack of flexibility in caregiver’s adjustment, feeling of loss of freedom expressed by the person with dementia, caregiver’s feeling of having to do it all and benevolent stimulation. Results showed that the VAMA scale had adequate reliability (test—retest and internal consistency) and validity (content, predictive, concurrent, and convergent). The VAMA scale shows promise as a useful tool for the measurement of the caregiver adjustment. This tool will evaluate the patterns of control behaviors implemented by caregivers that are detrimental to dyad relationship in the long-term. It will improve the identification of caregivers struggling with the management of their loved one’s disease to better accompany them, and obtain an indicator for tracking and for research evaluating the effectiveness of interventions.
PERSONAL AND SITUATIONAL DETERMINANTS OF POLISH POST-ACCESSION MIGRANTS’ SATISFACTION WITH SELECTED AREAS OF LIFE

Elżbieta Turska
Uniwersytet Śląski (Katowice, Poland)

The aim of the study was to determine the role of personal and situational variables in Polish post-accession migrants experiencing satisfaction with selected areas of life. The study involved 493 persons who have emigrated to 15 different European countries. An empirical model was used to verify the research hypothesis assuming that personal and situational variables are factors that significantly differentiate between Polish post-accession migrants’ sense of satisfaction with various areas of life. The personal variables considered in the study were sex, age, education level, marital status and having children. The situational variables were connected with the respondents’ situation in Poland before the migration and the current situation in exile. The level of satisfaction with selected spheres of life was diagnosed using the Partial Satisfactions Scale [Skala Satysfakcji Cząstkowych] by Janusz Czapiński (1994; 2003). The analyses showed that the sense of satisfaction is significantly correlated with the respondents’ personal variables and the current situation in exile, and is not related to their situation in Poland before the migration. Regarding personal variables, the level of satisfaction was significantly dependent on age, education level and marital status. Regarding the situation in exile, the differentiating variables were: the time spent in exile, the respondents’ financial situation, the decision to stay abroad for good, the command of the language spoken in the country, and having a job.
THE PERSONALITY TRAITS OF COLLEGE STUDENTS IN TAIWAN

Lin Jiun-Bih
Wen Cheng
Kie Ling Tang
National Sun Yat-sen University (Kaohsiung, Taiwan)

This study utilized the factor analysis to explore the personality traits of college students in Taiwan. Especially representing the traits domain of personality in the Internet Generation distinct from the traditional Big Five framework. The study conducted in two stages, and both were using the survey-format. The first stage adopted the Lexical approach by asking participants to freely fill in adjectives regarding their own and friends'/enemies’ “personality traits.” Using Meaning Extraction Helper (MEH), frequencies of all the trait adjectives were calculated. Afterward, the adjectives with similar meanings were clustered and the final 126 core trait adjectives were formed and used in the second stage. In the second stage, participants were asked to indicate to what degree each of the 126 trait adjectives could describe their own personality by a 5-point Likert scale from strongly disagree to strongly agree. The two stages recruited the separated samples from the population of Taiwanese college students. In Stage 1, a total of 262 participants ageing from 18 to 23 years old were recruited from five different universities. The Stage 2, The 244 participants with age ranging from 18 to 38 from three universities were included. The research method utilized parallel analysis and revealed 11 personality dimensions, named as Positive, Negative, Humor, Rationality, Introvert, Diligent, Creative, Reckless, Confidence, and Boring. The proportion of variance explained by the 11 factors was 47.31%. In order to examine gender differences among the samples, a serial of independent-sample t tests were used to determine whether the 11 trait adjectives perceived by male and female college students differently. The results showed that there was a significant difference (<.05) in the dimension of “humor,” and it was found that male college students tended to consider themselves a relatively higher level of humor than did female college students. The findings of the current study showed that the personality traits of college students in Taiwan can be classified as 11 dimensions. In addition, except for the dimension of humor, there was no gender differences among the personality traits.
THE RELATIONSHIP AMONG ONLINE GAMING ADDICTION, MINDFULNESS, AND LIFE SATISFACTION

Şeymanur Dönmez
Itır Tan Comert
Fatih Sultan Mehmet Foundation University (Istanbul, Turkey)

This study aims to investigate the relationship between online gaming addiction, mindfulness and life satisfaction. The sample of the study consisted of 1119 participants between the ages of 12-55 reached by easily accessible sampling method. In addition to the demographic information form prepared by the researcher; Online Game Addiction Scale (Kaya, 2013), Life Satisfaction Scale (Diener, Emmons, Larsen, & Griffin, 1985) and Mindfulness Scale (Brown & Ryan, 2003) were applied to participants. Research data were analyzed by using SPSS and AMOS programs. Confirmatory and exploratory factor analyzes of the scales were applied. The hypotheses of the study were tested with statistical analyzes and Sobel analysis was performed to test the relationship between the variables. 81.5% of the participants were playing online games and 18.5% were not playing. 79.1% of the participants stated that they played online games and made new friends through the games and 35.2% of them stated that they met in real life with friends they acquired through games. It was found that the participants played online games and played an average of 3.9 hours per day. Most played games were Counter-Strike (23.2%), PlayerUnknown BattleGrounds (16.6%) and League of Legends (11.2%). In order to test the effect of gender, independent samples t-test was computed. It was seen that the scores of men on the “malfunctions” ($t(901) = 3.09, p < .05$) and “success” ($t(901) = 5.87, p < .001$) factors and total score of Online Game Addiction Scale were significantly higher than the scores of the women ($t(901) = 5.97, p < .001$), while the mean scores of the women on Life Satisfaction Scale were significantly higher than those of the men ($U = 71005, p < .05$). Basic linear correlation analyses showed that there is a negative correlation between online game addiction and mindfulness ($r = -.357, p < .01$), negative correlation between online game addiction and life satisfaction ($r = -.19, p < .01$), and positive correlation between life satisfaction and mindfulness ($r = .23, p < .01$). Basic linear regression analyses showed that life satisfaction and mindfulness are negative predictors of online gaming addiction and mindfulness is a positive predictor of life satisfaction. The Sobel analysis showed that there was a partial mediator role of mindfulness on the relationship between online gaming addiction and life satisfaction (Sobel: $-5.670$, Sd.H.: $.013$, $p < .01$). The findings showed that the level of online gaming addiction increases with low levels of life satisfaction and mindfulness. These findings coincide with the results of other studies in the literature. The fact that mindfulness has a partial mediator role in the relationship between online gaming addiction and life satisfaction is a new finding that contributes to the literature.
FEATURES OF SOCIAL AND PERCEPTIVE ABILITIES OF MATHEMATICALLY GIFTED STUDENTS

Yuliya Tushnova
Don State Technical University (Rostov-on-Don, Russia)

The problem of giftedness today is relevant not only for science, but also for the economic and social spheres. Now requirements to intellectual potential of the person increase, there was a social order for experts with individually expressed professional abilities in different types of professions. In modern society, the share of science-intensive technologies is increasing, which is impossible without increasing the intellectual potential of the country. This actualizes the problem of studying mathematically gifted youth at the stage of its self-determination at the University. Practical solutions require, first of all, issues related to the psychological characteristics of adaptation of mathematically gifted youth. Modern studies have shown that giftedness is a holistic, multilevel, multicomponent, dynamic education (A.Kolmogorov, V.Druzhinin, M.Kholodnaya, T.Vinogradova, V.Semenov, E.Kryukova, etc). Describing giftedness as a psychological phenomenon, often note the high level of intelligence, general and mathematical abilities. Mathematical giftedness considered in different approaches: research in mathematical giftedness private abilities (V.Krutetskiy), research the General factor of mathematical giftedness (I.Werderlin, G.Eysenck, L.Yampolsky, N.Metelskii, V.Druzhinin, A.Kolmogorov), reearch of gender characteristics of mathematical giftedness (A.Kolmogorov, V.Druzhinin, T.Vinogradova, V.Semenov, K.Cairns, John.Stanley, T.L.Hilton, etc.). In foreign researches, attention is paid to the study of self-concept and personality characteristics of mathematically gifted children and adolescents (C.H.Solanoa; J.M.Tsua, etc), the results of the research of motivation characteristics (V.V.Stetica, V.Vidovica, L.Arambasica, J.R.Malpassa, H.F.O'neil, D.Hocevar). The research work aim was to study the social and perceptive abilities of mathematically gifted students. The research sample consisted of 50 students of natural science specialties aged 17-23 years (58% men). The research methods were: testing (test of analytical mathematical abilities, subtests of R.Amthauer), expert evaluation, questionnaire (based on diagnostics of social and perceptual abilities), statistical methods (W-Kendall, Kruskal-Wallis test, Chi-squared test). The research results describes the features of some intellectual abilities, self-assessment of intelligence and socio-perceptive abilities of students with different levels of mathematical abilities. The profiles of social and perceptive abilities of students with expressed analytical mathematical abilities were made, on the basis of which it is possible to develop a program of psychological support for this category of students. The authors (material) – the winners of the Scholarship program of Vladimir Potanin 2017/2018 (contract grant No. GSGC- 60/18).
MAKE-UP YOUR BEAUTY, ACCEPT YOUR BODY AND REDISCOVER YOUR SELF

Valentina Costanzo  
(Acireale, Italy)  

Maria Gioelli  
(Noto, Italy)  

Bianca Maria Caniglia  
(Scordia, Italy)  

The present work reports the results of a study that seeks to investigate the prevalence of anxiety and depressive symptoms and the resulting psychological distress in three different groups of patients. All this in the light of what the sick person is facing, the sense of crisis and the loss of their identity as a woman due to the crumbling of their own Self. This intervention focused on the care of the Self, starting from the concept of identity, through a process of empowerment based on self-esteem. Rediscovering one’s body through a real process of self-recognition could help these women to lower levels of anxiety, depression and psychological distress. After the initial administration of some scales, the perceived psychological well-being was evaluated in a work divided into 3 sessions during the week: — creation of a self-help group supervised by the psychologist, — a make-up workshop to improve oneself rediscovering a ‘new’ beauty and — a session with Nurturing-Touch techniques to accept your body. Three groups of women, 10 with breast cancer (45-55 years), 10 women with physical disabilities (30-50 years), 10 women with different diseases hospitalized in a RSA (70-80 years and with MMSE> 20). It was decided to include exclusively the risk factors related to the person and not related to the socio-environmental context, the disease or the therapies. For the assessment of psychological well-being, the PGWBI scale was used, associated with the HADS scales. In the first four weeks the self-representation of the state of well-being to the emotional sphere showed in the groups of cancer patients and in those hospitalized at RSA, high levels of anxiety and depression that reached high levels of distress, with scores between the borderline cases and indices clinically indicative, in women with disabilities, a mild-to-moderate level of anxiety and depression and low levels of self-control and general health emerged. In the following two months the levels of general suffering diminished in each group, with greater awareness of their own self and body, humanizing the medical path.
Emotional labor continues to attract interest of researchers and practitioners due to its prevalence in organizations and importance on work-related processes and outcomes. Even though considerable research examined outcomes related to emotional labor, studies investigating the personal and organizational factors which exacerbate or alleviate use of emotional labor strategies (i.e. surface acting and deep acting) are relatively scarce. Thus, in this study, we aim to examine the effect of negative affect and negative events on emotional labor process by utilizing Personality Systems Interaction Theory’s approach (Kuhl, 2000). In this sense, we aim to investigate the moderating effects of action/state orientation and organizational affect climate on the relationship between affect related factors and emotional labor. Specifically, we hypothesize that the positive relationship between surface acting and high negative affect will be moderated by action orientation and affect climate such that the relationship will be smaller in magnitude for action-oriented employees and for employees whose organizations endorsed authentic affect climate. We aim to collect data from 100 white-collar employees across five consecutive workdays via online survey to accurately account for individual variances and between-person effects. We will analyze the data by conducting multilevel modeling in Mplus 7.1. We will discuss about results and implications considering their contribution to the theory and practice.
SOCIAL-PSYCHOLOGICAL SATIETY OF LIVING CONDITIONS IN MODERN METROPOLISES

Ivan Larionov
Tatiana Drobysheva
Russian Academy of Sciences (Moscow, Russia)

Relevance of study of social-psychological satiety is caused by tendencies of modern world — modern cities are constantly growing. This constant growth leads to several consequences, such as changes in information environment, permanent appearance of new products, goods, services etc. Another important consequence of constant growth of modern cities is increasing rate of life and constant exposure to a huge number of external influences in environment and social life. All of these facts have negative influence at modern citizens and their psychological health. Social-psychological satiety is a condition of the human psyche, protective mechanism from an overflow of various stimuli from the surrounding world. Social-psychological satiety is a complex condition that is caused by a variety of phenomena of social life in the urban environment: excessive communication, an abundance of information etc. Study of this new phenomena, its sources, consequences and ways to overcome will help to understand functioning of psyche in modern constantly in modern metropolises. Purpose of a study — reveal and study the severity of social-psychological satiety depending on its sources in modern metropolis. Sample — 87 respondents in age 19-30 Methods of a study — focus group, author’s survey questionnaire, statistical analysis (descriptive statistics, frequency and correlation analyzes (Spearman cr.)), content analysis of survey materials. Results of research showed that social-psychological satiety is connected with city environment and associates with negative and positive emotional expressions, periphery of social representation contents. Prototypical analysis of Verges and it clearly shows that core of representation of satiety contents both positive and negative emotional expressions, periphery of representation contents statements about living conditions in metropolis. Instruction to association test didn’t contain any references to satiety as specific city phenomena. Analysis of data allowed to distinguish several forms of satiety, as emotional expressions and behavioral attitudes. Both forms are caused by high rate of life, monotony of life, weather conditions, excessive social contacts. But behavioral attitudes are also caused by abundance of different pastime opportunities, goods, services etc. Social-psychological satiety is complex phenomenon, clearly manifested in the urban environment and entailing a number of negative mental effects that threaten the individual’s physical, social and psychological well-being.
TV CHARITY ACTIONS AS A SUBJECT OF PSYCHOLOGICAL IMPACT ON MASS AUDIENCE

Vladimir Litvinov
Lomonosov Moscow State University (Moscow, Russia)

There are three objects of psychological impact: emotions, cognitions, behavior. When television appeared the problem of such impact become extra notable. All the investigations were devoted mainly to research of negative effect of the impact (Cumberbatch). The aim of the project — studying of TV impact on audience’s emotions by the example of charity actions. The project includes 16 participants (M age=31.4, SD=5.32, 8 male). And as a method to define empathy level was used Emotional Empathic Tendency Scale. When interrogation was over all the participants of the research were combined in focus-groups. Intention of the audience to take part in charity action depends on their level of empathetic abilities. People with different level of empathy had also different important for theirselves factors and effects of charity plots, when they formed a decision of taking part in charity movies. So that empathic viewers are more tempted to react at emotional components of charity plots (demonstration of the main hero’s scars, hospital conditions, pulsing music, baby’s cry). On the other hand such factors as concrete facts, proofs or familiar live experience played the main role in perception for responders with low empathy level. But at the same time high level of cognitive empathy can appear with low level of emotional empathy. Such conclusion is proved in theoretical rationales of researchers who divided empathy on emotional and cognitive (Davis, Rogers, Goldstein). But the greatest impact on the audience’s emotional state was caused by demonstration of empathy feeling from the main hero’s relatives on the screen. The viewer feels empathy towards both the main hero and his relative, and feels with empathy from relatives to the hero. Thus particular qualities of television impact on the audience’s emotions by the example of charity actions, studied in this research, allow us to confirm concepts of the researchers who believe in changing of human behavior and his emotions with help of television audio-visual effects (Matveeva, Winterhoff-Spurk, Bandura, Gerbner). But in contrast to prevailing opinion in academic circles about only negative effect of this impact, our research demonstrates mechanisms of its positive effect.

PARENTS’ PERCEPTION OF THE POSSIBILITIES OF THE EDUCATIONAL SPACE OF MOSCOW

Igor Vachkov
Moscow Pedagogical State University (Moscow, Russia)

The research presents the results of the study of the views of students’ parents on the possibilities of the educational space of Moscow in solving the problems of education and socialization of children. About one third of respondents directly or indirectly indicate dissatisfaction with the quality of education provided for their children. The vast majority of parents believe that the main task of the school is to prepare their children for admission to University.
NOT CONSTRUCTIVE STRATEGY OF SELF-AFFIRMATION AS THE FACTOR OF EMOTIONAL BURNING OUT OF TEACHERS IN INNOVATIVE ACTIVITY

Liudmila Dolinskaya
Moscow Pedagogical State University (Moscow, Russia)

This presentation is devoted to a concept emotional burning out of the teacher, the main reasons for emergence of emotional burning out in innovative activity are defined, the interrelation of strategy of teachers in innovative activity is considered and prevention methods are lit.

FOREIGNER BELIEFS REGARDING INDIVIDUALS WHO SELL SEX IN THAILAND

Madeline Stenersen
Elin Ovrebo
Kimberly Adams
Lauren Hayes
The University of Memphis (Memphis, USA)

The current study examined the beliefs of foreigners in Thailand towards ISS in the country. Previous literature indicates that beliefs and attitudes towards individuals who sell sex (ISS) directly effect this populations' ability to access adequate healthcare, and employment services (Human Rights Watch, 2012; Lazarus et al., 2012). Little is known about the beliefs towards ISS in Thailand, and with Thailand’s growing population of foreigners, their beliefs deserve scholarly attention. Survey participants include 250 adults currently in Thailand who self-identify as foreigners. Participants responded to a series of Likert-type questions regarding their beliefs towards ISS, their impact on society, and the motivation of those individuals to sell sex. As previous research has shown that ISS are regarded differently based on their gender (Weitzer, 2009), participants were asked the same questions separately for female, male, and transgender ISS. Independent samples t-test results indicate significant differences in the beliefs of participants towards ISS based on the gender of the individual selling sex. For example, participants agreed that female (M = 3.54, SD = 1.16) or transgender (M = 3.56, SD = 1.02) ISS were more likely to be selling sex voluntarily then were male ISS (M = 3.45, SD = 1.02), t(250) = 50.29, p < .001. Additionally, female participants (M = 2.41, SD = .77) endorsed a more negative view of ISS when compared to male participants (M = 2.11, SD = .96), t(250) = 2.24 p < .001. Finally, participants who had never purchased sex (M = 2.83, SD = 1.20) were more likely to report that ISS in Thailand, regardless of gender, have a negative impact on Thai society when compared to individuals who have purchased sex (M = 1.99, SD = .99), t(250) = 5.70, p < .001. The proposed poster will include full results and statistics from all item responses. These findings have the potential to better inform strategies targeting foreigners regarding their knowledge and awareness of the realities of ISS in Thailand. They also serve to increase awareness of male and transgender ISS in Thailand, a population often absent in literature.
THE ROLE OF DISPLAY RULE SALIENCY AND PERSON-ORGANIZATION VALUE FIT ON EMOTIONAL LABOR PROCESS: A MULTILEVEL INVESTIGATION

Mehmet Peker
Birce Uca
Gülgün Meşe
Ege University (Izmir, Turkey)

The studies investigating the relationship between emotional labor and related outcomes mostly endorsed cross-sectional designs. Recent studies however revealed that emotional labor process and performance have episodes, fluctuating on daily, even momentary basis. Moreover even though individual characteristics are important in explaining differences in emotional labor and its influence on personal and organizational outcomes, recent research also suggests importance of organizational practices on intra-individual level relationships (Beal & Trougakos, 2013). Contributing to this line of research, the present study aims to test the effects of saliency of organizational display rules and person-organization value congruence on the relationship between emotional labor and related outcomes, namely, affective delivery, need for recovery and work engagement. Drawing on job characteristics model and value fit perspective, it is hypothesized that for employees who report low saliency of display rules and high value congruence with their organizations, the detrimental effect of emotional labor would be alleviated. This improvement in turn is expected to result in higher affective delivery performance and work engagement and lower need for recovery. The data is aimed to be collected from 80 employees who work in jobs that require regular interaction with customers. It will be collected for five workdays and two measurements (one at the end of workday, the other at the evening) will be taken each day. The data will be analyzed with hierarchical linear modeling which is appropriate for specifying the between and within person effects. The study is expected to contribute to the both theory and practice related to emotional labor and the results will be discussed with regard to its implications on them.

SOCIAL AND PEDAGOGICAL COMPETENCE OF EXPERTS OF THE SOCIAL SPHERE

Svetlana Seryakova
Moscow Pedagogical State University (Moscow, Russia)

We propose the conceptual model of social and pedagogical competence of specialists in the social sphere, its structure and interrelation of components within the national psychological concept of identity integration. The research results of personal traits that make a basis of competence for the specialist in the social sphere are shown.
THE COMPUTER-BASED BATTERY FOR NEUROPSYCHOLOGICAL ASSESSMENT IN 6-9 YEARS OLD CHILDREN

Aleksey Korneev
Ekaterina Mateveeva
Tatiana Akhutina
Aleksei Gusev
Alexander Kremlev
Lomonosov Moscow State University (Moscow, Russia)

The assessment of cognitive functioning in 6- to 9-year-old children is one of the developing directions in psychological science. Investigating cognitive functioning at this age is important for a theoretical understanding of cognitive development, and it is also important for the purpose of developing reliable methods for assessing the individual characteristics of children to identify developmental disabilities. Various methods of assessment of cognitive functioning in children are used: observation, experiments, testing and methods of behavioral assessment. In the present study we describe a computerized method of neuropsychological assessment, developed by us in the tradition of Russian neuropsychology. We developed the computer-based battery for assessment of cognitive functions in 6-9 year children. It consists of six tests for assessing executive functions, functions of activation regulation, functions of visual-spatial information and auditory information processing. Namely, the Dots task, two-colored Schulte-Gorbov tables (SGt), one-back task, Corsi block span test, Understanding of Similar Sounding Words (USSW) test, and Understanding of Reversible Grammatical Constructions (URCG) test are included in the battery. The battery is developed in the software platform "MSU-Practice" which allows researchers to conduct the tests, collect data and analyze them. We conduct a pilot study of the battery. A total of 50 preschoolers, 56 first-graders, 123 second-graders and 68 third-graders took part in the study. All children took the computer tests and went through a neuropsychological assessment adapted for children between the ages of 5 and 9. The correlation analysis showed the following: — The productivity of performance of Dots task, SGt, one-back task is correlated with indexes of executive functions and functions of activation regulation; — The results of Corsi-block test are correlated with index of visuospatial information processing — The results of USSW test are correlated with index of auditory information processing. — The productivity of performance of URCG is correlated both with index of executive functions and the index of visuospatial information processing. The results of the pilot study allow to conclude that the new computer methodology is sufficiently sensible and valid to assess different components of higher mental functions in children. The work is supported by the Russian Foundation for Basic Research, project no. 19-013-00668.
EARLY MALADAPTIVE SCHEMAS AND SOCIAL ANXIETY (IN UNIVERSITY STUDENTS): THE MEDIATING ROLE OF MINDFULNESS AND SELF-COMPASSION

Burcu Ebru Aydoğdu
Adviye Esin Yılmaz-Samancı
Dokuz Eylül University (Izmir, Turkey)

Within the framework of the schema model, disconnection/rejection schema domain (DRSD) has been determined as positively related to social anxiety (SA). It was also reported that people with high SA have lower levels of mindfulness, indicating a difficulty in accepting inner experiences without judging. As a related concept, self-compassion includes being kind and understanding towards oneself, but individuals with SA are known as mainly critical of themselves. This study aims to investigate the mediating roles of mindfulness and self-compassion in the relationship between DRSD and SA. Participants consisted of 274 university students who were recruited by online survey. The instruments were Liebowitz Social Anxiety Scale, Young Schema Questionnaire-Short Form, Five-Facets Mindfulness Questionnaire, and Self-Compassion Scale. The hypothesized mediation model was tested using PROCESS Macro for SPSS. The parallel multiple mediation analysis demonstrated that the total effect of DRSD on SA was significant (B = .26, SE = .03, t [272] = 8.73, p < .001). The DRSD, mindfulness, and self-compassion together accounted for 22% of the variance in SA (R² = .22, F [1, 272] = 76.30, p < .001). After controlling for the mediator variables, the direct effect of DRSD on the level of SA was also significant (B = .15, SE = .04, t [272] = 3.73, p < .005). Bootstrap analysis showed that the total indirect effect of DRSD on SA through the self-compassion and mindfulness was significant (B = .11, SE = .03, 95% CI = .06 to .17). Examination of the specific indirect effects of mediating variables demonstrated that DRSD was predictive of SA only through self-compassion (B = .10, SE = .03, 95% CI = .04 to .16), but not indirectly through mindfulness (B = .01, SE = .02, 95% CI = -.03 to .06). DRSD was associated with the increase in SA through the total indirect effects of self-compassion and mindfulness in university students. Regarding the direct effect, DRSD was related to higher levels of SA after controlling for mediator variables. Confirming our expectations, DRSD was predictive of increased levels of SA indirectly through the individual effect of self-compassion.
Metacognition is a crucial component in self-regulating learning, and a positive contributor in academic success. On the other hand, metacognition seems to be influenced by personal factors which are associated with goal achievement, such as hope and self-efficacy. The aim of this study was the investigation of (a) students’ self-reported metacognition with respect to both metacognitive knowledge: declarative, procedural and conditional, and metacognitive regulation: planning, monitoring, information management and evaluation, when they are doing school work or homework, (b) the role of hope (agency thinking and pathway thinking) in the formulation of general self-efficacy, and in the impact of general self-efficacy on metacognition (metacognitive knowledge and metacognitive regulation), and (c) the direct and interact effects of metacognition, hope and self-efficacy on school performance in language and mathematics. The sample consists of 185 fifth and sixth grade students, both genders, who randomly came from 15 state schools from various regions of Greece. Data were collected at the second school term of the total three terms, via the completion of self-report scales, except for school performance which was estimated by the students’ teachers. The main results from multivariate and univariate statistical analyses between and within groups showed that (a) the students reported use of metacognitive knowledge (mainly, declarative) and metacognitive regulation (in the most monitoring, and least evaluation) at a moderate extent when they do school related work, (b) agency thing and, predominately, pathway thinking were positive formulators of self-efficacy, (c) self-efficacy and hope had complimentary moderate impact on metacognition but their effect different between the components of metacognition, (d) the three sets of concepts, as a group, influenced school performance positively, with agency thinking being the most powerful of it. The findings are discussed in terms of practical implications in education, and future research.
The key question around which we have been questioning for a long time is "What is the psychological rehabilitation in oncology? The term traditionally refers to the scope of disability, disability, and deficit. How to declare it in oncology? Taking care of the patient as a person rather than a disease is the foundation of the new approach in oncology: you are interested not only and no longer how long your patient will live after a diagnosis of cancer but how he will live and live with it. The purpose of this study is to define a psychological rehabilitation model based on clinical indicators and reports of patients in order to observe their impact on their quality of life and the way they can enjoy comprehensive and integrated assistance, inspired by a systemic and humanistic approach, Improving the relationship between all involved actors (patients, care-givers, healthcare workers). The study was conducted on a sample of 321 related patients of Medical Oncology of the A.O.U.P.V.E. of Catania from 2016 to today. Qualitative and quantitative methodologies were used. The study is still ongoing. Preliminary results indicate that cancer patient express the need more information about prognosis. The quality of global life is medium-high with significant difference over the stadium of disease: it appears lower in metastatic patient. This preliminary analysis underscores the importance of integrated psychological rehabilitation model: they consider patient as a person and not as "organ". Pay attention also to the resources of the person, to the Its resilience and its empowerment.
EMOTION RECOGNITION IN DRUG ABUSERS PATIENTS: IMPACT OF THE MAIN DRUG USE

Lozano Óscar Martín
Sergio Navas León
Manuel Sanchez García
Sara Dominguez Salas
University of Huelva (Huelva, Spain)
Manuel Benítez Zamorano
Comunidad Terapéutica of Cartaya Clinical Huelva, Spain)

Social interaction is based on recognition of emotions in other people. According to studies that compare drug abusers with healthy persons, this ability is impaired in drug use patients. However, there are still few evidences analyzing the impact of the different substances. In this sense, the aim of this study is to compare the execution in the Ekman facial recognition task of cocaine, alcohol and heroin use disorder (SUD) patients. Cross-sectional survey design. The sample consisted of 103 patients under treatment at the Addiction Care Center of Huelva (Spain) (32 alcohol SUD, 30 heroin SUD and 41 cocaine SUD). Ekman Facial Expressions Test was used to analyze the recognition of emotions. Chi-square and ANOVA’s were used to compare the sociodemographic and emotional recognition. Regression analysis was performed to know if patterns of drug use are related with emotions recognition. There were not statistically differences between the three groups on sociodemographic variables (gender, age, employment, level of studies and marital status). Worse execution in Ekman Facial task was observed in alcohol patients for sadness (F2,98 = 3.54; p=.033) and the total emotion recognitions (F2,98 = 6.44; p=.002). Regression analysis show that in alcohol patients, numbers of drink per day was related with the total number of emotions recognized ( = -0.18; t=-2.74; p=.013). Similary, in heroin patients, quantity of heroin per day was related with worse recognizing of emotions ( = -1.58; t = -3.23; p=.007). The results show that drug abuse profile has different impact on the recognition of emotions. Specifically, the alcohol group is the one with higher level of impairment on this cognitive ability. It has also been observed that the dysfunction is greater according to the amount of drug taken at day.
NEUROPSYCHOLOGY OF MNEMONIC ABILITIES

Svetlana Murafa
Moscow State Pedagogical University (Moscow, Russia)

The theoretical basis of our research is the theory of abilities from the position of the system approach of V. D. Shadrikov. The experiment involved students of grades 1-4 with developmental delays in the number of 130 people and 200 primary school students with the usual rate of mental development. Comparative analysis showed that the structure of the mnemonic abilities of younger students with developmental delays and the control group has a different qualitative expression and productivity. Functional mechanisms prevail in the structure of mnemonic abilities of younger schoolchildren with developmental delays. Operational and regulatory mechanisms of MNEMIC abilities of primary school children with CRA are in the early stages of their formation. Memorization of younger students with CRA at the age of 7-10 years is performed with the support of the functional mechanisms of mnemonic abilities. The analysis of the characteristics of memorization of simple non-verbal meaningless material revealed difficulty in drawing the already memorized material: previously memorized and correctly reproduced. The revealed effect of the inability to correctly copy meaningless nonverbal material after its correct memorizing and reproducing (Murafa, Cheremushkina). The essence of the effect is that after the correct reproduction and memorization of the visual material, the subjects were not able to draw previously memorized and reproduced material. Which was immediately presented to them for redrawing, excluding time. Among subjects with mental retardation effect is evident: 44% of 7-8 year olds, 45% — 9 year olds, 50% of 10-12 year old subjects. The effect manifested in the experiment is due not only to defects in mnemonic abilities, memory, but also underdeveloped perception and attention. The effect is also a proof of age-related underdevelopment of certain brain structures that are characteristic of children with developmental delays. The effect of inability to correctly draw nonverbal meaningless material after its correct memorization and reproduction is a characteristic indicator of the functioning of cognitive abilities of children of primary school years with developmental delays. The fact of its existence is a strong argument about the existence of neuropsychological specificity of mental development processes in ontogenesis.
ATTITUDES TO OTHERNESS: CZECH ONLINE SURVEY

Nikola Minarcikova
Martina Barcaj
National Institute of Mental Health, Czech Republic; Charles University, Faculty of Education

Veronika Jurickova
National Institute of Mental Health, Czech Republic; Charles University, 1st Faculty of Medicine

Marek Preiss
National Institute of Mental Health, Czech Republic; University of New York in Prague

The feeling of otherness arises because of the subjectively perceived difference of the other from oneself (Sokol, 2016). The feeling of otherness is closely connected to Self because it helps to define one’s identity (Staszak, 2009). The feeling of otherness can be also seen as a warning sign that someone other can be dangerous (Sokol, 2016) or that one’s unique identity may be threatened (Varvin, 2016). In other words, the more insecure is one’s identity, the more of a threat is someone who is perceived as a representative of otherness.

Set of 4 personality and identity measures (translated to Czech) were used – BFI-10 (Rammstedt & John, 2007), Ego Identity Scale (Tan et al., 1977); Level of Personality Functioning Scale Brief Form (Bach & Hutsebaut, 2018), Propensity to Moral Disengagement Scale (Moore et al., 2012). The attitude to otherness was measured by the Bogardus Scale of Social Distance (Bogardus, 1947) using Romani, foreigner, homeless person, migrant, person with mental disorder, person with physical disability as representative of otherness.

Participants for this internet-based study were recruited through the posts on social media. The sample consisted of total N=260 participants (95 men, age from 19 to 55 years, M=27.5, SD=6.7).

No interrelation of attitudes toward otherness and ego identity was found. From Big Five personality traits Openness to Experience and Conscientiousness were found to be related to social distance. Tendency to engage in moral disengagement is intercorrelated to intolerant attitudes.

It is not surprising that perception of otherness is influenced by various internal as well as external characteristics. The results showing the association between attitudes to otherness and identity are not yet clear.
Human-made disasters such as terrorism, especially when it is applied on repeated intervals, i.e. ongoing terrorism, lead to significant psychological disruptions in the communities (Fullerton, Ursano, Norwood, & Holloway, 2003; Galea & Resnick, 2005). Although direct victimization to terrorism is consistently investigated in the literature, studies regarding indirect victimization are limited. The purpose of the current study was to explore short-term psychological impacts of indirect victimization to ongoing terrorist attacks on college students, who are denoted as a risk group due to their young age (Bonanno, Galea, Bucciarelli, & Vlahov, 2007; Brewin, Andrews, & Valentine, 2000; Norris et al., 2002). For this purpose, qualitative research methodology was adopted. 10 undergraduate students who were living in Ankara, Turkey were recruited. They were vicariously exposed to ongoing terrorist attacks through various media resources. Semi-structured interviews were conducted and these data were analyzed using interpretative phenomenological analysis. Qualitative analysis revealed three superordinate themes, which are the recollections of terrorist attacks, heightened feelings and triggers, and ways of coping. The first of these themes represented the characteristics of terrorist attacks that affected participants more adversely than any other negative life event. This theme had following subthemes: identifying with the victims and brutality of terrorism. The second superordinate theme revealed that participants experienced sadness, anger, fear, guilt, despair, disappointment and hopelessness. Each of these feelings was found to have several triggers (e.g. sadness for the deceased, anger for the state, fear from the police, and guilt from moving on with life). The final superordinate theme was representing participants’ coping efforts to deal with their feelings. This theme had the following subordinate themes: seeking safety, attempts of re-adaptation, togetherness, avoidance, holding onto a positive future, acceptance. These results reflected extensive psychological impacts of ongoing terrorism that spread out to indirect population. Considering these widespread effects, there is a clear need for well-organized disaster preparedness system tailored specifically for terrorist attacks. The coping efforts of indirect victims in this study are in line with the five intervention principles as denoted by Hobfoll et al. (2007), which will be discussed in detail.
INTELLIGENCE, CREATIVITY AND COPING

Natalia Volkova
Institute of Psychology of Russian Academy of Researcher (Moscow, Russia)

The relation of conceptual structures, intelligence, creativity and coping has not yet been the subject of a psychological research. Our study aimed to reveal interrelations between the features of the organization of the concept with intelligence, creativity and coping. A complex design was used in our research including assessment of (a) IQ (RPM); (b) creativity (TTCT); (c) coping strategies; (c) the semantic differential technique (SD) (stimulus word "potential"). Participants of the experiment were 408 students aged 18-24 years (mean 19.32±1.48) among them 79.2% of girls. We processed the data by mathematical and statistical approach: primary data that were collected from eligible respondents, were subjected to be analyzed using linear regression. The findings revealed that the concept "potential" has considerable number of reliable interrelations both with indicators of the general abilities (IQ, creativity) and with coping strategies. It was shown that the maximum saturation of the concept with sensory-emotional features can lead to a decrease in the productivity of intellectual activity. It should be noted that the role of the considered indicators of concepts in efficiency of intellectual activity is slightly lower, than in creative activity. It was found that between the variable measures of differentiated participation of sensory-emotional features of the concept and indicators of coping strategies there is quite close, but at the same time, multidirectional relationship. Thus, we may conclude that conceptual structures may act as the intermediary in relation to intelligence, creativity and coping strategies. The finding of our research may be useful for solving the problem of human mental resources increasing through the development of conceptual thinking.
PERSONALITY TRAITS AND GENDER: EFFECTS ON SELF-EFFICACY AT WORK

Paulina Robalino
Universidad Argentina de la Empresa (Caba, Argentina)

Mariel Musso
CONICET (Caba, Argentina)

Whereas personality traits represent stable individual characteristics that mostly derive from individual genetic endowment, self-efficacy can enhance learning and performance (Caprara et al. 2010). Self-efficacy is a crucial cognitive and motivational belief impacting on several aspects of behaviour at workplace. Self-efficacy has been related to the effort and perseverance, coping strategies to deal with labour demands, work engagement, and job performance. The aim of the present study was to analyse the effects and interaction effects of personality traits and gender on self-efficacy at work. The participants were 314 employees from three different sectors (blue, white and pink collar), both gender (52.5% female), ages between 18 and 75 years old (M= 34.66; SD= 10.93). Factorial design 2 (low- high personality trail) x 2 (gender) was applied. We use a socio-demographic questionnaire; NEO-FFI Personality Inventory (Costa & McCrae, 1992) to measure Openness to Experience (α =.73), Agreeableness (α =.71), Emotional Stability (α =.82), Extroversion (α =.83) and Conscientiousness (α =.79); Self-efficacy at work scale (Loeb, et al, 2016, Spanish version Robalino & Musso, 2018) that measures self-efficacy for inter/intrapersonal processes, and occupational self-efficacy oriented to cognitive tasks in the workplace (α =.88). Results: Personality traits has a significant effect on self-efficacy. Specifically, Neuroticism on task self-efficacy (F(1,312)=50.168; p<.001; η²=.139), Conscientiousness on task self-efficacy (F(1,312)=47.856; p<.001; η²=.133), Extraversion on social self-efficacy (F(1,312)=45.440; p<.001; η²=.127), Agreeableness on social self-efficacy (F(1,312)=33.321; p<.001; η²=.096). In addition, Openness to Experience has an effect on self-efficacy in recognizing the emotions of others (F(1,312)=6.943; p<.01; η²=.022). Moreover, there are significant gender differences in self-efficacy at work. Men have greater task self-efficacy (t(312)=-2.730; p<.01) and social self-efficacy (t(312)=-2.793; p<.0). There are no gender differences in self-orient emotional self-efficacy, emotional self-efficacy to understand-other, emotional self-efficacy to help others. Finally, MANOVA’s results suggest that there are no interactions effects between gender and personality traits on self-efficacy at work. Results are consistent with previous studies. Limitations and new hypotheses will be discussed.
THE RELATIONSHIPS BETWEEN THE PROCRASTINATION, SELF-REGULATION, AND USE OF SOCIAL NETWORKING SITES

Natalya Rudnova  
Perm State University (Perm, Russia)

Dmitriy Komienko  
Perm State University Head of the General and Clinical Psychology Department (Perm, Russia)

Procrastination is conceptualized as postponing some actions crucial to the timely completion of assignments (Lay, Schouwenbur, 1986) or to "voluntarily delay an intended course of action despite expecting to be worse off for the delay" (Steel, 2007, p. 66) become a widespread phenomenon that has been established as a stable trait. It is defined as a self-regulatory failure, representative of low conscientiousness, high impulsivity, and thought control problems. Despite this rise in recognition and importance, the exact nature of procrastination is still being debated. Social networking sites (SNSs) have rapidly expanded since their inception in the early 2000s. Now social networking sites (Facebook, VKontakte, etc.) are the part of modern life, but they are also the cause of achievement (primarily academic) decline. Self-regulation and procrastination are the features that can be defined as personality factors in online social network use. There is some proof of the negative role of procrastination as well as low self-regulation in academic success. However, relations between procrastination and self-regulation are still unclear. This study examines associations between procrastination, self-regulation, intensity, and intrusion of social networking sites (SNS) usage. The sample consists of 321 users of Russian SNS VKontakte, from 17 to 60 ages. SNS usage assessed by SNS Intensity scale and SNS Intrusion scale. The characteristics of procrastination and self-regulation (emotion regulation and activity regulation) were evaluated. Procrastination positively associated with SNS Intensity and SNS Intrusion and negatively with cognitive reappraisal and general self-regulation, and has no associations with the expressive suppression. Sex and procrastination revealed as significant predictors of SNS intensity and intrusion. Women are more tending to use SNS and reveal negative aspects (relation, emotional, work problems) of intensity and intrusion of online social network usage. Surprisingly, but the age of participants does not affect SNS features as expected.
DIFFERENCES IN THE PROFILES OF MOTIVATION BETWEEN HIGH-ABILITY SCHOOL STUDENTS AND THEIR AVERAGE-ABILITY AGE PEERS

Svetlana Petrova  
Psychological Institute of the Russian Academy of Education (Moscow, Russia)

The study aimed to reveal the peculiarities of motivational content and future time perspective in high ability students compared to their peers with ordinary intelligence for the age. 240 students of V, VII, and X grades (from 11 to 16 years) of secondary schools put together two groups. The first group included 120 students (equally of each grade and gender) with the IQ higher 125. The second group included 120 students (equally of each grade and gender) with the IQ from 85 till 115. The following methods were used: the tests of cognitive abilities, the questionnaires on personality characteristics (motivation, school anxiety, self-assessments of abilities, etc.), and school achievements. We also used Russian version of the Method of Motivational Induction by J. Nuttin. The results were processed using the independent t-test and the one-way analyses of variance (ANOVAs). The results obtained revealed the significant age and gender differences in students’ motivation both in terms of the motive contents and the time localization of motivational objects in the whole sample and in the each group separately. Results indicated significant increase of the social motives and decrease of the will to possess something from V to VII and X grades. The study also showed the differences in the motive contents and the time perspective between the high ability and their ordinary age peers, as well as between the high ability boys and girls. The motives of social contacts were expressed much more strongly in the high ability children in all grades. In grades VII and X in addition to already specified dominance of social motives, in the high ability students the localization of motivational objects in the educational period dominated. The data obtained expand the conceptions about motivational development of the adolescents, as well as the ideas about motivational and personal characteristics of the high ability schoolchildren. These results could find the application for education and support of intellectually gifted students, and their psychological counseling.
Perfectionism is an important, multidimensional personality construct given its ties to psychological disorders, association with academic achievement, and adaptive and maladaptive components, as indicated through the development of the Almost Perfect Scale-Revised (APS-R; Slaney et al., 1996). Research suggests there may be links between individual perfectionism and family environment based on the hypothesis that maladaptive perfectionism develops in authoritarian and controlling family environments (Flett et al., 2002). The APS-R was modified into a family form named the Family Almost Perfect Scale (FAPS; Wang, 2010) to measure perceived level of perfectionism from one’s family. Several studies have examined FAPS among diverse cultural groups to validate its psychometric properties and understand the cross-cultural impact of perfectionism (Ortega et al., 2014). Russia may be at a unique risk for maladaptive perfectionists given the authoritarian and collectivistic culture, controlling child-rearing practices, and social value of perfectionism (Rusanova, 2017). The current study examined the factor structure of the Russian FAPS among 169 college students (50 men, 119 women) at a national university in Russia; researchers examined how different types of perfectionistic families compare on outcome variables like psychological distress, personal perfectionism, and GPA. The adjusted Russian FAPS included 15 items, and yielded the following model fit statistics: $\chi^2(87, N = 169) = 182.52$, $p < .001$, $CFI = .901$, $SRMR = .064$, $RMSEA = .081$, which indicated adequate fit. The correlations between corresponding APS-R and FAPS subscale scores provided evidence for convergent validity. Participants were then classified into different types using cluster analyses based on their FAPS scores. Three groups emerged—adaptive perfectionistic families ($n = 75$), maladaptive perfectionistic families ($n = 41$), and nonperfectionistic families ($n = 53$). Participants in the maladaptive perfectionistic family group reported significantly higher levels of depressive mood, anxiety symptoms, and imposter syndrome than the adaptive perfectionistic family group. Results from this study suggest that Russian FAPS has adequate psychometric properties, and can be used to assess and classify participants regarding their perceived family perfectionism. The distinctively adaptive and maladaptive natures of family perfectionism were evident in this Russian sample, though limitations were discussed.
EXPRESSIVE WRITING INTERVENTION FOR TURKISH BREAST CANCER PATIENTS: A STUDY PROTOCOL

Umut Çivgin
Boylam Psychiatric Hospital Clinical Psychologist (Ankara, Turkey)

Gülay Dirik Turkey Izmir
9 Eylül University PhD, Professor of 9 Eylül University (Izmir, Turkey)

The number of breast cancer patients is increasing (TUIK, 2015). Therefore, there is an increase in the number of studies investigating the physiological and psychological effects of breast cancer. Psycho-oncology research indicated that depression and anxiety are the most common disorders in breast cancer patients (Cvetkovic ve Cvetkovic, 2017). Expressive Writing Intervention (EWI), which frequently affected these variables, also plays an important role in psycho-oncology literature (Pennebaker ve Susman, 1988; Sohl, Dietrich, Wallston ve Ridner, 2017). In the light of literature, the aim of this research is to test EWI for Turkish breast cancer patients in terms of the variables (depression, anxiety, and psychological flexibility) after the intervention. Ninety breast cancer patients who have completed their treatment processes will be considered as participants. Pre-test, post-test and follow-up (one month after post test) will be taken with the questionnaire set. Measures of depression, anxiety, quality of life, perceived social support and flexibility will be administered. Also, a booklet will be prepared for the implementation of the EWI. The measurements taken before—after the intervention and the follow-up measurement will be compared using ANOVA, t-test and regression. It is seen that physiological and psychological results affect the quality of life after cancer treatment. Researches showed that although depression, anxiety and psychological rigidity have a negative effect on cancer patients, some interventions, such as EWI, have changed this situation in a positive way. With this study, it is expected that expressing emotions in Turkish culture will have positive outcomes in breast cancer patients. After intervention expected results will be that participants’ depression and anxiety symptoms will decrease and their quality of life and psychological flexibility will increase. This study is considered to be the first in terms of joining breast cancer and EWI in Turkish literature and it is thought that it will contribute significantly to the international literature with the results of EWI.
PANIC ATTACKS: WHEN THE SELF-AUTONOMY ORGANIZE ATTACKS IN ORDER TO GET HEARD. A DIFFERENT PERCEPTION OF THE SYMPTOM

Drivakou Despina

AUTH, Medical School (Thessaloniki, Greece)

Panic attacks usually visiting people with dedication to others needs nor them, when the same time they are focusing on the excellence and their performance. They love to get complimented from others when they pleased them a lot when the same time have neglected their personal or emotional needs. The self-needs (autonomy part) cant is a priority. The external environment where the person lives and acts (dedication part) is always the priority. This presentation will not argue about the control of the symptom but for the disharmony between the autonomy and the dedication, the performance and self-needs. The people that suffer from panic attacks, do not estimate the importance of self-needs and the importance of the armory through the dedication to the external environment and the priority to the internal environment. People with panic attack symptom are seeking for help and they usually trapped themselves to hard prescriptions, Psychiatry and medical diagnosis for long life, without an option to escape from that pattern. When a person is aware for this view of panic attacks, feel more in depended and ready to face the impact of the next episode, much more different than ever before. In simple words, they receive a treatment that makes them aware of the reason that the episodes coming back and what they have to do next as a vention before the intervention, offer help to themselves. According to the systemic perception the “environment” in which a system exists is a whole system, a meta-system. As a whole, it faces inward, the system is concerned with maintaining its internal steady state. As a sub-whole, the system faces outward, responding to its environment (a meta-system) in a potentially infinite regression of relevant contexts. When dedication against autonomy is the argument, then the challenge is how Ego can manage this conflict.
THE EFFECT OF POSITIVE AND NEGATIVE CONTACT ON THE EVALUATION OF STEREOTYPE CONTENT

Isabel Cuadrado Guirado
Andreea Alexandra Constantin
Lucía López-Rodríguez
Belén Tristán López
University of Almería (Almería, Spain)

The effect of intergroup contact on improving attitudes toward outgroups has been widely and systematically proven. In contrast, scholars had only recently began to focus on the effects of negative contact. The objective of this study is to experimentally test, in a sample of adolescents, the effect of negative and positive contact on the perceived morality, sociability and competence (stereotype content dimensions) of two immigrant groups in Spain: Moroccans (M) and Ecuadorians (E). Considering literature on the boundary conditions of contact’s effects, we also examine the role of perceived typicality in this relation. Adolescents (N = 133; Mage = 15.14, SD = 1.09) were randomly assigned to one of the six experimental conditions of a 3 (Imagined contact valence: positive vs. negative. vs. control) X 2 (Group: Ecuadorian vs. Moroccan) between-subject design. Participants imagined a positive or negative contact situation with a Moroccan or Ecuadorian, or a walk in the outdoors (control condition). Next, they rated the ethnic group of the imagined interaction partner (E or M) on the dependent variables, and also the perceived typicality of this character. In the positive contact condition, adolescents perceived the evaluated group more sociable than in the negative contact condition. Moderated moderation analysis (Model 3, PROCESS v3.0 Macro for SPSS; Hayes, 2017) revealed that the relation between contact valence and morality and sociability was moderated by the perceived typicality of the interaction partner only for the M group. When the interaction partner is perceived as typical, negative contact relates with low levels of perceived morality and sociability, whereas positive contact relates with high levels of perceived morality and sociability of the M group. When the interaction partner is perceived as atypical, negative contact relates with high level of perceived morality and sociability of the M group, whereas a positive contact relates with low levels of perceived morality and sociability of this outgroup. Our findings confirm and extend previous research as they consider and experimentally test the effect of both negative and positive contact on stereotype content, as well as on the boundary conditions in which intergroup contact may improve intergroup relations during adolescence.
THE ATTRIBUTION AND REASONING OF A SUPERVISOR’S PATERNALISTIC LEADERSHIP — A SUBORDINATE PERSPECTIVE

Ming-Yen Lee
Chun-Rei Hu
Department of Business Administration, Chung Yuan Christian University (Taoyuan, Taiwan)

Chou Wan-Ju
Chung Yuan Christian University (Taoyuan, Taiwan)

Though there is much research concerning paternalistic leadership, most of them take the leaders’ perspective rather than the subordinates’ in examining the effect of leadership behaviors on subordinates. Yet, subordinates’ interpretations and affirmation towards their leaders are of paramount importance as they may significantly influence the interaction between two parties as well as the leaders’ behaviors. Thus, acknowledging this literature gap, this study attempts to undertake the perspective of subordinates to understand how they interpret and attribute the Paternalistic Leadership behaviors of their superiors. This study conducts in-depth interviews to collect data with 16 valid dyad (both supervisor and subordinate) interviews of 45 key descriptions of leader behaviors. The findings shows that there are positive and negative interpretations of superiors’ behaviors from the view of subordinates. Particularly, it illustrates that positive interpretations are resulted from the perception of a parental spirit, encouragement of taking initiating roles, and family atmosphere in the organizations. In contrast, negative interpretations mainly stem from subordinates’ perception that superiors’ behavior is purely a way to vent their emotions or achieve personal benefits.
Transformation of the characteristics of the social development is associated with the changes of the external and internal components of the relations. There is a general increase in uncertainty, instability of conditions of social involvement, as well as intensive change in the main parameters of the social situation of development during childhood. The description of the "social situation of development" — a specific relationship between the child and the social environment for each age, mediating the processes of social involvement (L.S. Vygotsky). Nowadays it is necessary to clarify the parameters of the social situation of development of a child of preschool age in a changing society. The sample of the empirical study was consisted of children of institutions of preschool education of secondary and senior preschool age (100) and their parents (28). Based on the results of the study the prevalence of non-constructive types of parent-child cooperation in the families of the respondents was found out. Also the priority of traditional family values in the children has been revealed, parents act as significant adults, but the educational potential of parenthood is not realized; a child often feels lonely in the family, has lack of communication with parents and common activities. The institution of preschool education seems to be rather attractive to children. It gives the ability to communicate with peers, implements gaming and productive activities, the teacher acts as an object of idealization and performs the function of support. In general the analysis of the situation of the child in the group of the educational institution has shown that there is a favorable atmosphere in this relationship subsystem. Constructive and non-constructive types of motivation for interaction with peers were roughly on the same level (individualism — 24%, competition — 22%, aggression — 4%; cooperation and equality — 20% per each, altruism — 10%). It is important to optimize the main parameters of the interaction of preschool children in the conditions of the institution of preschool education and the family (in the context of the identified trends) in order to support the positive social adjustment of the children of preschool age.
UNDERSTANDING SAFETY BEHAVIOUR: ROLE OF SAFETY CLIMATE, SUPERVISORY BEHAVIOUR, AND INDIVIDUAL MOTIVATION

Onur Cem Dogru  
University of Sheffield Postgraduate Researcher  
(Sheffield, United Kingdom)

Mehmet Peker  
Ege University (Izmir, Turkey)

Safety climate can be seen as a bridge between organizational rules/regulations and individual safety behaviour. But it is also important to examine how and through which mechanisms safety behaviour is manifested in employees. For this purpose, the present research aims to examine the relation between safety climate and safety behaviour, whether this relationship is mediated by motivations of workers to comply with the rules, and whether their relationship changes depending on supervisory behaviour. We collected data from 388 blue collar workers in a major factory. Analysis results show that safety climate is significantly related to safety behaviour of employees, and this relationship is partially mediated by motivations of workers to comply with the safety rules. Moreover, we have also tested the moderating role of supervisors’ behavioural integrity for safety and found that workers reflect their motivations into actual behaviours more when their supervisors have higher behavioural integrity for safety. Findings indicate that organizational safety climate is associated with safety behaviours of workers both directly and through its association with safety motivations of workers. Moreover, the extent to which supervisors do what they preach amplifies the association of safety climate with safety motivation. These results contribute to workplace safety research by underscoring the importance of supervisor behavioural integrity in explaining under what circumstances the influence of safety climate on safety motivation is facilitated.
Metaphoric expression links two unrelated concepts which share some common characteristics. Conventional metaphors are familiar and readily interpretable, and frequently used in language, (e.g., Time is running out). Whereas novel metaphors are unfamiliar and more difficult to interpret (e.g., You may trod me in the very dirt, but still, like dust, I’ll rise). Most studies on reception of metaphors have shown that conventional metaphors are processed faster than novel ones. Comparing to literal expressions, metaphors are processed faster (Giora, 2003). The present study investigates processing of novel and conventional metaphors using eye tracking technique. We examined eye movements while reading of novel and conventional metaphors. The first group of participants read Wisława Szymborska’s poem with novel metaphors (e.g., On the right a cave where Meaning lies). The second group, read a modified version of the same poem with conventional metaphors (e.g., On the right is a dead end). Eye movements of all participants (N = 45) were recorded while they were reading the poem. Areas of interest were drawn around novel and conventional metaphors, and we compared percentage of fixation time spent on reading the two types of metaphors. We analyzed 9 pairs of metaphors: novel vs. conventional. We found significant differences between novel and conventional metaphors in percentage of fixation time: Surprisingly, participants spent more time reading conventional vs. novel metaphors. The results are not consistent with previous studies showing that conventional metaphors are read with less effort than novel metaphors (e.g., Giora, 2003; Lai, Curran & Menn, 2009). However, none of the studies examined metaphors in the context of poetry.
RELATIONSHIPS BETWEEN EARLY MALADAPTIVE SCHEMAS, PSYCHOLOGICAL FLEXIBILITY, AND ALCOHOL USE

Elçin Yorulmaz
9 Eylül University (İzmir, Turkey)

Hakan Coşkunol
Ege University (İzmir, Turkey)

In the studies on alcohol use, it was stated that two billion people used alcohol in the World (World Health Organization, 2014). Alcohol use was associated with many physical and psychological disorders (e.g. Boden & Fergusson, 2011; Boffetta & Hashibe, 2006; Kushner, Abrams, & Borchardt, 2000). As alcohol use is widespread and related to many health-related outcomes, it is important to identify the causes and factors that may be related to alcohol use that initiate and maintain alcohol use. These are thought to be early maladaptive schemas and psychological flexibility. Therefore, the aims of this study were to investigate the relationships between early maladaptive schemas, psychological flexibility and the use of alcohol, and to examine the moderator role of psychological flexibility on the association between early maladaptive schemas and alcohol use, based on studies that have identified the buffering role of psychological flexibility on the association between early maladaptive schemas and psychopathology (Fischer, Smout, & Delfabbro, 2016). To examine these aims, 120 participants using alcohol completed Demographic Information Form, Young Schema Questionnaire, Acceptance and Action Questionnaire, Alcohol Use Disorder Identification Test. Pearson correlation and Hayes process macros (Hayes, 2013) were used in the analysis of the study. Early maladaptive schemas, psychological flexibility and alcohol use were found to be correlated with each other. However, psychological flexibility did not moderate the association between early maladaptive schemas and alcohol use. The association between early maladaptive schemas and psychological flexibility provides additional support for the use of schema therapy and acceptance and commitment therapy in alcohol use disorder. Although these two therapies have been dealt with in two different ways, there have recently been recommendations for integrating schema therapy and acceptance and commitment therapy (e.g. McKay, Lev & Skeen, 2012; Parfy, 2012). This study is expected to bring innovation to the literature, and this study is thought to be the basis for future studies.
THE CONCEPT OF SOCIO-PSYCHOLOGICAL HEALTH AMONG THE POPULATION OF THE REPUBLIC OF SAKHA (YAKUTIA)

Nadezhda Melnikova
M.K. Ammosov North-Eastern Federal University (Yakutsk, Russia)

Elena Belinskaya
Lomonosov Moscow State University (Moscow, Russia)

Purpose of the study was to clarify the content of the concept of "socio-psychological health" and create a model of monitoring socio-psychological health. An analysis was made of the current state of research into the problem of health and the study of the everyday views of the population of the Republic of Sakha on it (2016). The sample consisted of 278 people (61 men, 217 women). Document analysis, focus group, in-depth interview, content analysis, correlation analysis were used. On the basis of a theoretical analysis of the concepts, the main parameters of socio-psychological health was given. 1. Respondents’ assessment of their economic well-being. 2. Respondents estimate the socio-cultural situation in the region. 3. Evaluation by respondents of the nature of their social communications and interaction. 4. Assessment of indicators of psychological health and well-being. 5. Evaluation by respondents of their physical health. Analysis of the perceptions of the population about health allowed the following conclusions: 1. Participants clearly identify the criteria for mental, psychological, social and socio-psychological health. 2. In general, there is a high consistency of descriptions of the types of health among different groups of respondents. Mental health, according to research participants, is an integral part of general physical health; its main characteristic is adequacy. A psychologically healthy person is a healthy person; able to solve his problems on his own; able to regulate his state of the organism in stressful situation. A social health is the social activity of the population and, above all, employment of the able-bodied population, involvement in various social institutions, including participation in traditional joint activities. Socio-psychological health is a stable functioning of a person’s personality, a positive image of "self", a need for self-development, as well as the formation of productive forms and ways of human interaction with the external environment. The content of the concept of socio-psychological health, obtained from the results of the analysis of representations of the population, largely coincides with the criteria outlined in the result of a theoretical study and may be parameters of the model of socio-psychological health of the population of the Republic of Sakha (Yakutia).
CHARACTERISTIC FEATURES OF PSYCHOLOGICAL DEFENCES OF STUDENTS WITH DIFFERENT COGNITIVE ORIENTATIONS

Liudmila Jurievna Kruteleva
Zhanna Jurievna Kara
Southern Federal University (Rostov-on-Don, Russia)

Psychological defences have a contradictory nature. On the one hand, they help a person to adapt to the outside world taking into account his/her inner life and mental state (levels of stress and anxiety). On the other hand, at the same time they can reduce a person’s ability to adapt to the social environment and negatively affect his/her attitude to oneself. Psychological defence includes both unconscious and conscious mechanisms and is closely connected with the value system of a person and his/her coping strategies. The purpose of the research is to study characteristic features of psychological defences of students with different cognitive orientations. The theoretical grounds of the study are based on the theories of unconscious mind and psychological defences by S. Freud, A. Adler, E. Bibring, A. Freud, C.G. Jung, D. Lagache, etc.; on the theories of coping behavior by A. Bandura, E. Frydenberg, R.M. Granovskaya, S.E. Hobfoll, R.S. Lazarus, L. Murphy, I.M. Nikolskaya, etc.; and on the concepts of logo-analysis by V.E. Frankl and existential analysis by A. Längle. The empirical part of the study includes such methods as questioning (a specially developed questionnaire), testing (The structure and strength of psychological defences [L.Yu. Subbotina]; Values scale [S.H. Schwartz]; Locus of control [J.B. Rotter]; Coping Strategies Indicator [J. Amirkhan]; Existence scale [A. Längle, C. Orgler]) and statistical data processing. The sample consists of 85 students aged 18-26 years old who have been divided into three groups depending on their cognitive orientations (the area of specialization): the first group — “man–nature”, the second group — “man–man” and the third group — “man–sign”. The main results show that all the groups display quite a high level of psychological defences; values as ideals coincide in general, whereas values as individual priorities, coping strategies and existence have significant differences for all three groups. Discussing the findings it is possible to conclude that all the students have quite the same values as ideals, but depending on cognitive orientations they rely on different individual values which become apparent in different psychological defences and, as a result, in different coping strategies.
SPATIAL WORKING MEMORY AS ANCEDENT FLUID REASONING CAPACITY

Yulia Burdukova
Moscow State University of Psychology and Education (Moscow, Russia)

Olga Alekseeva

Irina Rzhanova
Psychological Institute of Russian Academy of Education (Moscow, Russia)

Significant relationships exist between general fluid intelligence and each of the following constructs: short-term visual recognition memory, working memory capacity (WMC), and processing speed. The aim of our study was to analyze relationships between fluid reasoning and other cognitive functions. The sample included 62 children (53% boys), mean age = 12.8 years, SD = 3.2. Methods: 1) Fluid reasoning scale (Gf) from the KABC-II, which consists of two subtests—Story Completion and Pattern Reasoning. 2) Tests from CANTABecIpe: Spatial working memory (SWM), Simple reaction time (SRT), Choice reaction time (CRT), Delayed matching to sample (DMS), Pattern recognition memory (PRM), Stockings of Cambridge (SOC). It was found out strong interrelations between Gf scale, Story Completion scores and SWM error scores, but not between Pattern Reasoning scores and SWM error scores. Correlation for Gf scale and SWM error scores: $r = -0.38$, $p = 0.01$; correlation for Story Completion scores and SWM error scores: $r = -0.34$, $p = 0.03$. The regression model for Fluid Reasoning Scale was significant ($F = 6.85$, $p = 0.01$) and explained almost 14.3% of the dispersion. But only spatial working memory scores significantly affected the dependent variable. Other predictors such as processing speed (SRT and CRT), short-term memory (DMS and PRM) and planning functions (SOC) have no relations with Fluid reasoning. Consequently, only spatial working memory contributes to fluid reasoning. This work was supported by grant RFBR No 18-013-01179.
ATTITUDES TOWARDS ANIMALS IN RUSSIAN ADOLESCENTS INVOLVED IN SCHOOL BULLYING

Irina Volkova
Herzen State Pedagogical University (Saint Petersburg, Russia)

Although empathy is generally recognized to impede aggressive behaviors, recent studies revealed that this connection may not be that evident for adolescents involved in bullying. One possible solution of this paradox is the complexity of the empathy which has both affective and cognitive component. Such complexity makes it difficult to study empathy by direct methods. Attitudes towards animals are suggested to be associated with empathy. The main hypothesis is that the attitudes towards animals differ for victims and bullies. However, Russian tools for studying attitudes towards animals or pets are scarce. The objectives of the study were to adapt 2 existing tools for Russian sample: Cruelty to Animals Inventory by Dadds et al. and Pets Attitudes Scale by Templer, Salter, and then measure differences for bullies and victims with modified version of Olweus Bully/Victims Questionnaire. Also, empathy was measured with Interpersonal reactivity index. On the first stage, tools were translated into Russian through double translation procedure. On the second stage, a pilot study was conducted. The study sample included 70 pupils of secondary schools of Saint Petersburg (age 11-13). Study methods included confirmatory factor analysis and reliability measures. The study showed that the scales have sufficient psychometric properties. Attitudes towards animals also differ by gender. On the third stage, the main study was conducted. The models associating attitudes to animals and bullying were built for bullies and victims. Preliminary analysis revealed that empathy components had mediating effect in both models. The results suggest that the empathy is a mechanism for both bullying and animal-related behavior. The study is supported by Russian Foundation for Fundamental Studies № 18-313-00131
THE PREDICTIVE ROLES OF EARLY MALADAPTIVE SCHEMAS, PARENTING STYLES, AND SCHEMA COPING PROCESSES IN WELL-BEING OF PRIMARY CAREGIVERS OF DEMENTIA PATIENTS

Elçin Yorulmaz
9 Eylül University (İzmir, Turkey)

Özlem Bozo
Middle East Technical University (Ankara, Turkey)

Giving care to a dementia patient is a challenging process and associated with many physical and psychological health outcomes (e.g. Coope et al., 1995; Vitaliano et al., 2002). It is thought that one of the variables that affect the psychological health outcomes may be early maladaptive schemas (Young, Kolosko, & Weishaar, 2003). In addition, studies showed that early maladaptive schemas have a mediator role in the relationship between parenting styles and psychopathology. The aims of this study were to test this relationship in caregivers of dementia patients and to examine the moderator role of schema coping processes on the association between early maladaptive schemas and caregiver well-being. 99 caregivers of dementia patients participated in this study. Participants completed the measures of Young Schema Questionnaire, Young Parenting Inventory, Young Compensation Inventory, Young Rygh Avoidance Inventory, and Caregiver Well-Being Scale. Hayes process macros was used in the analysis (Hayes, 2013). Early maladaptive schemas mediated the association between parenting style and caregiver well-being basic needs. However, the mediator role of early maladaptive schemas between parenting styles and caregiver well-being activity of living was not confirmed. Moreover, schema coping processes did not moderate the association between early maladaptive schemas and caregiver well-being. The effects of parenting styles on caregiver well-being basic needs was mediated by early maladaptive schemas. That is, the increment in negative parenting caused an increase in schema scores, which resulted in decrease in caregiver well-being basic needs. This study provided empirical confirmation for caregiver studies having early maladaptive schemas as a mediator between parenting styles and caregiver well-being basic needs. Therefore, including early experiences with parents and early maladaptive schemas to the treatment related to psychological problems of dementia caregivers might be important for better outcome. This notion may be a support for those applications in Schema Therapy. Overall, as for clinical implications, the findings of this study may help to understand the importance of early experiences on the caregiving processes.
CHESS-PLAYER' CREATIVE ACTIVITY, TRANSFORMED BY INFORMATION TECHNOLOGIES

Ekaterina Vasyukova
Lomonosov Moscow State University (Moscow, Russia)

The results of the study of chess players’ creative activity at the dawn of the invasion of computers and during their active use are presented (Vasyukova 1997; 1999; 2012), G. Kasparov’s interviews with grandmasters who contributed to the development of chess in the 70-80s, concerning the opening changes in connection with the advent of computers in the late 20th century are analyzed (Kasparov 2007). Features of chess play in situations human vs. human and human vs. computer were compared. It is shown that an essential component of the chess play is communication between partners, associated with the cognition of the opponent and the impact on him. In the play with computer the communication component is simplified, but does not disappear, that is manifested in the anthropomorphization of computer. In games with computer in attack style chess player positional factors prevail. The transformations of creative activity in the use of Computer Information Search Chess Systems are described — the emergence of new components of activity, increasing the importance of serious analysis along and time spent on it, a significant increase in the proportion of time to opening study. Independence in analysis and confidence in all stages of the game distinguishes the users of these systems as creative individuals. Chess-players have problems that are psychological — coordination of knowledge and thinking, intelligence and creativity, the effectiveness of memorizing. Three positions of grandmasters in relation to opening changes with the advent of computers in chess are revealed — revolution, evolution, creative work brake. The chess creativity features in the computerization era are: analysis accuracy, breadth of the opening repertoire of the leading players, leveling differences in the play styles, thinking not by concepts but by moves, the increasing role of one-time individually-directed novelties, caution, drying the play; less deep strategies and original ideas; more accentuated sport side. We concluded that human creativity would be enriched when chess-player use a computer as an assistant and build a dialogue with him. In conditions of computerization demands of autonomy and critical thinking of human increase.
PRELIMINARY RESULTS OF THE COGNITIVE CONTROL CHALLENGE TASK IN PATIENTS WITH MAJOR DEPRESSIVE DISORDER

Vida Ana Politakis
Anka Slana Ozimič
Andraž Matkovič
Grega Repovš
University of Ljubljana (Ljubljana, Slovenia)

Every day we are faced with challenges that require appropriate organization and coordination of our cognitive abilities to be able to respond in an effective, goal-directed manner. Some of the challenges are well known and responses well practiced and automatized, many, however, require purposeful, explicit control over the coordinated use of the available cognitive resources. Dynamic shifting in flexible cognitive control engages processes like attention focusing and sustaining, inhibiting distracting effects, monitoring and correction of behavior and goal-directed behavior. Cognitive control is domain-general and presents coordination and flexible switching between a wide range of operations in a constantly changing environment, enabling efficient and flexible processing of information and appropriate behavior. Cognitive control plays an important role also in most psychiatric and neurodegenerative disorders (among them major depressive disorder (MDD)) and the ability of successful cognitive control is one of the factors that influence the course of the disease. The purpose of our study was to develop a new, improved version of the Cognitive Control Challenge Task (CCCT) that could be used in clinical population. The task’s psychometric properties were investigated and results correlated with other behavioral cognitive measures. The task is currently still being applied to inpatients with MDD with the goal to include at least 50 participants. CCCT requires shifting between different cognitive processes and integration of available information. It consists of auditory and visual stimuli of different modalities and cognitive abilities (selective attention, working memory, deduction, behavioral inhibition, shifting, decision-making) that follow different rules in stable and flexible mode. Reaction times and accuracy of participants’ responses were measured. In addition, participants also performed a standard battery of cognitive tests. The results of the analysis are expected to show similar psychometric properties as the previous version of the task but easier for use in clinical population. Additionally, as cognitive functions in MDD are severely impacted we expect the results to significantly correlate with results from other cognitive control tasks proving that the CCCT task could thus be potentially usable for psychodiagnostic purposes in patients with MDD.
EXPERIENCES OF TRANSGNATIONALISM AND FORCED MIGRATION FOR FEMALE SYRIAN REFUGEES IN TURKEY: A GROUNDED-THEORY APPROACH

Lindi Herrin
The Chicago School of Professional Psychology
(Richmond Hill, Savannah, USA)

Immigration is a global issue that impacts receiving, transit, and countries of origin. The protracted conflict in Syria is in its 8th year, and the influx of refugees has been an enormous challenge for Syria’s neighbors, with strong implications for the stability of the entire region. This project explores how nontraditional countries of migrant settlement, specifically Turkey, manage the influx of refugees from Syria. Transnationalism and migration-systems theory will provide a framework for analysis. This study was conducted by gathering information directly from female Syrian refugees in Istanbul. Questions in a semistructured interview process covered topics such as forced migration from Syria to Istanbul, access to services in Turkey put forth in the 1951 Refugee Convention and the Turkish Law on Foreigners and International Protection, as well as any possible motivations to continue the migration process out of Turkey to a third country of settlement abroad. Grounded-theory design, authored by Charmaz, has guided the data analysis, specifically transnationalism and migration theories, which resulted in 17 focused codes and 4 themes. Obtaining information directly from female refugees allowed them a voice and potential participation in developing feasible solutions.

FORMATION OF STIMULUS EQUIVALENCE CLASSES THROUGH CLASSICAL CONDITIONING PROCEDURES: A SYSTEMATIC REVIEW

Víctor Estal-Muñoz
Gladis Lee Pereira
Elena Gálvez-Delgado
Natalia Andrés-López
María Xesús Froxán-Parga
Universidad Autónoma de Madrid (Madrid, Spain)

Transfer of functions through stimulus equivalence classes allows to explain why stimuli acquire new functions in the absence of direct training. However, to date studies that employ an operant conditioning paradigm have received more interest that those that employ a classical conditioning paradigm. The aim of this work is to carry out a systematic review about stimulus equivalence classes researches that employ a classical conditioning training, as well as to analyse the implications that this might have in the study of verbal behaviour and the impact in the applied field (for example, the clinical practice). The researches show that transfer of function is also possible not only when an operant conditioning training is employed (for example, match-to-sample training) but also employing classical conditioning procedures. These results are interesting for two main reasons. At an experimental level, they help to understand the learning processes that might explain the transfer of function phenomena, bringing some light to how verbal behaviour is acquired and modified. At an applied level — as it could be the clinical practise — they help to clarify both the intervention process and therapeutic change since verbal behaviour is the most relevant behaviour given its spoken nature.
THE RELATIONSHIP BETWEEN ALEXITHYMIA AND COPING STYLES: THE MEDIATOR ROLES OF ANGER AND ANGER EXPRESSION STYLES

Bukre Kahramanol
Izmir Katip Celebi University (Izmir, Turkey)

Ihsan Dag
Hacettepe University (Ankara, Turkey)

The concept of alexithymia basically points to the various problems that individuals experience in defining and expressing their feelings. A review of the literature shows that alexithymic characteristics may cause various difficulties in anger and its expression. Furthermore, it is seen that alexithymia, anger and anger expression styles are important variables to predict coping styles. From this point of view, the aim of this study is to investigate the mediator roles of anger and anger expression styles in the relationship between alexithymia and coping styles in the university sample. The present study included 434 college students (244 women, 190 men). In addition to the Demographic Information Form, participants were administered the 20-item Toronto Alexithymia Scale (TAS-20), the State-Trait Anger Expression Inventory (STAXI) and the Ways of Coping Questionnaire (WCQ). The mediation analysis was conducted via using PROCESS macro model with 5000 bootstrapping samples along with updated mediation procedures (Hayes, 2018). The mediation analysis showed that the trait anger, anger-out and, anger-control mediated the relationship between alexithymia and problem-focused coping styles. Additionally, trait anger, anger-in, anger-out and anger-control have mediator roles in the relationship between alexithymia and emotion-focused coping styles. It is concluded that the relationship between alexithymia and coping styles is mediated by anger and anger expression styles. Therefore, current study emphasizes the benefit of addressing alexithymic characteristics, the frequency of anger experience, and healthy ways of anger expression simultaneously and as a whole rather than individually in psychotherapies aiming to strengthen the ways of coping with stress.
THE EFFECTIVENESS OF APPROACHES TO CREATIVITY IN PRESCHOOL AGE CHILDREN IN DEVELOPMENTAL PSYCHOLOGY AND PEDAGOGICS

Svetlana Churbanova
Aleksandra Leontieva
Lomonosov Moscow State University (Moscow, Russia)

The topic of this work has to do with the search for the conditions for maximizing the creative potential in childhood, ensuring readiness and successful adaptation to schooling, creating prerequisites for productive learning activities (Davydov, 1986; D'yachenco, 2008; Kravtsova, 1996; Kudryavtsev, 2001; Torrance, 1972; Obukhova & Churbanova, 1992). The purpose of this study is to describe various multidimensional approaches to the analysis of the role of creative imagination and creativity in the mental development of children. A number of approaches aimed at developing creative imagination and creativity of preschool children have been proposed. These have been implemented in developmental psychology and pedagogics (Rizi et al., 2011; Shawareb, 2011; Taylor et al., 2015; Wong & Chee, 2016). This work used quantitative meta-analysis to synthesize several approaches to developing creative imagination and creativity, specifically in the field of developmental psychology at the preschool level (Ruhizan & Nor, 2014). Web of Science, EBSCOhost, Google Scholar and elLIBRARY.RU were searched for studies of approaches to creative imagination and creativity from the 2009-2018 period. Based on 14 articles, four approaches and five different instruments used to develop creative imagination and creativity were identified. It was found that the grand mean effect size for creative potential approaches is 1.13 with a standard deviation of 0.61 for preschoolers. Also, two main themes have been identified: one, a study of factors influencing the development of children's creative achievements, and two, development of pedagogical approaches that stimulate creative abilities. The creative potential of preschoolers is associated with a high level of social behavior, the creation of «paracosms», the use of images and meanings of words from various contexts, bilingualism and the creative abilities of teachers. The results illustrated that the various factors and pedagogical approaches have a positive effect on the development of creative imagination and creativity of preschool children. Therefore, further empirical research aimed at finding possible interrelations between the level of development of verbal generalization, verbal thinking and the creative imagination is recommended. This is necessary for the competent management of the development of creative imagination and creativity of preschool children.
GOVERNANCE AND LEADERSHIP OF WOMEN BETWEEN SELF-RECOGNITION AND EXTERNAL RECOGNITION

Monica Terlizzi
Antonietta Bozzaotra
Lucia Sarno
Maria Piccirillo
Consiglio Ordine degli Psicologi (Napoli, Italy)

The present work comes from practical experience of the Board of Order of Psychologists of the Campania region, entirely composed of woman, that daily confronts the needs of its members. For five years we have worked to develop spaces for reflection and verification in an institutional framework where we have dealt with voters, citizens, employees, collaborators, clients, colleagues, fielding professional skills and experience as well as some typically feminine skills that bring a authentic added value to the traditional leadership model: collaboration, flexibility, mediation, listening. Skills that can trigger change and innovation The research has planned to: administering anonymous questionnaires to investigate the values of female leadership administering of semi-structured interviews to a group of 50 people including collaborators, employees of the organization, colleagues and trainees to invite a deep reflection on the data emerging from the analysis of the questionnaires. The results that emerged confirmed the need to courageously expose themselves to criticism and to affirm the right to women’s leadership to make decisions that regard a category 80% made up of woman This has allowed the creation of many activities on the territory: memorandum of understanding with the Department for Equal Opportunities and Social Policies of the Campania Region, events in distance learning for maternity psychologists, events to combat gender violence, collaboration for the activation of 47 Antiviolence Centers in the Region Campania, Baby Care project, a free service for psychologists that allows them to take part in the events together with their children who are welcomed by operators specialized in recreational and educational activities who take care of themselves.
Army is an important social institute of any state. Army service has got its characteristic features which are ambivalent: on the one hand, it is prestigious and honourable, and, on the other hand, it is dangerous and hard. That is why some young men enter the university which has got a military department to avoid army service. The purpose of the research is to reveal psychological features of students studying at the military department in the civil university. The theoretical grounds of the study are based on the works by Abdurakhmanov R.A., Antsupov A.Ya., Borah E.V., Bryan C.J., Karayani A.G., Korchemny P.A., Peterson A.L., Young-McCaughan S.B., etc. The empirical part of the study includes methods of testing (Values scale [S.H. Schwartz]; Motivation of professional activity [C. Zamfir]; Scale of achievement need [Ju.M. Orlov]; Level of subjective control [E.F. Bazhin, E.A. Golynkina, L.M. Etkind]), questioning (a specially developed questionnaire) and statistical data processing. The sample consisting of 60 students who study at the military department in the civil university has been divided into three groups: men who intend to continue army service and make a career of a serviceman; men who want to obtain a rank and do not serve in the army; and women who decide to get some military competences, but are not going to serve in the future. The results show that all the groups qualitatively and quantitatively differ in the structure of leading values. In groups 1 and 3 internal motivation forms the foundation of professional activity whereas in group 2 it consists of external negative motivation. Achievement need and level of subjective control do not have statistically significant differences. Discussing the findings it is possible to conclude that students who connect their future with the army rely on values of independence and adherence to traditions, and have a conscious internal motivation. Young men who do not joint their future with the army service are guided by values of "achievement" and "power" and try to avoid failures. And women leading by kindness and conformity have got a carefully considered approach to choosing their future professional career.
THE EFFECTS OF DICHOTOMOUS THINKING ON DEPRESSION IN JAPANESE COLLEGE STUDENTS

Takeyasu Kawabata  
Nohiko Abe  
Shokei Gakuin University (Natori, Japan)  
Tomoko Okuda  
Chiba University (Chiba, Japan)

Recently, an approach to assessing dysfunctional thinking has emerged that focuses on the form of cognition rather than its content. Many studies demonstrated that cognitive therapy reduced relapses of depression via changes in the style rather than the contents of thinking, reducing absolutist dichotomous thinking. Rumination, which consists of longer chains of repetitive, recycling, negative, and self-focused thinking is also a key cognitive or behavioral feature of dysphoria and major depressive disorder. The first purpose of this study was to explore the effect of dichotomous thinking on depression. We expected that dichotomous thinking will increase depression (Hypothesis 1). It was expected that dichotomous thinking will enhance ruminative thinking (Hypothesis 2). Two-hundreds Japanese college students (Males: 107, Females:93, M age= 20.02 ± 1.42) participated in the study. They were asked to fill out the Dichotomous Thinking Inventory (DTI; Preference for Dichotomy, Dichotomous Belief and Profit-and-Loss Thinking) (Oshio, 2009), Kessler 6 (Kessler et al. 2002; Furukawa et al., 2003) and the Japanese version of Ruminating-Reflection Questionnaire (RRQ)(Trapnell & Campbell,1999; Takano & Tanno, 2008). A structural equation analysis based on maximum likelihood estimation was applied to test the hypothesis. The final model showed that Preference for Dichotomy only enhanced depression by increasing Dichotomous Thinking and Profit-and-Loss Thinking, Dichotomous Belief directly increased depression and Profit-and-Loss Thinking only enhanced depression by increasing rumination. The overall fitness of the final model was of an acceptable level, as indicated by chi² (5) =8.40, p=.14, GFI=.98, AGFI=.95, RMSEA=.06. Hypothesis 1 was supported. Dichotomous thinking enhanced depression. Hypothesis 2 was supported. Dichotomous thinking increased rumination. The results suggested that dichotomous thinking increases depression by two pathways.
Recent research has found that people utilize either a forward or backward planning when setting goals (Park, Lu, & Hedgcock, 2017). According to which planning strategy individuals follow, deadline framings may vary. In the case of the forward planning, individuals will focus more on the present, because they will begin with what needs to be done first. In contrast, the backward planning will encourage individuals to focus more on the future by thinking about what they want to achieve first. Accordingly, we posit that there can be two possible reference points in deadline framings: (1) today which is the present and (2) a day in the future. In addition, the resource slack theory suggests that people perceive that there will be more surplus time in the future compared to the current moment. (i.e., slack; Zauberman & Lynch, 2005). Based on the previous literature on time framing and the resource slack theory, we argue that deadline framings may alter individuals’ time perception. Specifically, we propose that people will perceive more (less) time left until the deadline given the future-focused (the present-focused) deadline. We recruited participants from Amazon Mechanical Turk (N=116, 57 Females, Mean Age=39.88). Participants were randomly assigned to either hypothetical scenario condition (present- vs. future-focused deadline). After then, they responded time slack question asking how much time they feel that they have until the due date (7-point Likert scale, 1=Not at all, 7=Very much). We conducted an independent samples t-test to test our hypothesis. The result revealed that participants in the future-focused condition (M=3.29, SD=1.60) were more likely to perceive that there is more time left until the deadline than those in the present-focused condition (M=2.53, SD=1.46; t(114)= -2.65, p=.009). The findings suggest that compared to the present-focused deadline, the future-focused deadline led people to perceive more time left until the deadline, perhaps by positioning a temporal reference point in the future. Shifting time perception through deadline framing could be applied to successfully manage our daily plan (e.g. school assignment, travel or project management). More details, limitations, and future directions will be discussed in the poster.
TODDLERS’ SLEEP AND FAMILY PROCESSES

Simona De Stasio
Francesca Boldrini
Benedetta Ragni
Lumsa (Roma, Italy)

Simona Gentile
Ospedale Bambin Gesù (Roma, Italy)

Within a transactional family dynamics model (Schermerhorn & Cummings, 2008), children’s adjustment, including sleep behaviors, is conceptualized as influencing and being influenced by multiple subsystems within the larger family system (Bell & Belsky, 2008; Bernier et al., 2013). Based on this conceptual framework, the current study examines reciprocal links between young children’s sleep, emotion regulation, parenting stress, marital satisfaction and perceived social support by both parents. Main aim of our study was to contribute to the growing field of knowledge about connections between parenting dimensions and toddlers’ sleep, including both parents, and examining the conditions under which parental psychosocial functioning was related to bedtime routines in toddlerhood. 80 Italian intact two-parent families of toddlers aging from 18 to 36 months (48 boys) participated in this study. Parents completed Emotion Regulation Checklist (Shields & Cicchetti, 1997), Parent-Child Sleep Interaction Scale (PSIS, Alfano et al., 2013), Parent-Stress Index-Short Form (PSI-SF; Abidin, 1995), Social Provisions Scale (SPS, Cutrona & Russell, 1987), Dyadic Adjustment Scale (DAS-4; Sabourin et al., 2005) and ad-hoc semi-structured interview. As expected, the results confirmed that child emotion lability and parenting stress’ dimensions were significantly positively correlated with PSIS Total and Sleep Conflict scores. The main results of the hierarchical regression model, performed to evaluate the predictive roles of studied variables on parenting stress level, showed that child emotion lability (β = .28, p < .001), critical sleep interaction (β = .31, p < .001), sleep’s problems (β = .20, p < .001) reported by the mothers predicted variance PSI Total of both parents. Furthermore, the findings of the second hierarchical regression model, performed to evaluate the predictive roles of studied variables on child’s sleep, showed that maternal parenting stress (β = .55, p < .001), low perceived social support (β = .40, p < .001) predicted variance of child’s sleep problems. Findings highlight the importance of examining children’s sleep within the context of the larger family system.
WHY AND WHEN SPORTS SERVICE EMPLOYEES ENGAGE IN PROACTIVITY VITALITY MANAGEMENT: THE ROLE OF PSYCHOLOGICAL FLEXIBILITY AT WORK

Che-Chun Kuo
Tunghai University (Taichung, Taiwan)

Ying-Lien Ni
National Chiayi University (Chiayi, Taiwan)

Lung Hung Chen
National Taiwan Sport University (Taoyuan, Taiwan)

Yun-Ci Ye
National Taitung University (Taitung, Taiwan)

Recent studies highlight that individuals may proactively manage their physical and mental energy (i.e., vitality) to facilitate work effectiveness. However, why and when employees perform proactivity vitality management has not yet been explored. Based on the proactivity perspective and acceptance and commitment therapy, we argue that employees with higher proactive personality might engage in more proactivity vitality management via the increase of psychological flexibility at work. Furthermore, the authors propose that those high in proactive personality tend to have greater psychological flexibility at work and are more likely to activate such psychologically flexible ability to have higher proactivity vitality management in persisting with and their proactive work goals. Using a time-lagged investigation, a total of 248 sport service employees working in 12 public fitness centers (mean age = 31.89 years) completed the assessment of proactive personality at Time 1, psychological flexibility at Time 1, and proactivity vitality management at Time 2 one month later. Supporting the authors’ expectations, the results indicate that proactive personality was positively associated with proactivity vitality management via the mediating process of psychological flexibility at work. Moreover, the mediating process of psychological flexibility at work was stronger when proactive personality was high. The current study contributes to proactivity literature by identifying the antecedent, mechanism, and boundary condition of proactivity vitality management. Specifically, our findings advance the understanding of how and when individual differences in proactive tendency can shape employees’ proactivity vitality management. In addition, our research suggests that employees’ psychological flexibility can be a key mental ability in mediating the relationship between proactive personality and proactivity vitality management. Our results also provide practical insight into the field of individual proactivity in sports service industry.
CONTROLLABILITY AS A COMPONENT OF OPTIMISTIC ATTRIBUTIONAL STYLE: WHEN IT WORKS AND WHEN IT DOESN'T

Oleg Sychev
Shukshin Altai State Humanities Pedagogical University (Biysk, Russia)

Tamara Gordeeva
Lomonosov Moscow State University (Moscow, Russia)

Evgeny Osin
National Research University Higher School of Economics (Moscow, Russia)

Previous investigations showed that controllability appeared to be a more problematic dimension of attributional style in negative situations than that in positive situations (Ashforth & Fugate, 2006). Controllability of failures showed weak consistency with globality or stability and had low loadings on the negative attributional style factor. We hypothesized that controllability may be either pessimistic or optimistic depending on the specific content of attributed cause. Method. To test this hypothesis, we used content analysis of answers for failure situations in a Russian version of ASQ (Gordeeva, Osin, & Shevyakhova, 2009), which includes 12 hypothetic situations, seven of them are failures. Each participant wrote supposed cause for every situation and rated it on three parameters: stability, globality, and controllability. The sample comprised 603 students of two Moscow universities (mean age 24.55, 52% females). Two experts classified participants’ answers into nine categories formulated after a preliminary analysis of the data. Cohen’s kappa was .87, indicating high reliability of coding. To find out how the association between controllability and generality (a sum of stability and globality) depends on the content of causes, we used moderation analysis with frequencies of every category as moderators. Results. The results of moderation analysis demonstrated that controllability only showed a statistically significant positive correlation with generality (indication of pessimism) when the content of attributions didn’t include negatively evaluated internal causes (e.g., “I am incompetent”). When the attributions involved own negative traits, the correlation coefficient became negative ($p = 0.018$ for the moderation effect). A similar moderation effect showed that positive correlation of controllability and generality became stronger in cases where attributions did not include non-judgmental internal causes (e.g., “My idea was unsuitable”, $p = 0.044$). Other categories of attributions didn’t influence the size of correlation between controllability and generality. Conclusions. Controllability of failures may have different meaning (optimistic or pessimistic), depending on the types of attributions people use. Optimistic attributional style in negative situations involves low controllability of external causes and high controllability of internal causes.
Investigation of the motivation and hierarchy of students values is important because they are at the beginning one of the most decisive process in a person’s life — professional becoming. The purpose of the study is to evaluate the structure of the leading motivations and values of modern students who receive education in technical specialties. Participants were 113 students (99 males, mean age 19), majored in “Industrial electronics”. Motivation was measured by test of motives of the educational activities of A. A. Rean and V.A. Yakunin, The Academic Motivation Scale, test of values R. Inglehart and values survey module G. Hofstede. Also used tests of self-organization activities E.YU. Mandrikovoy and for studying professional identity of L. B. Schneider, and Balanced Measure of Psychological Needs (K. Sheldon and D. Hilpert). Factor analysis revealed 5 factors that explained 71.9% of the total variance. First factor included combined internal and external motivation, “traditional values”, “self-expression values”. Second included combined internal and external motivation, “goal-setting” and “self-indulgence”. Third had “collectivism” and “masculinity”. Fourth included combined cognitive motivation and motivation of achievement, self-development, self-esteem and “planning”. The fifth is “short-term orientation” and “collectivism”. Results show that respondents tend to live for today, they respect traditional values, but show a preference for their own interests, which are above the interests of the group. Correlation analysis shows that achievement motivation is associated with several of the personal characteristics of students. For example, achievement motivation and self-determination ($r = 0.315; p = 0.001$); achievement motivation and need for competence ($r = 0.3567; p = 0.0$). This suggests that in young people the need for achievements arises from the desire to be truly professional in their field, about the focus on long-term results. Acknowledgements: The study was funded Russian Foundation for Basic Research, project №18-013-00781

The universality of the Five-Factor Model (FFM) of personality and the NEO-PI-R as an operationalization of the FFM has been well established in the literature. However research from African and Asian countries suggests that the FFM does not adequately describe personality in these contexts. It has been argued that the collectivist dimension in particular is not captured in the FFM. This study presents results from the South African context using both literature review as well as empirical evidence based on data collected in the Gauteng and
Eastern Cape regions of the country on student and community samples. The results speak to the universal expression of some personality factors and facets like Neuroticism and Conscientiousness but also indicate the possibility for culturally specific expressions of other factors like Agreeableness. The expression of Openness to Experience in this context is discussed. These findings are discussed within the continued debates on the universal applicability of the FFM.

**IS PARTICIPATION TO NA DUTY? JAPANESE SYSTEM OF LOCAL AUTONOMY AND ITS PROBLEMS**

Takehiko Baba  
Kyushu University (Fukuoka, Japan)

Japanese neighborhood associations (NAs) were developed and maintain as local powerful group. In war age, the national government use those well organized NAs as effective groups to help the war situation. So, after Japanese surrendered, the United Nations prohibited NAs for 5 years. When the prohibition time was over, NAs were immediately revived. Japanese people believed NAs were necessary to control local condition. A typical NA consists of 100~150 households. A leader is chosen in discussion. One household has one voting right of the annual general meeting. They have a special ranges and these ranges are never overlapped. So, residents cannot chose NAs to join in. They can register just only one NA. NA’s actions are based on reliable relation among neighborhood. Therefore, NA always offer some opportunities to meet neighbors, like as neighborhood festival, and sports events. NAs treat public action requested by municipal governments, and try to control their local environment. (This is the reason why Japan is clean country.) Most of NA have a kind of semi-public character, but they don’t have group status like as "NPO", based on laws. Such ambiguous NA position now makes friction with local people. Is participation in NA attraction duty? Many people (especially in urban area) do not want register / participate to their NA. The participant observation has been conducting from 2006, over 50 NAs were accept my investigation and offer their information. NAs still work for local people: from baby to old people. However, working people cannot attend NA works. Also, single young/aged people are increasing. The programs of NAs are not fit to them. Some participant reported that only semifixed executive staffs conducting rigidly. From another view, municipal governments are tend to request too many roles for NAs. Actually, many posts are installed to realize governmental policies. This is one big reason NAs are hated. People do not want such volunteer works. If NAs and their culture are maintained, that may productive for our local autonomy. How to solve the problems? How NAs can be changed? These are the key to protect out NA culture.
APPEARANCE AS A TRIGGER FOR LOOKISM

Daria Pogontseva
Southern Federal University (Rostov-on-Don, Russia)

Any interaction includes an assessment of the appearance of Another. In the modern world of media create a steady stereotype of "beautiful-successful." On the one hand, it creates an interest in the appearance, it implies perfectionism and dissatisfaction with appearance, on the other hand triggers such kind of discrimination as Lookism. Lookism — is discrimination someone because of her/his appearance, and can manifest itself in various forms: from negative (bullying, shaming) to positive (more beautiful people can get additional benefits in connection with the assessment of their appearance). In our study, we consider the negative forms of Lookism, namely the manifestation of verbal bullying and cyber-bullying associated with the appearance. We have considered the free descriptions of people who have faced verbal manifestations of Lookism in real life or in cyberspace. It should be noted that almost 100% of respondents once becoming a victim of bullying associated with the appearance, irrespective of age and the attractiveness of appearance ratings. In our study, we consider exactly which parts of the body, the features of the external appearance are most often subjected to naming. We also studied discriminatory jokes on social networks that indicate different features of appearance. It can be said that one of the main triggers of bullying is the weight of a person, this can be explained by the fact that this characteristic of the external appearance is most easily identified. This study is conducted in the frameworks of research project № 171801260 supported by Russian Science Foundation.
COMPARATIVE STUDY ON PSYCHOLOGICAL PROGRESS IN DIFFERENT FAREWELL OF LOST OBJECTS (FROM COMPARISON OF PETS AND LOVERS)

Akane Takahashi
Shukutoku University (Chiba, Japan)

Fujimori (1997) pointed out that the period of staying at each stage model of grief by farewell and the order of passing stages will be different by the object to be lost or the situation in the stage model of grief by farewell approximately. As pet loss, departure from young people's romance and etc have become social phenomena in recent years, it seems that the way of recovery is different by each type of farewell. In this study, we aimed to compare psychological responses to different loss situations, focusing on pet losses and loss of lover which everyone could have experience. Human research subjects were two persons that one has experienced parting with a pet and the other has experienced parting with a lover. And, both of them were men in their twenties. They were interviewed and contents change into verbatim. Analysis used the grounded theory approach. Psychological reactions common to the two kinds of farewell were the following five those were "surprise against sudden farewell without signs", "feeling of loss due to farewell of loneliness", "looking back on the process from encounter to farewell", "Relax depression by consulting with others", "preparedness for farewell anticipation ". Partings with a pet were clear to be in a state of parent-child relationship of "taking care of the role of life by care". It was thought that maintaining this relationship was linked to "I want to convey the cute love of a pet to others" or "change that gentle to animals". Meanwhile, in partings with a lover, there was a change in the relationship that the lover returned to the other person in "days to seek reason not to know farewell". Ambiguous reasons for farewell can be suggested as being an important key for "to live a life unchanged" even if it remains "not recovering". References: Fujimori, K. (1997). Assistance for mental health and recovery of disaster victims. Matsui, Y. (Edit). Psychology of grief. Science Corporation
A STUDY ON THE EATING DISORDERS: FOCUSING ON EATING BEHAVIOR

Chiharu Mimura
Shukutoku University (Chiba, Japan)

Eating disorders are a pathological states of extreme eating behaviors that ignore the biological desire (Kiriike, 2005) and, they involve eating behavior problems. They have been studied from the viewpoint of the parent-child relationship and the desire for thinness (Baba, 2013). New findings, however, elucidate the course of eating disorders from the perspective of eating behavior. This study aims to clarify the details of eating behavior in eating disorders, considering the detailed process of the change. Seven women (teenagers to woman in their forties) with a history of diagnosis of eating disorder (anorexia nervosa) participated in this study. Participants were confirmed to be in a state of remission. First, I provided adequate explanation for research, and then conducted an interview after agreement was obtained. All interview contents were transcribed. This interview data was analyzed using the grounded-theory approach (Saiki, 2013), which emphasizes the verifiability of data and generates new theory. The analysis generated 13 categories. Based on these generated categories, the process of change from the state of refusing eating behavior is shown in the model diagram. Eating disorders involved conflicts of a “Sense of crisis against the eating” and a “Sense of fear against the physical condition.” The conflict process was managed by “justifying the reason for eating.” As a result, it gradually became possible to eat various things. Depending on the patients, conflict resolutions are different; some participants began general eating behavior while others began eating behavior with avoiding animal food. For remission of eating disorders, the process of convincing oneself is important. When following that process by “justifying the reason for eating,” it gradually becomes possible to eat various foods. Reference: Kiriike Nobuo (2009). Eating disorders — I do not eat it, I can not eat it, I can not stop eating it- 2nd edition, Igakusyoin, p5. Saiki Kureighiru Syoko (2013). Qualitative research method Seminar 2nd edition: Learning the grounded theory approach, Igakusyoin Baba Kenichi (2013). Recent treatments for eating disorders, Chapter1, Kongousyupan, pp10-25.
Japan is regarded as a country with lower levels of happiness compared with foreign countries. Also, it is said that men are less likely to experience happiness than women (Koyasu, 2012). Happiness is accompanied by positive emotions, but those emotions are diverse. For Japanese people, gender differences in the experience of emotions are expected. The aim of this study is to examine the differences between men and women with regard to their experience of other emotions that accompany happiness. In this study, we conducted an internet survey of 82 participants, including undergraduate students and working adults, between 20 and 50 years of age. First, the participants were asked “What kind of emotions do you feel with happiness?” Next, they were asked about other emotions they experienced when in a happy state. Using OECD guidelines on measuring subjective well-being, the participants were asked about 15 emotions: joy, calm, loneliness, sadness, happiness, feeling good, pleasure, melancholy, satisfaction, boredom, tiredness, fun, enthusiasm, infatuation, and anger. Responses for each item were scored on a 5-point scale ranging from “True” to “Not applicable at all.” A t-test was conducted to examine difference between men and women, and significant differences were observed for calm (t [70.49]=3.16, P <.01), loneliness (t [80]=2.65, P <.05), and pleasure (t [80]=2.18, P <.05). The results indicate that women are more likely to feel “calm” when they are happy, and men are more likely to feel more “pleasure” than women. It was also shown that in the happy state, men are more likely to feel more “loneliness” than women. Happiness for women may involve gaining a sense of stability and maintaining one’s emotions, and happiness for men may involve experiencing pleasant feelings as a result of satisfied desires. After examining sex roles and the sociocultural factors that affect men and women, it is clear that more research on the emotions that accompany happiness caused by gender differences is necessary. reference Koyasu,M 2012 A cross-national study on happiness :Data from thirteen countries. Japanese Psychological Review, Vol. 55, No. 1, 70-89.
ONLINE TRANSDIAGNOSTIC TREATMENT FOR EMOTIONAL DISORDERS

Anabel De La Rosa Gomez
Mario Fabián Vázquez Sánchez
Alicia Ivet Flores Elvira
National Autonomous University of Mexico (Mexico, Mexico)

Berenice Serrano Zarate
Jaume I University (Castellon de la Plana, Spain)

Anxiety is highly prevalent and often accompanied by comorbid depression disorder in Mexico population. Internet-based interventions have shown to be one effective treatment modality. Transdiagnostic internet-based interventions might be promising to overcome comorbidities. This study aims to evaluate the efficacy of an online transdiagnostic treatment for emotional disorders. 18 participants who requested the psychological assistance service to the Psychological Support Center will be randomly assigned to two 8-week online interventions: a) experimental group, following the guidelines proposed by the transdiagnostic unified Protocol (PU) (Barlow et al., 2010), and b) control group under cognitive behavioral treatment (traditional intervention). In both groups statistically significant differences were found in depression (z = 0.35, p = 0.05, d = -1.89), anxiety (z = 0.38, p = 0.05, d = -2.07) and emotional dysregulation (z = 0.00, p = 0.05, d = -2.11) levels. And also in TCC condition: BDI (z = 0.35, p = 0.05, d = -2.10), BAI (z= 0.15, p= 0.05, d = -2.43) and DERS (z = 0.008, p = 0.05, d = -2.66). There were differences between groups obtaining in the BDI (U = 39.5, p= 0.05), in the BAI (U = 25.3, p= 0.05) and in the DERS (U = 22.1, p= 0.01). The present study will provide evidence on the efficacy of online transdiagnostic treatment protocol for emotional disorders.

IN-GROUP MEMBERSHIP PROMOTES TRUST TOWARD INTELLIGENT SYSTEM ACROSS DIFFERENT RELIABILITY LEVELS AND ANTHROPOMORPHIC FEATURES

Zhang Jingyu
Institute of Psychology, Chinese Academy of Sciences (Beijing, China)

Xiangying Zou
Chunhui Lv
Institute of Psychology, Chinese Academy of Sciences Master (Beijing, China)

Past studies have found that the in-group membership of an intelligent system can lead to more positive user experience toward the system. In this study, we explored whether such a factor can improve users’ trust in intelligent decision support tools and whether such an effect depends on system reliability and anthropomorphic features. We manipulated reliability levels (95%, 70%, 45%) in study 1 and anthropomorphic features (avatar, computer) in study 2. The minimum group paradigm was adopted to control the membership of the intelligent system, and we measured trust by using both subjective rating and compliant behaviors toward system recommendations. The results showed that the intelligent system with an in-group membership resulted in higher trust as compared to the system with an out-group membership. The strength of these effects held constant across different reliability levels and anthropomorphic features. We discussed such findings in light of group identity theory and human-robot trust literature.
EMPATHY AFFECTS A WAY OF USING PRAISE

Kazuhiro Ikeda
Shokei Gakuin University (Natori, Japan)

This study investigated the relationship between empathy and output skill of praise. One hundred twelve participants were asked to write as many praise words as possible in five minutes. They classified those words into four type: person praise (talent and ability), process praise (effort), result praise (achievement), and other praise. Participants were asked to rate 10 empathy items from Japanese version of a short form of the Profile of Emotional Competence (Nozaki and Koyasu, 2015). The correlation coefficient between number of praise words for each classification and the average value of empathy was calculated. Results showed that a positive correlation between process praise words and empathy, and a negative correlation between person praise words and empathy.

TRAUMA AND RESILIENCE IN INCARCERATED WOMEN

Anabel De La Rosa Gomez
Daniel Arturo Guajardo Garcini
National Autonomous University of Mexico (Mexico, Mexico)

Exposure to highly stressful events is a widespread experience for adults and children, men and women in any cultural context. Several studies have identified personal, school, family, health and substance use variables that distinguish women in jail from their peers without conflict, such as a high incidence of violent events, sexual abuse, domestic violence, absence of family support and in general negative conditions in their family and social context. The present study aimed to know the presence of symptoms of post-traumatic stress disorder, as well as indicators of resilience in incarcerated women. 94 women participated in a Social Readaptation Center, between 20 and 65 years of age (M = 33.5, SD = 10.5), who answered voluntarily in group mode, 2 self-report instruments: checklist for the disorder by post-traumatic stress-DSM-V and Mexican resilience scale. 80% of women have witnessed or experienced at least one traumatic event and 27.7% showed indicators of post-traumatic stress. The evaluation on resilient factors reports that 45% perceive strength and self-confidence, 19% social competence, 13% social support, 12% family support and 11% structure. There is a moderate and significant negative correlation between the resilience and post-traumatic stress symptomatology (r = -0.417, p <0.05). Based on these findings, it is suggested that the relationship between the experience of traumatic events and posttraumatic symptomatology could be mediated by the resilience protection factor.
ATTITUDES TOWARDS ONLINE PSYCHOLOGICAL COUNSELING IN PERSONS WITH DISORDERS AND MENTAL ILLNESS

Magdalena Chęć
Maria Ligocka
Krystian Konieczny
Agnieszka Samochowiec

University of Szczecin (Szczecin, Poland)

A specialist in online psychological help establishes a relationship with a person experiencing problems or suffering from mental disorders through various forms of internet communication. Online help can assume the form of a short intervention, consultation, psychoeducation or psychotherapy. One's attitude towards online psychological help is considered to be a ‘relatively permanent tendency to positively or negatively evaluate this help, regardless of whether this attitude is expressed in the form of beliefs, feelings or behavioral tendencies’ (Chęć et al., 2016). The aim of this study was to determine attitudes towards online psychological help circulating among persons suffering from various mental disorders, with the following research hypotheses: H1/H2: There are differences in attitudes towards online psychological help between patients with different psychiatric diagnoses/ between mentally ill patients and patients with mental disorders. H3: Patients with previous experience in using online psychological counseling perceive this kind of help in a more positive way. H4: Not using online help stems from perceived greater effectiveness of traditional forms of psychological help. So far, the study sample has comprised 200 patients recruited at the Department and Clinic of Psychiatry of the Pomeranian Medical University in Szczecin (the study will end in June 2019 and the target sample will consist of 400 patients). Research tools included a self-constructed Attitude Scale for Online Psychological Assistance – 2 and a socio-demographic Patient Survey. Our results suggest that there are no differences in attitudes towards online psychological help between patients with different psychiatric diagnoses (p>.05), but patients with mental illness have a more positive attitude than patients with disorders, but only when communication is by e-mail (t=2.0738; p<.039). Patients with experience in using online help have a more positive attitude only to help with crisis intervention (t=2.513; p=.013). The majority of patients did not use online psychological help because they did not know it (34.4%) or preferred personal contact with a specialist (31.7%). Thanks to the above analyses and interpretation of results, it will be possible to determine attitudes and indicate reasons both for and against using online psychological help in persons with various mental disorders.
MOBILE APPLICATION FOR TRAINING IN CLINICAL SKILLS IN ONLINE PSYCHOLOGY STUDENTS

Anabel De La Rosa Gomez  
Samanta Xiadani Mendoza Castillo  
Rosa Isela Sánchez Hilario  
National Autonomous University of Mexico (Mexico, Mexico)  
Berenice Serrano Zarate  
Jaume I University (Castellon de la Plana, Spain)

Online Psychology students need a professional training that provides them skills and efficiency for dealing with emotional health problems. One of the most challenging and crucial skills that trainers should teach to new therapists is to establish a functional therapeutic relationship with patients. Some authors suggest that a "therapeutic presence" is a predictor of an effective therapeutic relationship (McDonough-Means, Kreitzer, & Bell, 2004). Mindfulness is a meditation practice that involves bringing the practitioner's awareness completely to the present moment without judging or evaluating that experience (Kabat-Zinn, 1990). In recent years, numerous therapists have been exploring the theoretical and practical connections between mindfulness and the therapeutic relationship (Hick & Bien, 2008), including applications in family therapy (Gehart & McCollum, 2008; Lysack, 2008), Acceptance and Commitment and cognitive-behavioral approach (Wilson & Sandoz, 2008). In this sense, the main purpose of this research was the design, development and evaluation of a mobile application for the training of clinical competences (emotional and cognitive empathy, psychological well-being and sense of presence) based on mindfulness techniques. The training program of the app has a five months extension and is grounded in a professional skills model. A pilot study was carried out with 10 undergraduate online psychology students of the last year. The results of the cognitive therapy scale (ETC), by Beck and Young (1980), showed that the participants improved their clinic skills after they accomplish the training program. Likewise, the results of the non-parametric test of Wilcoxon showed differences between the evaluation before and after the training program (z = 2.20; p = .027). Regarding the satisfaction with the training program, the students considered that it is an innovative training scenario for the development of their clinical skills. Thus, it is pertinent to propose a promising alternative to the lack of professional practice scenarios and, in this way, to get students involved in real scenarios linked to their interests or to the curricular structure itself. In this sense, new perspectives of research and technological development are opened for practical teaching.
VALIDATION OF A RUBRIC TO EVALUATE OPEN EDUCATIONAL RESOURCES FOR LEARNING

Anabel De La Rosa Gomez
José Manuel Meza Cano
Germán Alejandro Miranda Díaz
González Santiago Edith
Judith Rivera Baños
National Autonomous University of Mexico (Mexico, Mexico)

Although in the literature you can find assessment tools on Learning Objects (OA) or Open Educational Resources (OER), the notion of Units of Support for Learning (UAPA) involves the use of web elements such as audio, video, images, text and an explicit instructional design. However, there is no instrument to evaluate the relevance of these units. Therefore, it is pertinent to create an instrument that allows to account for the level of development of these objects in their context as a challenge in the design of evaluation strategies and techniques that cover the demands of these new learning environments (Quintana & Gil, 2015). The present work accounts for the process of validity of a rubric with 41 criteria, each with three levels of performance, developed from a documentary search on relevant aspects to include in a learning object. We contacted 6 expert judges who chose for each criterion if it was useful, useful but not essential or not necessary, based on this, the Content Validity Reason (CVR) was calculated, obtaining 32 validated criteria. Among some conclusions it can be mentioned that there seems to be a difference between what international literature dictates and what judges considered as relevant in some criteria.
The present study examined the influences of sequentially increasing or decreasing data on relative value judgments among different cultures. In the study (N = 444), one of two tables was presented to participants. One table showed a monthly sequence of barley prices increasing, while another table showed the prices decreasing, with both tables meeting at the same value in the final month. The participants were asked to evaluate this value for either an increasing or decreasing table on a 9 point scale. Finally, the participants were asked to answer their knowledge and interest in the actual average price of barley, and the influences of the average price on their daily life. An ANCOVA was performed on Sequential data (2; Increasing vs. Decreasing) as independent variable and Knowledge of the product’s price, Interest in the product’s price, and Influences of the product’s price on the daily life as covariates in Poland vs. Japan. There were no significant effects with Knowledge of the product’s price or Interest in the product’s price as covariates both Poland and Japan. On the other hand, a significant effect was found with Influences of the product’s price on the daily life as a covariate. For Japanese people, there was no significant effect of Influences of the product’s price on the daily life. On the other hand, for Polish people, the same price was evaluated as more expensive under the increasing condition compared to the decreasing condition with Influences of product’s price on the daily life as a covariate (F(1, 199) = 132.39, p <.001). The results revealed that there were different inter-mediated effects of the product’s price on people’s daily life between cultures. This indicated that there are different judgmental processes for the product’s price in the sequentially increasing or decreasing trends among different cultures. Future studies will be necessary to elaborate the factors that underlie the different judgmental processes.
PERCEIVING COLLINEAR, PARALLEL, AND PERPENDICULAR CONTOURS

Maria Dvoeglazova
Tadamasa Sawada
National Research University Higher School of Economics (Moscow, Russia)

The human visual system processes contours in a retinal image efficiently if they form a regular configuration. It was shown that the orientation threshold, measured with a perpendicular junction and with a pair of parallel contours, is lower than an orientation threshold measured with a single contour or a junction of a non-perpendicular angle (Koshmanova & Sawada, 2019). Note that these perpendicular and parallel configurations only depend on the orientations of the contours forming the configurations. But, also note that, a collinear configuration of two contours also depends on the positions of the contours, and that this additional factor can affect our perception. In this study, we used a psychophysical method to test the perception of a collinear configuration of contours and compared it with the perception of perpendicular and parallel configurations of contours. The perception of these configurations was characterized with the orientation threshold of a single contour that was measured with a modified Method of Constant Stimuli (Koshmanova & Sawada, 2019). Here, a lower threshold for a particular configuration suggests that this configuration can be processed more precisely and accurately than the others. These thresholds were measured with 3 levels of eccentricity of the contours forming the configurations. Three participants, including both authors, were tested. We found that the threshold measured with a collinear pair of contours was lower than the threshold measured with a perpendicular configuration ($F(2,16) =4.438, p = 0.029$). No statistically significant difference among the thresholds was observed between the conditions with the collinear and the parallel configurations, or between the conditions with the perpendicular and the parallel configurations ($p > 0.05$). This result suggests that the visual system is as sensitive to collinear contours in a retinal image as it is to parallel contours in a retinal image.
MIND-WANDERING DURING INCUBATION IMPROVES FLEXIBILITY IN CREATIVE PROBLEM-SOLVING WHEN NEGATIVE AFFECT IS GENERATED

Akina Yamaoka
Shintaro Yukawa
University of Tsukuba (Tsukuba, Japan)

Previous research suggests that engaging in undemanding tasks during an incubation period produces more mind-wandering and facilitates more creative problem solving than engaging in demanding tasks or simply resting. However, the aspects of creativity that mind-wandering can improve have not been completely examined. Moreover, previous research showed a possibility that the more mind-wandering was generated, the more negative affect increased. Therefore, in the current study, we examined which aspects of creativity are improved by mind-wandering during incubation and whether it induces negative affect. First, we asked 54 undergraduate students to complete a working memory task. Second, they engaged in creative problem solving using the Unusual Uses Test (UUT) both before and after the incubation period. During the incubation period, we assigned participants to three conditions: sitting, Sudoku, and no incubation condition to manipulate the frequency of mind-wandering. In the sitting condition, participants simply sat in a chair, perhaps engaging in mind-wandering. In the Sudoku condition, they engaged Sudoku, with likely less or no mind-wandering. Participants who were in the no incubation period continued to think about the UUT. Immediately after the incubation period, they were asked to rate their levels of mind-wandering during incubation and their current emotional state. ANCOVA showed that there were no significant differences regarding improvement of creativity between the incubation conditions. However, additional analysis showed that regardless of incubation conditions, when we controlled the participants’ working memory capacity, the participants who reported higher levels of mind-wandering during incubation exhibited higher flexibility in UUT than those reporting lower levels of mind-wandering. The more the flexibility improved, the more negative affect was generated. In further research, we will examine what kind of mind-wandering can improve creative problem solving without generating negative affect.
TRANSFERRING THE FULL RANGE OF LEADERSHIP MODEL INTO THE DIGITAL AGE

Anna Roeltgen
Conny Antoni
University of Trier (Trier, Germany)

Christine Syrek
University of Applied Sciences Bonn-Rhein-Sieg (Bonn, Germany)

Numerous laboratory and field studies demonstrate the differential effects of leadership behavior as defined in Bass and Avolio’s (1991) Full Range of Leadership Model. Studies report predominantly positive effects of transformational leadership on motivation, effort, and performance in face-to-face interactions. Inconsistent findings are reported with regard to the effects of transformational and transactional leadership in computer-mediated work processes. This field study examines the effect of digitally transmitted transformational and transactional leadership on attitudes towards leaders and work engagement. For this purpose, validated video vignettes which show leaders with either a transformational or transactional (management-by-exception or contingent reward) leadership behavior, who hold a pre-written annual speech were used. A sample of 131 participants with and without professional experience from various economic sectors participated in an online study. The short version of Utrecht Work Engagement Scale (Schaufeli & Bakker, 2003) was used to assess work engagement. Self-generated items were used to determine attitude towards the leader. Results suggest that transformational leadership has a significantly more positive influence on the attitude towards the leader compared to both dimensions of transactional leadership (p < .01). Contrary to our hypothesis, contingent reward revealed significantly lower values with regard to work engagement (p ≤ .001), while there was no significant difference between the transformational and management-by-exception leadership conditions. Mediation analysis for categorical predictors indicate that work engagement is mediated by attitude toward the leader. Results imply that differences in leadership behavior reflect in the employees’ behavior not only in face-to-face but also in digital work contexts.
INDIVIDUAL RESPONSE TO STRESSORS AND EFFICIENCY IN PROJECT ACTIVITIES

Yulia Dmitrieva
Svetlana Korobova
South Ural State University (Chelyabinsk, Russia)

After analyzing the results of the study of the specifics of the project activity as one of the methods for developing human resources, we address the problem of implementing a graded approach to its organization based on the personalities of subjects. We justify the relevance of assessing subjects’ individual response to stressors at different stages of the project activity to increase its efficiency. As an example of such activities, we look at the project activity of students in the framework of a learning process as they are mastering professional competencies. We assessed individual response of subjects to stressors based on the specific dynamics of activation of cerebral hemispheres. The study involved 56 students attending graduate courses and majoring in various fields. To perform diagnosis of hemispheric activation, we used Aktivatsiometr ATs-9K, a device for comprehensive psychophysiological diagnosis designed by Yu.A. Tsagarelli. This hardware and software complex consists of a device for diagnosing activation of cerebral hemispheres based on the galvanic skin response and PC software for automatic data processing. The study calculated individual-typological activation indicators (13 measurements in a familiar setting) and activity-situational activation indicators (7 single measurements at different stages of the project activity). The stress response was diagnosed if the activity-situational indicators of activation of cerebral hemispheres exceeded individual-typological activation indicators by more than 1.5 times. The results of the empirical study show different types of individual responses to stressors at different stages of the project activity. The analysis of the profiles of individual responses to stressors allowed us to differentiate subjects into groups, and also identify subgroups of students with the maximum resources for each stage of activity.
THE RELATIONSHIP BETWEEN VALUES AND AMBIVALENT SEXIST ATTITUDES IN TURKISH UNIVERSITY STUDENTS

Gül Deniz Derin  
Sercan Balm  
Istanbul University (Istanbul, Turkey)

The Ambivalent Sexism Theory proposes there are ambivalent beliefs toward both men and women (Glick & Fiske, 2001). The ambivalence sexism toward women has two forms: hostile sexism (HS) and benevolent sexism (BS). HS includes negative stereotypes and prejudices toward women while BS represents the perception of women as weak and naive women; therefore sees them in need of protection. The ambivalence sexism toward men also includes two dimensions: Hostility toward Men (HM) and Benevolence toward Men (BM). These dimensions show the similar conflicting attitudes may arise towards men by women. In this study, it is suggested that sexist attitudes towards genders may be closely related to values which are certain beliefs and goals guide individuals. The aim of this study is to examine the relationship between sexism orientations and individuals’ values within the framework of Schwartz’s values theory. It was predicted that some value dimensions such as universalism, conformity, tradition, and power would be strongly related to all forms of sexism. The study was conducted with 255 university students in Turkey. The 40-item version of the Portrait Values Questionnaire, the Ambivalent Sexism Inventory and The Ambivalence Toward Men Inventory were used as the measurement tools to examine relationships between variables. The findings confirmed a positive, meaningful and strong relationship was found between conformity, tradition, power values and ambivalent sexism forms (HS, BS, HM, BM). The positive relationship between conformity, tradition and HM was one of the unexpected findings of the study. In addition, contrary to expectations, no significant relationship was found between universalism value and HS and HM. The strong and positive relationship between tradition, power, conformity and sexist beliefs was discussed within the framework of the system justification theory. The fact that universalism does not have a meaningful relationship with sexism dimensions has been interpreted as a general tolerance towards people which leads evaluating people positively regardless of their gender. The results were discussed in accordance with socio-political environment which could affect the sexist attitudes. It should be noted, the 70% of the research sample was composed of women. Such limitation’s possible impact to the results was discussed.
THE FRAMING OF SOCIAL COMPARISONS: DRIVING UPWARD AND DOWNWARD DIRECTIONS IN RISKY DECISION MAKING

Marios Andrianos
Chrysanthi Nega
Ioanna-Sofia Spentza
The American College of Greece-Deree (Athens, Greece)

The present study investigated the influence of social comparisons and framing effect on risky decision making. Prospect theory has successfully addressed several deviations of risky decision-making with framing effects to have been largely discussed in literature (Steiger & Kuhberger, 2018). Previous research has suggested that decision making under uncertainty is sensitive to social reference points, yet few evidences exist regarding the combined effect of framing and social comparisons (Mishra, Barclay & Lalumiere, 2014). The aim of the current study was to investigate the role of attribute framing in relative performance feedback with upward social comparisons expected to lead to a greater risk-seeking behavior compared to downward social comparisons. Differences on risky decision making were also examined between high and low performance rankings, gain and loss trials, and different expected values between the decision probable outcomes. The sample consisted of 113 undergraduate students (60 females). A cross-sectional 2x2x2x3 mixed factorial experimental design was adopted. Purported relative performance feedback was given to participants in relation to the Cognitive Reflection Test. Feedback was presented in short vignettes in the form of upward-framed and downward-framed social comparisons in respect to high-ranking and low-ranking positions. Participants completed a Two-Outcomes Risky Decision-Making Task that included manipulation of expected values among probable outcomes within trials of gains and trials of losses. A four-way mixed analysis of variance was performed. Between-subjects analysis revealed that upward-framed social comparisons lead to increased risk-seeking compared to downward-framed social comparisons (p = .022). Different performance rankings did not have a significant effect on risky decision making. Within-subjects analysis showed that risk-seeking was greater in gain trials compared to loss trials (p < .001), with participants to be sensitive to changes in expected values of the outcomes (p < .001). Risky decision-making is sensitive to relative performance feedback, but only through framing of social comparisons and not across different performance distributions. The findings imply that cues of inferiority lead to more extreme responses in decision-making, and provide complimentary evidence suggesting that relative social reference points could explain risk-taking behavior.
ARE ATTRACTIVE FACES CAPTURING ATTENTION? EXAMINING THE COGNITIVE SCIENCE OF HUMAN MATING

Tereza Karavi
Chrysanthi Nega
Ioanna-Sofia Spentza
The American College of Greece-Deree (Athens, Greece)

Attractive faces capture attention, but characteristics of the individual’s value as a partner, captures attention even more. Evolutionary social cognitive theories investigate romantic relationship retention strategies from potential rivals, by examining lower-order cognitive processes (Maner, Miller, Rouby & Gailliot, 2009; Maner & Ackerman, 2015). The aim of this study, was to examine the effect of Mate Value (high/low; how attractive an individual is considered by a potential partner) on reaction times towards attractive and average attractive same-sex target photographs. Individuals in the High MV condition were expected to have faster reaction times compared to low MV individuals in attractive same-sex targets. Moreover, females would engage in slower reaction times compared to males towards attractive targets. The study followed a 2x2x2 mixed-subjects design by recruiting 128 undergraduate college students. Attention allocation was tracked by measuring the reaction time (ms) of each participant, through a visual dot-probe procedure, for targets selected from the Chicago Face Database. A three-way mixed ANOVA (MV x gender x attractiveness) revealed a significant main effect of MV was found (p= .006), indicating that MV manipulations could affect the reactions of participants against potential rivals despite attractiveness of targets and gender. Moreover, a second three-way ANOVA was conducted (MV-perceived x MV-manipulated x attractiveness) revealing a significant three-way interaction (p=.034), showing that in congruent conditions (low perceived/ low manipulated MV) individuals had significantly slower reaction times compared to incongruent conditions (low perceived/ high manipulated MV) in the high attractive faces (p=.008). The relation of narcissism and self-esteem was explored as well. This study added to the existing literature of mating, as an innovative priming condition, that of MV, was found to affect attentional biases. Moreover, it strengthened the “attractiveness” assumption, suggesting that individuals engage in automatic cognitive low-order processes when encountering attractive others, who are perceived as rivals. Finally, the examination of a manipulated MV combined with congruency or incongruency of the perceived MV could explain reaction time differences, especially in attractive same-sex target photographs.
WHO WILL ACTIVATE GENDER STEREOTYPES BIAS?

Nina Vavassori
Chrysanthi Nega
Ioanna-Sofia Spentza
The American College of Greece-Deree (Athens, Greece)

Historically, men and women have occupied different societal roles. As societies have evolved, stereotypes and social roles attached to men and women, have also changed. The Associative and Propositional Evaluation (APE) suggests that different types of automatic associations (stereotype) require a relative fit between a preexisting structure of association in memory and a specific set of external input stimuli. Thus, depending on the context, a stereotype associated with certain attributes in memory may be activated or not. Indeed, recent findings have shown that the level of GS varies when participants are exposed to different types of sexism (benevolent/ hostile). Nonetheless, GS level could also be sensitive to gender presentation within a priming itself. The aim of the current experiment was to examine the influence of different contexts on the level of implicit attitudes regarding gender roles. One hundred and ninety-nine participants (N=199) were randomly assigned into eight priming conditions. The priming depended on the interaction between the types of sexism (benevolent/ hostile), gender presentation (female/ male) and congruency/ incongruency of gender. Gender stereotype level was measured by the implicit association test (IAT) which assessed attributes related to warmth and competence. Results showed that gender presentation within priming did not affect the level of GS except when congruent context was combined with hostile sexism in which males showed greater GS bias compared to females (p= .072). Surprisingly, across all priming conditions, women’s implicit GS increased compared to men’s (p= .037). Finally, hostile sexism provoked a quicker response of participants compared to those exposed to benevolent sexism which indicates a greater GS bias (p= .026). GS activation in males can originate from an in-group confrontation instead of gender comparison with out-group. This tendency shows that acquiring warmth attribute can be perceived as downgrading among males. Interestingly, women expressed a greater GS bias which may reflect their need for improvement in both attributes, while not wanting men to improve on attributes stereotypically related with female role. Future research should examine the reliability of these attributes in order to support their representativeness of gender roles.
DOES IMPULSIVITY INFLUENCE CRIMINAL BEHAVIOR? A STUDY WITH SUBJECTS IN TREATMENT FOR SUBSTANCE USE DISORDER

Enrique Moraleda Barreno
Alba María Serrano-Ponce
Sheila María Velo-Ramírez
José Andrés Lorca-Marín
University of Huelva (Huelva, Spain)

Izaskun Bilbao
Agencia Servicios Sociales y Dependencia Ade Andalucía (Huelva, Spain)

Impulsivity is related with adverse outcomes such as substance use disorder (SUD) (Verdejo-Garcia, Bechara, Recknor, & Perez-Garcia, 2006) and criminal behaviour (Leverso, Bielby, & Hoelter, 2015). However, the factors underlying this relationship are not clearly understood and impulsivity has rarely been examined among incarcerated adults. The fact that the SUD is very frequent in prison inmates makes it difficult to know whether impulsivity is directly related to the probability of entering the prison or instead it is frequent in this population because it is associated with the use of drugs. The objective of this work is to study whether there are differences of impulsivity between two groups of patients with SUD in treatment, one consisting of inmates of a prison (N=27) and the other belonging to therapeutic communities (N=30). To conduct the study, each participant completed a self-report measure of impulsivity, the Impulsive Behaviour Scale (UPPS-P) and a behavioural impulsivity task, the Delay-Discounting Task (DDT). The results of the present research show significant differences in all levels of impulsivity which are greater in the group of internal subjects than in those belonging to therapeutic communities. UPPS-P: Lack of Premeditation (t(55)=6.40, p<.001); Lack of Perseverance (t(55)=2.84, p<.003); Positive Urgency (t(55)=4.34, p<.001); Negative Urgency (t(55)=12.33, p<.001); Sensation Seeking (t(55)=3.15, p<.003). DDT (t(55)=4.38, p<.001). Our study establishes a link between impulsivity and the likelihood of being in prison in patients with SUD, which emphasizes the importance of impulsivity in criminal behaviour. It could be interesting to study the effects of a treatment of impulsivity on the probability of future criminal behaviour of inmates. Acknowledgment: This study was supported by the “Longitudinal study about the effect of treatment on executive function recovery in patients with cocaine and alcohol dependence: implications on treatment outcomes” funded by the Delegación del Gobierno para el Plan Nacional sobre Drogas (Spain) (grant number Q7150008F-2016/034).
THE MEDIATOR ROLE OF ATTACHMENT BETWEEN DATING VIOLENCE AND RISK FOR SUICIDE

Marcela Gracia Leiva
Darío Paéz Rovira
University of Basque Country (San Sebastián, Spain)

Alicia Puente Martínez
University of Basque Country post-doctorate scholarship (San Sebastián, Spain)

Silvia Ubillos Landa
Bárbara Cuadrado
University of Burgos (Burgos, Spain)

Gender violence is a global health problem, could be occur in the first relationships of courtship. Dating Violence (DV) occurs between adolescent and young couples (13-25 years old) who do not cohabit, have no children in common or have no judicial ties. It appears in new technologies in the form of harassment, humiliation and threats towards the couple. There are risk factors such as the relationship with parents and friends and its consequences are related to the risk of suicide (RS). The present study examined the relationship between the victimization of DV off and online, the attachment to parents and friends and the risk of suicide. We conducted a quantitative study with a descriptive, correlational, and transversal design with a sample of 650 students (71.7% girls and 28.3% boys) between 13 and 25 years in Spain (M = 20.04, SD = 3.029). Participants response to paper-based (n = 311; 47.8%) and web-based (n = 339; 52.2%) questionnaire. The results showed that off line violence was greater than of online type. There were not differences by sex excluding sexual violence, in which women showed higher rates of victimization than men. Detachment and direct aggression were the most relevant forms of offline and online violence, respectively. DV (off and online) were associated with an increase of risk for suicide. Off line violence mediation analysis (detachment and humiliation) showed that the relationship with parents (alienation) and peers (alienation and communication) predicted RS. In the second model, online violence, the parents and peers alienation dimension had an effect on RS. In both models, DV was related to a detrimental relationship between adolescents and young people with their parents and peers, which in turn increased the risk for suicide. Dating violence is positively related with the risk to commit suicide. Attachment problems in adolescents with their parents and peers mediate the relation between DV and the risk to commit suicide. DV is a serious problem for adolescents and young couples. There is a need for DV prevention in adolescents and continue research on factors that reduce victimization and its consequences.
COGNITIVE FLEXIBILITY AMONG SUBSTANCE USE DISORDER PATIENTS WITH PATHOLOGICAL PERSONALITY TRAITS

Enrique Moraleda Barreno
Universidad de Huelva (Huelva, Spain)

María José Estepa

David Fernández

Celeste Rodríguez
Therapeutic Community of Cartaya Psychologist (Huelva, Spain)

There is a growing body of research showing that substance use disorder patients show abnormal functioning in prefrontal cortex related to executive cognitive dysfunction (Jannuzzi et al., 2010). On the other hand, literature suggest specific links between executive functioning and personality trait, were neuroticism and extraversion seem to be related to measures of all EF processes — including cognitive flexibility (Miyake et al., 2000; DeYoung 2011). The Alternative Model for Personality Disorders defined in DSM-5 Section III assumes that personality facets are distributed in a dimensional way in the population, varying along a continuum from normality to pathology (Markon, Krueger, & Watson, 2005). Since the publication of this model, a remarkable interest in empirical research in recent years has been shown (Al-Dajani, Granlnick, & Bagby, 2016; Krueger & Markon, 2014). Up to date, only one study analize relationships between EF measures and DSM-5 AMPD domains (Fossati et al., 2018), pointing out to different relationships between cognitive flexbility and AMPD facets on a sample of SUD patients. 207 SUD patients were recruited from the Provincial Drug Dependency Services of Huelva (Spain). All participants were administered the Spanish translation of the PID-5 SF, whose psychometric features are studied in Diaz-Batanero et al., (2017). Cognitive flexibility was measured using Berg’s (Wisconsin) Card Sorting Test (WCST; Berg 1948). More perseverative responses ($t = 2.09, p = 0.037$) and perseverative errors were found on SUD patients with pathological scores on deceitfulness ($t = 2.34, p = 0.018$). Same tendency was found those patients with scores above T65 on distractibility ($t = 2.27$ and $t = 1.98$ respectively; $p < .05$). Patients with pathological scores on rigid perfectionism, impulsivity and risk taking showed more perseverative errors ($t = 2.01 – 2.58; p < .05$). All facets of dishinibition domain (except for irresponsability) were related with more perseverative responses, showing worse cognitive flexibility on SUD patients with a dishinibition component of personality. No relations with facets of negative affect was found. Acknowledgment: Q7150008F-2016/034.
IS IT POSSIBLE TO PREDICT THE OCCURRENCE OF RIPPLE EFFECTS IN THE SOCIAL AMPLIFICATION OF RISKS?

Yasunari Okabe
Obihiro University of Agriculture and Veterinary Medicine
(Obihiro, Japan)

Masahide Saitoh
Nippon Sport Science University (Setagaya, Japan)

As the repercussions of the risk perception of a certain technology intensified by actual or hypothesized accidents and incidents (e.g., new reports on existing risks), the risk perception of other technologies may be increased, even if there was no scientific evidence. In this study, the generalization hypothesis of risk perception based on the relevance among risks was investigated. The hypothesis was suggested by the classical notion in learning psychology that the gradient of generalization is determined by the similarity between the critical stimulus and the target. A web survey was conducted in March 2017, in which 2000 Japanese participants were asked to rate their risk perceptions, benefit perceptions, and acceptances of 24 technologies (e.g., nuclear power generation, 3D printers, artificial intelligence, and unmanned aircraft), as well as the relevance among these technologies. The results showed positive correlations between risk perception (or benefit perception) of the target technology and the theoretically estimated risk perception (or benefit perception) of the same technology, which was calculated as the sum of the perceptions of the other technologies weighted by the relevance to the target technology. Furthermore, multiple regression analyses revealed the theoretically estimated perceptions of risk and benefit were significant predictors of the acceptance of technologies. These results suggest the generalization hypothesis of risk perception could be used to predict the occurrence of ripple effects in the social amplification of risks (e.g., damage caused by harmful rumors).
STUDY ON SELF-ESTEEM IN SOCIAL ANXIETY: CONTRIBUTION OF SELF-REFERENCE PARADIGM

Sana Dridi
Sandrine Kalenzaga
David Clarys
CeRCA (Poitiers, France)

Social anxiety disorder (SAD) is the most common psychiatric disorder after major depressive disorder and alcohol dependence. The DSM-5 (APA, 2013), defines the SAD as a fear of the negative evaluation of others in social and/or performance situations. This fear paves the way to the avoidance of social situations, thus leading to a handicap in the social and professional performance. Social anxiety would result namely from a disorder of self-esteem (Cooley, 1902). The purpose of this study is to investigate the effect of inducing a positive self-image on the self-esteem expressed and implied by participants suffering SAD. We have explored whether positive self-image induction leads to an increase in Rosenberg self-esteem scale (RSES), measuring explicit self-esteem, while lack of increase should characterize the scores of participants in performance (induction of neutral self-image). On the other hand, we have investigated, using an ERS protocol, whether positive (vs neutral) self-image induction results in a significant reduction of the negativity bias in the recall of information encoded in reference condition to self and/or reference to self-perception by others, reflecting an improvement in implicit self-esteem. To test these hypotheses, (N = 192) social anxiety participants completed two RSES and performed two tasks of ERS (encoding and recovery) inspired by the paradigm of Rogers et al. (1977) and reviewed by Mansell and Clark (1999), before and after being exposed to a positive or neutral self-image induction exercise, depending on the experimental condition to which they were assigned. Consistent with the hypotheses, the induction of a positive self-image has increased explicit self-esteem, and lead to a significant decrease of the negativity bias in the recall of information encoded in self-reference and reference to self-perception by others, reflecting an improvement in the implicit self-esteem of participants. This study confirms the interest of using self-mental imagery in the management of SAD.
THE IMPACT OF PERSONAL FEATURES OF RESEARCH PARTICIPANTS ON THE ADEQUACY OF PERSONAL SUCCESS FORECAST IN DIFFERENT TEST SITUATIONS

Irina Makarevskaya
Sochi State University (Sochi, Russia)

The results of all psychological measurements are mediated by reciprocal relationships between the measured property, method, procedure and subject of measurement. Most important for a psychodiagnostician is information about situational peculiarities of behavioral and cognitive reactions of people in various test situations. V.N.Druzhinin highlighted the need to consider ecological validity, emphasizing that using standard psychodiagnostic procedures in different test situations may cause completely different interpretations of the results. Ecological validity, as test validity with reference to property measured within a specific situation, in our view, involves the need to answer the questions — how is the test situation itself represented in the consciousness of the research participant, and how authentic are the research results as viewed by the research participant. We compared different measurement cases — "situation of examination" and "situation of client", and classical and adaptive test situations. The measured property were specific capabilities of 150 research participants. We also studied personal features of participants using the methodologies: J.Rotter Locus of Control, Rusalov Structure of Temperament Questionnaire, Spielberger State-Trait Anxiety Inventory and McCrae and Costa Five-Factor Personality Inventory. Mann-Whitney U-test statistical processing demonstrated considerable differences in the adequacy of personal success forecast in a "situation of examination" and "situation of client" (p=0,001). In a "situation of examination" the participants forecast possible failure of the activity more often than in a "situation of client". Comparison of adaptive and classical test situations showed that in adaptive test situation the participants are considerably more optimistic in the forecast regarding the test result (p=0,005). The adequacy of personal success forecast in different test situations is much affected by such personal features of participants as: trait anxiety (p=0,001), neuroticism (p=0,02), extraversion (p=0,03), manifestation of guilt feeling (p=0,04), internality (p=0,01), activity level (p=0,03) and ergicity (p=0,001). Knowing specific components of personal success forecast made by participants with different personal features in different test situations, we will have a more clear understanding of the impact of the measurement procedure context on the efficiency of different psychodiagnostic tools.
A DYADIC APPROACH TO THE RELATIONSHIP AMONG INSECURE ATTACHMENT, CONFLICT RESOLUTION STRATEGIES AND MARITAL SATISFACTION

Bretaña Ione
University of the Basque Country (San Sebastián, Spain)

Alonso-Arbiol Itziar
University of the Basque Country (UPV/EHU) (San Sebastián, Spain)

Recio Patricia

Molero Fernando Spain Madrid

Pardo de Santayana Juan Spain Madrid
Universidad Nacional de Educación a Distancia (UNED) (Madrid, Spain)

Hitherto relationship research has most often considered from an intrapersonal perspective when examining the links between adult attachment, conflict resolution strategies and marital satisfaction. The aim of this study was to analyze dyadically the influence of conflict resolution strategies (demand and avoidant) on marital satisfaction, taking into account the role of insecure attachment (avoidance and anxious dimensions). This research study investigated gender differences in conflict resolution strategies and the influence of these strategies on marital satisfaction. A sample of almost 150 heterosexual couples, involved in exclusive relationships, and ranging from 18 to 72 years old, completed measures of adult attachment, conflict resolution strategies and marital satisfaction. Dyadic and structural data were tested using the Actor-Partner Model (APIM). The model tested show a food fit T (χ2/gl = under 2 (19 df, p < .05), GFI and CFI above .95, and RMSEA = under .08). The results show that avoidance attachment, but no anxious attachment, predict actor and partner’s marital satisfaction. We found gender differences in the use of avoidant as conflict strategy, being men’s avoidant what exerts same influences on their own and their partner marital dissatisfaction, but this was not observed for women that tend to use withdrawal as conflict resolution strategy. Only in the case of men, their relational characteristics and their own conflict resolution strategies predict their own marital satisfaction. In this case, avoidant as conflict resolution strategy has a mediator role between the attachment and marital satisfaction. Demand as a conflict resolution strategy does not predict own and partner marital satisfaction. The results show the importance of embracing a dyadic perspective in the understanding of the role of attachment and conflict resolution in couples. Key words: dyadic, attachment, withdrawal, demand, satisfaction, gender.
Mirror neuron systems have been a target of research across numerous disciplines in neuroscience. There are relatively fewer efforts to leverage established research methods in mirroring to evaluate clinical and health psychotherapeutic techniques for their evidence basis. Dohsa-hou was originally developed for cerebral palsy patients in Japan and demonstrated ways in which body movements are involved in promoting awareness of bodily states. The theory of Dohsa-hou is framed along a general process of intention, effort, and the realization of an intended body movement that conforms to the subjective experience of motor resonance. A distinction about the self rather than another as the agent of control and movement performance change is proposed in Dohsa-hou, and empirical support from clinical case studies in Japan has indicated its psychotherapeutic utility for autism, schizophrenia, and others. However, the psychophysiological basis for the suite of body movements as they are monitored through guided attention and whether they differ from unmonitored forms of executed body movement remains unclear. Toward this end, this study measures EEG mu power responses used in mirror neuron research to compare degrees of self-oriented behavioral intention in action execution between an experimental group of participants conducting Dohsa tasks with guided attention and an active control group performing the same but unsupervised movement tasks. EEG power data (Nihon Kohden, EEG-1100) for 18 participants randomly assigned to each condition were taken at pre- and post-performance of the movements in two-time intervals. Mu responses were calculated and compared as log power ratios (condition/baseline) for each time point at the C3, C4, and Cz regions in accordance with previous studies. Confirmation of the results are forthcoming, but a preliminary independent sample t-test suggested that mean log ratios for the two conditions significantly differed for the T2 post-test C4 (t (16) = -2.777, p = 0.007) and Cz regions (t (16) = -1.845, p = 0.042). This study aims to clarify if greater attention to self-performance via lower mu responses occurred in the Dohsa-hou-based action execution, but analyses are ongoing. Implications for synthesis between psychotherapeutic and psychophysiological research will be discussed.
Performance in implicit cognition tasks is related to both substance use and treatment results. Implicit measures such as word association tasks present ambiguous stimuli and participants can respond to them in either a drug-related or a drug-unrelated way. A tendency to interpret ambiguous stimuli as drug-related is considered an interpretation bias, and it is thought to affect drug consumption because of its role in anticipating rewarding or punishing consequences. It is well documented that interpretation bias is related with higher rates of drug use in non-clinical samples and at-risk populations. However, there are fewer studies of interpretation bias in patients with substance use disorder, and none of them measured changes in interpretation bias after treatment. It has been found that other implicit measures such as attentional bias are reduced after a successful treatment. This outcome is more robust in inpatients than in outpatients, where mixed results have been found. The objective of this work is to provide, for the first time, a pre-treatment – post-treatment interpretation bias measure using a novel task, the Word Association Task for Drug Use Disorder (WAT-DUD). Twenty six outpatients and 76 inpatients participated in the study. Four measures were collected when treatment began and three months later: Drug-related responses, non-drug-related responses, reaction times after ambiguous images and after explicit drug images. The Substance Dependence Severity Scale, the Cocaine Craving Questionnaire-Now and the Multidimensional Craving Scale were also used. Results showed that inpatients had higher interpretation bias scores in the pretest than in the posttest (M=.28, SE=.19; M=.24, SE=.20, p=.016). Interpretation bias in outpatients did not show significant changes. Besides, in the inpatients higher reduction in interpretation bias was associated with better treatment adherence (B(1)=3.62, p=.037). These results are consistent with those found using attentional bias tasks and allow us to investigate other behavioral processes related to the treatment outcome of drug use disorders. This work was supported by the Ministerio de Economía y Competitividad (Spain) under Grant "PSI2016-79368-R".
THE STUDY OF EXISTENTIAL PERSONALITY FULFILLMENT IN THE PROCESS OF PSYCHOTHERAPY

Marina Solobutina
Kazan Federal University (Kazan, Russia)

The content of the study reveals the subjective perceptions and experiences of clients about the changes in the understanding of themselves and the world in the process of existential psychotherapy. Consideration of the qualitative changes in a person’s life as a result of psychotherapy was based on the concept of existential fulfillment. Changes inherent in life in general, in the process of psychotherapy are associated with understanding the difficulties in human life. In existential psychotherapy, there is an opening up of opportunities for experiencing the fullness of human existence and ways of avoiding existential fulfillment. The purpose of the study is to describe the clients’ perceptions of therapeutic change in relation to the experience of existential fulfillment and authenticity in relations with the world. Research methods: the Existence Scale (A. Längle & C. Orgler) and the Phenomenological study of the therapeutic changes of clients in the process of psychotherapy. Sample study: 40 subjects, who are clients of long-term existential psychotherapy. The age of the subjects from 21 to 53 years. Phenomenological research was conducted on the basis of studying the experience of personal psychotherapy of 6 clients. The results of the study. Getting a psychotherapeutic experience has a positive effect on the dynamics of self-distancing indices, self-transcendence, freedom and responsibility. The experience of existential personal fulfillment is interconnected with the degree of human contact with oneself and the ability to interact with the external environment qualitatively. Experiencing the true existential level of living helps a person to be aware of his needs and to be in contact with his feelings. Phenomenological research based on the description of the experience of personal psychotherapy made it possible to reveal some subjective ideas about therapeutic changes. In psychotherapy, the client enters their existence into the therapeutic space. Psychotherapy is also a situation that embodies his being-in-his-world. Comprehending the way of experiencing the therapy itself allows the person to see himself truly in relationship with the world. In existential psychotherapy, a person turns to the subjective perception of the world and himself in the world, and brings about a subjective order in his experiences.
Tourism research suggests that past travel experiences affect present tourist behavior in terms of travel career (Pearce, 1988). This study attempted to investigate the differences in the most memorable travel experiences based on travel career. Six hundred Japanese respondents aged between 36 and 65 years were asked to complete a questionnaire online. The travel career of respondents was divided into five groups based on the results of cluster analysis using three variables: the traveling experience in 47 prefectures in Japan, score on the scales of mastery of travel, and age. The groups were called middle-aged beginners, middle-aged experts, elderly beginners, elderly intermediates, and elderly experts. The results were as follows. (1) For experts, the most memorable travel experiences often occurred overseas or at distant destinations in Japan. (2) For elderly experts, the most memorable travel experiences often involved traveling alone. (3) For beginners, the most memorable travel experiences were regarded as memories with fellow travelers or experiences got refreshed. (4) For intermediates and experts, the most memorable travel experiences were regarded as the turning points in their life. Based on these results, the process through which tourists develop their travel career is discussed.
THE AGGRAVATING INFLUENCE OF PARENTIFICATION ON THE MENTAL HEALTH IN SIBLINGS OF INDIVIDUALS WITH A DISABILITY

Didem Arikan Colak
Mujgan Inozu
Hacettepe University (Ankara, Turkey)

The phenomenon of parentification is defined as the lack of boundaries between the sub-systems that constitute the family system and the assumption that children undertake the roles and responsibilities of the parents in a way that is not suitable for their age and developmental periods (Hooper, 2008). Previous studies have indicated that family stressors such as alcoholic parent, immigration, or disabled member of the family would increase the phenomenon of parentification (Winton, 2002). This study was aimed to examine whether well siblings of children with an disability endorsed different levels of parentification as compared with siblings of healthy children. The present study was also examined the relationship between the phenomenon of parentification and depression, anxiety, somatization symptom cluster (Kroenke et al. 2010) and Obsessive-Compulsive Inventory-Revised (Foa et al. 2002). The results indicated that the parentification score of the siblings of children with disability (M =36.85, SE =1.27) was significantly higher than the score of the control (M =33.28, SE =0.90), t(178)=2.34, p<.05, CI (0.55-6.57). The regression analysis revealed that sub-dimensions of parental parentification toward sibling and parentification toward parent predicted depression, anxiety, somatization symptom cluster (R=0.19, R2=0.04, F(1,17)=6.10, p<.05) and obsessive compulsive symptoms (R=0.26, R2=0.07, F(1,18)=12.99, p<.05). These results provide evidence for increased emotional parentification in well siblings of children with disability, and parentification was meaningfully related to increased depression, anxiety, somatization, and obsessive compulsive symptoms. The results underline the importance of preventive intervention programs that aim to educate the family on adverse influence of parentification mental health.
VIOLENT GAMES AND AGGRESSION: MODERATOR ROLE OF PARENTAL GUIDANCE

Seda Merve Şahin
Sami Çoksan
Middle East Technical University (Ankara, Turkey)
Serpil Yıldız — Çoksan
Ankara University (Ankara, Turkey)

With the spread of digital technology, the effects of video games which have violent content on children's behaviors have been the subject of curiosity. The literature indicates different findings. Some researchers suggest that violent games lead children to aggression while others indicate that playing violent games do not directly cause violence (see, Calvert et. al., 2015; Ferguson, 2015; Lin, 2013; Prescott, Sargent, & Hull, 2017). They demonstrate that there are mediator or moderator variables such as children's cognitive assessment powers, social attitudes towards violence, means of transport for violence and punishment after violence to indicate this relationship even social learning was effective in this context. The current study examines that mediator role of identification with game characters in the violent game (M) in the model and moderator role of parental guidance (W) on all paths between X, M, and dependent variable (Y), aggressive behavior (see, Hayes' Process Model 59, 2018). Our sample was 9 - 17 aged 140 children. We directly asked children about their duration of violent game playing. We used the Identification with the Player Character Scale (Hefner, Klimmt, & Vorderer, 2007) to measure character identification. Participants answer the Social Support Questionnaire for Children (Gordon-Hollingsworth et. al., 2015) for the perceived parental support. The Aggression Scale (Orpinas & Frankowski, 2001 ) is used to measure our dependent variable which is children's aggressive behavior. Sample size analysis shows that it should be at least 138 participants total. According to the expected results, we think that the duration of violent video games play and identification with game characters in them will predict children's aggressive behavior; however, we expect that the effect of the identification on aggressive behavior will decrease when perceived parental guidance increases. The results showed that when duration of violent game playing rises, identification with game character increases. On the contrary of our hypotheses, neither duration of violent game playing, nor identification with game character predict aggressive behavior. Effect of the constant on both identification with game character and aggressive behavior is significant. Therefore, future studies should leave classical violent game and aggressive behavior association and focus new predictors.
INHIBITORY CONTROL AND EXTERNAL BEHAVIOR IN CHILDHOOD

The aim of the present study was to examine the relationship between inhibitory control and external behavior. External behavior may occur at both behavioral and cognitive levels. Behavioral level studies typically involve inhibition and motor responses and impulse control. Cognitive level studies focus on the mental processes of attention and memory. Childhood externalized behavior is being increasingly viewed as a public health problem. The construct of external behavior refers to a combination of behavior problems. They are manifested in children's behavior and reflect the surrounding environment in a negative way. Two groups of children participated in this study. All participants attended elementary school and used Bulgarian as their mother language. The following methods are used: Inhibitory control checklist rated by parents; neuropsychological assessment. This study demonstrates that primary school children with external behavior show impairment in inhibitory control, irrespective of cognition and neuropsychological deficits.

AMBITION AS A MOTIVE OF SOCIAL BEHAVIOR

Ambition is a desire to become a significant and recognized person to other people for the real achievements and actions. As a motivational formation, ambition directs human activity to socially significant achievements — success in life and social "top", professional and career advancements, fame, leadership positions and power, etc., which provides as a result the recognition of the personality of an ambitious man. As an achievement motivation ambition includes strong desire for self-actualization and self-development; striving to achieve more than parents; striving to be better than others; low daydreaming; aspiration to win; motivational tension. Ambition is not associated with the availability of inclinations and abilities, with human intelligence and knowledge, etc. It is a kind of «energy center» that makes a person strive for achievements in the chosen field.
THE RELATIONSHIP OF VULNERABLE NARCISSISM WITH LIFE SATISFACTION & PERCEIVED SOCIAL SUPPORT IN DYSFUNCTIONAL INSTAGRAM USERS

Deniz Köroğlu (Ankara, Turkey)
Yusuf Coşku İnceler (Ankara, Turkey)
Çankaya University Department of Psychology Student

Merve Topcu (Ankara, Turkey)
Çankaya University Department of Psychology Faculty member

Instagram use affects individuals’ well-being. Previously found that there is a significant and positive relationship between Instagram using and narcissism. Vulnerable narcissism (VN) is related to socially avoidant behaviors, sensitivity to failure and being criticized, the existence of high levels of anxiety, and feelings of emptiness and inadequacy (Casale, Fioravanti, & Rugai, 2016). Research suggested negative association among VN, life satisfaction (LS) (Ng, Cheung, & Tam, 2014) and perceived social support (PSS) (Dickinson, & Pincus, 2003). However, research on the relationship between Instagram use and VN is limited (Casale, Fioravanti, & Rugai, 2016). The relationship among VN, LS, and PSS in Instagram users was examined. A cross-sectional online survey was conducted. 246 Instagram users who are within the age range of 16 and 30 and reported decrease in daily functioning in their life due to Instagram use enrolled in the study. Informed consent, socio-demographic form, the Hypersensitive Narcissism Scale, the Satisfaction with Life Scale and the Multidimensional Scale of Perceived Social Support were given to the participants. Correlational analysis revealed that VN is significantly and negatively associated only with friend dimension of PSS (PSS – F) ($r = -.18, p < .01$). In addition, Linear regression analysis demonstrated that PSS – F ($t = -2.85, p < .01$) also significantly predicted VN ($F(1, 244) = 8.11, p < .01$). $R^2$ revealed that perceived social support from friends explained the variance of VN with the proportion of 3%. That is, perceiving low social support from friends may increase the severity of VN or may be an eventual consequence of vulnerable narcissistic relational patterns. It can be said that significance of only friend dimension could be related to university students sampling. Also, Individuals with vulnerable patterns may affect negatively more from Instagram even if their frequency of account use is less. In addition, those with vulnerable narcissistic patterns may perceive themselves as dysfunctional rooted from feelings of emptiness and inadequacy. Since the Instagram reinforces the ideal, they may feel more failure, emptiness and inadequacy resulting higher anxiety so they may externalize and blame Instagram for their dysfunction. Therefore, it can be concluded that those with vulnerable narcissistic patterns may be influenced negatively more than the grandiose ones so their frequency and time spent on Instagram may be found less or insignificant in the literature regarding vulnerable narcissistic patterns.

Key words: Vulnerable narcissism, Social support, Instagram
HOW TO FOSTER INTEREST AND MOTIVATION TOWARD NATURAL SCIENCES: A CASE STUDY

Elena Vysotskaya
Maria Yanishevskaya
Psychological Institute of Russian Academy of Education (Moscow, Russia)

Svetlana Khrebtova
Moscow Pedagogical State University (Moscow, Russia)

Anastasia Lobanova
School 2101 Leading teacher (Moscow, Russia)

Iya Rekhtman
Introchemist Association Coordinator (USA Morrisville, NC)

Cognitive interests and intrinsic motivation are recognized as an important condition and an ultimate goal of effective teaching and successful learning. The Developmental Instruction considers an interest as the phenomenon when students grasp the big idea of a whole topic, so they can look at each particular part as a detail of a big system. From this point of view, to design an innovative course means to deliver students a whole picture from the start — how people think and work in this domain and what opportunities can bring the learning of it. Unfortunately, traditional teaching can bring such insights, at the best case, at the end of the course rather than at the start.

According to Davydov’s approach, students can acquire the look from inside the system if they reconstruct cultural ways of human thinking in their own goal-oriented meaningful activity which triggers the process of concept formation. For teaching natural sciences this means to have a long introduction where students try on the role of a cultural grown-up who transforms natural materials into objects and instruments that serve human purposes. We test this hypothesis by using three modules of previously designed our introductory science course “NartURE” for 5-graders (Vysotskaya et al., 2017) to teach 3-graders (18 students, 9-10 year-olds). The first "Shipwreck-survivors" game showed that at the start students took ready-made objects to the "island" and were not very interested in the game. At the end they took instruments and rare materials and could not stop playing — they endlessly pondered over the strategies to make things to survive. Some students, who joined to the class in spring, acted the same way as our students did at the beginning. Thus, we observed a shift from the position of “users” to position of “makers” and a boost of interest throughout the school year. Vysotskaya E., Khrebtova S., Lobanova A., Rekhtman I., Yanishevskaya M. (2017) Text-lab-model triad for testing ancient technologies: introductory science course for 5-graders. In EAPRIL 2017 Conference Proceedings. Retrieved from: https://www.eapril.org/sites/default/files/2018-04/ConfProceedings2017.pdf
PSYCHOLOGICAL CORRELATES OF EMOTIONAL AND PERSONAL WELL-BEING

Galina Glotova
Lomonosov Moscov State University (Moscow, Russia)

Larisa Karapetyan
Ural Federal University (Yekaterinburg, Russia)

The objective of the research was to explore some psychological correlates of emotional and personal well-being. Design: a quasi-experimental study was conducted. The correlation analysis (by Spearman) was applied to the data obtained. The "Self-assessment of Emotional and Personal Well-being" (SEPWB) research tool (Glotova, Karapetyan, 2009) were offered to adults. The participants had to assess themselves on a seven-point scale, using the following parameters: "happy", "lucky", "optimist" (positive emotional component A); "successful", "competent", "reliable" (positive personal component B); "pessimistic", "unhappy", "envious" (negative component C). The results for each of the nine parameters were analysed and the general index of SEPWB (A+B-C) was calculated. The following research tools were also used: the Myers Briggs Type Indicator (MBTI - F; EI scale; the high scores on the EI scale mean the introversion, and the low scores mean the extraversion); the Rogers-Diamond Test of Social-Psychological Adaptation (SPA). The correlation (n=857) of the general index of SEPWB (A+B-C) with the continuous "extroversion-introversion" (EI) scale of the MBTI-F, is statistically significant (r = -0.280; p < 0.001).

All of the six positive parameters of the SEPWB showed negative correlation (p<0.001) with the EI scale, i.e. with introversion. The negative parameters, on the contrary, had shown positive correlation with introversion. These results correspond to the results obtained using other constructs of well-being and other research tools (Schmutte, Ryff, 1997; Keyes, Shmotkin, Ryff, 2002). Multiple correlations (by Spearman) were revealed (n = 1201) between the nine parameters and the general index of "Self-Assessment of Emotional and Personal Well-being" tool and the integral indicators of the Rogers-Diamond Test SPA. The results showed the positive parameters and the general index of self-assessment of emotional and personal well-being as positively correlated with the six integral indicators of the SPA, while the negative parameters of emotional and personal well-being correlated negatively with the six integral indicators of the SPA. People with high scores of the positive parameters and the general index of self-assessment of emotional and personal well-being are characterized by extraversion, high scores of adaptation, self-acceptance, and acceptance of others, emotional comfort, internality, need to dominate.
FORMATION OF META-SUBJECT COMPETENCIES BY MEANS OF SCHOOL SUBJECCTS

Irina Ulanovskaya
Elena Vysotskaya
Maria Yanishevskaya
Psychological Institute of Russian Academy of Education (Moscow, Russia)

Studying the problem of interrelation between education and development, Vygotsky emphasized the leading role of education. Meta-subject results ("learning to learn", cognitive reflection, logical operations, planning, understanding of the text, communication, social interactions and others) are indicators of cognitive development in education. The goal of our study was to identify the factors contributing to the quality of the developing meta-subject result. A group of researchers in the Psychological Institute of Russian Academy of Education (Moscow, Russia) worked out a set of methods to evaluate meta-subject educational results and tested about 2650 junior school graduates in 57 Moscow schools. Diagnostics showed, on the one hand, a low level of these competencies, and on the other hand, permitted to identify a group of students with statistically higher results. The level of meta-subject competencies in this group is 57% (compared to 38% on average); some results are above by 1.4 – 1.8 times. These students were trained in the program of developmental education (B.Elkonin- V.Davydov). The main difference between these programs and the traditional ones is the change in the content of training within the framework of the activity theory, in particular, the use of models as a means of concepts’ analysis and orientation in problem solving. School subjects in developmental education are constructed so as to reveal to the student the subject and activity bases of the new field of knowledge as the sphere of his own cognitive development. The obtained results confirm our hypothesis that meta-subject competences can be formed by means of organizing school subject learning activity. The means that support meta-subject effects of school subject education are mediation of problem solving by special models and schemes of concepts and of forms of students’ joint learning activity.
JEALOUSY, ANGER AND INTIMATE ABUSIVENESS: A SYSTEMATIC REVIEW

Silvia Ubillos Landa
Sandra Nieto González
Universidad de Burgos (Burgos, Spain)
Alicia Puente Martínez
Universidad del País Vasco ((San Sebastián, Spain))

Intimate partner violence increasingly has been recognized as associated with significant morbidity and mortality, particularly among women. The great majority of interventions aimed at prevention and treatment of intimate partner violence (IPV) in Spain focus on negative emotions. This study reviews the available evidence of anger and jealousy. PRISMA statement protocols were used. Abstracts were searched from different relevant databases using appropriate database-specific keywords. Regarding anger 1151 articles were found. After reviewing the title and abstract, 54 potentially relevant articles were selected. Regarding jealousy, 793 articles were found, and 77 potentially relevant articles were selected. Three studies for anger and two for jealousy were eliminated because they were not significant. Finally, following the inclusion and exclusion criteria 8 studies related to anger and 11 for jealousy were included. The r statistics were generated using Excel macro program (Wilson, 2016). The Zr mean effect of anger and jealousy on aggression was calculated. Results showed that 12.5% (n=1) of the 8 studies of anger has a low relation with violence (lower than .19), 12.5% (n=1) reported a moderate effect size (between .20 and .29), and 75% (n=6) a large effect size (higher than .30). Regarding jealousy (k=13), results show that 7.7% (n=1) of the total of studies presented a low effect, while 30.7% (n=4) reflected a medium level effect size. Finally, 61.6% (n=8) presented a large effect. The mean r for the 13 jealousy studies were high (.38), and for the 8 anger studies were medium (.28). There are multiple empirical studies that demonstrate anger and jealousy are significantly and positively associated with IPV aggression. In this review jealousy was one of the strongest predictors of psychological and physical IPV perpetration, whereas, anger also was related with perpetration even though it effect size was smaller than jealousy.
THE IMAGE OF A TERRORIST IN THE REPRESENTATION OF MODERN YOUTH

Olesya Shipitko
South Federal University (Rostov-on-Don, Russia)

In the modern world the phenomenon of terrorism poses a serious danger to society, since it is based on methods of psychological influence associated with the achievement of a negative effect aimed at civilians. The main goal of terrorists is to destabilize social consciousness. This goal is achieved with the help of various news content. Young people are most susceptible to destructive propaganda, which has a negative effect on their personal and professional development. In recent years the problem of terrorism has been investigated in various scientific fields. Psychologists are especially interested in the social and psychological aspects of this issue. Therefore we obtained empirical data from 100 young people living in the city of Rostov-on-Don, aged from 18 to 25 leading a socially active lifestyle. The study was carried out in blank form using three questionnaires and one author form, developed on the basis of the method of semantic differential. The questionnaire revealed the structural components of the external image and personality traits of a terrorist in the view of young people. The questionnaire consists of three blocks: socio-psychological characteristics, behavioral characteristics and appearance. To process the results of the survey used the procedure of quartering. The mentioned questionnaires were used to obtain information about the benevolence hostility and life-meaning orientations of the respondents. Hypotheses were tested that youth’s perceptions of a terrorist’s image have a core (socio-psychological and behavioral characteristics) and periphery (appearance), and the hypothesis was confirmed that there is a connection between the personality characteristics of young people and their life-meaning orientations, which determines the nature of ideas about the image of a terrorist. The results showed that the image of a terrorist in the representation of young people is less associated with its external attributes. In the minds of young people, stereotypes are not formed towards representatives of certain nationalities and confessions in appearance. It has been established that the indicators of young people’s meaningful life orientations are related to the level of expression of their hostility and benevolence which determines the formation of the image of a terrorist in consciousness.
For learning to be effective, learners need to regulate their own motivation levels to ensure that these levels do not decrease (e.g., Wolters, 2003). Such motivational regulation is examined in the field of self-regulated learning research (Zimmerman & Schunk, 2011); however, there are few studies concerning motivational regulation in cooperative learning. To examine the relationship between motivational regulation strategies and situational motivation in cooperative learning, a self-report questionnaire was administered to 16 undergraduates from two universities before and after cooperative learning in class. General usage trends in motivational regulation strategies in cooperative learning were measured using a pre-questionnaire, and situational motivation and engagement during cooperative learning were measured using a post-questionnaire. The results of a correlation analysis indicated that the general usage trend of motivational regulation strategies was not correlated with engagement during cooperative learning. Next, we analyzed the relationship between motivational regulation strategies and situational motivation in cooperative learning qualitatively. The two students with the highest scores for the general usage of strategies and the two students with the lowest scores were selected for qualitative analysis. The results indicated that situational motivation during cooperative learning was relatively more stable in the two students with the highest scores compared to the two students with the lowest score, especially in the latter-half of learning. These results indicated that motivational regulation strategies play an important role in stabilizing situational motivation, especially in the latter stage of cooperative learning. This is consistent with the results of previous studies revealing that motivational regulation strategies are correlated negatively with instability of situational motivation during lectures (Umemoto & Inagaki, in press). There are few studies that examine motivational regulation strategies in cooperative learning situations. Thus, the present study, which examined the effects of motivational regulation strategies on situational motivation in cooperative learning, is meaningful for self-regulated learning research.
THE IMPACT OF BABYSITTERS ON THE FAMILY DYNAMICS

Nazli Akay
Basak Sahin Acar
Middle East Technical University (Ankara, Turkey) (Turkey, Ankara)

A large body of research has pointed at the child’s early years as an important period for healthy psychosocial development (Sroufe & Rutter, 1984), and therefore it is crucial to study the actors and factors that shape the course of a child’s development. In urban families, one such actor is the nanny. Although nannies occupy a substantial place on a cared child’s daily life, the effects of nanny care on the child’s development are mostly unknown. In addition, it is important that nannies be thought of as a part of the family system, who interact with most of the family members on a daily basis (Akay, 2013; Barnhart, Huff, & Cotte, 2014). In the present research, we aimed to obtain more detailed information about the nanny-family and nanny-child interactions through the self-reports of mothers and fathers of children between the ages of 1.5 and 5. The parents have been given an online survey, which included questions regarding the childcare responsibilities and relationship dynamics of the family both when the nanny is present and absent, as well as Perceived Partner Responsiveness Scale and Child Behavior Checklist. The preliminary results showed that the mothers who spent more time with the cared child evaluated father-child and babysitter-child relationships more negatively. The data collection for the present research is ongoing, the full set of results are to be presented in the congress.
TEMPERAMENT TYPES CORRELATION WITH MENTAL STATES SELF-REGULATION METHODS

Alexey Nazarov
Kazan Federal University (Kazan, Russia)

At the present time, the self-regulation of mental states is a current area of science. While not an easy task, skillful management of one’s own condition increases the productivity of a person, his activity, increases the general psycho-emotional state. The study of the relationship of types of temperament and methods of self-regulation of mental states will allow identification of the mechanisms of influence on the self-regulation of the state. In our research, 59 students of the Kazan Federal University took part. Their ages ranged from 17 to 19 years of both sexes. We used: 1. the personal questionnaire of G. Ayzenck EPI, 2. the questionnaire for determining the methods of self-regulation of mental states (Prokhorov AO, Nazarov AN). To obtain statistically reliable data, we used Spearman’s nonparametric correlation and Pearson's parametric correlation. The data was processed using the SPSS 19.0.6 statistical package. We obtained the following data: correlation between the low level of extraversion and the method of self-regulation “Reflection-reasoning” and “Communication” was revealed at the level $p = 0.05$, which means that introverts, due to their temperament properties, tend to concentrate inside themselves, at the same time they can communicate with familiar people to seek social support or simple communication. With a high level of extraversion, there is a correlation with the “Shutdown-Switching” self-regulation method, which means that it is easier for extraverts to switch to something else in order to “take a rest” from a situation that causes negative states. There is also an interconnection $p = 0.05$ of a high level of neuroticism with the self-control method “Communication”. The presence of an object for “splashing out” of one’s experiences is necessary both for the introvert and for the extrovert. For an introvert, most likely, it will be close people, but for an extrovert there can be both close and completely unfamiliar people. Studies of a low level of neuroticism and methods of self-regulation did not provide a statistical link. We can assume that this is due to the fact that people of a given level of neuroticism can use a wider range of methods of self-regulation.

DEVELOPING COGNITIVE ARCHITECTURE OF A MULTIMODAL WHEELCHAIR ROBOTIC SYSTEM FOR DISABLED PEOPLE

Sergei Shishkin
Valery Karpov
Artemy Kotov
Boris Velichkovsky
National Research Center «Kurchatov Institute» (Moscow, Russia)

Different concepts for a robotic wheelchair design for disabled people are discussed and tested. The selected approach is based on a cognitive multimodal user interface to maximize autonomy of the wheelchair user and to allow him or her communicating intentions by high-level instructions. Manual, voice, eye-tracking and BCI signals can be used for strategic control whereas an intelligent autonomous system can perform low-level control. Our report describes novel solutions that have been tested on real robotic devices, as well as the prospects for using the EEG/MEG, fNIRS, myographic, and eye-tracking technologies based on registration of parameters of human psychophysiological systems.
EMOTIONAL EXPRESSIONS RECOGNITION IN DUAL DIAGNOSED PATIENTS

Óscar Martín Lozano
Sergio Navas
Manuel Sánchez-García
Ana Maria de la Rosa
University of Huelva (Huelva, Spain)

According to the somatic marker theory, substance addiction is associated with abnormal activation and integration of emotional states (Verdejo-Garcia and Bechara, 2009). One main component of adaptive emotional functioning relevant to addiction maintenance and treatment is the ability to recognize basic emotions expressions. The scarce evidence on emotion recognition in addiction show that polyconsume is associated to poorer recognition (Fernández-Serrano et al., 2010). Moreover, a number of behavioral studies have revealed a pattern of alterations in facial emotion recognition involved on associated disorders such as borderline personality disorder (Domes, Schulze, & Herpertz, 2009), antisocial personality disorder (Marsh & Blair, 2009), and emotional disorders (Surguladze et al., 2004). However, up to our knowledge, there are no studies analysing the summative impact of comorbidity (dual diagnosis) on emotional recognition. The aim of this study is to analize the execution in the Ekman facial recognition task on a group of substance use disorder (SUD) patients, comparing results between patients with and without comorbid disorders. Cross-sectional survey design. The sample consisted of 80 patients under treatment at the Addiction Care Center of Huelva (Spain). 21 of patiens have a comorbid concurrent disorder. Ekman Facial Expressions Test was used to analyze the recognition of emotions. Chi-square and mean comparison tests were used to compare the sociodemographic and emotional recognition. There were no statistically differences between the three groups on sociodemographic variables (gender, age, employment, level of studies and marital status). Worse execution in Ekman Facial task was observed in comorbid patients for anger (t = 2.43, p =.017). Reaction times were higher on comorbid patients for recogntion of joy (t = 2.52, p =.014), anger (t = 3.40, p =.001) and sadness (t = 2.85, p =.005). The results show that comorbidity on SUD patients has higher impact on the recognition of emotions. Specifically, difficulties on recognition of anger and sadness on comorbid patients could have an impact on social interactions involved on therapeutic progress surveillance. Further research is needed to analise the differential impact of each of comorbid pathologies.
MUSIC FOR HEARTBEAT RECOVERY AFTER ACUTE STRESS: THE EFFECT OF DIFFERENT TYPES OF MUSIC AND VERBAL SUGGESTION

Anastasia Katsouli
Chrisanthi Nega
Deree College — The American College of Greece
(Athens, Greece)

The purpose of this study was to examine the stress reducing effect of different types of music when heard through passive listening and in combination with verbal suggestion. We expected that research supported music would lead to more stress reduction in comparison to preferred music, whereas verbal suggestion would enhance the stress reducing effect of each type of music. Undergraduate college students (N=100) performed a challenging three-minute mental arithmetic task and were randomly assigned to either sit in silence or to listen to different types of music either through passive listening or in combination with verbal suggestion. The study employed a 5x3 mixed ANOVA with intervention being the between subject’s variable (research supported music VS preferred music VS research supported music in combination with verbal suggestion VS preferred music in combination with verbal suggestion VS control group) and the time of Heartbeat Measurement (BPM) as the within subjects (pre, stress and post). All music interventions led to significant stress reduction (p < 0.01). Participants who listened to research supported music combined with verbal suggestion experienced the greatest degree of relaxation (p < 0.01), followed by participants in the research supported music intervention (p < 0.01). Findings provide experimental support that music prevents stress-induced changes, the robustness of which is enhanced in the presence of verbal suggestion. Implications of the study, limitations and suggestions for future research are discussed.

OLDER OUTPATIENTS’ NEGATIVE EXPERIENCES OF DEPRESSION-RELATED HELP-SEEKING AND DISCRIMINATION-RELATED COPING STRATEGIES

Tsai Yun-Fang
Chang Gung University (Tao-Yuan, Taiwan)

Given the increasing number of older people worldwide, suicide in this age group has become a global healthcare issue. The most significant predictor of suicide for older people is depression. However, older people do not readily and willingly undergo depression screening in clinical settings. Stigma could be an important barrier to help-seeking behaviors in people with mental illness. The purposes of this study were to explore older outpatients’ negative experiences of depression-related help-seeking and discrimination-related coping strategies. A qualitative research design was used. Participants were recruited from geriatric, medical, and psychiatric clinics at four hospitals in northern Taiwan. Data were collected through individual in-depth interviews using a semi-structured interview guide. Verbatim interview transcripts were analysed using ATLAS.ti, version WIN 7.0. Sixty-seven participants (N=100) had suffered from depression but only nine had experienced discomfort/discrimination while seeking health care for depression. They felt other people were afraid of them, unfriendly, and avoided having any interaction with them. They commonly used passive strategies (e.g., forget it, leave it alone) to deal with. Our results could help health care providers to have a better understand about older adults’ negative experiences about depression-related help-seeking and provide a better care this group in the future.
THREE BALTIC COUNTRIES AND RUSSIAN UNIVERSITY STUDENTS’ ATTITUDES TOWARD FOREIGNERS

Kristi Kõiv
University of Tartu (Tartu, Estonia)

The present study examines similarities and differences between Estonian (N=118), Latvian (N=101), Lithuanian (N=101) and Russian (N=100) university students’ attitudes towards foreigners. Open-end questionnaire data results using quantitative content analyze from a sample of 420 students revealed that that students’ conceptual definitions of foreigners differ from the common elements of definitions of foreigners. Three Baltic countries university students were generally open and tolerant toward foreigners in the area of individual differences evoked from cultural enrichment, but their attitudes show some variation depending on the nationality of respondents. Students in three Baltic countries were agree, that foreigners have influenced them more positive than negative way, but the reasons of influence was different: Lithuanians empathize more sympathy and helping behaviour and Estonian more enlargement of knowledge’s with increase of tolerance. Acceptance or un-acceptance of foreigners depends on the level — foreigners were more accepted in personal level and un-accepted in cultural level (violence, discrimination, religious extremism).

THE RELATIONS BETWEEN CONSTRUAL LEVEL AND TIME ESTIMATION: THE EFFECTS OF INTENTIONALITY AND SUBJECTIVE TIME PERCEPTION

Şeyma Sevgican
Gülen Ünal
Ankara Yıldırım Beyazıt University (Ankara, Turkey)

Construal level theory tries to explain the relationship between psychological distance and one’s thoughts about events, which could be either concrete or abstract. According to this theory, the mind is defined as a double-pole axis and the ends of this axis are considered as concrete and abstract mindsets. Individuals in the concrete mindset consider the concrete details of events as important and deal with the event by using its smaller pieces. However, the abstract mindset individuals focus on the central and main features of the event. The main difference between these two axes is the perception of the events (Trope & Liberman, 2010). In this study, it is aimed to investigate the role of concrete and abstract mindset in prediction of duration for an activity. Researches have shown that individuals tend to underestimate the time they need to complete a task. This phenomenon, usually referred as planning fallacy, has been examined in different ways. Excessively optimistic time estimates are mostly due to cognitive characteristics about how individuals create scenarios (Kahneman & Tversky, 1979). It is expected that time estimation will differ according to construal level, subjective time perception and intentionality (having a goal in the task). To test this hypothesis, an experiment was conducted. The time perception in the experiment was studied by verbal time estimation. Besides, mindset and intentionality were manipulated. The results showed that when the subjective time perception is low and there is a goal in the task, abstract mindset individuals estimated the time longer than concrete mindset individuals do. On the other hand, when the subjective time perception is high and there is no goal in the task, abstract mindset individuals estimated time shorter than concrete mindset individuals do, but, when the subjective time perception is high and there is a goal in the task,
abstract mindset individuals estimated time longer than concrete mindset individuals do. It means that when the subjective time perception is high, abstract mindset individuals’ time estimation increases because of the goal in the task. The results and limitations of the study are discussed within the context of the related literature.

PERCEPTION, RECOGNITION AND STRUCTURING OF EMOTIONS THROUGH EMOJIS.

Liliya Babakova
University of Plovdiv (Plovdiv, Bulgaria)

Advances in technological development have led to increased interpersonal interaction, including emotional expression through digitalization. Most of these digital systems offer their users the use of emojis (digital facial expressions used to express ideas, emotions, etc.). Some research finds that the increase in the available emojis causes confusion as to what these images mean, what emotions express and how to apply in daily communication. The present study aims to determine how young people perceive certain emojis, whether their ideas about certain emoticons match Facebook definitions, how often they use them and how they structure them. Methods: 33 emojis were selected, expressing emotions such as joy, love, sadness, amazement, anger, etc. People surveyed had to group them together and appreciate how often they use them in their daily life. Another 21 emojis expressing emotions were selected and a Facebook emoji list definitions was proposed separately, and the subjects surveyed had to determine which emoji corresponded. The sample consisted of 178 students aged 20-22. It has been found that the most commonly used emojis are those which express love and joy, and the most unused — disgust and fear. The cluster analysis of the emojis grouping has shown that the participants in the experiment divide emojis into three main categories: the first category emojis are associated with positive emotions such as love, joy, happiness. The second category is negative emotions — fear, disgust, exhaustion, disappointment, anxiety, sadness, embarrassment. And the third category includes emojis expressing “unpredictable” emotions such as surprise, but also negative emotions such as shame, anger, etc. The results of recognizing emojis on Facebook definitions have shown that most respondents do not recognize most emojis as Facebook has defined them. It can be concluded that most people use emojis expressing positive emotions, for two reasons: first, when sending emojis expressing joy or love, people want to be sure that their message will be properly understood and accepted positively and second, sending mostly positive emoji, individuals tend not to show vulnerability that they do not experience negative emotions.
CONFLICTOLOGICAL COMPETENCE: STUDY OF THE STRUCTURE

Irina Belasheva
Marine Esayan Russia Stavropol
FSAEI HE (Stavropol, Russia)

Conflictological competence is realized by competencies and is a multi-level system of motivational, cognitive and behavioral components of conflictological readiness as a practical readiness to resolve conflicts through a set of skills to objectively reflect and understand the conflict, to predict and assess its consequences, to prevent and resolve the conflict; and conflict resistance as the ability of a person to optimally organize their behavior in difficult situations of social interaction, as well as the mechanisms of their formation and implementation. The aim of the research is to study the components of conflictological competence in terms of their manifestation in University students enrolled in different courses. Research methods were: «Strategies of behavior in a conflict situation» (K. Thomas), «Aggressiveness and Proneness to Conflict» (E.P. Ilyin and P.A. Kovalev), «Behavior Self-Regulation Style» (V.I. Morosanova), "General communicative tolerance" (V.V.Boyko), method of diagnostics of the level of development of reflexivity by A.V. Karpov, «Psychological diagnostics of coping-mechanisms» of A. Heim 

Statistical technology: Kruskal-Wallis H difference criterion, factor analysis. The study involved 150 people (17 – 23 years) who are students of 1 – 4 courses of the North Caucasus Federal University. According to the results of factor analysis of the values of psychological variables-components included in the structure of conflictological competence, 5 empirically representative groups of parameters (factors) were identified. Designations of factors (conflictological competencies) are given in accordance with the analysis of the contribution of variables to the factor structure: sthenic intrapersonal-oriented conflictological readiness, emotive-personal conflictological readiness, constructive-activity conflictological competence, interpersonal-oriented conflictological competence, interpersonal conflict potential. The analysis of differences (Kruskal-Wallis H-criterion) in the level of statistically structured conflictological competences between student courses showed their significance in 3 competences: — a tendency to increase sthenic interpersonally-oriented readiness of conflictological from 1-St to 4-th course; — significant development of interpersonal-oriented conflictological competence to the 4th course; — the maximum development of the competence "interpersonal conflict potential " is in the 3rd year, and it abruptly begins to gain noticeable weight from the minimum positions from 2-d course. By the 4-th course, the internal readiness to enter into conflict is reduced.
LINKING INTERPERSONAL EMOTION REGULATION TO WORK RELATED OUTCOMES: THE ROLE OF AUTHENTIC EXPERIENTIAL CLIMATE AND EXTRAVERSION

Yaşar Kose
Mehmet Peker
Gülgün Mese
Ege University (Izmir, Turkey)

The current study aims to investigate the effect of intrinsic interpersonal emotion regulation on the relationship between work-related negative predictors (i.e. job stress and work conflict) and detrimental outcomes (i.e. ego depletion, need for recovery and intra-organizational surface acting). Building on Affect Climate Model (Parke & Seo, 2016), we also hypothesize that organization-level authentic experiential climate acts as a moderator by facilitating the help-seeking for emotion regulation in the workplace. Moreover, we posit that employees with high extraversion will more readily reach coworkers for emotion regulation, which in turn will decrease negative work outcomes. We aim to reach 250 white-collar employees across 35 organizations to test organization-level authentic experiential climate’s effect on individual-level relationships. Hierarchical linear modeling will be used to test the hypotheses. We hope that the results will shed light on the buffering effect of workplace interpersonal emotion regulation against negative work events and on the importance of authentic experiential climate and extraversion in explaining under what circumstances interpersonal emotion regulation at workplaces thrives.

IS INTERACTING WITH A HIGH STATUS INDIVIDUAL REALLY EXHAUSTING? THE EFFECTS OF SOCIAL STATUS ON SELF-REGULATION.

Chien-Ru Sun
National Chengchi University (Taipei, Taiwan)

The strength model of self-control suggests that individuals will invest more self-regulatory resources on an important self-control task, and therefore impair the performance on the subsequent task. The present research investigated the prediction that interaction with high status individuals may temporarily impair cognitive functioning. Participants were randomly assigned to a 2 (IAT bogus feedback type: status concern vs. performance concern) x 2 (confederate status: high vs. equal) experimental design. The main dependent measure was the performance on the subsequent number-comparing task. The result revealed a significant interaction effect. Participants who were told that they had unconscious hostility toward high status people and then interacted with the high status confederate performed significantly worse on the subsequent number-comparing task. That is, when interacting with high status individuals we often try to posture and present ourselves in a better way, and thus consume more inner resource and then affect subsequent performance. Possible cultural influence and Implications are discussed.
A COGNITIVE MODEL OF ANOREXIA NERVOSA: EATING DISORDERS AS A MALFUNCTION OF COMPETING NEEDS

Ruben Hovhannisyan
Tomas Jurcik
Higher School of Economics (Moscow, Russia)

Recent advances in neuroscience on competing need states and social pain are explored and a testable theoretical model is developed to help explain behaviours and cognitions related to Anorexia Nervosa and related Eating Disorders. The author analyzed literature relevant to Social and physical pain correspondence, fear mechanism, pain suppression, and eating disorders. Research over last decades has shown that physical and social pain have similar neuronal mechanisms. Thus rejection has similar neuronal activity as acute pain, and socially isolated people have higher expression of genes involved in inflammation. Recent research on mice showed that hunger can suppress inflammatory pain. Based on that hunger might also suppress ‘inflammatory’ social pain which is the pain of loneliness or feelings related to perceived insufficient social support. A mental simulation of behavior related to hunger addiction shows that it is similar to the behavior of patients with Anorexia Nervosa. Thus, if hunger is suppressing pain of loneliness, eating should turn off that pain suppression. This, due to the short interstimulus interval may create a strong connection between pain and food via stimulus-response learning. Unexpected pain linked to food in turn will activate fear mechanisms, and make the person anxious shortly before and after food consumption. Irrational fear of food will lead to different behavioural coping styles of behavior associated with food such as avoidance, purging or excessive exercising, and trigger different negative automatic thoughts related to its consumption (e.g., “I don’t like this food” or “I am fat”). Viewing Anorexia Nervosa from this novel cognitive-behavioural perspective could help better explain eating disordered behaviour more generally, interactions among the different risk factors, contributing causes, and demonstrate more clearly how anorexia nervosa related behavior regulates affect. The presentation will explore how this model may be tested experimentally and will discuss implications for psychotherapy.
A LONG-TERM FOLLOW-UP THE HEALTH-RELATED QUALITY OF LIFE ON TAIWANESE PATIENTS WITH COLORECTAL CANCER

Mei-Nan Liao  
Chang Gung Memorial Hospital (Taipei, Taiwan)

Colorectal cancer is the most common cancer in Taiwan. Health-related quality of life is an important parameter in cancer care. Little is known about the long-term effect on the quality of life in Taiwanese patients with colorectal cancer. This study aimed to investigate the changes in quality of life and related factors in colorectal cancer patients over 2 years after diagnosis. Prospective and longitudinal design was used in the study. 121 participants were recruited from four hospitals in Taiwan. Data was collected at six time points: one week after diagnosis (baseline, T0), the start of treatment (T1), and 3 months (T3), 6 months (T4), 12 months (T5) and 24 months (T6) after diagnosis. Subjects were assessed by the following questionnaires: EQ-5D, EORTC QLQ-C30, EORTC QLQ-CR29, KPS, and background information. The results indicated patients persisted in having moderate levels of quality at T0-T5. The levels of general quality of life (EQ-50), QLQ-C30 and disease-related quality of life (QLQ-CR29) were significant lower at starting treatments (T1) than the other of time points. Amongst all of the symptoms related disease and treatment, problems with anxiety, pain in buttocks/anal area/rectum, dry mouth, physically less attractive affected the quality of life of patients most severely. The time since diagnosis, the levels of KPS, and the levels of physical and roles function, pain and diarrhea in QLO-C30, and the levels of sore skin, emotional distress in QLQ-CR29 could predict the general quality of life. Therefore, the healthcare staffs need to develop and implement psycho-educational intervention to prevent or minimize adverse outcomes related to cancer diagnosis and treatments, so as to improve their quality of life.

METACOGNITIVE STRUCTURES OF PATIENTS WITH AND WITHOUT CANCER

Isil Bilican Yurteri  
Hacer Hicran Mutlu  
Hasan Huseyin Mutlu  
Mahmut Gumus  
Istanbul Medeniyet University (Istanbul, Turkey)

There is very little research examining cognitive structures and thinking patterns of patients in comparison to a control group. This study investigated metacognitions of the patients with and without cancer. The participants were patients with cancer (N=279) and patients without cancer (N=212), assessed in a major private hospital in Istanbul. The participants were administrated the Metacognition Questionnaire-30. The findings indicated that patients with a cancer diagnosis scored higher than the controls on all subscales of the MCQ-30, F(1, 489) = 56.57, p = .00. Patients who received chemotherapy treatment had the highest scores on the MCQ-30, F(1, 255) = 5.08, p = .03. Higher levels of metacognitions were observed in patients who were in early stages of cancer, F(2, 255) = 5.28, p = .01, as opposed to locally advanced or metastatic stages. Patients with a chemotherapy history without a history of operation showed the highest levels of negative metacognitions. Findings of this study point out to a need for psychological support programs for patients with cancer, especially those who undergo chemotherapy and those who are in early stages of cancer.
TIME PERCEPTION DIFFERENCES BETWEEN PRODUCTION AND COUNTING

Seray Özgör
İlayda Bilir
İstanbul Okan University (İstanbul, Turkey)

Mina Çekin
İstanbul Kültür University (İstanbul, Turkey)

Cansin Özgör
Marmara University (İstanbul, Turkey)

Time perception has a multi-dimensional structure affected by many internal and external factors. Thus, it is needed to study with basic methodological designs to understand the core concepts of it. In our study, we compare two different time perception paradigm with three different methods. The first paradigm we study in two different experiment is time production. In the first experiment, participants were given numbers changing between 1 and 9 at the beginning of each trial and then asked to produce time in seconds according to the number given. Production of time starts when a white circle as a stimulus comes on a screen and participants stop it with a mouse click when they think the given amount of time has passed. In this way, participants only decide to the ending point of the time. The second experiment is similar with one exception; production of the time does not start with the appearance of the stimulus but with the mouse click of participant and stops with the second mouse click. Thus, the participant can decide both the starting and ending points of the time. The other paradigm we study is the time estimation which requires the participant to decide how long the stimulus stayed on the screen. To asses this paradigm, again a white circle used as a stimulus in the third experiment. However, in this time, participants are only required to count the time has passed when the stimulus on the screen and choose the right number in a 12-Likert scale to declare their estimation judgment about time in the second screen. Results of these three experiments will be compared to understand the differences between the two paradigms. Furthermore, the effect of the time production method in time judgments will be compared within the same paradigm. The significance of the results in terms of understanding the core aspects of the time perception will be discussed.
FEMALE MIGRANTS ARE “DREAMING”: THE FUTURE WISHES FOR THEMSELVES AND THEIR CHILDREN

Pelin Karakus-Akalin
Istinye University (Istanbul, Turkey)

Melek Goregenli
Izmir Solidarity Academy (Izmir, Turkey)

The aim of the present study was to provide a qualitative analysis of wishes that female migrants have about their own future and about their children fortune in Turkey. For this purpose, semi-structured interviews were conducted with 41 ethnically different intra-country female migrants who moved from different rural regions and resettled in a metropolitan province of Izmir. The interview form included several socio-demographic questions (e.g. age, income level, ethnic identity), open-ended questions related to migration history and the changes in cultural practices and gender roles. The taped interviews were transcribed and analysed by content and discourse analyses. The findings revealed that three major themes emerged related to participant’s wishes about their own future: 1. Acquisition of property (e.g. buying a house, buying a bigger house etc.) 2. Moving back to hometown 3. Acquisition of a profession and economic freedom, respectively. Concerning their children, it was found that the dominant themes were related to the wishes which the participants would have given better educational or wealthy opportunities to their children. Furthermore, participants mostly wished for their children to acquire a profession to live self-sufficiently and a good spouse to get married. The emerging themes were discussed in relation to acculturation attitudes, the perceived distinctions between rural and urban life, cultural values, gender ideology and individualism-collectivism.
PSYCHOLOGICAL WELL-BEING AND GENERATIVE BEHAVIORS IN MEXICAN ELDERS

Ana L. Gonzalez-Celis
E. Ruiz
National University of Mexico (State of Mexico, Mexico)
J. Karina
M. Acuña
University of Hidalgo (State of Hidalgo, Mexico)
A. Magallanes
University of Baja California (State of Baja California, Mexico)

Aging has been viewed from a more positive perspective, where is not only about losses and damage, but also about being on an age where it can enjoy life and live with well-being. The challenge is to find those resources like generative behaviors that seniors have. 188 Mexican adults (60-94 years old), 67% women, 33% men, completed two instruments: The Ryff's Well-being Scales (Deci & Ryan, 2008; Ryff, 1995), with two factors: Hedonic and Eudaimonic well-being, and the Loyola's Generative Behaviors Scale (McAdams & de St. Aubin, 1992), with six factors: 1) knowledge transmitted to the next generation, 2) things to be remember, 3) creativity, 4) be productive, 5) contribution to the community, and 6) responsibility of other people. Psychological well-being and its dimensions were significantly associated ($r > .80, p < .001$) with the presence of generative behavior. Finding that the behavior with greater psychological well-being ($M = 81.04, SD = 8.18$) was "Things to be remembered", like to write a story, poem or letter. The findings highlight the importance of generative behaviors in adulthood are associated with well-being. However, by finding differences in the types of generative behaviors at the level of well-being, is proposed the idea that generativity must be contextualized the relationship between environment and individual both the social and psychological dimension. A resource that can be used in the later age is generativity, which refers to the ability of older people to develop and grow through activities that contribute with the improvement of the context in which they live and participate, and thereby improve their psychological well-being and life satisfaction.

FEMINIST PORNOGRAPHY: USES AND CORRELATES

Caroline Marker  
Psychology of Communication and New Media  
University of Würzburg (Würzburg, Germany)

Ines Vogel  
Media Center University of Koblenz-Landau (Landau, Germany)

With the rise of the World Wide Web, access to pornography has never been easier. Thus, a large body of research conducted in the past investigated (mostly negative) psychological correlates and consequences of pornography use. Results show that the consumption of hardcore and especially violent pornography is related to a higher objectification of women, the acceptance of rape myths and violence against women (e.g., Hald, Malamuth, & Yuen, 2010). Moreover, findings also indicate detrimental effects of pornography on sexual and body self-esteem as well as on relationship quality (e.g. Leickly, Nelson, & Simoni, 2017; Stewart & Szymanski, 2012). Due to the predominant stereotypical display of gender roles in pornography, the negative effects, and the precarious working conditions of actors in mainstream pornography, some feminist groups call for a general pornography ban. However, feminist pornography—as a countermovement to the prohibition call—has developed in the last years embracing pornography as a chance to communicate healthy, consensual, and pleasurable sexuality without the objectification of women (and men). Unfortunately, research on psychological correlates and consequences of feminist (in contrast to mainstream) pornography is still in its infancy. Hence, the aim of our study is to investigate possible correlates of feminist pornography. Based on the self-proclaimed goals of feminist pornography producers (e.g., to depict gender equality) and on previous findings concerning (mainstream) pornography use, we examine the impact of feminist pornography on gender role attitudes, sexual self-esteem, body appreciation, and relationship satisfaction. All variables are assessed with an online questionnaire aiming at a sample size of 300 participants. Data collection is currently still in progress and will be completed by December 2018. The survey includes validated scales for each variable, socio demographics, and ad hoc items to assess current mainstream and feminist pornography use as well as interest in feminist pornography. As data collection is still in progress, we unfortunately cannot provide our results at this point. We believe that this topic is highly relevant to the psychological community and will be happy to present and discuss our findings in 2019.
FEELING OF KNOWING JUDGEMENTS UNDER DIFFERENT REMEMBERING STRATEGIES

Seray Özgör
Bahcesehir University (Istanbul, Turkey)

Mina Çekin
Istanbul Kultur University (Istanbul, Turkey)

İlayda Bilir
Istanbul Okan University (Istanbul, Turkey)

Cansin Özgör
Marmara University (Istanbul, Turkey)

Feeling of knowing (FOK) is one of the oldest yet barely understood paradigms. To be able to make judgments on what and how much we learned can affect our future performance for better learning. However, the system behind these judgments should be better understand to ensure their accuracy. In the current study, we assess the FOK judgments of participants under three conditions. At the beginning of the experiment, participants are instructed to learn a series of word pairs. Then their performance on remembering the second word of each word pair is assessed with recall, cued-recall and recognition tasks. Between conditions, participants are asked to judge their feelings about if they later could remember the word that they could not remember or wrongly remembered in the previous task. They made their judgments on a bar scale between two ends ranging from 1 could not remember or could remember. Thus, it is tried to get more detailed judgments. Proximity to either ends would present the likelihood of remembering that information in the future. Participant’s judgments are compared with what they could remember and could not remember. Therefore, the effect of remembering strategies on FOK judgments will be assessed.
CRISIS LOSSES OF PROFESSIONAL ACTIVITY AT «THIRD AGE»

Elvira Symanyuk
Ural'skiy federal'nyy universitet imeni pervogo prezidenta Rossii B. N. Elcina (Ekaterinburg, Russia)

The aging process causes many inevitable changes in a person's life, including retirement. For many workers, the pre-retirement period is acquiring a crisis nature, which is connected with the need to assimilate a new social role and behavior, rejection of the usual professional tasks. Retirement means decrease the social professional field and contacts, reducing financial opportunities, worsening social status. The severity of the crisis of loss of professional activity depends on the nature of work (manual workers experience it more easily), marital status and health. The crisis state is associated with psychological traps that arise at this age: "psychological impotence"; professional deformations; preservation of previous relationships and ways of life; loss of professional identification. These destructive tendencies destroy the existing self-concept, generate anxiety and confusion. By the end of the adulthood stage, both women and men should rethink their place in the socio-professional space, due to the cessation of an active role in society. A compensatory psychological growth that this age becomes a feeling of self-confidence, or self-acceptance, supporting a person’s self-esteem and social value. To overcome the feelings of uncertainty and social and professional inferiority contributes to the emphasis on authority in the workplace, and in the family too. The psychotherapeutic effect of such recognition affects the strengthening of social and professional activity and the increase in self-esteem and self-esteem. Overcoming the crisis of loss of professional activity involves revising the self-concept, finding new meanings of life, correcting self-awareness, enhancing spirituality and morality. And of course, people at this age need psychological support and help. One form of such support can be a socio-psychological education, the purpose of which is to develop a culture of decent living, mastering the skills of personal hygiene, self-service, and home economics. The main thing is to start to form a psychological readiness for meeting old age in a timely manner.
EMOTIONAL RESPONSE TO VIDEO-CLIPS WITH VIOLENT CONTENT: PRELIMINARY RESULTS FROM ALPHA ASYMMETRY AND BETA/ALPHA POWER RATIO

Pedro J. Rosa
CIS-ISCTE/UL and EPCV/ULHT (Lisbon, Portugal)

Past studies on violence processing have addressed individuals’ emotional responses to violence scenes, as a means to understand the psychophysiological mechanisms underpinning human aggressive behavior. While some of these studies have targeted the peripheral and central responses of individuals when exposed to scenes displaying physical violence against a human target (i.e., beating, stabbing, shooting), none has considered the specificities of sexual violence. Sexual violence is defined as a sexual act committed against an individual who does not, or is not capable, of giving consent, and it is intrinsically different from the concept of violence as framed in mainstream studies testing individuals’ responses to violence contents. Accordingly, this study was aimed at examining whether sexual violence induce specific cortical activation and valence patterns of response. Findings are expected to add on the specific cortical pathways involved in sexual violence processing. Twenty men voluntarily exposed to a scene displaying a man raping a woman (sexually violent content), scene displaying physical violence against a woman (violent content) and a scene with non-violent interaction among man and woman (non-violent content). All scenes were from commercially available movies. Participants’ emotional psychophysiological responses to movie scenes were measured through a 14 channel EEG cap at 128 Hz. Statistical analysis using repeated measures ANOVA did not show significant effects neither on Frontal Alpha Asymmetry nor beta/alpha power ratio across movie scenes. Preliminary findings do not show significant effects across scenes. However, the current results suggest that the raping scene induces more positive valence and less activation than the physical violence scene. Future studies are thus expected to test whether sexual violence yields differentiating responses in the beholder, as well as the behavioral consequences of such specific effects.
CONTRIBUTION OF SPATIAL MODULATIONS OF BRIGHTNESS GRADIENTS TO FACE PERCEPTION

Daria Alekseeva
Sergey Nikolaev
Vitaly Babenko
Denis Yavna

Southern Federal University (Rostov-on-Don, Russia)

Most interesting for human vision are the image areas of spatial heterogeneity. Striate neurons (first-order filters) extract brightness gradients. The second-order filters combine the outputs of the first-order filters and detect spatial heterogeneity of the local features. We were aimed to determine the utility that second-order visual features possess in visual images categorization. The observers were students with normal vision. We used 126 face images of both genders, different races and emotional expressions. For Experiment 1, with the help of the second-order filter model, we extracted from initial images those areas where the brightness gradients were spatially modulated. 3 stimuli sets were created from the same input images. The first set retained just contrast modulation areas, the second one retained orientation modulation ones, and the third one had spatial frequency modulation ones. Thus, the stimuli combined those areas of the initial image that contained the same-dimension modulation within different spatial frequency bands. The target stimuli were randomly inserted within the sequence of irrelevant stimuli (objects of various categories created identically). The stimuli duration was not limited. The observers’ task was to detect faces and preferably identify their races, genders, and emotional expressions. 75 observers were engaged in Experiment 1. We discovered that the best performance was obtained if the images consisted of contrast or orientation modulations within the bandwidth of 6 to 22 cpf. Faces were detected in 97% of trials. The percentage of correct answers was 96 for the gender, 95 for the emotional expression, 93 for the race. These results could be obtained when we used 50% of the extracted second-order features with higher modulation amplitude. The information from the spatial frequency modulation areas was not sufficient to solve the task. The target stimuli in Experiment 2 were only different in the fact that they were combined from the initial face image areas which had no spatial modulations. Participants were 25 observers. It was revealed that preservation of just homogeneous parts in the stimuli made face perception impossible. Our results show that the image areas with spatial modulations of contrast or orientation contain all information needed for face recognition. Supported by RFBR (17-06-50141)
The aim of the study is to establish gender differences in the system of personality values and in the indicators of psychological well-being in role of value orientations in psychological well-being for high school students. The theoretical basis of this study consists of K. Riff’s concept of psychological well-being and S. Schwartz’ theory of universal values. Participants were 69 high school students (32 boys and 37 girls) 16-17 years old from schools of Kazan and Ufa took part in this study. K.Riff’s methodology was used for the study of psychological wellbeing. This methodology contains 6 scales that form the unified scale “General level of psychological well-being” (Shevelenkova, Fesenko, 2005). S.Schwartz’ methodology (Schwartz et. al.,2012) was used for identifying personality values. Data analysis: U-criterion of Mann—Whitney, correlation analysis with the use of Spearman criterion. Results. It has been established that all the indicators of psychological well-being for girls are higher than for boys. The study has revealed that the significance of “Power Dominance” and “Power” values are higher for boys, while “Benevolence” and “Self-Transcendence” values are higher for girls (p≤0,001). The values aimed at preservation of traditions and following rules have negative correlation for both boys and girls. The important things for psychological well-being of teenagers are self-affirmation and striving for change. The conducted correlation analysis revealed that values of psychological well-being according to “Autonomy” and “Personal Growth” scales correlate with value orientations for both boys and girls (with p≤0,01). The indicators on scales “Positive relations with others” and “Purpose in Life” are interconnected with value orientations only for girls (with p≤0,01), and indicators on such psychological well-being scale as “Environmental Mastery” correlate with values only for boys (with p≤0,01). The values for boys and girls are primarily related to those parameters of well-being which reflect the specific features of age and gender. Values, acting like criteria used by people for judging events and themselves, are closely related to well-being. Values also express social expectations, including gender norms. Personality values contribute to the assessment of well-being, present the opportunity to compare one’s achievements with gender norms. The study was supported by Russian Foundation for Basic Research, project 18-013-01206
DEVELOPMENT AND VALIDATION OF THE MEDIA AND INFORMATION LITERACY SCALE (MILS) FOR THE 2ND AND 3RD CYCLE OF BASIC EDUCATION IN PORTUGAL

Pedro J. Rosa  
CIS-ISCTE/IUL and EPCV/ULHT (Lisbon Portugal)

Conceição Costa  
CICANT/ULHT (Lisbon Portugal)

Kathleen Tyner  
University of Texas at Austin (Austin, USA)

Carla Sousa  
Sara Henriques  
ULHT (Lisbon Portugal)

Communication and sharing of meanings in a highly mediated world require multiple literacies. Regardless of definitions and approaches, these literacies have been open up critical debates about what media skills citizens should have, as well as when they should be acquired. In the present study we report on the process of developing and validating Media and Information Literacy Scale (MILS) for students in the 2nd and 3rd cycles of Basic Education in Portugal. Construct validity and reliability of MILS were examined with a sample of 1151 students in the 2nd and 3rd
cycles of Basic Education in Portugal. The EFA revealed a three-factor structure, consisting of 22 items that explain 53.23% of the total variance. The scale has an excellent overall internal consistency ($\omega_I = .92$), with an adequate internal consistency for all subscales (Cronbach’s $\alpha$ and Ordinal $\alpha > .70$). The MILS has good psychometric qualities and could be an advantageous instrument for the prognosis and evaluation of interventions related to media literacy in Portugal.
VALIDATION OF A NEW TOOL TO EVALUATE PACKAGE LEAFLETS OF MEDICINES: LIS-RPL

Pedro J. Rosa
CIS-ISCTE/IUL and EPCV/ULHT (Lisbon Portugal)

Carla Pires
Marina Vigário
Afonso Cavaco
University of Lisbon (Lisbon Portugal)

Considering the regulations of European Medicine Agency, Package leaflets of medicines (PLs) must be clear and understandable. Importantly, the number of tools to evaluate this type of health documents is very limited. Aim: to validate a tool for evaluating subjects’ satisfaction/perception on readability of PLs (LIS-RPL). This study was carried out in 2 Portuguese regions (Lisbon and Centre). Overall, 503 participants (53.1% male) were conveniently selected. They were purposively and homogenously distributed per three groups of education: 1 to 6; 7 to 12; and >12 years of schooling. LIS-RPL was developed in line with the requisites of the European Guideline on the readability of package leaflets of medicines, constituting a Likert-Scale that was pre-tested in a previous study. This tool was initially composed of 14 Items. Participants were required to evaluate 12 randomized PLs with LIS-RPL. An exploratory Factor analysis (EFA) was applied to evaluate dimensionality. Also, a minimum rank Factor analyses (PA-MRFA) was carried out. The adequacy of the matrix for EFA was evaluated with KMO index and Barlett’s test of sphericity. The possible existence of a broad second-order Factor was analysed based on an Exploratory Bifactor Analysis (EBA) with Schmid-Leiman Solution. Factor simplicity was checked with Bentler’s Simplicity Index (BSI) and Loading Simplicity Index (LSI). Reliability was proved through the application of diverse coefficients. The EFA suggested a two-Factor structure consisting of 12 items and explaining 69.11% of variance. Factor were strongly correlated with each other (r = 0.80). The Schmid-Leiman solution indicated the existence of a general Factor (loadings above .50). Good simplicity indices: BSI = 0.99 (percentile 99) and LSI= 0.48 (percentile 99) were found. Internal consistency results indicated a good reliability of the LIS-RPL. We have validated LIS-RPL, which seems to be an appropriate tool to evaluate Participants’ satisfaction/perception of European Portuguese PLs.
THE EMOTION REGULATION INTERVIEW-REVISED FORM: INITIAL PSYCHOMETRIC PROPERTIES IN TURKISH

Pelin Bintas-Zorer
Orcun Yorulmaz Turkey Izmir
Dokuz Eylul University (Izmir, Turkey)

Background: Among recent factors that have drawn attention of researchers in clinical psychology, emotion regulation (ER) is a critical factor, owing to some findings showing its associations with many psychopathologies as well as well-being in general. A variety of measures have been developed to evaluate different strategies and difficulties in ER and most of them are self-report instruments. In order to eliminate some limitations of present scales by providing a more comprehensive and detailed assessment tool, the Emotion Regulation Interview (ERI; Werner et al., 2011) based on the main process model of ER and specialized for social anxiety has been developed.

Aim: Although there are several scales aimed to assess this concept in Turkish, there is no effort for adaptation of such interview yet. Furthermore, ER has been suggested to be not only intrapersonal but also interpersonal concept and it is important for other emotions as well. Thus, the basic purpose of the current study is actually to adapt and examine psychometric properties of the ERI in Turkish but at the same time, we revised to extend the scope of ERI by including some items on interpersonal nature (e.g., social support seeking) and some other strategies (e.g., rumination) that can be adjusted various emotions (i.e., anxiety, sadness, anger).

Method: The sample of the study will be consisted of 100 adult participants. The participants will complete a series of scales about ER, difficulties in ER, attachment patterns, relationship and life satisfaction, depression, anxiety and stress, and will be interviewed via revised version of ERI.

Results: Within the scope of reliability analysis of ERI-Revased Form, after 1 month from the first administration, interview will be reapplied to 20 of the participants and test-retest reliability will be evaluated. Correlation coefficients between ERI subscales and that of relevant scales will be examined for evaluating convergent validity.

Conclusion: It is considered that expansion of the scope of this revised ER interview form would provide important contributions to the field of research and applications in clinical psychology, because it evaluates various ER strategies used by the individual in different situations that awaken a specific emotion.
THE IMPORTANCE OF TRANSVERSAL COMPETENCIES IN ACADEMIC SUCCESS: THE COGNITIVE FLEXIBILITY

Cristina Guerra
Gastão Marques
Instituto Politécnico de Portalegre (Portalegre, Portugal)

To identify the importance of cognitive flexibility in academic success was the objective of the study. The research hypothesis is the following: the cognitive flexibility is predictive of academic success. There are a growing recognition on the importance of transversal competencies, where is the cognitive flexibility, in the learning, with reflexes on smart behaviours. The reference to these competencies as essentials in the XXI century is recurrent in the literature (Binkley, Erstad, Herman, Raizen, Ripley, Miller-Ricci, & Rumble, 2012; Lippman, Ryberg, Carney & Moore, K. A. 2015; Delors et al., 1996; Gordon, Halasz, Krawczyk, Leney, Michel, Pepper, Putkiewitcz, & Wisniewski, 2009). To analyse if cognitive flexibility can predict academic success, multiple linear regression studies were performed (stepwiser proceedings). In this study the independent variables were (i) cognitive variables, among them the cognitive flexibility measured through the cognitive flexibility development test (Guerra, 2012), the crystalized intelligence measured trough comprehension of WAISIII subtest, the fluid intelligence measured trough the progressive matrix of Raven III test, the self-perception of cognitive flexibility measured trough the cognitive flexibility scale (EFC, Guerra, 2007), the self-perception of practical intelligence (API, Guerra, 2007), the self-perception of emotional intelligence (EIQV) and the self-perception of social competencies (TPCS, Candeias, 2001) and (ii) sociodemographic variables (age and genre). As dependent variables the academic results (average note of access to higher education, the actual course average note and the notes of Portuguese and math chairs in the 12 th year: the one before the higher education level). The study was performed on a sample of 603 students belonging to 15 different study areas in the Portuguese public higher education. The final model of predictors, in the majority of situations, retained only cognitive variables and the cognitive flexibility comes up, in all situations, as the bigger predictor. The average note of access to higher education explains 34,1% of the found variance, the actual average note explains 27,1%, the Portuguese's note explains 27,3% and math's note explains 19,2%. These results suggest, globally, an important contribution of cognitive flexibility to academic success.
ANALYSIS OF COPING TENDENCIES AND ABILITIES AMONG THE YOUTH IN LITHUANIA AND RUSSIA

Asta Vaitkeviciene
Albina Kepalaite
Daiva Alifanoviene
Darius Gerulaitis
Odeta Sapelyte
Siauliai University (Siauliai, Lithuania)

The first variant of adaption Ways of Coping Questionnaire for further validation among Lithuanian population has been done (N=761). Scales’ consistency test (Cronbach’s Alpha) has the minimum acceptable level of alpha in scales measuring coping as a disposition about $\alpha = 0.65$. For intra-individual questionnaires, such as WCQ, lower values of alpha are allowed (about $\alpha = 0.55$). The results obtained in Lithuania show not very high consistency of scales: in the period of $\alpha = 0.578 - 0.759$. Especially low they are for Accepting Responsibility $\alpha = 0.578$; Self-Controlling $\alpha = 0.584$; Confrontive Coping $\alpha = 0.600$ coping scales. The best Alpha is shown for Positive Reappraisal $\alpha = 0.759$ and Seeking Social Support $\alpha = 0.734$; Planful Problem Solving $\alpha = 0.694$ coping scales. One of the reasons of low to middle self-consistency of coping scales is the following. The “direct-back” translation from English into Lithuanian and back from Lithuanian into English was not done according to a standard procedure — only by one person (not by 3 as demanded). It could have influenced meanings transmitting wrong or distorted it to the translated into Lithuanian items (Kline, 2015). Concurrent validity has not yet been got. The problem is — there is not a single psycho-diagnostic coping instrument in Lithuanian now. Thus the process will include getting correlations with other important tests giving indicators of adaptive / maladapive behavior (i.e. Self-efficacy Scale, STAI, BDI, etc.). All average coping strategies’ means are of middle-below middle level. It could manifest no stress / not tense coping, or “indifference” to stressors. General observations of the sample (all belong to social risk groups) are helping guess that people are recognizing, reflecting, and understanding their own psychological states and experiences (stress, depression, social ill-being) and their outcomes weak. Statistics shows weak sex differences and more evident cross-cultural and age differences in the sample. All coping meanings among Russians are higher, (especially Self-controlling, Planful Problem Solving), which is connected with either higher stress levels or its better recognizing, as the Russian sample consists of people belonging to different socio-cultural context.
EVIDENCE-BASED ON TEST CONTENT OF THE THREE MOST COMMONLY USED TEST DESIGNED FOR ASSESSING BROAD AUTISM PHENOTYPE

Marta Godoy-Giménez  
Antonio González-Rodríguez  
Ángel García-Pérez  
Ángeles F Estévez  
Pablo Sayans-Jiménez  
University of Almería (Almería, Spain)

The broad autism phenotype (BAP) has been defined as a set of subthreshold characteristics qualitatively similar to those presented in autism spectrum disorders (ASD: Hurley et al., 2007). Three self-report questionnaires have been typically used to assess the BAP: the Broad Autism Phenotype Questionnaire (BAP-Q), the Autism Quotient (AQ), and the Social Responsiveness Scale (SRS). Wainer et al. (2011) confirmed that, when applied together, these three tests form a robust three-factor structure coherent with the original BAP structure: pragmatic language difficulties, aloofness, and rigidity. However, the present ASD definition in the DSM-V is structured around only two domains: 1) deficits in social communication and social relation, and 2) a pattern of repetitive restrictive behaviors and interests. This study aimed to explore to which extent the content of these three BAP tests suits in the new BAP two-domain conceptualization. We performed two expert judgments so as to assess which items of the BAPQ, the AQ, and the SRS would have adequate item-metric properties and would be relevant for assessing the BAP subdomains to which they would belong according to their content. Firstly, a group of five experts, four in neuropsychology and one psychometrics assessed the clarity, comprehensibility, concretion, degree of self-reference, and evaluation of the items. Seventy-seven items were selected for conducting the subsequent expert judgment. Secondly, a group of 22 judges (20 professionals and 2 academics) evaluated the items from the three tests regarding their relevance. We selected items according to the Aiken’s content validity coefficient. Our results revealed a remaining pool of 51 items selected, 32 for social communication and social interaction impairments, and 19 for a restrictive and repetitive pattern of behaviors and interests. These findings point to a possible under-representation of several subdomains, which leads us to conclude that a new test assessing properly (with a representative sample of subclinical ASD indicators) all the BAP domains and subdomains is needed. This research was supported by a grant (PSI2015-65248-P) from the Spanish Ministry of Economy and Competitiveness, co-founded with ERDF (FEDER) funds. MGG is supported by a pre-doctoral grant by the Ministry of Education, Culture, and Sport (FPU2015-01562).
FACIAL APPEARANCE AND PERSONALITY TRAITS: HOW WE MAKE FIRST IMPRESSIONS FROM OTHERS’ FACES.

Marta Godoy-Giménez  
University of Almería (Almería, Spain)  
Robert Ward  
Bangor University (Bangor, United Kingdom)  

People willingly judge the personality traits of others from mere facial appearance, and these impressions can be surprisingly accurate, for example, resulting in better than chance discrimination of Extraversion and Neuroticism, even under highly restricted conditions with neutral face images (e.g., Jones, Kramer, & Ward, 2012). However, there has been no systematic investigation of how facial expression might reveal or conceal cues to personality in such images. The current study explored to what extent accurate discrimination was affected by a voluntary smile. Individual photos of 48 European women scoring high and low on Extraversion and on Neuroticism were presented, with smiling and neutral photos of each woman mixed within blocks, to 120 observers. As expected from previous studies, we found accurate discrimination with Neutral expressions, for both Extraversion and Neuroticism judgments. Furthermore, as expected, smiling images were rated significantly higher for Extraversion and significantly lower for Neuroticism. However, the results of most interest related to how accuracy (the difference between the ratings of women with high and low trait values) was affected by the voluntary smiles. Here we found that smiling interacted with the trait, such that smiling had little effect on the accuracy of Extraversion discrimination, but drastically reduced the accuracy of Neuroticism judgments. These results demonstrate that the effects of facial expression on accurate personality inference depend very much on the specific trait being judged. Finally, we also measured Autistic Quotient (AQ) and other autism-related scores of observers, to see if accurate discrimination of traits from appearance was correlated with subclinical levels of autistic traits. No such correlations were found. We speculate on why smiling may have trait-specific effects on observer accuracy.
THE EFFECT OF SCHIZOTYPY AND SEX IN SOCIAL FEAR LEARNING

Marta Godoy-Giménez
Antonio González-Rodríguez
Ángel García-Pérez
Angeles E Estévez
Fernando Cañadas
University of Almería (Almería, Spain)

Schizotypy is defined as a combination of traits qualitatively similar to those found in people with schizophrenia (Johns & van Os, 2001), but milder in their expression, that can be found in the general population (Badcock & Dragovic, 2006). Since animal models of schizophrenia have suggested fear learning impairments (Gill et al., 2018), we aim to explore the relationship between this type of learning and schizotypy. Some studies also suggest a higher fear conditioning measuring skin conductance response (SCR) in women than in men (Inslicht et al., 2013). Therefore, we investigate how sex may influence the social learning of fear depending on the presence of schizotypal personality traits. All participants (undergraduate students) completed the Schizotypal Personality Questionnaire (SPQ; Raine, 1991). After that, during the observation phase, they visualized a video that showed a learning model sitting in front of a computer screen who received an uncomfortable shock (US) seven times (out of ten) when a specific coloured square was presented (CS+) on the screen. However, when a different coloured square (CS-) appeared, the shock was never given. Later on (test phase), they were told they were about to do the same experiment so they will receive shocks paired with the same coloured square as the learning model. However, they never received a shock. We registered participants skin conductance response (SCR) to assess learning, which allowed us to explore their autonomic response through the observation and the test phases. In order to analyse the data, we took into account the sex of our participants and their score in every factor of the SPQ. To our knowledge, this is the first study which explores the relationship between schizotypy and fear acquisition through observation. The results are discussed in light of previous literature on schizophrenia and observational fear learning. This research was supported by a grant (PSI2015-65248-P) from the Spanish Ministry of Economy and Competitiveness, co-founded with ERDF (FEDER) funds. MGG is supported by a pre-doctoral grant by the Ministry of Education, Culture, and Sport (FPU2015-01562).
COMPARISON OF TWO QUESTIONNAIRES OF STUDENT OPINION OF UNIVERSITY STUDENTS ABOUT TEACHING PRACTICES.

Martha Elba Alarcón-Armendáriz
Alfonso Reyna-Torres
Hortensia Hickman-Rodríguez
Sergio Méndez-Lozano
National Autonomous University of Mexico (Mexico City, Mexico)

Education is a fundamental factor for the personal development. However, in order to fulfill its mission, it is essential to improve its quality. For this, among other factors, teachers must be offered the tools that contribute to perfecting their work. In this sense, the first step is to identify the teacher profiles. However there is a lack of consensus about which are the characteristics of the ideal instrument to respond to this need. The purpose of this paper is to compare two questionnaires of students’ opinions on the teaching practices answered by the students of the Psychology Department of a Mexican public university. Two instruments were used, the Student Opinion Questionnaire on Teaching Practice (COPDE), consisting of 52 items on the Likert scale of five categories that range from never to always, grouped into four dimensions, and the Opinion Questionnaire on Teaching Performance (CODD), consisting of 14 items, 2 of them dichotomous, and the remaining 12 on a Likert scale of four categories that range from never to always, grouped into six dimensions. Both instruments were answered, independently, by the students at the end of the 2016-1 school period (fall of 2015). 3030 questionnaires were recovered from the COPDE and 5511 from the CODD, referring to 222 and 246 teachers, respectively, out of a total of 296 teachers. The analysis was done with only 13 items from the COPDE and 12 from the CODD, considering that they were the most similar in both instruments. The median value is 4, maximum possible, in all the CODD items, 5 in 62% and 4 in the remaining COPDE items. The percentages of response per item vary between one instrument and another, without significant differences between them. The qualitative analysis showed that the constructs of practice and teacher performance seem to allude to the same topic. Both instruments are correlated, although the length of the COPDE allows to explore in greater detail the dimensions of interest. The analysis should continue to propose an alternative that recovers the benefits of both instruments considering that these are applied simultaneously in the institution.
WHY GIFTED ADOLESCENTS LIKE LEARNING?

Alexey Stekhov
Kidsout Head of School (Moscow, Russia)

Tamara Gordeeva
Lomonosov Moscow State University (Moscow, Russia)

Modern studies show that intrinsic motivation and interest are characteristic features of gifted people that stimulate their high achievements (Vallerand, 1994, Gottfried et al., 2006, Gordeeva, 2011). Why do gifted adolescents like learning? The goal of our study is to understand the values of gifted adolescents as the source of their high intrinsic motivation. Two groups of adolescents participated in the study — gifted learners (N=66) and learners from a common school (N=45). Gifted teenagers were recruited from one of the top-5 Moscow schools among those who demonstrated high intellectual performance (victories in all-Russian competitions and high scores in the Russian National Exams). To understand the value orientations of the adolescents, we analyzed their qualitative answers to the question “What do you think happiness is?”. To measure subjective well-being the Lubomirski’s subjective happiness scale [Lyubomirsky, Lepper, 1999; Osin, Leontiev, 2008] and the dispositional optimism scale by Carver and Scheier (LOT) were used. Both questionnaires showed satisfactory reliability (the Cronbach alphas ranged from 0.79 to 0.82). Two qualified experts-psychologists identified eight qualitative categories of the analysis of adolescents understanding of happiness including joy and pleasure, meaningful life, achievements, health, happy close relationships with other people, having a family, etc. The answers were analyzed blindly. Analysis of the qualitative responses in the two groups showed that there are similarities as well as significant differences in the understanding of happiness among the adolescents of the two groups, which obviously reflect their values. Firstly, the gifted adolescents significantly more often associated happiness with a meaningful life within which a person can develop, create and express themselves (p<.01). Secondly, the gifted adolescents tended to relate happiness to achievement. Thirdly, the gifted adolescents significantly less often associated happiness with family and close relationships with people (p<.05). No differences in happiness itself and other measures of psychological well-being were found which confirms that the obtained results are not due to the level of adolescents’ psychological well-being, but to their value orientations. Gifted students conceptions of happiness helped to shed light on why gifted adolescents love to learn and have higher achievement intrinsic motivation than their peers who don’t demonstrate high intellectual achievements.
THE RELATIONSHIP BETWEEN ALTRUISTIC PUNISHMENT AND COOPERATION

Tuğçe Gündüz
Özge Ünal
Mersin University (Mersin, Turkey)

Talha Köseoğlu
Eskisehir Osmangazi University (Eskişehir, Turkey)

Contrary to what the theory of kin selection (Hamilton, 1971) suggests, humans cooperate with strangers in large groups. Theorists have been concerned for many years with the question of which mechanism is responsible for the survival of the cooperative behavior in social groups. Some researchers have referred to the phenomenon of altruistic punishment in order to respond to this question (Boyd et al., 2003). Because some members of a group punish noncooperators at a cost to themselves, researchers have suggested that altruistic punishment should be regarded as a second-order cooperation. The aim of this study is to investigate the relationship between altruistic third-party punishment and cooperation. There is some evidence (Fehr and Gachter, 2002) showing that average cooperation between members of a group has sharply increased in the presence of punishment, whereas it is decreased in the no-punishment condition. However, most of the research showing the relation of altruistic punishment and cooperation have been conducted in laboratory settings. In this study we aim to examine this relationship in social life. We will give participants some scenarios including norm violation by a member of their own social group and investigate whether punishment of the noncooperators will increase their intention of cooperation with another member of their group. The sample will consist of 150 participants. In the punishment condition participants will have the option of punishing noncooperators while in the no-punishment condition there will not be this option. Then we will measure the participants’ intention of cooperation with a member of their group in the two conditions and compare them. We are expecting that the level of intention of cooperation in the punishment condition will be higher than that in the no-punishment condition. Furthermore, we will examine the moderating role of one’s identification with ingroup in the relationship between witnessing norm violation and punishment. We are expecting that strong ingroup identifiers will punish the violator more harshly than weak identifiers do. The findings will be discussed in the frame of regarding literature.
RESULTS OF A STUDY ABOUT THE EFFECTS OF A MUSIC INTERVENTION ON ANXIETY LEVELS DURING PORT CATHETER SURGERY

Philip Hepp (Düsseldorf, Germany)
Helios University Clinic Wuppertal (Düsseldorf, Germany)

Nora Schaal
Heinrich Heine University Düsseldorf (Düsseldorf, Germany)

Stress and pain reductions by music during surgical procedures have been shown in different medical settings. Nevertheless in small operative procedures like port catheter surgery evidence is sparse. In this pilot study 20 patients undergoing port catheter placement or removal with local anesthesia have been randomly assigned to music vs. no music intervention during surgery. The medical staff was blinded to whether the patient listened to music or not. Stress levels were measured by subjective (STAI questionnaire, visual analogue scales) and objective (vital parameters, saliva cortisol and amylase levels) parameters at different time points on the day of the surgery (before, during and after). There was a significant drop from before to the end of the surgery in state anxiety (p=.042) and heart frequency (p=.047) in the music intervention group. For cortisol and amylase only a trend towards lower levels in the music intervention group could be detected at this point. These preliminary results show a positive influence of music intervention in the setting of port catheter placement. Further results will be presented at the conference.
AN INTEGRATED APPROACH FOR TREATING DEPRESSION AND ITS INFLAMMATORY CORRELATES: PSYCHOTHERAPY AND A HEALTHY DIET

Giuseppe Maniaci  
Caterina La Cascia  
Alessandra Giammanco  
Manfredi Rizzo  
Daniele La Barbera  
University of Palermo (Palermo, Italy)

Depression is considered a systemic illness often associated with low-grade inflammation. Despite several treatments have shown to be effective on depression, the relevance of adopting an integrated approach emerges, working both on mood unbalance and on the associated inflammation. Given these premises the aims of this randomized trial were: 1. The assessment of the efficacy of a structured Functional Therapy program (FT) (a body-oriented psychotherapy approach) both on mood and inflammation, in patients with depression (PSY group). 2. The efficacy of the addition of a diet that mimics fasting (FMD) to modify mood and inflammation (PSY-D group). 20 consecutive patients were recruited from the Unit of Psychiatry of the Policlinico "P. Giaccone" in Palermo. Subjects with an inflammatory disease, schizophrenia, bipolar disorder, or a QI<60, or a BMI<17 or >34.99 were excluded. After the recruitment, subjects were randomized into two groups, PSY or PSY-D (T0). The PSY group completed an FT protocol (20 individual sessions), which were scheduled twice a week for the first two months and once a week for the last month (three months total). PSY-D group completed both FT protocol and FMD. The subjects were retested at the end of the treatment (T1) and three months later (follow-up) (T2). A significant reduction of depression (F (2,18) = 35.516, p = .001), together with an increase of self-esteem F (2,18) = 17.860, p = .0001 and quality of life (F (2,18) = 25.246, p = .00002) was highlighted in the PSY group. Also for the PSY-D group the same changes in mood (F (2,14) = 85.598, p = .000), self-esteem (F (2,14) = 51.174, p = .00005) and quality of life were highlighted (F (2,14) = 30.979, p = .00002). Furthermore, comparing PSY and PSY-D no significant differences between groups on mood, on those parameters were highlighted. However a non-significant trend was highlighted orienting for a stronger result on PSY-D group. We are evaluating the efficacy of those treatments on blood cytokines. The FT program has shown a strong efficacy on depression, highlighting the necessity to treat this disorder through an integrated approach.
FEATURES OF FIGURATIVE THINKING IN ARTISTICALLY GIFTED JUNIOR SCHOOLCHILDREN

Alla Belousova
Don State Technical University (Rostov-on-Don, Russia)

As shown in A.G. Asmolov, V.V. Rubtsov, V.I. Slobodchikov, V.A. Yasvin's researches, the educational environment is a factor contributing to the creative development of the individual and the development of creative talent. We conducted a research for the purpose of studying features of the development of figurative thinking of gifted younger schoolchildren, who have pronounced abilities in artistic creativity and are engaged in the Children’s Art School. Diagnostics of the image of the world and the level of development of figurative thinking of younger schoolchildren was carried out on the basis of the Children’s Art School (60 people) and the secondary school of Morozovsk (60 people). We used the test "Assessment of figurative thinking", the test “Picture of the world”. For quantitative data processing, mathematical methods were used: Pearson Chi-test, Mann-Whitney U-test, dispersive analysis. A comparative analysis of the peculiarities of the image of the world of younger schoolchildren from the Children’s Art School and the secondary school showed that there is a tendency towards significant differences in the choice of a landscape picture of the world. The "landscape" picture of the world is characteristic of 76% of junior schoolchildren of the art school and 58% of students in the secondary education school (the differences are significant). There are significant differences in the development of figurative thinking: younger schoolchildren from the School of Arts have a higher level of development of figurative thinking than students in the secondary education school: 58% of pupils of the school of arts have a higher level of development of figurative thinking, while this indicator is typical only for 40% of students of the secondary educational school. Dispersion analysis made it possible to establish the existence of a connection between the features of the image of the world and the development of figurative thinking: for schoolchildren depicting landscape and mediated pictures of the world, a higher level of figurative thinking is characteristic than for pupils depicting a planetary picture and a picture of their immediate environment. The author (of the material) is the winner of the Vladimir Potanin Scholarship Program 2017/2018. Published by the grant of the V. Potanin Charitable Foundation.
The choice of a partner and the script for developing intimate relationships depends on the value representations about the family (Byng-Hall, 1985), and the behavior patterns observed in parental family that can be regarded as an aspect of intergenerational transmission. In studies analysing intergenerational transmission of working models of intimate relationships, the similarities and discrepancies in representations of parents and children were found (Grigorova, 2016). Currently, we are witnessing generational shifts in the phenomenology of close relationships that lead to conflicting ideas about intimacy among young people. However, the essence of these contradictions is not well understood and described. The study was aimed to describe the model of intimate relationships in representations of young people based on their image of parental family and their future family.

The study involved 80 respondents from full families; 39 men and 41 women, mean age = 21.8 ± 1.42 years old. Method: a questionnaire for identifying the representations of intimate relationships in one’s own future family and in parental family; the questionnaire “Role Expectations and Preferences in Marriage” by A.N. Volkova; the method “Evaluation of the sexual profile” by O.F. Potemkina. Parametric t-student test, Chi-square Pearson test were used for data processing. The data analysis had showed a greater willingness of young people, compared to their parents, to openly express their feelings, privately and on public, verbally and non-verbally; to feel more relaxed in demonstrating their naked body (p ≥0.003). Significant differences emerged (p <0.001) in such parameters as “parental-educational sphere” and “social activity” (p <0.001) and in representations of the sexual sphere in parental family and one’s own family. And a similarity was found in the parameters “emotional support” and “identification with a partner”. The differences lie in the importance of common extra-familial interests, as the basis for building and maintaining relationships, and the meaning of the sexual intimacy. For young people, the sexual sphere is more important than, in their opinion, for their parents, who, in order to maintain family relationships, focus on parental functions and on household duties. INFLUENCE OF MANAGERS’ GENDER AND JOB POSITION DESERVINGNESS ON STEREOTYPES, EMOTIONS, AND BEHAVIORS

Isabel Cuadrado Guirado
University of Almería (Almería, Spain)

Anita Iaconianni
University of Padua (Padua, Italy)

Belén Tristán López
University of Almería (Almería, Spain)

Andreea Alexandra Constantin
University of Almería (Almería, Spain)

Annamaria Manganelli
University of Padua (Padua, Italy)

The objective of this study is to experimentally investigate, in Spanish and Italian samples, the effect of managers’ gender and deservingness of the job position on the stereotype content dimensions (morality, sociability and competence; Leach et al., 2007) and emotions and behaviors proposed by the BIAS Map model (Cuddy et al., 2007). We also evaluated schadenfreude following a negative event occurred to the target. Based on the “Think Manager-Think male” paradigm (Schein, 2001) and literature on schadenfreude and gender (Spears, 2013), a 3 (Gender: Male, Female, Not specified) × 2 (Deservingness: Yes, No) between subject design was used. Participants (NItaly = 189; NSpain = 171) were randomly assigned to one of six experimental conditions. They had to read a description of a manager (either man, woman or gender not specified) whose academic and working trajectory made him/her/it worthy or unworthy of a future job promotion. Next, stereotype, emotions, and behavioral tendencies towards people with similar characteristics as the target were assessed. Finally, a negative event was presented, and schadenfreude and perception of deservingness of the event were measured. For each sample, MANOVAs showed that: (a) Gender did not have significant effect on the stereotypes regarding the target. Nevertheless, the presence of a bias has been confirmed: a manager receives more stereotypically masculine than feminine evaluations; (b) Deservingness has a significant effect on each dependent variable (except envy in both samples; and compassion in the Spanish sample). Subsequent univariate analysis revealed that a person deserving its high-status job position was considered more competent, sociable and moral, elicited more admiration and less contempt, and more facilitation and less harm behavioral intentions than a person that did not deserve its job position. Also, a target worthy of its position elicited less schadenfreude than an unworthy target. In conclusion, in both samples, Spanish and Italian, the deservingness of a high job position plays an important role on evaluations towards managers concerning stereotypes, emotions and behaviors, regardless target’s gender.
EMOTIONAL REGULATION AND COPING STRATEGIES IN VICTIMS OF DATING VIOLENCE

Marcela Gracia Leiva
Alicia Puente Martínez
Darío Páez
University of Basque Country (San Sebastián, Spain)
Silvia Ubillos Landa
Bárbara Cuadrado
University of Burgos (Burgos, Spain)

Dating violence (DV) has serious consequences on the health of young people. It is defined as aggressions (physical, sexual or psychological) practiced by one of the couple’s members (who do not cohabit, have no children in common or have no judicial ties) against the other. In this study we analyzed a) the types of DV victimization by sex; b) the emotional regulation and coping strategies (Measure of Affect Regulation styles; MARS) adopted by victims in comparison with non-victims; c) the relationship between DV and well-being among victims. In a cross-sectional study, with Spanish students (N = 650, 466 female and 269 male; age between 13-25 years, M = 20.04, SD = 3.029), some participants answered to the questionnaire in paper (47.8%) and others online (52.2%). The sample was divided by victims of some episode of DV (N = 484, 75.2%) and non-victims (N = 160, 24.8%) (n=6 lost values). Results indicate that the highest frequency of DV victimization was detachment (64.1%), coercion (53.1%), humiliation (35.1%), sexual (27.6%) and physical (14.8%) violence. Victimization from sexual violence among women (31.1%) was higher compared to men (18.6%) (χ² = 10.33, p = .001).

The victims (vs. not victims) adopted more 14 of the 17 emotional regulation and coping strategies: direct instrumental, psychological abandonment, social isolation, social support, rumination, distraction, reappraisal, social comparison, acceptance and self-control, passive physiological regulation, inhibition and suppression, venting, confrontation, regulated expression. The level of well-being was lower among victims (M = 6.47, SD = 2.18) than non-victims (M = 7.45, SD = 2.15) (F = 23.948, p = .0001). In addition, some of the strategies, such as, psychological abandonment, social isolation, rumination, passive physiological regulation, inhibition, confrontation and regulated expression, were negatively related to well-being. While others, such as, problem-directed action, search for social support, positive re-evaluation, the search for self-rewards, active physiological regulation and discharge, were positively related with the wellness. These results support the idea that DV diminishes the well-being of the victims and highlight the importance of emotional regulation and coping strategies among DV victims to face violent relationships.
WE CAN STOP BELIEVING IN MEMORIES OF ANY AGE.

Valentine Vanootighem
Evelyne Moyse
Serge Brédart
University of Liège (Liège, Belgium)

The phenomenon through which an autobiographical memory is no longer believed to be a representation of an event that really happened, despite a vivid recollection of the event, has been termed a nonbelieved memory (NBM). The age distribution of NBMs reported by young and older adults typically reflects a large proportion of events dated to childhood. The present study aimed to further investigate the age of origin of NBMs by using instructions that include an NBM related to adulthood. Participants aged from 40 to 80 years were asked to describe an NBM, to explain why they had stopped believing their memory, and to rate its phenomenal characteristics. Participants also described and rated an age-matched believed memory (BM). The results revealed a similar proportion of nonbelieved events experienced in childhood and adulthood, thus calling into question the hypothesis that NBMs are mainly related to childhood events. We also found that NBMs might emerge for different reasons depending on the time of events. Additional analyses indicated that, overall, the influence of temporal distance on the ratings of phenomenal characteristics was similar for BMs and NBMs.
Quality of life is a complex construct that requires a multidimensional research approach and the assessment of both subjective and objective factors. Young peoples’ future expectations are usually positively correlated with the quality of their life, while youth with disabilities can either have high expectations from the future that may or may not be realistic, or they may be unsure of their future. Therefore expectations from the future in youth with disabilities are often described as highly individualistic in their nature. In order to determine perceived quality of life and expectations from the future in youth with and without disabilities, the following instruments were used: Comprehensive Quality of Life Scale Intellectual/ Cognitive Disability (Cummins, 1997), Personal Wellbeing Index-Intellectual Disability (Cummins, Lau, 2005), Future’s Expectation (Ajduković, Kulenović; 1993, in Urbanc, 1999) and How Do I Evaluate My Own Future (Urbanc, 1999). The sample of participants included 218 young people who attended final secondary school classes. According to the type of education and the educational program, three sub samples were formed: 1. youth with disabilities included in special education program in special schools; 2. youth with disabilities included in special education program in regular schools; 3. youth without any disabilities attending regular schools. Multivariate data analyses showed the difference between objective components of self-perceived quality of life in youth with and without disabilities, while all of them perceived higher quality of life. Typical youth from regular schools had significantly lower future’s expectations and were less afraid of the future in comparison to their peers with disabilities from regular schools. The significant correlation was found between specific components of self-perceived quality of life and future’s expectations in youth with and without disabilities. Obtained results point out the need for systematic and continuous monitoring of young people during the period of their transition to the adulthood. Special attention should be payed to young people with disabilities, in order to create more advanced national policies for them and give adequate support at the system level.
“Multifactor model for studying the attitude to appearance” was developed on the basis of theoretical analysis and compilation of data on the impact of socio-cultural, socio-demographic, socio-psychological, personal factors on the importance, satisfaction, concerns, estimates and self-assessments of the appearance in the interpersonal and intra-group interaction (Drozdova, Labunskaya, 2017). In the center of this “model” there is a phenomenon — the “value of appearance” (Labunskaya, Serikov, 2018). “Model” reflects interferences of the “value of appearance” and various phenomena, connected with appearance (the self-attitude towards appearance, estimates and self-assessments of the appearance, satisfaction, concern about appearance). “Model” reflects interaction of set of factors which cause a certain place of the “value of appearance” in hierarchy of values of the person. The importance of value of appearance in various spheres of life can have positive and negative consequences: decrease in success of training; restrictions in the sphere of labor employment; deformations in the sphere of the child parental relations; violations in the sphere of the family and marriage and romantic relations.

On the basis of the significance of the values of the appearance is formed “Lookphobia”, elected by the discriminatory practice—“lookism”. In our empirical researches it is emphasized that the attitude towards appearance, is studied, mainly the western psychologists. Considering influence of socio-cultural factors, the task of studying of the attitude towards appearance of modern Russian young people is set. Results of a number of our researches indicate dynamics of ideas of the Russian students of the functional importance of attractive appearance in the educational sphere; on the differentiated approach to estimates of appearance of teachers and self-assessments of students (Bzezjan, Labunskaya, 2018); on the importance of appearance for the sphere of the romantic relations (Gura, Labunskaya, 2018). These and many other data indicate, that Russian young people has developed a point of view on “investment force appearance” i, as social capital. The results of our studies confirm the findings of foreign researches. This study is conducted in the frameworks of the research project №17 1801260 supported by the Russian Science Foundation.
AN INTERDISCIPLINARY APPROACH TO WELL BEING AND RECOVERY POST HURRICANES

Milagros Mendez
Roberto Frontera
University of Puerto Rico (San Juan, Puerto Rico)

Every year, for the six months that lasts the hurricane season, the Caribbean Region faces potential forms of disasters (i.e., hurricanes, flooding, and earth wakes). Puerto Rico was recently hit (in September of 2017) with a category five hurricane called María that led to massive devastations. Several efforts have been developed to aid the recovery of the island whereas many psychologists have played a crucial role. One of those efforts was initiated at the University of Puerto Rico, through a collaborative agreement with the Hispanic Federation, to offer direct and indirect services to address the mental health and recovery needs of the population of Puerto Rico affected by hurricane Maria. Our ultimate goal is to develop an innovative, replicable, and evidence-based model of training and service delivery for natural disasters that attends to the immediate needs of our population in the aftermath of María (including identification and treatment of trauma related to natural disasters). This represents an innovative multilevel approach to services with an inter-disciplinary focus to mental health, whereas, expertise from the fields of social work, rehabilitation counseling and psychology are brought together for its design and implementation. For this presentation, we will discuss the conceptual framework of such interdisciplinary approach, which includes the cultural adaptations of the model, with a focus on the lessons learned from this experience.
THE CONCEPT OF HAPPINESS ACCORDING TO SOCIAL CLASS, AND ITS MODAL REFERENCES

Emilio Moyano
University of Talca (Talca, Chile)

Darío Paez
University of the Basque Country (San Sebastian, Spain)

Rodolfo Mendoza
University of Bio-Bio (Chillan, Chile)

The concept of happiness according to social class, and its modal references. Happiness is a concept of difficult definition, in content as in operationalization. His study is of increasing cultural and social interest as seen in an increasing literature and the dissemination of rankings comparison between countries. There are psychometric instruments to measure happiness, emerged in Anglo-Saxon culture, but the identification of concepts and instruments born in Latin American culture is just beginning. The main objective here is to synthesize first of all the concept of happiness reported in two independent studies of samples of Chileans of popular and middle-class sectors (n = 141 and n = 341 respectively) with their respective meanings. Second, the frequency of nine philosophical referents of Happiness is reported in a sample of convenience (n = 750) of two cities of the center-south of Chile. It is observed that in the imaginary of people from popular and middle-class sectors, happiness refers to a state of mental equilibrium and achievements. There is a more marked reference to the satisfaction of basic necessities for the first sector and to the interpersonal relations in the second. The modal philosophical reference — predominant — of happiness is that of satisfaction. The educational level appears associated with a greater affiliation to the referents tranquility and stoicism. The young conform more to the referents satisfaction and Carpe Diem. These results are compared with those of other countries of America and the differences of referents of happiness are discussed according to social status and the life cycle, in the context of the Latin American culture. Key words: Happiness, concept, social classes, philosophical referents.
MAKING DECISIONS: SATISFYING, MAXIMIZING, MINIMIZING, AND THEIR DIFFERENT EFFECTS ON WELL-BEING.

Emilio Moyano Chile Talca
University of Talca (Talca, Chile)

Rodolfo Mendoza
University of Bio-Bío (Chillán, Chile)

Making decisions is an area of sustained science development because of its obvious and undoubted importance. Among the theoretical concepts related to this, maximization and satisficing have been central in psychology and other sciences. The scientific literature with regard to the concept of maximization and the instruments to measure it has become dominant, but the orthogonality of the proposed dimensions as components of it has been discussed. Notwithstanding Simon's approach (1951, Theory of limited rationality) that the dominant tendency in human functioning would be satisficing and not maximization, this — and probably because of dominant pro-capitalist education — has been privileged in his study over other concepts. In addition, a strong accent has been placed on the models of measurement of maximization, being rare to find a discussion on the founding theory and its social implications today. Here it is discussed about that emphasis and of this lack respectively. We review particularly the concepts of maximization, satisficing and the most recent minimization, based on three conceptualizations and theoretical models, and their relationships with three measures of subjective well-being: grief, happiness and vital satisfaction. Models are assessed in a sample of 402 Chilean university students. Our results provide paradoxical evidence of the theoretically established relationships with respect to evidence from international literature. This is discussed here in its theoretical implications, for the conceptualization of decision-making and the empirical consequences of measurement.

COMPARING HUMAN PERFORMANCE MEASURED USING DIFFERENT PSYCHOPHYSICAL METHODS AND TASKS

Tadamasa Sawada
National Research University Higher School of Economics (Moscow, Russia)

Human performance of detection and discrimination tasks in behavioral experiments is traditionally characterized with some descriptive variable such as a threshold or d-prime. In conventional psychophysical methods, the stimuli used in the experiment are points in a one-dimensional space and the responses to these stimuli are represented as a function along the stimulus dimension. The function of the responses is characterized by a few parameters some of which are used as descriptive variables of the human's performance. In this presentation, I describe how the psychophysical method can be generalized to stimuli represented as points in a multi-dimensional perceptual space and how the results of this generalized method should be interpreted. Here, I discuss the perception of the orientation of a single contour and the perception of a configuration formed by multiple contours (e.g. parallel or perpendicular configurations, Koshmanova & Sawada, 2019). This generalization method is based on the assumption that the contours forming the configurations are perceived individually from one another and that the configurations are perceived as linear combinations of the contours. The perceived orientations of the individual contours are represented as the individual
dimensions of a multi-dimensional perceptual space. A function representing the responses to the configuration can be characterized by the orientation threshold to each contour. This assumption allows me to compare the perception of some configuration with the perception of another configuration quantitatively.

WEARABLES FOR MENTAL HEALTHCARE: FINDINGS FROM A ROUTINE PRACTICE IMPLEMENTATION STUDY

Tom Van Daele
Nele A. J. De Witte
Thomas More University of Applied Sciences (Antwerp, Belgium)

Romy Sels
Glen Debard
Bert Bonroy
Thomas More University of Applied Sciences (Geel, Belgium)

Wearables collect reliable, continuous and ecologically valid physiological data that can inform on both vulnerability factors and the process of recovery in mental disorders. However, current clinical applications in this field are limited. Burnout and depression are highly prevalent mental disorders that have a large impact on psycho-emotional wellbeing and are associated with substantial societal and economical costs. The Carewear project aims to enrich current employment assistance programs and the treatment of depression with the implementation of wearable technology. We have developed an online software platform and accompanying clinical guidelines that allow healthcare professionals to use physiological data as a useful addition to their current practices. In two use cases we investigate the experienced added value of this implementation of wearable technology to help prevent burnout and treat depression. Clients wear a wristband that registers heart rate variability, stress (through skin conductance and heart rate data), and physical activity. The physiological data can be inspected and completed on the Carewear platform and consequently discussed in regular consults. Healthcare professionals and clients complete questionnaires before and after the implementation, specifically the Flemish Unified Theory of Acceptance and Use of Technology (UTAUT) questionnaire, the Depression Anxiety Stress scale (DASS) and the Burnout Assessment Tool (BAT). Additionally, participants report on their personal experiences with Carewear. The study is still ongoing but will be finished by July 2019. Healthcare professionals and clients from different organisations and with varying care as usual have already been included. The results will provide important insights into how professionals and their clients experience Carewear and how the implementation of wearable technology in clinical practice can be improved to meet the needs of end users. To summarize, the Carewear project aims to encourage the use of wearable technology in mental health by providing a user-friendly platform and clinical guidelines tailored to elevated stress and depressive symptoms. This makes physiological data more accessible and comprehensible for both healthcare professionals and clients. The current implementation study will provide insights into the benefits and challenges of using wearable technology in current clinical practice.
The increase use of smartphones in adolescence has led clinicians and researchers to study this phenomenon deeply. Indeed adolescents seem to be at risk of smartphone addiction because they are yet to develop self-control in smartphone use. Therefore, a low self-control could be a risk factor for the development of emotions and behavior difficulties in the adolescence period. The principal aim of the current study was to confirm the factor structure of Smartphone Addiction Inventory-Italian (SPAI-I; Pavia, Cavani, Di Blasi, & Giordano, 2016) version for adolescents, and to evaluate the factor structure of Smartphone Addiction Inventory (SPAI; Lin, Lin, & Lee, 2014), original version among Taiwan's sample. Furthermore, the relation between self-control, smartphone addiction symptoms, internalized and externalized symptoms across gender and age were investigated; especially, considering the influence of self-control role on those symptoms. A total of 446 Italian early adolescents and adolescents completed Self-restraint subscale of Adolescent Self-Consciousness Questionnaire (ASC; Nie & Ding, 2009; Nie, Li, Dou, & Situ, 2014), Total Difficulties Score of the self-report version of Strengths and Difficulties Questionnaire (SDQ; Goodman, 1997), and Italian version of Smartphone Addiction Inventory. A Confirmatory Factor Analysis (CFA) confirmed the factor structure of SPAI-I and did not indicate a good fit with the Exploratory Factor structure of the original version of SPAI-I. Furthermore, self-control was significant and negatively correlated with each dimensions of SPAI-I. Regression models showed that self-control had an influence on internalized and externalized symptoms. The present findings suggested that SPAI-I can be used to assess smartphone addiction among adolescents, highlighting self-control skills importance in diminishing this addiction.
SUBJECTIVE RATINGS OF SIBLING PSYCHOLOGICAL SIMILARITY

Oksana Baskaeva
Psychological Institute of the Russian Academy of Education (Moscow, Russia)

Svetlana Pyankova
Lomonosov Moscow State University (Moscow, Russia)

Self-perception and perception of the partner in sibling pairs were studied. Goal of the study was to estimate a level of perceptible similarity between oneself and one’s sibling by personal characteristics. A particular way siblings percept psychological peculiarities of each other reflects a level of mutual identification, influences relationships in a pair and their level of social adaptation. Sample: 151 pairs siblings (302 participants; 196 women, 106 men). Two sub-samples: elder siblings (mean age – 29 years, SD = 8.52); (2) younger siblings (mean age – 26.1 years, SD = 8.30). Every participant filled questionnaires twice: Eysenck Personality Inventory (EPI), Locus of control questionnaire, Short Big Five (B5), Dark Triad. Instruction 1: “Estimate a level of agreement with each statement.” Instruction 2 required filling the questionnaire for one’s sibling: “How do you think your brother/sister could answer this question?” Therefore, every participant had two types of indicators: self-assessment and assessment from the partner. Spearman correlations of similarly-named indicators in sub-samples were calculated. Statistically significant correlations between self-assessments and partner assessments in both sub-samples were found.

Correlations in the younger subgroup are closer: 19 significant correlations; 0.27 < r < 0.74; p < 0.01 for 16 correlations, p ≤ 0.03 in three cases. 14 significant correlations in the elder subgroup; 0.26 < r < 0.64; p < 0.01 for 9 correlations, p ≤ 0.04 in five cases. Self-assessments of younger siblings are significantly correlated with assessments received from elder siblings by all studied indicators, but Openness to experience (Big Five) and the subscale Internality indicator (Locus of control). In the elder subgroup no significant correlations were found by a general and four subscale Internality indicators (Locus of control), Social Desirability (EPI) and Agreeableness (Big Five). Correlation coefficients are statistically significant by all Dark Triad indicators in both subgroups. Following the results of the research, siblings rate psychological similarity of each other highly enough. Siblings understand their siblings’ self-perception in a relatively accurate way; negative characteristics of each other are assessed more accurately. Studied peculiarities of sibling psychological status are an important component of the psychological climate in a family in general.
VISUAL SIGNALS DISCRIMINATION UNDER STRESS

Tatiana Zabrodina
Aleksandr Sorokin
Tula State University (Tula, Russia)

Visual signals discrimination under stress T.A. Zabrodina, A.S. Sorokin Tula State University

Mechanisms and dynamics of stress reactions are not quite clear yet. Using the psychophysical
"Yes-No" method, we studied effects of emotional stress on temporal and structural
characteristics of sensory processes. Visual
discrimination of line lengths was investigated in
20 patients of a dental clinic. Waiting for medical
treatment and receiving it were natural sources
of stress for them. The first series was carried
out immediately before the dental treatment. The
second series was conducted a few days later,
when the patients were in a calm state, since
they came to the clinic "for control" and dental
intervention was no longer required. The results
have shown that stress significantly affects both
the sensitivity index $d'$ and the decision making
criterion $P_n$ (according to Atkinson). The
dynamics of these indices is heterogeneous
among different individuals. According to the
average group data, stress caused not only an
increase of time, spent to solve the sensory task
(in almost all persons), but also a decrease in
sensitivity due to an increase of false alarms
probability while reducing the criterion
conservatism. The individual data analysis
revealed 3 subgroups of participants – with high,
medium and low resistance to stress. 1. Stress
increased the sensitivity by increasing hits
probability. In this case, the criterion was more
liberal than in the stress absence. Stress
resistance was the highest in this group (20% of
patients). 2. Stress led to the sensitivity decrease
due to an increase in false alarms probability. In
this case, hits probability remained at the same
level, and the criterion conservatism also
decreased. A medium stress resistance was
observed (60% of patients). 3. Stress caused a
significant decrease in the sensitivity due to a
simultaneous decrease in the hits probability and
an increase in the false alarms probability. For
this group, on the contrary, the criterion became
more conservative. These 20% of subjects
showed low stress-resistance. The results mean
that excessive emotional arousal, turning into
negative emotions, prevents a successful
performance. Thus, an individual degree of
stress-resistance may be manifested in
psychophysical indices dynamics. These features
of stress responses should be considered in the
professional selection for work related to
emotional stress.
PSYCHO-LEXICAL TAXONOMY OF CHILDREN LEXICON OF PERSONALITY BASED ON FREE DESCRIPTION

Krystian Macheta
Pedagogical University of Cracow (Cracow, Poland);
John Paul II Catholic University of Lublin (Lublin, Poland)

Iwona Bojan
Angelika Bondyra
Oleg Gorbaniuk
John Paul II Catholic University of Lublin (Lublin, Poland)

Most of research focused on the lexicon of individual differences describing adults. The purpose of this research was to establish a lexicon of personality of children aged from 9 to 13, based on a free description. The research involved 100 children. The children managed to describe themselves as well as the other people whom they know. In virtue of the interview, there were collected 6231 personal descriptors which the children used to describe people. The compiled lexical material was categorised by 13 judges, according to the taxonomy proposed by Angleitner et al. (1990). The taxonomic decisions of the judges have been verified due to their validity and internal consistency. Analyses showed the relationship between the lexical structure of the terms which children used to describe themselves and the lexical structure of the words used to describe themselves and others (likes and dislikes). Also, the difference between the structures of person-descriptive terms used for describing the children from their own perspective and another perspective is significant. Furthermore, it was discovered that the age has an impact on the received content of psycho-lexical categories. Percentage of used dispositional terms is significantly higher in descriptions made by older children. Moreover, the lexical structure of self-description is different than the structures of descriptions of liked and disliked people. The significantly larger part of self-descriptions is done with states terms although in the description of others dispositional terms are dominating. Gender does not have an impact on the number of words used in the description. Analysis of the factor structure is the next step to understand the way how a child perceives themselves and others.
A person’s Emotional Intelligence can either make or break him/her. Hence, it becomes very important to delve deep into this subject especially keeping the teenage group in perspective. A profound insight into EI can help teenagers manage their life in a much better manner. It can assist them in becoming good leaders and can also save them from emotional setbacks like depression, anxiety, stress, and much more. It is the ability to manage one’s own emotions and be considerate of that of others. EI, helps manage relationships with empathy. The main aim of conducting this research is to understand how the various aspects of EI are important and what role do they play in shaping a person. Teenage is a very crucial state and can attract many issues and to avoid these issues, one needs to be emotionally intelligent. It is the need of the hour. The tool used for this paper is Emotional Intelligence Scale by Anukool Hyde, Sanjyot Pethe, and Upinder Dhar and the sample population of this research is from the age group of 17-22 and 200 students filled the questionnaire. This tool is a five point Likert scale and has 34 questions. After collecting the data, analysis was done using Excel and SPSS software. The results of the first 100 people from the sample population are: None of the people from the sample population have low level of EI. 18 out of the first 100 have average level of Empathy whereas the other 82 have high level of empathy. 17 out of the first 100 stand at the average level when it comes to Managing Relations whereas the other 83 stand at the high level of the same. These are some of the results. There are a lot of integral aspects of EI, like Empathy, Managing Relations, Integrity, Self Development, Value Orientation, Commitment, Altruistic Behaviour, Self-Awareness, Emotional Stability, and Self Motivation. The aspects, put together briefly form Emotional Intelligence.
EXPLORING MENTAL ROTATION IN SCHIZOTYPY

Marta Godoy-Giménez
Ángel García-Pérez
Antonio González-Rodríguez
Fernando Cañadas
Angeles F Estévez
University of Almería (Almería, Spain)

Mental rotation is a spatial working memory (SWM) skill that allows individuals to convert a mental image from one position to another. Recently, it has been suggested that an SWM performance deficit might be associated with the presence of schizotypal traits in the general population (e.g., Hazlett et al., 2014). However, evidence regarding schizotypy and mental rotation is scarce and contradictory. In the present study, we aim to further explore this issue. Since previous studies have shown sex differences in SWM tasks (e.g., Boone & Hegarty, 2017), we also investigate whether sex affects participants’ mental rotation performance. All participants (undergraduate students from the University of Almería) were assessed using the Schizotypal Personality Questionnaire (SPQ; Raine, 1991). Later on, they performed a new mental rotation SWM task involving the rotation of the stimulus to be remembered (a black circle split into sixteen portions by four axes; two of the portions were coloured white). According to previous studies, we observed a significant sex effect. Results also revealed that there were no differences between high and low schizotypy participants suggesting no mental rotation impairments in schizotypy. However, it could also be that our task was not demanding enough to detect them. Future studies might assess this issue. One relevant question future research might also address is whether other different SWM functions could be affected in high schizotypy individuals. This research was supported by a grant (PSI2015-65248-P) from the Spanish Ministry of Economy and Competitiveness, co-founded with ERDF (FEDER) funds. MGG is supported by a pre-doctoral grant by the Ministry of Education, Culture, and Sport (FPU2015-01562).
UNDERSTANDING AND BELIEFS ABOUT THE ETIOLOGY AND TREATMENT OF MENTAL ILLNESS IN SODO DISTRICT, ETHIOPIA

Kimberly Hook
Lauren Ng
*Boston University School of Medicine/Boston Medical Center (Boston, USA)*

Eyerusalem Getachew
*Addis Ababa University (Addis Ababa, Ethiopia)*

Amantia Ametaj
*Boston University (Boston, USA)*

Low- and middle-income countries have very few mental health professionals, and efforts to increase access to treatment are a global priority. However, beliefs about and treatment of mental illness are expressed differently among cultures, and understanding of these factors is a critical step in developing treatment options. Specifically in Ethiopia, current efforts to address mental illness often lack psychotherapeutic interventions, and it is unclear if such efforts are in accord with cultural norms. This qualitative study aimed to identify clinically and culturally relevant characteristics of the population in Sodo District, Ethiopia to better understand beliefs about the causes of mental illness and perceptions of treatment. Purposeful sampling was used to recruit 48 patients, caregivers, health care providers, and leaders. Semi-structured, in-depth interviews were conducted, recorded, and transcribed in Amharic and translated into English. Four coders conducted thematic analysis using NVIVO 12. Results from this study indicate that mental illness is understood to stem from spiritual attacks (i.e., evil doings of other people), stress (e.g., challenging life events), and/or trauma. Existing methods of coping include relying on church or religious beliefs, drinking alcohol, sleeping, socializing, walking, or seeking justice (i.e., using someone as a mediator to make peace). Informal methods of treatment include using holy water or seeking advice from elders or community leaders. Patients and providers overwhelmingly noted that counseling and seeking advice were appropriate methods to seek relief from mental health symptoms. Accordingly, efforts to adapt and integrate psychotherapeutic interventions seem well-aligned with norms and desire for treatment. These findings suggest possible mechanisms of improving treatment options in the effort to lower the existing global treatment gap.
UNDERSTANDING THE STRATEGIES TO INTEGRATE CONCEALABLE STIGMATIZED IDENTITIES INTO INTERNATIONAL NGO WORK

Saajan Bhakta
The Chicago School of Professional Psychology
(Wichita, USA)

The impacts of starting, developing, and sustaining an NGO as an individual with multiple concealable stigmatized identities are far reaching. The learning that has taken place over the last six years by way of developing trust and rapport among cultures who have historically frowned upon such identities provides a solid groundwork for teaching the strategies for the integration of concealable stigmatized identities into NGO work. Overcoming cultural, community, and societal stigmas in an effort to rally support for a common mission while leading an NGO focused on humanitarian efforts has provided Bhakta with a foundation for supporting those living with a concealable stigmatized identity from an international NGO perspective. Understanding how NGOs around the world can meet this population’s needs is not only important, but equally as challenging, especially when taking a culturally competent and informed approach to philanthropic service. “After leaving an Indian airport, I heard the faintest of knocks sounding on my car window. I was only eight years old. I looked up to find a woman, hardly clothed and in dire need of food, standing outside the car. Her small child is cradled in her tight arms, and my heart breaks. She was sitting there watching her child suffer because she couldn’t do anything about it. What did she live for? Ever since this experience, I have always wanted to better the lives of others, especially the less fortunate.” In 2010, Bhakta founded PovSolve. PovSolve is a registered 501c3 nonprofit organization making positive change by raising money and creating awareness for human suffering. PovSolve works on the international scale to meet the basic human needs of those living in poverty. PovSolve focuses on food, water, education, healthcare, and shelter. PovSolve has funded the construction of a school in Zambia, built water wells throughout Kenya, funded a hospital in India, and supported orphan efforts in Venezuela. Being an NGO that has worked across diverse countries and cultures, the NGO has had the chance to interact, both directly and indirectly, with those having a concealable stigmatized identity.
IMPLICIT COLOR-EMOTIONAL DIAGNOSTICS OF SUBJECTIVE REPRESENTATION OF MENTAL HEALTH AND PSYCHOLOGICAL WELL-BEING

Ludmila Shaigerova
Andrei Kiselnikov
Roman Shilko
Yuri Zinchenko
Dmitriy Vinitsky
Lomonosov Moscow State University (Moscow, Russia)

Traditionally, the affective component of mental health representations and psychological well-being refers to emotions, moods, feelings, which are usually measured using questionnaires and other deliberate techniques. However, not all components of emotional processes are conscious, which is why the question of implicit assessment of mental health representations and psychological well-being is still very important. This study refers to the perceptual-semantic association methodology (Kiselnikov et al., 2013), based on Sokolov’s vector spherical psychophysiological model of color, emotions and semantics (Sokolov, 2013). This methodology treats colors as mediators that can help measure implicit associations between emotions and specific semantic categories. The aim of the study was to reveal the implicit multidimensional structure of subjective emotional-semantic representation of specific categories related to mental health and psychological well-being. The method of perceptual-semantic association was used; 40 participants (29 females, aged 26.4±9.7 years old) were tested. Factor analysis was applied to the averaged matrix of subjective differences between 1) ten basic emotions (happiness, surprise, fear, sadness, disgust, anger, calmness, shame, contempt, and interest), 2) 15 crucial semantic categories for mental health and psychological well-being (self, life, family, friends, work, independence, leisure, future, faith, wealth, psychologist, psychological help, stress, depression, and mentally ill), and 3) ten basic colors. The classical two-factor emotional-semantic subjective space was revealed (Russell, 1980). Semantic categories representing mental health and psychological well-being are located definitely on the surface of the implicit two-dimensional Russel’s affective circumplex (classical «Valence» and «Arousal» basic affective axes). The positive pole of the «Valence» axis showed «family», «interest», «future», «friends», and «leisure»; the negative pole of the «Valence» axis presented «contempt», «disgust», «shame», «fear», and «stress». The activated pole of the «Arousal» axis showed «wealth» and «anger», whereas the deactivated pole of the «Arousal» axis showed «sadness», «calmness», «mentally ill», and «depression». Other categories were located in areas closer to the middle of both axes. The perceptual-semantic association method is a precise research tool which helps to uncover the implicit emotional load of verbal categories related to mental health and psychological well-being. The research was supported by Russian Foundation for Basic Research, grant #17-29-02506.
A STUDY OF ENVIRONMENTAL PSYCHOLOGY: OVERVIEW OF MERSIN IN TURKEY

Ezgi Mehmetoglu
Mersin University (Mersin, Turkey)

Melek Gögenci
Izmir Solidarity Academy (Izmir, Turkey)

The place is often used in conjunction with the social network, the workplace, the environment, and other networks associated with the environment. For those experiencing these places of focus, the place contains subjective meanings. These concrete relations with the environment include social, emotional and symbolic meanings related to the context (Lalli, 1992). Cognitive maps are the combination of information and images that people have about the environment they live in with their meanings and symbols in their minds. Unlike geographical maps, it contains images developed by people in relation to the earth. Cognitive mapping, first born by Tolman (1948), is a process that brings together memories of people's spatial environment, recalling these memories, coding and resolution of spatial information (Downs and Stea, 1973). Building a more livable city for people is through the study of behavioral practices shaped by psychological and mental representations of people (Gögenci, 2010). For this purpose perceptions of Mersin and Turkey in this study, a practical image and behavior were examined. The study was conducted by gathering cognitive maps from 130 students in five different departments of Mersin University. Cognitive maps are given to students in A3 size paper, in the mind and thinking of Mersin and Turkey was transferred paper. As a result of the analysis of cognitive maps; Mersin is mentioned in ten different categories. These categories are composed of three main structures consisting of the physical and social conditions of the city, the critics of the city and the city related experiences. 9 categories come to mind when it is said Turkey; they include representations of geographic regions, their feelings and thoughts about the country, their criticisms and various places. The student population who indicated Mersin with Turkey together is only 30 percent of the all sample. The student population who imply Turkey with neighborhoods are 7 percent of all sample. The results are quite striking in terms of the representation of Turkey and Mersin. In light of the findings, the perceptions of Mersin University students is discussed from the perspective of environmental psychology.
THE RELATIONSHIP BETWEEN DIALECTICAL THINKING AND THE ABILITY TO RESOLVE CONFLICTING SITUATIONS IN CHILDREN OF DIFFERENT AGE

Anastasia Belolutskaya
Lomonosov Moscow State University (Moscow, Russia)

At the beginning of the 21st century the ability to resolve conflicting situations productively is becoming one of the most demanded both in the labor market and in modern social life. The ability to find solutions in problem-contradictory situations covers a number of fundamental mental properties, the key of which is the so-called "Creative" thinking. In the scientific psychological literature there are more than a dozen terms to define this phenomenon. It should be noted that many foreign and domestic researchers recognize that the "dialectical" way of thinking may be considered as a factor contributing to a high capacity for intellectual creativity. The key foreign researchers of dialectical thinking are: K. Riegel, M. Besseches, O. Laske, O. Robinson, and others. In Russia, a structural-dialectical approach is being developed, where the formation of dialectical thinking is considered as a separate line of cognitive development, originating in preschool age. The hypothesis of the study is that dialectical thinking is significantly positively associated with the ability to resolve problematic situations productively by children of different ages. Sample: the schoolchildren of the first grade (School No. 514, 69 respondents) and high school students (school No. 1448; 80 respondents) Methods of diagnosing dialectical thinking "What can be at the same time?" (N.Veraksa), "Unusual tree" (N.Veraksa); method of diagnosing the ability to resolve problem situations "Heroes in the city" (A.Belolutskaya) Significantly positive correlation coefficients were obtained. In the case of primary school students, r = 0.42 for n = 69 (P 0.01); in the case of high school students, r = 0.39 with n = 80 (P 0.01). Thus, the hypothesis about the connection of dialectic thinking and the ability of productive resolution of problem situations by children of different ages was confirmed. The findings suggest that it is necessary to develop educational programs for the development of dialectical thinking for children of different ages.
ETHICAL CODE OF ORGANIZATIONAL CULTURE: CODE INFLUENCE ON ORGANIZATIONAL FUNCTIONING (ORDER APPROACH)

Liudmila Aksenovskaya
Saratov State University (Saratov, Russia)

Maria Kuznetsova
University of Wyoming (UW-Casper, USA)

The socio-psychological research of the organizational culture is actively implemented in the framework of the Order approach developed by Liudmila Aksenovskaya (1997, 2005). In the order approach the culture is ethically determined order and it has the following definition: complicated socio-psychological order of organizational and managerial interactions that are constituted and regulated by systems of ethical senses of the participants of interactions. The structure of the order model of organizational culture includes three aspects (suborders), which are formed as a result of a leader using one of the three managerial models: (1) suborder “family” (which is responsible for the emotional and value unity of the organization members); (2) suborder “army” (which is responsible for the goal-oriented unity of an organization); (3) and suborder “church” (which is responsible for the meaning unity of an organization). Six techniques for order diagnostics of organizational culture have been used at the present time. There are two techniques for leader individuality level, managerial team level, and overall organizational level. The goal of this empirical research was to explore the influence of ethical senses of participants of organizational interactions on formation of the characteristics of organizational culture. There was a total of 680 participants in this study from effective project teams in hi-tech fields, police, and different departments of a state organization. The main research methods were order diagnostics of organizational culture, documents analysis, vector 3-D modeling of organizational culture. It was discovered that there are six ethical cultural codes of organizational culture: 1) code "A-C-F" (covers "breakthrough" type of activity in the conditions of deficit of time), 2) code "C-A-F" (the same in the conditions of ample time), 3) code "C-F-A" (promotes the formation of “corporate religion,” 4) code "F-A-C" (provides success in the beginning of organization’s activity), 5) code "F-C-A" (creates conditions for stabilization), 6) code "A-F-C" (“survival” code of an organization). Organizational cultural code is set by the method of order diagnostics of organizational culture. Depending on the existing conditions and organizational goals, the code can be changes, and by doing this we can influence the effectiveness and productivity of the organization.
SOCIAL PERCEPTIONS OF ORGANIZATION: STRUCTURE AND SPECIFICS
(ON THE EXAMPLE OF SARATOV UNIVERSITY)

Liudmila Aksenovskaya
Saratov State University (Saratov, Russia)

Maria Zhizhina
Saratov National Research State University after N.G. Chernishevsky (Saratov, Russia)

The study of perceptions of a higher education institution as an organization seems to be productive and expedient, and the results can be used in efforts taken to form an effective image of a higher education institution in order to identify preferences of different groups of the target audience, and specifically in terms of developing a program for positioning and promoting the image of the higher education institution in the educational market. In 2016-2018, 180 respondents including students, applicants and parents of school graduates of educational institutions in Saratov participated in the study of social views on a university as an organization (an image of a university). Research and data processing methods included an author’s questionnaire, the method of free association, and the Verges data processing method. The study also showed the critical role of media communications and, in particular, a media presentation of a university on the Internet, social networks in the process of shaping respondents’ positive views. Regarding the role that modern media technologies play, the next stage of work can be focused on studying the social networks of a university in order to develop the organizational structure of a university.
DATA-MINING AS A TECHNIQUE OF STUDYING THE VIRTUAL SELF IN THE SOCIAL NETWORK "VKONTAKTE"

Ludmila Shaigerova
Olga Vakhantseva
Roman Shilko
Alexandra Dolgikh
Olga Almazova
Lomonosov Moscow State University (Moscow, Russia)

Social networks provide youth with ample opportunities not only to express their attitude towards the world and the current events, but also to present themselves and to construct their identity. A multidisciplinary analysis of research data suggests that the influence of the digital society on the identity development can be understood through the relations between the real self, the ideal self and the virtual self. Self-presentation of users in the social network Vkontakte makes it possible to get information about various aspects of the virtual self, including their world outlook, sources of inspiration, and life values. The study was dedicated to the life values presented by users on the social network Vkontakte. The study used the innovative technology of data-mining in the R development environment. The online profiles were analysed through the section "The main things in life", where users can choose one of the eight values: family and children, career and money, entertainment and leisure, science and research, making the world better, self-development, beauty and art, fame and influence. The study included 9596 online profiles of users under and up to 18 years old. The users were from seven groups in the Vkontakte from different federal subjects of Russia. The most common value chosen by more than half of adolescents is "family and children". Most often, this choice is present in the profiles from the Republic of Tatarstan (69%) and from the Republic of Dagestan (65%), less often — in Moscow (51%), St. Petersburg (50%) and Rostov Region (53%). "Self-development" takes the second place in the hierarchy of values. Such values as "beauty and art" and "fame and influence" are least often chosen. The other values occupy different places in the values hierarchy of adolescents from different regions (Pearson $\chi^2 = 214.251$, $p<0.05$). The prevalence of "family and children" in the online profiles indicates the influence of cultural traditions on the identity of contemporary adolescents living in Russia. At the same time, some life values are determined by regional or ethnic traditions. The project was supported by the Russian Science Foundation (project No 15-18-00109).
The perception, interpretation and conceptualization of one’s health are mediated by the system of cultural values and norms. Nowadays, the research of culturally mediated cognitive aspects of health and psychological well-being, the perception of health problems in different cultures, among immigrants and ethnic minorities is developing. This study presents the comparative analysis of perception of factors affecting health by population living in two Russian federal subjects. The survey included participants from city of Moscow (48 people) and Kemerovo Region (52 people) between the ages of 18 and 53 (62 females and 38 males). The participants were asked to rank the following categories, from one to six, according to the rate of their influence on human health, in their opinion: (1) genetics, heredity; (2) a healthy lifestyle (good sleep, food, absence of bad habits); (3) good environmental conditions; (4) regular medical examination, timely referral to a doctor; (5) lack of stress or ability to cope with it; (6) financial well-being. The perceptions of the most and the least important factors influencing health coincide in both samples, which is confirmed by the Mann-Whitney U-test. Respondents from both groups (Kemerovo region and Moscow) believe that the lifestyle has the greatest impact on human health ($U = 1187.0; p = 0.657$), and financial well-being is the least important ($U = 1206.5; p = 0.767$). The differences are manifested in the perception of such factors as genetics, heredity ($U = 925.0; p = 0.023$) and the environmental conditions ($U = 858.5 p = 0.006$). Participants from Moscow estimated the influence of genetics as significantly higher, whereas the influence of a good environmental situation as significantly lower than the participants from Kemerovo Region. The analysis of the hierarchical system of perception of the factors affecting health suggests that there could exist invariant factors that determine health and well-being of Russian people. The most important is the lifestyle. At the same time, differences in the assessment of other factors, for example, the environmental situation, may result from regional differences. The research was supported by Russian Foundation for Basic Research, with the Grant 17-29-02506.
CORRELATION OF INDICATORS OF LIFE TRAJECTORY AND SUBJECTIVE WELL-BEING OF ADULTS WITH HEARING IMPAIRMENT

Tatiana Adeeva  
Inna Tikhonova  
Svetlana Khazova  
Kostroma State University (Kostroma, Russia)

Subjective well-being is considered in the context of the life trajectory. In the analysis of the life trajectory, great importance is given to the important turning life events, specific conditions of life, experiences of the individual. The conditions and events of life are not predictors of subjective well-being, but can be a means of achieving it through interpretation, experience, willful overcoming. The aim of the study is to characterize and determine the specificity of indicators of subjective well-being of adults with hearing impairments by analyzing life trajectories. The participants: adults with hearing impairment. Methods used were subjective Well-being Scale by Sokolova M. V. (Sokolova, 1996), methodology of the study of life trajectories, a combination of clinical and psychological interview method of collecting history and technique “life Line” modification D. T. Vasilenko. The life trajectory represented by adult hearing impaired may be defined as hyperthymic. Respondents allocate a few important events of life, most of the events are evaluated very positively. Consequently we can talk about the self-presentation of rather a high level of subjective emotional well-being. However the study of subjective well-being using a standardized technique revealed low values. The general level of subjective well-being is low, it is in the range of values below the average norm (M=3,94 sten, Me=4 sten, Mo=3sten). The problem is experienced by respondents in the form of emotional symptoms, tension and sensitivity. The structure of emotional distress is dominated by tension and sensitivity (susceptibility) manifested in a sense of discomfort, a sense of dependence on others, a desire for privacy, mental and emotional symptoms in the form of increased emotional reactivity, restlessness, distraction. Thus, it is possible to state the disharmony of subjective well-being of the hearing impaired. This result is explained by the peculiarities of mental development of respondents: verbalization difficulties, concrete thinking, lack of continuous life memory, specific emotional environment. The subjective well-being demonstrated by respondents may be the result of insufficient analysis of the significance of events and their impact on subsequent life. The study was supported by RFBR, project No.17-06-00812.
**STRENGTHENING CAREER GUIDANCE AND COUNSELING TO PROMOTE ACCESS TO DECENT WORK**

Louise Michelle Vital  
Lesley University (Cambridge, USA)

Higher education experiences and career expectations of emerging adults: A focus on university students and graduates in Haiti  
The purpose of this paper is to examine the higher education experiences and career expectations of emerging adults. Data for the study was collected in 2013 from a higher education centered NGO in Haiti. The paper offers insights from students, alumni, and staff who named several factors that contributed to higher education and career challenges and discussed strategies to support the success of emerging adults in the country. A major factor was the HigherEdOrg (pseudonym) responding to university access and persistence in Haiti. Current literature on higher education in Haiti and labor market reports have also been reviewed. Concerns and suggestions related to wellness, identity, and success of Haiti’s emerging adults as they navigate a university to work/career path will be discussed from the country's socio-economic and cultural contexts. The paper has wider implications for discussion on mapping effective support for emerging adults in struggling economies in a global context.

---

**A STUDY OF THE RELATIONSHIP BETWEEN CHANGE IN POSITIVE EMOTION AND PERSONAL CHARACTERISTICS**

Takuro Nakatsuho  
Shukutoku University (Chiba, Japan)  
Hatsuho Ayashiro  
Komazawa Women's University (Tokyo, Japan)  
Mari Hirano  
Tokyo Kasei University (Tokyo, Japan)

In recent years, research has been actively conducted on topics including subjective well-being and positive emotion. In positive psychology, efforts are being made to improve well-being, and various works and exercises are also proposed. Well-being does not change in a short time, but what kind of personality factors are influential or uninfluential in case of a change? Understanding this point is considered effective for practice in positive psychology. Therefore, the purpose of this study was to examine what kind of differences in personal characteristics can be seen in the case of a change in “positive emotion,” which an aspect of well-being. Data of 554 persons (male: 247) living in Japan were collected through a web-based investigation. A second survey was conducted about one month after the first survey. The measures used were Positive Emotional Scale (the Japanese version of the Oxford Happiness Questionnaire, Qi & Asakawa, 2011), Ten Item Personality Inventory (the Japanese Version, Oshio et al., 2012), Meta social skill (Ishii, 2007), and Highly Sensitive Person Scale (the Japanese version, Takahashi, 2016). The Positive Emotional Scale (5~30 score range) was used to assign participants into the two group. In Group1 (n=59), the difference between the first and second survey scores was 5 (absolute value of 5), and in Group2 (n=495) it was only 4 or less. Personal characteristics in the two group were analyzed using the t-test. Findings Results of the analysis revealed the following. Ten Item Personality Inventory (Extraversion (t=.248, n.s),
Agreeableness (t=-.081, n.s.), Conscientiousness (t=.401, n.s.), Emotional Stability (t=1.356, n.s.), Openness to Experience (t=-.022, n.s.), Highly Sensitive Person Scale (t=-1.056, n.s.), and Meta social skill (t=1.396, n.s.). There was no significant difference in the two groups for any scale. From the results, no difference was found between the two groups for each scale. Personal characteristics such as personality and meta cognition may not be associated with change in positive emotion. People with any personality can expect a change in positive emotion, and so the development of intervention through positive psychology is expected in a dimension different from the change of personality.

WHY DO PEOPLE FEEL SIMILAR OR DIFFERENT FROM OTHERS? THE ROLES OF PERSONALITY, SELF, PARENTIFICATION AND EMOTION REGULATION

İlgün Bilekli  
Hacettepe University (Ankara, Turkey)  
Deniz Bilger  
Bursa Uludağ University (Bursa, Turkey)  
Fatma Oktay  
Süleyman Demirel University (Isparta, Turkey)

Emotional regulation (ER) studies reveal that positive ER strategies are related to one's positive affect, self-esteem and psychological adjustment (Nezlek & Kuppens, 2008), and ER difficulties are associated with negative psychological outcomes. Although ER is frequently addressed as an internal process, it has recently been mentioned as interpersonal ER (Batson, 2011). On the other hand, the urge to conform (individuals behave in a similar way with others) is one of the most fundamental issues in social psychology (Asch, 1956; Milgram, 1963; Sherif, 1936). In this study, we aimed to examine emotional conformity and emotional independency of individuals. In other words, when people express emotions, do they feel depend on the emotions of one another or do they feel independently? We hypothesized that people who are dependent on someone else's emotions react differently from independents in terms of parentification, ER difficulties, personality and self construct. 285 undergraduates aged between 18-30 have participated and completed the battery of questionnaires composed of Difficulties in Emotion Regulation Scale-16, Short-Form Five Factor Personality Inventory, Autonomy and Relatedness Scales and The Parentification Inventory. The students were asked to read the scenarios that triggered the feelings of fear, sadness, anger and happiness and to imagine themselves in that situation. It was evaluated with categorical responses that people would react differently from their friends’ emotion expression or would react depending on the feelings of their friends in the scenario. One-way ANOVA was conducted to compare people reacted dependent on their friend’s feelings or independent, in terms of parentification, self construct, ER and personality dimensions. Results indicated that those who expressed emotional reactions depending on the friend’s emotional response significantly differed from those who reacted independent of their friends in terms of autonomous-separate self, autonomous-related self, emotion regulation difficulty/non-acceptance, sibling-focused parentification, personality/emotional balance and imagination scores. Consistent with our expectations, it can be said that feeling similar with someone or different could be shaped by one’s self construct, personality, ER types and parentification levels. Results are also consistent with Kağıtçibaşı’s family change model. The findings will be discussed in the light of literature.
EMOTION REGULATION DIFFICULTIES AND DEFICITS IN INTEROCEPTIVE AWARENESS DEPENDING ON OBESITY’S SEVERITY: A CASE CONTROL STUDY

Clemence Willem  
Marie-Charlotte Gandolphe  
Jean-Louis Nandrino  
University of Lille (Villeneuve d'Ascq, France)

Méline Roussel  
Diabetology Center – CETRADIMN (Roubaix, France)

François Pattou  
University of Lille (Lille, France)

Difficulties in emotion regulation may be responsible for overeating and weight gain of obese people, by increasing their risks of emotional eating (Gianini and al., 2013). Meanwhile, deficits in interoceptive awareness may increase and maintain emotion regulation difficulties (Murphy and al., 2017) as well as overeating behaviors in obese people, by complicating their awareness and distinction of visceral and emotional cues. Few studies have explored emotion regulation difficulties and deficits in interoceptive awareness conjointly and according to the obesity’s severity. The aim of the study was, first, to confirm that people suffering from obesity display emotion regulation difficulties and deficits in interoceptive awareness, then, to explore differences in emotion regulation and interoception in patients with moderate or severe obesity. 165 participants were assigned, according to their BMI, to the "normal weight" group (N=55; BMI<25), "moderate obesity" group (N=55; 30 ≤ BMI < 40) or "severe obesity" group (N=55; BMI ≥ 40). Participants completed self-report questionnaires assessing emotion regulation (CERQ; DERS) and interoceptive abilities (MAIA; FFMQ). ANOVA and contrast analyses were conducted, to compare performances of the three experimental groups. People suffering from obesity, as a whole, reported significantly less adaptive emotion regulation strategies (as measured by CERQ) (p=.016) and more emotion regulation difficulties (as measured by DERS) (p=.013) than normal weight people. Obese people also presented less interoceptive abilities than normal weight individuals did (as measured by the MAIA) (p=.021), such as, less ability to trust their body signal and use them to adapt their behaviors (p<.001). No significant differences were found between moderately and severely obese people concerning emotion regulation and interoception. Results showed both difficulties in emotion regulation and deficits in interoceptive awareness. Such deficits are present whatever the severity of obesity. Emotion regulation and interoceptive abilities are privileged targets of psychotherapeutic interventions, regardless of the severity of obesity.
ASSESSING THE BAP: PAST AND FUTURE RESEARCH

Marta Godoy-Giménez
Antonio Gonzalez-Rodriguez
Ángel García-Pérez
Pablo Sayans-Jiménez
University of Almería (Almería, Spain)

Robert Ward
Bangor University (Bangor, United Kingdom)

The Broad Autism Phenotype Questionnaire (BAPQ) is the psychometric tool for assessing the broad autism phenotype (BAP) most widely used across different cultures and countries. However, when applying a test to different cultures or languages its indicators could not be measuring the same amount of construct (BAP severity) and that could generate problems of equivalence among the BAPQ scores of the different applications. Despite its frequent use in different cultural contexts, there is not any research focused on studying the severity invariance of the BAPQ items. Here we aim to explore Differential Test Functioning (DFT) between the English and the Spanish versions of the BAPQ using Rasch models. These models allow us both to estimate item severity in each different application of the questionnaire and to statistically contrast it between samples. This analysis provides information regarding the amount of BAP that would be necessary to endorse each BAPQ item in both versions. Besides it can help to determine if the differential item functioning is due to the translation process or to cultural differences (i.e., some behaviours could imply different levels of BAP severity depending on the culture). This study was performed on two subsamples, 349 Spaniards answered the Spanish version of the BAPQ and 124 Brits responded to the original BAPQ version. The results showed DFT in the three BAPQ subscales: Aloof (5 out of 12 items showed statistical differences), Rigidity (8 out of 12 items showed statistical differences), and Pragmatic Language (4 out of 12 items showed statistical differences). These results indicate that there is not an equivalence between some of the BAPQ items of each BAPQ version and should encourage other researchers to repeat these analyses in the rest of BAPQ versions and applications. These results are also discussed in detail regarding the nature of the differences between versions (e.g., one Aloof item and another of Pragmatic Language seem to show translation problems). This research was supported by a grant (PSI2015-65248-P) from the Spanish Ministry of Economy and Competitiveness, co-founded with ERDF (FEDER) funds. MGG is supported by a pre-doctoral grant by the Ministry of Education, Culture, and Sport (FPU2015-01562).
THE CHARACTER DYNAMICS PROBLEM AND EMOTIONAL EDUCATION OF VYGOTSKY IN CHILDREN

Yun Te Na Wu
Inner Mongolia Normal University (Hohhot, China)

Lev Vygotsky is a famous psychologist in the Soviet Union, as well as the founder of the school in social cultural history, and the founder of the Soviet Union's child psychology. On the problems of the formation and development of children's characters, Vygotsky has made an excellent study in dynamic and static researches. Especially, he put forward the ideal that the dynamic problems of children's characters formed by a multi-dimensional and multi-level psychological structure. The emotional power, the will power and the rational power of the child's character constitute a very complicated connection, and the development of the character is not simply determined by the external environmental factors, so their connections are not a one-way or static connection, but a two-way interactive dynamic process. Vygotsky ’s pioneering research on the idea of children's character dynamics and its application in educational practice had produced a profound influence in the field of education and psychology. In this study, the dynamic thought of the children's character is combed in order to contribute to the development of children's emotion and the research of children's emotional education and we hope it can throw light on the further research.

STUDY ON THE OWN RACE EFFECT OF FACE RECOGNITION OF MONGOLIAN AND HAN NATIONALITY

You Hou
Inner Mongolia Normal University (Hohhot, China)

The own-race effect of face recognition is a hot topic in recent years. Most of them focused on different races like Eastern and Western races. However, there are few relative studies focused it on inter-ethnic groups. Inner Mongolia is a minority autonomous region including both Mongolian and Han nationality. There’s no research on whether Mongol and Han have own-race effect. Based on the contact experience theory, we selected Mongolian and Han college students as subjects and used the behavior experiment and eye-movement technology to explore the own race effect and its characteristics. The first experiment used learning-recognition paradigm and 2 * 3 mixed design. The second experiment used eye-movement technology to further analyze the characteristics and eye movement patterns with learning-recognition paradigm. The two experiments’ results showed there was no significance for all subjects to recognize the Han and Mongolian faces in response time, but it took a longer time to recognize Caucasian faces. Mongolian subjects showed no significance in discrimination index when recognized Mongolian and Han faces, but showed poor discrimination when recognized Caucasian faces. Han subjects showed no significance in recognition discrimination when recognized all kinds of faces. Furthermore, the Han subjects’ first fixation position is nose, and Mongolian subjects’ is eyes, which showed the early processing mode is different between them. While the advanced processing for them is same, for both nationalities watched the nose for the longest time and the most watching times is the nose area, followed eyes, finally mouth. We can concluded:(1) In different races, Mongol and Han showed own-race effect; In different nationalities, Mongol and Han showed no own-race effect. (2) The eye movement patterns of Mongol and Han were identical to identify different race faces. There were differences in eye movement patterns between Mongolian and Han subjects.
THE EFFECT OF WORK ENGAGEMENT ON THE RELATIONSHIP BETWEEN JOB RESOURCES AND JOB CRAFTING

Reyhan Bilgiç
Bengi Türer
Deniz Çelik
Middle East Technical University (Ankara, Turkey)

Job crafting is one of the new research fields to deal with job design strategies. There is a growing body of literature to understand antecedent factors and outputs of job crafting behaviors in different work settings. In this proposal, we will investigate the relationship between job resources, work engagement and job crafting. Although the literature mostly agree that there is a positive relationship between job crafting and work engagement, there seem to be a confusion about one dimension of job crafting which is decreasing hindering job demands. Therefore, another aim of this study is to understand what kind of job resource specifically related to which type of job crafting behavior in order to lighten the characteristics of different types of job crafting behaviors. The data will be collected from engineers who are currently working full-time in private or public sector in all branches. During data collection, convenient sampling will be used and sample size is expected to reach up to 200. Participants will be given job crafting, work engagement and the job resources subscale from the job resources and job demands scales. Regression analysis will be used to analyze the collected data. It is expected that high job resources will positively affect job crafting and low job resources will negatively affect job crafting in general via work engagement. However, decreasing hindering job demands which is the sub dimension of the job crafting is expected to increase at the low job resources condition apart from other sub dimensions of job crafting. It is proposed that decreasing hindering job demands might be used as a coping strategy by avoiding, whereas the other three sub dimensions of job crafting are used to cope with the situation by approaching and requires involvement. Instead of avoiding, approaching can serve employees to increase work engagement and job resources because we are not implying causality and variables can have reciprocal relationship with each other. Hence, deep understanding of this relationship, can be useful for developing different strategies for healthier and more productive work environment.
PSYCHOLOGICAL WELL-BEING PREDICTORS OF STUDENTS WITH DIFFERENT DEVELOPMENT OF SELF-REGULATION OF LEARNING ACTIVITY

Igor Tsyganov
Irina Bondarenko
Psychological Institute of the Russian Academy of Education (Moscow, Russia)

The study is focused on the issue of regulatory and personal predictors of psychological well-being (PWB) of students. The theoretical basis was K. Riff’s approach to the study of PWB, V. Morosanova’s differential-regulatory approach to the study of individuality, and the model of personality factors “Big five” (Kettel, McCrae, et al.). The aim of the study is to determine the contribution of regulatory and personal factors to the level of PWB of students with different development of conscious self-regulation (SR) of learning activity in primary and secondary schools. Participants: students of the 4th (N=377) and 5th (N=174) grades. Methods. "Well-Being Manifestation Measure Scale" (Masse et al., 1998; adaptation: Morosanova et al., 2018); Big Five Questionnaire — Children version, BFQ (Barbaranelli, et al., 2003; adaptation: Malykh, et al., 2015); Questionnaire Profile of self-regulation of children’s behavior (Morosanova, Bondarenko, 2015). Results. Extreme and middle groups were identified for students’ 4th and 5th grade according to the level of development of conscious SR of learning activity. The contribution of regulatory and personal predictors to the level of PWB in each of the selected groups is estimated by the regression equation modeling method. Personal factors of Consciousness and Openness to experience make a significant contribution to the PWB in all groups in grade 4. Extraversion also contributes in the group with low SR, extraversion and neuroticism — in the group with medium SR, Responsibility — with high SR. As for five graders, a significant predictor of PWB in the group with low SR is the indicator of regulatory and personal characteristics of Responsibility, in the group with medium SR — Extroversion, Neuroticism (with a negative sign), Planning and Independence (with a negative sign), in the group with high SR — Planning, Neuroticism (with a negative sign) and Modeling. PWB of 4th grade students is defined by personal characteristics by the time of the end of primary school. We found the contribution of the regulatory indicator of Responsibility only in the group with high SR. At the beginning of secondary school the most significant contribution to the PWB in all groups is made by regulatory indicators and less to personal factors.
Regional connection with the territory of residence (regional identity) remains highly significant for modern people; it defines the motives of their regionally-focused behavior. Regional identity is formed through creation of an individual "image" of the region of residence reflected in specific personally-axiological units — regionally-focused concepts forming the regional identity conceptual sphere. The research objective is to identify the structure of such concepts inherent to young people aged 16-19. Selection of this age group is justified by the fact that at this particular period the personality is actively engaged in the process of self-identification. The research was conducted in February 2018. The sample included 61 members residing in the Sverdlovsk region. Research questions: 1. What territorially-focused concepts are presented in the respondents’ consciousness? 2. What is the factor structure of the regional identity conceptual sphere in adolescence? The respondents were offered to define 10 concepts which, in their opinion, comprehensively characterize the Sverdlovsk region and range them from 1 to 10. The factor analysis method was applied to the information obtained to define the regionally-focused concepts structure. The following concepts were mentioned by the respondents most often: Yekaterinburg city, forests, mountains, plants (the Sverdlovsk region is characterized with developed industry), rivers, frost, Sverdlovsk Teacher Training College (the place of the respondents' training), museums, Bazhov (the famous Ural writer), 1905 Square (Yekaterinburg historical centre), Church on Blood (built on the place of the Romanovs family execution), malachite (the Ural ornamental stone), Grinwich (the largest shopping centre in Yekaterinburg), winter, "Plotinka" (the architectural centre of Yekaterinburg), friends, Passazh (the large shopping centre situated in Yekaterinburg central square), Vysotskiy (the cult Soviet poet and the name of the first Yekaterinburg skyscraper), Ganina Yama (the place where the royal remains were buried). Qualitative analysis of the concepts most presented allows distributing them in 4 groups: climatic objects (rivers, mountains, etc.), cultural objects (museums, 1905 Square, etc.) architectural objects (Grinwich, Plotinka, etc.) and historical figures (Bazhov). Quantitative analysis allowed identifying a 6 factors model of the regional identity conceptual structure. The obtained results will be applied in studying the mechanisms forming personal regional identity in adolescence.
COGNITIVE-MOTIVATIONAL PREDICTORS OF EPISTEMICALLY UNWARRANTED BELIEFS

Peter Halama  
Centre for Social and Psychological Sciences Slovak Academy of Sciences (Bratislava, Slovakia)

The epistemically unwarranted beliefs are defined as those types of beliefs, which are outside the totality of evidence and knowledge that is available to human knowledge seekers (Lobato et al., 2014). Among others, they include conspiracies, paranormal beliefs and pseudoscience. Previous research suggested that cognitive processes (e.g. analytical thinking) can play a certain role in the acceptance of such beliefs (Swami et al., 2014). The current study deals with the specific cognitive motivation variables representing motivational tendencies toward the preference of specific ways of dealing with cognitive-informational tasks. It was hypothesized that cognitive motivations as personal need for structure, need for cognition and need for cognitive closure predict epistemically unwarranted beliefs. The sample included 801 participants (391 males, mean age 42.6 years) recruited from online panel of a research agency in the Slovak Republic. The measures included were The Epistemologically Unfounded Beliefs Scale (Halama, 2018) for measuring beliefs in conspiracies, pseudoscience and paranormal phenomena, Personal Need for Structure (Neuberg, & Newsom, 1993) Need for Cognition Scale–6 (Lins de Holanda Coelho et al., 2018) and the brief Need for Closure Scale (Roets, & Van Hiel, 2011). The data were analysed through multiple regression analysis. Personal need for structure and need for closure were found to be negative predictors of pseudoscience and paranormal beliefs. Need for closure was a positive predictor of all three types of unwarranted beliefs. More detailed analysis based on dimensions of the brief Need for Closure Scale showed that close-mindedness and decisiveness predicted these beliefs. The results supported the hypothesis that the cognitive motivation can contribute to acceptance of epistemically unwarranted beliefs. As need for closure was found to be a predictor of all types of unwarranted beliefs, it seems that especially cognitive preference for a quick answer on a given topic and intolerance of ambiguity promote acceptance of such beliefs. Lobato, E., et al. (2014). Examining the relationship between conspiracy theories, paranormal beliefs, and pseudoscience acceptance among a university population. Applied Cognitive Psychology, 28(5), 617-625. Swami, V., et al. (2014). Analytic thinking reduces belief in conspiracy theories. Cognition, 133(3), 572-585.
THE PROBLEM OF PSYCHOLOGICAL REHABILITATION OF PERSONS WITH DISORDERS OF MUSCULOSKELETAL SYSTEM ACQUIRED IN ADULTHOOD

Tatyana Razuvaeva
Yulia Gut
Evgeniya Pcholkina
Anna Lokteva
The National Research University “Belgorod State University” (Belgorod Russia)

An urgent problem is the task of improving the quality of life by improving the system of comprehensive rehabilitation of persons with lesions of the musculoskeletal system. In general, the situation with the growth of disability is deteriorating around the world, Russia is no exception. Suddenness of physical health disorders carries an independent traumatic effect, accompanied by a whole complex of psychological changes in the emotional, behavioral, cognitive spheres. Acquired disorders of the musculoskeletal system can cause instability of the emotional and hormonal background and, as a result, decrease of physical strength and mental abilities, loss of professional functions. The experience of the acquired defect becomes an additional burden on the mental state of a person, leaves an imprint on the person, contributes to a possible change in self-esteem, self-attitude, emotional background and social relationships and most often leads to the development of severe depression. However, in the rehabilitation practice of persons with acquired disabilities, there is a contradiction between the objectives of rehabilitation and the lack of a mechanism for solving these problems in the form of a developed concept for the introduction of a comprehensive model of social support for persons with disabilities. An effective process of complex rehabilitation involves the study of the rehabilitation potential of the individual (the system of personal characteristics that allow active and effective participation in the rehabilitation process) to determine the direction of psychological assistance. Rehabilitation technologies focused on correction and formation of adaptive personal attitudes, availability of various resource-developing types of psychological assistance will provide psychological readiness of the person to changes and will give the chance of finding of psychoemotional stability, understanding of the purposes, the changed opportunities and the place in life; overcoming of passivity, alienation; formation of independence, responsibility, an active life position. As a result of psychological rehabilitation, persons with disorders of the musculoskeletal system acquire a resource for strengthening mental and physical health and the possibility of self-realization. This article was implemented with the financial support of RFBR project № 18-413-310008\18
LIFE QUALITY HEALTH SCALE REGARDING REPRESSED SENIORS IN LATVIA

Vera Krieviņa
Baltic International Academy (Riga, Latvia)

Arija Karpova
Henrijs Kalkis
Latvian University (Riga, Latvia)

Currently, the research of the psycho-biological aspect of active ageing as well as late maturity are not considered as a priority in Latvia; though, the yearly data by the Central Statistics Board reveal a steady growth of the senior population comparing to employed inhabitants. The aim of the project is to suggest definite ways how to preserve the potential of the human resources in the late maturity period, to clarify whether statistically meaningful differences do exist between the repressed Latvian seniors and the non-repressed Latvian seniors regarding their life quality. The scale of the seniors health condition is compared as well as analyzed; the indicators of their mental belief and strength in the development of fair world accordingly. 42 repressed and randomized non-repressed Latvian seniors between ages 65 and 83 participated in the research. The research tools are questionnaires and non-standard interviews. As a result, essential differences have been obtained in the descriptive and conclusive statistics as well as within the qualitative analysis of the answers. The scale of the repressed life quality, its health as well as psychological climate correlate with the sense of socio-political justice. The family scale of the non-repressed life quality is linked with their personal justice as well as the common level of the sense of justice. The scale of the life quality, health and the scale of the socio-economic trends tend to feature negative associations, yet with a personal belief in the fair developments of a fair world. Despite old age (65-83), the majority of the repressed seniors as well as non-repressed seniors admitted their willingness to work instead of retiring. They are well-aware of their potential, being active and steady employees. Both groups are keen to appreciate the current developments in social life. Certain individual differences in the belief of a fair world point to the non-repressed disbelief, frustration and law inefficiency in the governmental policy. The repressed are unanimously dissatisfied with the governmental institutions and ongoing social processes in Latvia.
ON THE INDIVIDUAL AND TYPOLOGICAL CHARACTERISTICS OF GENERAL AND SPECIAL ABILITIES

Muhamed Kabardov
Elena Artsishevskaya
Psychological Institute of the Russian Academy of Education (Moscow, Russia)

Elena Bauer
Moscow Humanities and Technical Academy (Moscow, Russia)

The elaboration of the typological conception in relation to the humans contributed to the formation of the unique trend—differential psychophysiology. The novelty of this fundamental trend is that within it the methodological system for measuring inclinations of different abilities for the first time has been created (B. M. Teplov, N. S. Leites, V. D. Nebylitsyn, E. A. Golubeva, M. K. Kabardov et al.). Some interesting materials have been obtained, which specify our ideas on the nature of cognitive and communicative abilities, on the orientation and research activity. 1. Complex (system) comparison of psychological, physiological and behavioral levels of individual differences permitted to examine the general and special abilities (mathematic, musical, linguistic, pedagogical, artistic and graphic, literary) from the new point of view, propose their classification taking the natural prerequisites into consideration and determine their place in the individuality structure. 2. Studies of interhemispheric correlations have supplemented the manifestations of special abilities, in particular, in studies of the ‘language–speech’ dichotomy, which is examined together with the brain interhemispheric functional asymmetry. 3. It is well-known that alongside with the nervous system’s properties existing in both humans and animals I. P. Pavlov proposed the special human typology—‘artistic’ and ‘thinking’ types, which gives the opportunity for qualitative description of naturally stipulated information, activity processing types. In particular, the following dichotomies have been established: ‘Communicative and speech’, ‘cognitive and linguistic’ and mixed type of language abilities (M. K. Kabardov, E. A. Bauer), ‘algebraists’ and ‘geometricians’ (I. A. Levochkina, E. P. Guseva). Two other types have been discovered among the artistically gifted people—‘painters’ and ‘graphic artists’ (E. A. Artsishevskaya). ‘Teacher–method–pupil’ model (M. K. Kabardov) is also closely connected with the substantiation of the natural conditionality of different types of abilities. The rigid links in the triad permit to check the genuine relation between the natural and the acquired. It has been demonstrated that each of these three factors is variative: the styles of the teacher’s activity, education styles, or teaching methods (or education technologies) types; individual strategies of mastering knowledge, abilities and skills.
IN NEED FOR ACCEPTANCE OF PSYCHOLOGICAL RESEARCH AND THE VALUE OF METHODOLOGICAL TRAINING IN PSYCHOLOGY UNDERGRADUATES

Gustavo Gonzalez-Cuevas
Marcos Alonso Rodriguez
European University of Madrid (Madrid, Spain)

Psychology undergraduate students often fall prey to widespread misconceptions about the human mind. Here we examined whether student perceptions of psychology as a scientific discipline may predict common myths held in psychology. For this purpose, the scales Psychology As a Science (PAS), measuring the degree to which respondents view psychology as a science, and Psychology Information Questionnaire (PIQ), quantifying endorsed myths in psychology, were employed. PAS can be divided into three subscales: (1) respondents’ willingness to place psychology in the same conceptual or functional framework as the hard sciences; (2) beliefs regarding the need for psychological research and the value of methodological training; (3) views of determinism and belief in the predictability of behavior. Our sample comprised 51 psychology undergraduate students with an average age of 22 years. Overall, these results indicate that our students demonstrated a high number of erroneous beliefs about psychology. Multiple regression analysis also revealed that only beliefs regarding the need for psychological research and the value of methodological training predicted in a statistically significant way common misconceptions about psychology. This investigation, therefore, suggests that offering a rigorous curriculum and extensive support to develop an interest in solid psychological methodology might help train psychology students to be less gullible and more skeptical about mind myths.
PSYCHOMETRIC EVALUATION OF THE READINESS FOR INTERPROFESSIONAL LEARNING SCALE (RIPLS) QUESTIONNAIRE IN HEALTHCARE UNDERGRADUATE STUDENTS

Gustavo Gonzalez-Cuevas
P Valencia
Olga Greaciaco
Eva Icaran
JJ Beunza
European University of Madrid (Madrid, Spain)

RIPLS (Readiness for InterProfessional Learning Scale) is a self-report instrument to assess the readiness of students to engage interactively with students of other health professions in learning together. It can be divided into 4 subscales: (1) Teamwork & Collaboration (9 items); (2) Negative Professional Identity (3 items); (3) Positive Professional Identity (4 items); and (4) Roles & Responsibilities (3 items). Our present aims were to (1) evaluate attitudes and perceptions of health care undergraduate students regarding InterProfessional Education (IPE) and (2) determine the psychometric properties of the RIPLS. For this purpose, three hundred and thirty-seven Healthcare undergraduate students at European University of Madrid completed the RIPLS questionnaire. Our results demonstrated that Cronbach’s alpha for the RIPLS showed favorable overall reliability in terms of internal consistency, except for subscale 4. Importantly, the RIPLS score was sensitive to sex differences in subscales 2 and 4, as well as type of degree (Nursing vs. other Healthcare degrees) for subscale 4. Furthermore, age might inversely correlate with subscale 4 scoring. Finally, year did not account for differences in RIPLS scoring. All in all, the reliability and psychometric properties obtained in this study support the conclusion that this scale might represent a useful tool for the measure of changes in InterProfessional Education. Future research is needed to further evaluate and confirm the psychometric characteristics of this scale.

PSYCHOMETRIC ASSESSMENT OF A CEPHALOMETRIC RUBRIC IN DENTISTRY UNDERGRADUATE STUDENTS

Gustavo Gonzalez-Cuevas
Jose Maria Aguado Gil
Margarita Gomez
Gleyvis Coro
European University of Madrid (Madrid, Spain)

Educational practitioners in orthodontics have used cephalometric training as an instructional strategy for decades. Despite their widespread use, there is a lack of psychometrically sound assessment rubrics that researchers and practitioners can use to evaluate the quality of cephalometric training. To explore this issue, we developed and evaluated a new rubric tested in a sample of 126 dentistry undergraduate students at European University of Madrid. By applying reliability analysis, we found that our rubric demonstrated acceptable psychometric properties. We also observed that the internal structure of the rubric was unidimensional in our exploratory factorial analysis. We discuss implications for dentistry research and practice in relation with the use of modern psychometric tools.
FEATURES OF FACIAL EXPRESSION RECOGNITION BY RUSSIAN AND VIETNAMESE STUDENTS

Natalia Karabushchenko
Peoples’ Friendship University of Russia (Moscow, Russia)

Socio-political instability in the world and migration processes give rise to problem situations in modern society. The value of social perception and social intelligence increases significantly, contributing to better mutual understanding and readiness for interaction between representatives of different cultures. The theoretical and methodological basis of the research consists of theories (F. E. Vernon, J. Guilford, M. O’Sullivan, N. Cantor, J. F. Kihlstrom, D. V. Ushakov and others). The following methodological tools were used in the empirical research: 1) the test “Social Intelligence” by J. P. Guilford, aimed at the study of the social and intellectual abilities of the individual; 2) MSFDE (Montreal Set of Facial Displays of Emotion), aimed at studying the ability to recognize facial expression on the faces of our own and other ethnophors. The methods of mathematical statistics were used: Spearman’s correlation analysis and comparative analysis using the Mann-Whitney U test. The sample included 123 Russian students and 110 Vietnamese students, whose average age was 24 years. The study revealed that the success of the facial expression recognition by Russian subjects is related to their greater openness and communication experience, and for Vietnamese subjects to their greater femininity and tendency to seek social support. Thus, it was revealed that a high level of ability to predict the completion of a situation and read non-verbal emotions allows students from Russia to recognize facial expression more successfully, and students from Vietnam, due to their propensity to seek social support, realized through anticipation and flash-forward of actions are equally successful, as well as students from Asian countries recognize facial expression on people of Asian descent. The theoretical and empirical research was carried out with the financial support of the Russian Foundation for Basic Research, grant No. 17-06-00834 “Intellectual bases for the recognition of emotions by representatives of different cultures.”
VIOLENCE AS A RESULT OF POLITICAL POLARIZATION: A MEDIA SOCIAL STUDY

Andrea Giacomozzi
Andrea Barbará da Silva Bousfield
Juliana Fiorott
Federal University of Santa Catarina (Florianopolis, Brazil)
Raquel Bertoldo Bohn
Aix-Marseille University (Marseille, France)

Brazil is recently experiencing a phenomenon of political polarization, especially after the presidential elections of 2015 and the events that ended up generating the impeachment of the president-elect in 2015, Dilma Roussef. After these events, there was an increase in political polarization between opponents and impeachment advocates, and the ever more uninhibited presence of extreme right-wing discourses, associated with religious justification for the discrimination of ‘minorities’ (women, blacks, homosexuals, etc.). These discourses have been aimed at reducing the rights of marginalized populations, minorities and immigrants. Such polarization can be perceived through the restriction of social circles, since people who were once friends and even family members have cut off relations because of political dissent. Such phenomenon has had a lot of visibility through social networks, where people have blocked contacts with people who think differently, or even engaged in open conflicts because of this political dissent. In this political context has been characterized by a virtual campaign solidary with other far wing. Based on the Theory of Social Representations, this study aimed at identifying and analyzing the social representations of violence and political polarization in two Brazilian newspapers: A Folha de São Paulo and Estado de São Paulo, since January 2016 to December 2018. The database was created considering only the news that referred to violence in the context on political polarization in Brazil. The data were analyzed through lexical analysis with IRaMuTeQ software. Twenty five articles were analyzed. The news gave emphasis to the cases of violence that occurred mainly during the electoral period, including the attack suffered by the candidate Bolsonaro and the attack suffered by Lula’s militarians. Another aspect raised was the climate of persecution in federal universities, where teachers were prohibited to talking about politics in the classroom.
THE COST OF SHIFTING ATTENTION IN DEPTH BETWEEN REAL AND MIRRORED SPACE

Takahiko Kimura
Kansai University of Welfare Sciences (Kashiwara, Japan)

Kazumitsu Shionohara
Akihiko Kitamura
Osaka University (Suita, Japan)

Yasunori Kinosada
Shizuoka Institute of Science and Technology (Fukuroi, Japan)

Although mirrors are commonly used, how the human visual system operates in mirrored space remains unclear. Humans are capable of acquiring necessary information in mirrored space, even though all the images are reversed in reference to objects in real space. Therefore, in the present study, two experiments were conducted under real and mirrored observation conditions to compare the characteristics associated with shifting attention in depth. The study participants were 12 observers. A fixation point was located 120 cm from the participants. Four cubes with LEDs were arranged nearer to and farther from the fixation point under different depth conditions. The cueing paradigm (Posner et al., 1980) was used to clarify how well the observers could control their attention distribution. Information about the direction of a target relative to the fixation point (near/far) was based on color. Observers who used a chin rest were required to detect the target depending on pre-cues. The duration of the cue presentations was 300 ms. After the disappearance of the cue, a single target was presented. Under the real condition, the stimuli were presented in front of the observer, whereas, under the mirror condition, the stimuli were presented through a mirror (43 x 45 cm) behind the observer. The experimental design consisted of two observation conditions (real and mirrored), two types of cue validity (valid and invalid), and four target locations. The attentional costs were calculated (invalid trials minus valid trials) for each target location in the real and mirrored space. The results of a two-way ANOVA (observation x target locations) indicated a marginal difference in the main effect of the observation condition; however, no difference was observed in the main effect of target location, and no significant interaction was identified. Therefore, the attentional cost in mirrored space was larger than that in real space (32 vs. 21 ms, respectively). The findings of the present study suggest that the cost for reallocating attention in terms of depth is effortless under real observation conditions. Therefore, the difficulty in allocating attention to the rear space might represent a particular characteristic of mirrored space.
RELATIONSHIP BETWEEN YOUNG CHILDREN’S PLAY AND SOCIAL SELF-EFFICACY

Natsumi Sonoda
Yokohama National University (Yokohama, Japan)

In early childhood, children begin to feel social self-efficacy. It has previously been suggested that children’s cognitions of their teacher affects their social self-efficacy. However, the components of social self-efficacy are still not fully understood. This study aimed to examine the relationship between young children’s play and social self-efficacy. Participants were 30 Japanese preschoolers aged 5 and 6 years. The children were observed for 40-min periods in free-play settings using a video recorder, and their behaviors were coded to one of four play behaviors (functional play, constructive play, dramatic play, and games-with-rules) or eight non-play behaviors (exploratory, reading, unoccupied behavior, onlooker behavior, transition, active conversation, aggression, and rough-and-tumble) according to the Play Observation Scale. To examine the children’s social self-efficacy, the Young Children’s Self-Efficacy for Peer Interaction Scale was administered to the children. It was found that the children’s dramatic play with other children was positively related to their social self-efficacy. In addition, the children’s non-play behaviors, such as unoccupied behavior or exploratory, were negatively associated with their social self-efficacy. These results suggested that development of representational abilities demonstrated in group play may have an important role in young children’s social self-efficacy.
PERSONAL WISDOM DEVELOPMENT INVOLVES PAIN AND SUFFERING: EXPERIMENTAL VALIDATION

Ankita Sharma
Indian Institute of Technology Jodhpur (Jodhpur, India)

Personal growth occurs with life experiences and most importantly handling and reflecting on negative life experiences teaches us more (Mickler & Staudinger, 2008; Staudinger & Gluck, 2011). The distinction between personal and general wisdom is based on the differences in the development process and well-being paradox. Personal wisdom development involves more pain and suffering (Staudinger et al., 2005) yet feels more satisfying in retrospect. The wisdom literature so far is focused on understanding the concept which is majorly correlational, and recommendations are to study the idea experimentally so the concept can be brought to the intervention arena. Therefore, the present study attempts to explore, ‘the effect of personality disposition (emotional regulation, reflectiveness, openness to experiences and action orientation) in decision making and affect handling (regret handling). Precisely, 1) if people with different personality disposition differ in the choices, exploring the alternatives and handling regret in the face of failure; 2) if people with higher action orientation chose a risky option and if this choice results into failure how do they handle and finally, 3) does personality disposition predict regret handling. The objective was explored by implying SAWS questionnaire, share market task, and interview. The results suggested that openness to experience and preoccupation vs. disengagement dimension of action orientation significantly influences choice making and comparatively less regret experience. Additionally, individual high on openness and action orientation explore more alternative, choose risky options and report less regret if faced with failure. The common explanation for less regret after failure revolved around the theme of ‘at least I tried’. The mediator regression analysis suggested that the individuals with initiative tendencies regret less, similarly, people with openness to experience also regret less than their counterparts. However, individuals with high initiatives and openness to experience regret more in comparison to people with only openness or initiative tendencies. This experimental evidence confirms the observation that individuals who are open to different experiences and take specific actions to try new things will face more ups and downs and yet experience less regret.
THE EFFECT OF THE ANTISACCADE TASK ON MICROSAACADE SUPRESSION IN THE POSNER CUEING PARADIGM

Sofia Krasovskaya
Arni Kristjansson
Joseph MacInnes
National Research University Higher School of Economics (Moscow, Russia)

Microsaccadic eye movements belong to the category of micromovements, such as tremor and drift, though their functional purpose is still debated. Spatial cueing paradigms typically require fixational control, but this does not eliminate all oculomotor activity associated with the preparation of saccades in the cued direction. During the antisaccade task, planning and execution are separate processes and we therefore hypothesise that we may notice reduced microsaccade behaviour during the execution of antisaccade tasks as compared to saccade trials. The study is based on an eye-tracking experiment involving 22 participants asked to perform saccades and antisaccades in blocked or mixed sets of trials. Each participant contributed to three main blocks: 50 trials in the fixed saccade block, 50 trials in the fixed antisaccade block, and 200 trials in the mixed saccade—antisaccade condition. In the saccade trials, a green fixation cross is displayed at the centre of the screen, whereas during the antisaccade trials the fixation cross is red, allowing participants to prepare the appropriate response (but not direction) prior to the target. The results of the study imply a strong latency cost of antisaccades as compared to prosaccades and an additional cost of mixed blocks, though these two effects did not interact. Crucially, in the blocked antisaccade trials, we predict that a supressed oculomotor system would lead to a lower occurrence of microsaccades initiated by the participants, in particular the trials where observers did not make erroneous prosaccades. We believe this may be due to participants having enough time to prepare the top-down control of the oculomotor system, which leads to a predictable pattern for each participant, where they either suppress microsaccadic movements completely or do not throughout the entire block. We also predict that in the mixed block participants have less time to prepare the top-down microsaccade suppression and we will test this by comparing data between the saccade, the antisaccade and mixed blocks.
The Relationship of Readiness to Forgive Level with Subjective Well-Being and Emotional Intelligence.

Olga Vasilyeva
Nadezhda Blinova
Southern Federal University (Rostov-On-Don, Russia)

Engineering progress and rapidly changing social environment cause the increase of negative factors influencing people, impairing their emotional health. The study of complex relationship between the level of readiness to forgive and subjective emotional well-being, as well as heterogeneous interpretations of causes and manifestations of this relationship requiring new research strategies and appropriate psychological tools is of current concern. Based on the analysis of the concepts of forgiveness, emotional well-being and emotional intelligence and the study of the forgiveness phenomenon, we believe that emotional awareness and empathy are among the main forgiveness formation mechanisms. Objectives: 1) To analyze the level of readiness to forgive and distinguish groups of subjects who display low, medium and high tendency to forgive. 2) To reveal the level of emotional well-being and emotional intelligence and to determine the relationship with readiness to forgive level. Respondents: 75 students studying “Health Psychology”. For emotional well-being evaluation we used a subjective well-being scale. For the emotional intelligence study we used N. Hall’s technique. To determine the level of readiness to forgive, we developed a questionnaire that was based on the forgiveness phenomenon analysis obtained at the previous stage of the study. The variants of answers were scored on a scale, enabling numerical assessment of readiness to forgive. In accordance with the result, the respondents were divided into three groups, i.e. high, medium and low levels of readiness. Positive, reliable correlations were observed between the readiness to forgive level and subjective well-being indicators: “self-evaluation of health” and “level of satisfaction with everyday life”. The higher the indicator of readiness, the more pronounced the feeling of subjective well-being. We revealed significant correlations between “readiness to forgive level” and “emotional awareness”; “readiness to forgive level” and “emotional control”; “readiness to forgive level” and “self-motivation”. The “readiness to forgive level” values were also correlated with emotional intelligence “integrative indicator”. The results of the research add to the knowledge of forgiveness and can be used to diagnose problems in the emotional sphere as well as improve preventive measures by developing the readiness to forgive.
Poor sleep quality is highly prevalent in modern societies and can be associated with a multitude of problems for individuals and organizations, and also for society at large. Thus, there is a demand for research on the factors that contribute to sleep quality and for low cost interventions to enhance sleep quality. The present research projects analyses the relationship between the person factor self-compassion and sleep quality. Furthermore, it tests the hypothesis that this relationship is mediated by a diminished rumination. A self-compassionate mindset comprises a positive and caring attitude of a person toward her-or himself in the face of failures and individual shortcomings. Various work presented by Neff and colleagues has already demonstrated that self-compassion can provide a buffer against stress (Leary, Tate, Adams, Allen, & Hancock, 2007; Neff, Kirkpatrick, & Rude, 2007) and that self-compassion is negatively associated with rumination (Neff & Vonk, 2009, Raes, 2010). Corroborating this work, Zessin, Dickhäuser, and Garbade (2015) concluded in a recent meta-analysis that self-compassion is strongly linked to well-being ($r = .47$). However, to our knowledge, there is no published research on self-compassion as a coping mechanism against stressors with regard to sleep quality. The present research fills this gap by presenting (1) correlational evidence that self-compassion predicts higher sleep quality (e.g. daily protocol studies on sleep quality, studies with students’ self-reports) and by (2) experimental approaches to study whether short self-compassion interventions improve sleep quality. Results show indeed a positive relationship between self-compassion and sleep quality. This effect was mediated by rumination. Also in line with hypotheses, short self-compassion interventions improved sleep quality via reducing ruminative thoughts: Students in two different self-compassion intervention conditions reported higher sleep quality compared to a control condition. Again, rumination mediated this effect. In addition patients with major depressive disorder reported a significant increase in sleep quality and a significant decrease of ruminative thoughts after one week in a daily self-compassion intervention (compared to patients in a control condition). Limitations and implications for future research, such as the need of placebo control groups, objective sleep quality measures, and person–intervention fit designs are discussed.
PREVENTING SICKNESS ABSENTEEISM AMONG EMPLOYEES WITH COMMON MENTAL DISORDERS OR STRESS-RELATED SYMPTOMS AT WORK: A CLUSTER RCT CONDUCTED AT THE OCCUPATIONAL HEALTH SERVICES

Marijke Keus Van De Poll
Lotta Nybergh
Caroline Lornudd
Lydia Kwak
Gunnar Bergström
Karolinska Institutet (Stockholm, Sweden)

One of the main leading causes of sick leave in Sweden is Common Mental Disorders (CMD). This results in suffering for the individual and financial costs for the employer and society at large. Occupational Health Services (OHS) can offer employees help with interventions that consider both the individual and the work situation. The aim of the current study project was to evaluate the effectiveness of an intervention given at OHS to employees with CMD or stress-related symptoms, aimed to improve the match between the employee and the job situation. Employees received either a problem solving based intervention (n=41) or treatment as usual (TAU; n=59). First, the OHS consultant interviewed the employee and the employee’s supervisor individually. Thereafter, they had a joint meeting with the consultant. Data was obtained through questionnaires filled in by the employees at baseline, at 6 months and at 12 months after baseline as well as through monthly sms messages. The primary outcome was the total number of days of registered sickness absence during the 12-month follow-up period. Secondary outcomes were self-reported sickness absence, mental health, workability, impaired work performance and health related quality of life. The results reported here are based on self-report data. We investigated whether the frequency of sickness absence differed between the TAU group compared to the intervention group and whether exhaustion could predict the frequency of sickness absence. The intervention group had a lower total mean frequency of sickness absence compared to the TAU group, but preliminary results revealed this difference to be not statistically significant. Regression analysis showed that exhaustion was a statistically significant predictor, it was positively related to frequency of sickness absence, but there were no differences between the groups. The results will be of relevance both for the OHS sector as well as for interventions given at other arenas since it is important to find interventions that can reduce sick leave and costs and increase work ability.
THE ROLE OF SOCIAL WORKERS, PSYCHOLOGISTS AND PSYCHIATRISTS IN EASTERN AND WESTERN EUROPE: (WHAT) CAN WE LEARN FROM EACH OTHER?

Miranda Rutenfrans-Stupar
Tilburg University/SMO Breda (Tilburg, Netherlands)

Snezana Stupar-Rutenfrans
Utrecht University (Middelburg, Netherlands)

The Netherlands used to be and still is a very individualistic society (Hofstede Insights, n.d.), but the government aims to create a "participation society" (Rijksoverheid, 2013). In a participation society citizens are supposed to support and take care of each other. Appealing for aid (e.g., using social services) from the government is only an option when the person in question has no other resources such as a social network (Van Houten et al, 2008). Hence, a more collectivistic society is needed. Many eastern European countries used to have a collectivistic culture (Hofstede Insights, n.d.), but are dealing with other challenges related to social services and health care, certainly in the post-communist era: e.g., from our personal experiences we have observed that (mental) health care institutions in former Yugoslavian countries do not deliver services that match the high quality criteria of many western European countries. Additionally, we have observed that social workers in Serbia have a stronger position compared to Dutch social workers as they often fulfill the role of case manager in the health care system. Contrary, in the Netherlands licensed clinical psychologists or psychiatrists are fulfilling the case management role resulting in the probability that social service users are supported ("treated") from a medical perspective which can lead to more frequent and longer hospitalization. Moreover, the (traditional) context of western European societies differs considerably from eastern European societies, especially regarding the role family plays in feeling responsible and taking care of its members. The aim of the current research project is to examine the roles social workers, psychologists and psychiatrists fulfill in western European countries compared to eastern European countries. We are planning to examine these (various) roles in relation to the quality of support and in relation to the outcomes for social service users of different countries. Additionally, we are including the social context and structures in our research. This all is supposed to lead to practical implications by learning from each other. Currently, we are looking for partners (e.g., social services and universities) who want to collaborate in this research project.
The Internet Gaming Disorder, as seen in the DSM (2013) and now validated as a disease by the ICD-11 (2018), has been little investigated by psychoanalysis. The compulsive gaming and addictive behavior provides a significant distress in the individual’s everyday life, where the loss of control, escape from reality and social impairments are common symptoms. Therefore, we aimed our research at unveiling the development of its suffering organization. Here, we present one of the crucial cases discoveries from a compulsive online gamer based on the ongoing netnography (Kozinets, 2015) research that has been conducted with Brazilians young adults. For the data gathering we performed a netnography interview using the psychoanalytic discourse (Lacan, 1957/1998) as our canvas and as a method to interpret its results. Our findings point to the role of the ideal ego in gaming, where the subject tries to reach the narcissistic ideal self again, as once supposed by its parents, in single or multiplayer games. In case of this specific subject, complementary to his imaginary suffering, the compulsive gaming got chronic after a disappointment in the subject’s dream job, in which he failed. His supposed-to-have set of skills were not enough for his tutor to acknowledge and recognize him as what he believed he was and intended to be. Nonetheless, the saga that he often lives throughout the narrative of the games makes a fertile soil for his symbolic fantasy to occur, as the recurrent gaming makes it possible for the compulsion to repeat and take place, making a secondary gain effect to subjects’ life by relieving negative feelings. We conclude that, first, the imaginary realm is very appealing to gaming compulsion, since it makes it possible for the subject to see himself projected as the ideal ego, and it is made chronic when things do not go the way he desires in real life. Secondly, that the game is a fertile place for the compulsion of repetition to take place. We hope that this case report stimulates research in the Freudian field on compulsive gaming and that its finds benefit others to enhanced comprehend and treatment.
THE POLISH VALIDATION OF THE FUTURE TIME PERSPECTIVE SCALE

Aneta Przepiorka
Tomasz Jankowski
The John Paul II Catholic University of Lublin (Lublin, Poland)

Malgorzata Sobol-Kwapinska
University of Wroclaw (Wroclaw, Poland)

This study aimed to verify the psychometric properties of the Polish version of the Future Time Perspective Scale (FTPS), developed by Carstensen and Lang. We conducted three studies. In Study 1 the sample consisted of N = 652 participants aged 18 to 79 (Mage = 40.82, SD = 14.72). We performed confirmatory factor analyses to verify the dimensional structure of future time perspective and obtained a three-factor solution, the factors being: Focus on Opportunity, Focus on Time, and Focus on Life. In Study 2, the sample consisted of 771 participants aged 18 to 75 (M = 44.49, SD = 15.00). We confirmed the previously obtained three-factor solution for Polish version of the FTPS (FTPS/PL). We computed a correlation analysis to examine its external validity. The results confirmed the reliability of the FTPS/PL, its external validity, and the three-dimensional structure of future time perspective. Additionally, we examined the incremental validity of FTPS/PL for life satisfaction and positive and negative affect. In Study 3 we examined the test–retest reliability of the scale over one year. The results supported the possibility of using the Polish version of the FTPS in research.
Creativity is considered as presenting one of the more complex cognitive activities which involves several cognitive processes, personality tendencies and motivational-affective reactions. The objective of the talk is to examine the joint impact of cognitive and motivational variables in regard to creativity. The participants were 90 students in the behavioral sciences. They were administered the Torrance test of creativity assessing fluency, flexibility, elaboration and originality, and a survey about their interests in creativity which yielded an overall score of creativity interest. Cognitive processes were assessed by means of the Meaning Test (Kreitler, 2014) which provides information about the frequency with which the individual applies a set of different cognitive processes, based on analyzing communications of meaning the individual gives to a standard set of inputs. Previous studies (Kreitler & Casakin) showed that high scorers on creativity differ from low scorers in applying a specific set of cognitive processes, including examples, metaphors, shifts from the input, and content categories of structure and manner of operation. Motivational processes were assessed by the cognitive orientation questionnaire of creativity (Casakin & Kreitler) which provides scores on a set of four types of beliefs (about oneself, about others and reality, about norms and rules and about goals and wishes) referring to themes, such as self expression, and interest in innovation that were found to characterize creative individuals. The results of a regression analysis showed that the cognitive and motivational scores together provided a significant prediction of the four creativity factors (Torrance test). The variables with the highest coefficients were goal beliefs and self beliefs. The contribution of the motivational scores was higher than that of the cognitive. Interest in creativity was correlated significantly only with self beliefs. The findings shed light on the relative role of cognition and motivation in regard to creativity, providing guidelines for interventions designed to improve creativity.
The low spatial frequency (LSF) component of visual stream rapidly conveyed coarse information for global perception, while the high spatial frequency (HSF) component delivered fine-grained information for detailed analyses. Early feedforward theorists deemed that a coarse-to-fine process was sufficient for rapid scene recognition. However, some researchers discovered some early local recurrent processing in the primary visual cortex. The present study aimed to deeply explore how different spatial frequency components interacted with each other in the process of rapid scene recognition. The response priming paradigm was applied in the present study. It posited that a prime-target system was behaviorally equivalent to a feedforward system if the prime effect was enhanced with increase of SOA. Experiment 1 aimed to explore whether rapid feedforward sweep of original natural images could reveal a response priming effect. Further, in Experiment 2a, the LSF and HSF components of the same picture were set to be prime and target respectively. According to the coarse-to-fine theory, the LSF-to-HSF sequence may reproduce the response priming effect. As a comparison, Experiment 2b adopted the HSF-to-LSF sequence. Using original natural images, we found a typical response prime effect of both accuracy ($F(4,56)=3.18, p<0.05, \eta^2=0.19$) and RT ($F(4,56)=3.90, p<0.05, \eta^2=0.22$) in Experiment 1. This was consistent with the findings of previous study (Schmidt & Schmidt, 2009). But in Experiment 2, when the HSF and the LSF components of the same pictures were presented in a rapid sequence, neither the LSF-to-HSF sequence nor the HSF-to-LSF sequence reproduced the response priming effect. These results demonstrated that LSF or HSF component alone was not sufficient for rapid scene recognition. On one hand, participants needed some local recurrent processing in the primary visual cortex to integrate different spatial frequency components. On the other hand, low spatial frequency information was not conveyed faster than high spatial frequency information. Participants would take advantage of different spatial frequency information under different circumstances. In summary, rapid scene recognition involves both feedforward and feedback processing.
PSYCHOLOGICAL PREREQUISITES FOR WOMEN'S TOLERANCE TO GENDER-BASED VIOLENCE IN RELATIONSHIP

Alexey Khavylo
Irina Sedenkova
Irina Eremina
Katya Nikulicheva
Tsiolkovskiy Kaluga State University (Kaluga, Russia)

According to the results of the research made by the Amnesty International human rights organization, fourteen thousand women die every year in Russia as a result of male spousal violence. The problem of gender-based violence reflects cultural traditions, socio-economic factors and individual-psychological attitude of the person to this phenomenon. The purpose of this study was to identify psychological factors and prerequisites to women's tolerant attitude towards gender-based violence in relations. The woman's tolerance for the manifestations of gender-based aggression may be classified as the woman's lack of attempts to interrupt stop oppose confront this traumatic relationship. The following methods have been used: Questionnaire "Masculinity, feminism and gender type of personality" (Bem Sex Role Inventory adaptation of O.Lopukhova); "Questionnaire of the Image of Own Body" (O.Skogarevsky); "Scale for Moral Disengagement Assessment" (adaptation of Y.Ledovaya, R.Tikhonov, O.Bogolyubova, E.Kazennaya, Y.Sorokina), the author's questionnaire. The author's questionnaire aims to study the experience of parental violence towards their children, as well as to assess the current relationship and identify manifestations of gender-based violence in it.

The study involved 906 women aged from 16 to 42. For this purpose correlation analysis, factor analysis, and analysis of variance have been used. Three types of manifestations of gender-based violence against women are empirically identified: physical; psychological and economic gender-based violence. It has been stated that there is certain correlation between the experience of violence experienced by women in interpersonal relationship with the experience of parental violence towards their children: Rs=.279, p<0.001. The correlation between dissatisfaction with own body and tolerance to gender violence in relations is shown: Rs=.122, p<0.01. It has been proved that the psychological prerequisites of women's tolerance to the manifestations of gender-based violence in relationship are: experience of violence in childhood (Rs=.279, p<0.001), dissatisfaction with the own body (Rs=.122, p<0.01), manifestation of mechanisms of alienation of moral responsibility (Rs=.116, p≤0.01) and some socio-demographic factors. The results of this work provide an opportunity to create an express method of diagnosing gender-based violence in interpersonal relationships and contribute to practitioners' awareness of the causes of this phenomenon.
SATISFACTION WITH BODY IMAGE AS A COMPONENT OF SUBJECTIVE WELL-BEING

Alexey Khavylo
Irina Eremina
Irina Sedenkova
Katya Nikulicheva
Tsiolkovsky Kaluga State University (Kaluga, Russia)

The development of visual culture, aggressive influence of images advertised in modern society lead to actualization of the problem of self-image of body and physical attractiveness in many people. These days in Russian society it is possible to distinguish a tendency to formation of a cult of a healthy beautiful body. On the one hand a lot of people start taking closer care of their bodies. On the other hand however this may cause a decrease in self-esteem among those who consider their bodies to be inappropriate with the accepted standards of beauty and attractiveness. The following methods have been used: "Questionnaire of the Image of Own Body" and "Scale of Satisfaction with Own Body" (O.Skogarevsky); "Positive and Negative Affect Schedule’ (D.Watson; L.A.Clark; A.Tellegen; adaptation by E.Osin), "Satisfaction With Life Scale” (E.Diener, R.A.Emmons, R.J.Larsen и S.Griffin; adaptation of D.Leontiev and E.Osin), "Scale of Subjective Happiness” (S.Lyubomirsky, H.Lepper, adaptation of D.Leontiev), the author’s questionnaire. The study involved 560 people aged from 16 to 42: 132 men and 428 women. For this purpose correlation analysis, factor analysis, regression analysis and analysis of variance have been used. It has been proved out that the subjective well-being of the individual and the satisfaction of the body in men and women at each age-related stage of life are closely interrelated. The difference of self-esteem structure of body parts in men and women has been shown. The influence of socio-demographic indicators (education, marital status, presence of children, etc.) on the satisfaction with the body has been proved. Marital status affects the satisfaction of the body in men and women. According to the results of the study it has been found out that the satisfaction with the body is a component of subjective well-being and is interrelated with a number of individual personality characteristics. In the structure of satisfaction with separate parts of own body in men and women it is possible to allocate both general tendencies and certain gender specificity. The obtained results represent both scientific and practical interest for specialists dealing with the problems of body perception and informational and psychological safety of the person.
TRANSFORMATION OF MUTUAL ETHNIC STEREOTYPES AND GROWTH OF SOCIAL DISTANCE AMONG YOUNG PEOPLE IN THE REGIONS OF LOCAL MILITARY CONFLICTS (DONETSK, UKRAINE), POST-CONFLICT REGIONS (CHECHEN REPUBLIC, RUSSIA) AND BORDER REGIONS (ROSTOV-ON-DON, RUSSIA)

Anastasia Grishina
Irina Abakumova
Salina Zvezdina
Don State Technical University (Rostov-na-Donu, Russia)

The research is focused on the influence of ethnic identity on forming ethnic stereotypes among modern youth. The experimental basis of the study were state universities of Rostov-on-Don (as border region), Donetsk (as region of local military conflict) and Groznyi (as a post-conflict region) with a total of 150 participants. Using standardized methods (“Tolerance index” by G.U. Soldatova, etc; “Types of ethnic identity” by G.U. Soldatova, S.V.Ryzhova; “The scale of social distance” by E.Bogardus; “Bipolar profiles”) we identified type of ethnic identity, level of tolerance and social distance with other ethnic groups of each participant. Using bipolar scales of psychological traits allowed us to determine the content of autostereotypes and heterostereotypes between student from listed above regions. Using statistics allows us to draw a number of conclusions. The growth of social tension in the country or tightening of foreign-political situation moves youth’s ethnic identity to the pole of ethnic hyperidentity along with reduction in the level of ethnic tolerance and growth of social distance with other ethnic groups. Ethnic hyperidentity manifests in the genesis of ethnic positive autostereotypes and negative heterostereotypes among youth. Level of social distance among the youth in zones of varying conflict degrees is significantly different: students from the border and post-conflict regions show historically formed the degree of closeness-distance between ethnic groups, students from the region of the local military conflict show maximum distance with those ethnic groups that are at least minimally involved in the conflict, or just mentioned in the media coverage of the conflict, and the minimum distance with the ethnic groups, which themselves were ever members of local military conflicts. Increase of the social distance with the prevailing density of the population of ethnic groups was found in the region of local military conflicts. In region of local conflict with confrontation between subgroups within the same ethnic group we found changes not only in the variation part of the ethnic stereotype, but also in the core. In this case, there is a manifestation and increased social distance from their own ethnic group.
CROSS-CULTURAL VERSION OF AN ONLINE MINDFULNESS INTERVENTION FOR INTERNATIONAL STUDENTS IN GERMANY: A RANDOMIZED CONTROLLED PILOT STUDY

Sumeyye Balci
Anne-Marie Kuechler
Harald Baumeister
Ulm University (Ulm, Germany)

The stress level of university students affects not only their studies, but it also decreases their quality of life and can cause psychosomatic symptoms. Additionally, among international students, stress is influenced by living in and adapting to a foreign country, language barriers, and discrimination. Thus, makes it difficult for them to get access to support services in the host country. While stress seems inevitable among students, in a meta-analysis, online mindfulness interventions are proven to reduce stress (Jayewardene, Lohrmann, Erbe, & Torabi, 2017). Online interventions have the advantage of being independent of time and place, and its anonymity could attract more students to participate. In order to offer these students an intervention to reduce stress via increasing mindfulness and well-being, an online mindfulness intervention has been translated to English as generic as possible and will be presented to international students studying in Germany, Austria and Switzerland. The aim of this two-armed randomized controlled feasibility trial is to investigate the feasibility and acceptability of an English translated version of an online mindfulness intervention. The acceptability of a recruitment strategy, satisfaction with the online intervention, acceptance and adherence will be assessed to modify for a future RCT. The effectiveness of the intervention and some secondary outcomes, e.g. increased well-being, will be compared with a waiting-list control group. At the end of the intervention, participants will be invited to an interview about their experience with the online intervention, focusing on cross-cultural challenges in using digitized health interventions. A total of 30 participants, 15 per group, will be recruited through email groups of various universities using the www.StudiCare.com framework. The online intervention consists of 7 modules and 2 booster sessions. Each module aims at teaching a different skill of mindfulness or stress management. The online platform can be reached 24/7 and the participants will receive tailored feedback after completing each module. The results of the study will be analyzed in SPSS 24 with independent samples T-tests and correlation analysis which will investigate the relationship between mindfulness and secondary outcomes of the study. Barriers and facilitators will be analyzed within a qualitative research approach.
SELF-REGULATION LEVEL AND INTERNET ADDICTION: AN EFFORT TO ESTABLISH CONNECTIONS IN A LONGITUDINAL RESEARCH

Ekaterina Sedova
Tatiana Goryacheva
Pirogov Russian National Research Medical University (Moscow, Russia)

The problem of pathological internet use is an example of a problem brought in our life by new technologies. But the pre-disposition to a non-chemical addiction is supposed to form in an earlier age and that justifies the importance of studying the connection between the self-regulation level and problems related to internet addiction. The aim of the current research is to compare the results of the research of the self-regulation level having been carried out in the age of 8 and 11 years with the data characterizing the risk of the internet addiction in the age of 20-21 years. The research sample includes 23 persons, 10 males and 13 females. The self-regulation level is diagnosed with the neuropsychological methods in the age of 8 and 11 years (Luria’s battery of tests in the Semenovich’s adaptation). The current self-regulation level is diagnosed with the Morosanova’s Questionnaire, the risk of internet addiction is diagnosed with the Chen Internet Addiction Scale (CIAS). We have received rather contradictory results. Three our participants have a pronounced pattern of internet-addicted behaviour. They had various level of self-regulation at the first two stages: from high to low, but now all of them show the medium level of self-regulation. It is also interesting that three other participants who demonstrate the low level of self-regulation according to the Morosanova’s Questionnaire (two of them also had the low level at two previous stages) now show a minimal risk of internet addictive behaviour according to CIAS. An alarming result is that 10 participants (43%) are in the high-risk group of internet addiction. So the research shows that a low level of self-regulation either in elementary school or in the youth age does not always predict internet addiction, but the number of participants who can be related as the high-risk group for this issue is considerably high.
INNOVATIVE STUDIES ON ANALYTICAL PSYCHOLOGY’S ACTIVE IMAGINATION TECHNIQUE

Roselis Bittelbrumm  
Ichthys Institute for Analytical Psychology (Brusque, Brazil)

Maria Cristina Recco  
Ichthys Institute for Analytical Psychology (Maringá, Brazil)

Adelaide Pimenta  
Ichthys Institute for Analytical Psychology (Belo Horizonte, Brazil)

This presentation intends to report the results of the in-depth work on the Active Imagination technique performed by Sonia Lyra (PhD) and the group of psychologists that she coordinated in Brazil. This report has been collected from two unprecedented books published in Portuguese, which will soon be translated into English. The technique of Active Imagination was first developed by the Swiss psychiatrist Dr. Carl Gustav Jung (1875-1961) and then systematized by the Jungian analyst Dr. Robert Johnson (1921-2018), authors who provide the theoretical reference for the work. The technique has been researched in Brazil by the Psychologist and Jungian Analyst Sonia Lyra, Ph.D. in Religious Studies and Master’s in Philosophy, and Director of Ichthys Institute of Analytical Psychology in Curitiba — Paraná, Brazil. Lyra created the first ever Graduate course in Active Imagination Technique for the 15 psychologists that formed the group. The first book — Creative and Active Imagination (2016), is divided into two parts. Part one presents 24 texts, approached from several different angles on the technique; while the second part presents 6 texts on the scientific research already performed, beginning with cases of bruxism, Sjögren's Syndrome, and Post-traumatic Stress due to urban violence. The second book — Active Imagination: prima-materia of healing and quintessence of art (2017) consists of 18 articles on studies of the technique and its relation to healing and art. The technique of Active Imagination, as it has been practiced — one 60-minute session —, has been shown to be an effective factor in the transformation of psychosomatic symptoms. As a dialectic method, it promotes the dynamic interaction between conscious and unconscious contents, bringing about the possibility of symptom healing. In addition to the brief dissemination of the results obtained with the use of this technique so far, this presentation also identifies the new perspectives for research related to some psychosomatic symptoms which are currently in process: fibromyalgia, gestational infertility, insomnia, trichotillomania, burnout syndrome.
IMPROVISATION AS A METHOD OF COMMUNICATIVE SKILLS DEVELOPMENT

Olga Temezhnikova
The Academy of Public Administration (Moscow, Russia)

Tahir Bazarov
Lomonosov Moscow State University (Moscow, Russia)

The goal of our work is to create an improvised situation for communicative skills development. Improvisation is unexpected, spontaneous action, characterized by fast thinking and inquisitiveness. We were eager to find out the extent to which a stress situation slows down communication and improvisation processes and what helps to cope with a stressful situation created by us for the respondents. Method. The key aspect of our work was creating an improvised situation where participants had to demonstrate a high level of their communicative skills. The study experiment was carried out on the Department of Psychology of Moscow State University named after M. V. Lomonosov 30 full-time students have taken part in it. Within the framework of the study experiment the work included several stages: Preparation Stage, The Main Stage — execution, Final Stage. Preparation Stage included testing by two methods: 1.) Method of self-test on anxiety, rigidity, and extroversion (by D. Maudsley). 2.) Test for communication self-control estimation (M. Snyder) The improvisator got his bag by lot, started taking objects from it and speak about them as if they belonged to him. Representatives of all groups acted as improvisators. Improvisation was videotaped, which allowed us to give a qualitative analysis and expert estimation of the participants’ communicative skills, stress tolerance and spontaneity. We consciously selected a representative of the ‘first’ group to be the first participant of the experiment: according to the test results, members of this group have a low anxiety level and a high self-control level in communication, which is why it is easier for them to adapt to the suggested stress situation. Improvisators’ behavior was different by the way they managed the space around, telling their story, while the answers to unexpected questions demonstrated the level of improvisators’ spontaneity. Along with the study experiment the participants dove into the improvisation process deeper and the high level of communicative skills allowed them to cope with the stress situation, which was marked by expert analysts through giving high points to this parameter. The stress situation created by us was experienced by the participants as an optimal one for work.
PSYCHOLOGICAL IMPACT OF BRCA GENETIC COUNSELING: DECISION MAKING AND SUPPORT FOR WOMEN WITH RISK OF HEREDITARY CANCER

Alessandra Vela
Istituto Gestalt HCC Italy, SIPO (Società Italiana Psico-Oncologia) Regione Sicilia; Centro Genetica Oncologica Casa di Cura "Regina Pacis" San Cataldo (CL) (Palermo, Italy)

Adriano Schimmenti
Università degli Studi di Enna "Kore" (Enna, Italy)

Alice Moncada
Centro Genetica Oncologica Casa di Cura "Regina Pacis" San Cataldo (CL) (Siena, Italy)

Giuseppe Virzi
Centro Genetica Oncologica Casa di Cura "Regina Pacis" (San Cataldo, Italy)

About 5-10% of all breast cancer cases are attributable to germline mutations in BRCA1 or BRCA2 genes. Another type of cancer associated with germline mutations in the BRCA1 and BRCA2 tumor suppressor genes, is ovarian cancer. Positive results in the genetic test may produce important changes in the way patients perceive themselves and their family, it may have effects on personal identity, generate a sense of guilty toward family and a feeling of indeterminacy with depressive mood and fear of social discrimination. This is why Oncogenetic Counseling requires an interdisciplinary intervention: the contribution of psychology is, inside an integrated work, to prevent and manage dysfunctional psychological reactions to the genetic test, so that involved people can make informed and aware decisions about the preventive actions. The aim of this intervention-research is to identify how socio-demographic and psychological variables influence the decision making between prophylactic surgery actions (prophylactic salpingo-oophorectomy and/or prophylactic mastectomy) and intensive instrumental surveillance; to evaluate the efficacy of psychological support in decision making and increasing awareness about the choice felt most appropriate. This is a longitudinal study, with 4 measurements: Time0 — Pre-test — when patients receive informations about the gene test and decide if they want to continue, the aim is to assess patients’ present condition; Time1 — Post-test, when patients receive the result of the gene test, to evaluate the Decision Making in positive and negative people, positive ones begin an individual psychological support; Time2 (after 6 months) to evaluate the efficacy of psychological support for involved patients; Time3 (after 12 months) it is the time the psychological support end, the aim is to evaluate the efficacy of the procedure comparing who participated and who did not participate. The psychometric instruments used at each measurement are: Distress thermometer and Problem checklist, a self-report measure using an 11-point scale from 0 (no distress) to 10 (extreme distress). On the same page is an associated problem checklist, which asks whether the indicated level of distress is related to practical, family, emotional, spiritual or religious, or physical concerns; DSM-5 Self-Rated Level 1 Cross-Cutting Symptom Measure—Adult.
CATEGORICAL STRUCTURE OF YOUNG PEOPLE’S PERCEPTION OF RUSSIAN REGIONS

Vladimir Litvinov
Lidia Matveeva
Lomonosov Moscow State University (Moscow, Russia)

There is fact noted by many researchers that human world-image reflects basic categories of personal identity. (Koltko-Rivera, Berger, Luckmann, Leont’ev, Petrenko). And one of its main components is image of Russia, which is systemically important representation in human world-image. Research objective – to detect perception particularities of image of Russia and its separate parts. Authorial quiz and immersed interview, psycho-semantic differential and projective methods in the research. 26 recipients (Mage=22.6 years, SD=2.78; 11 male; from 14 regions of Russia) took part in this research. Results. The result of quiz show that the recipients used mostly their own experience (≈45 per cent of formed image) while forming the picture of Russian subjects in their thoughts, and followed influence of mass media by 8 per cent. However, recipient’s description of region images completely coincides with representation, provided by mass media. But at the same time the responders noted that they visited only 5-10 from 85 Russian regions and they could hardly have a personal experience of visiting the majority of regions and build a picture of it. Psycho-semantic research assumed description of image of next regions: North of Russia, Central Russia, South of Russia, the Northern Caucasus, Volga region, Ural, Siberia, Far East. According to combined analysis the main 5 factors, which could explain 97% of dispersion were: factor of «Moral value» (39%), which includes: simple, compromise, merciful, ingenious, safe, peaceful, able to enrich, native, reliable, hardworking; factor of «Emotional distance»(26%): cheerful, bright, worm, dirty, flourishing, open, close, lazy; «Traditional character» factor (14%): spiritual, ugly, backward, generous, chaste, religious, independent; «Independent» factor (12%): powerful, strong, authority, independent; «Patriotism» factor (6%): patriotism, alike others, authority. In the course of projective method the participants should not art images connected with representations of a definite territory on a contoured map. The majority of associative images was connected with mention of 3 macro regions: Siberia (21), the Far East (15), North of Russia (18). These results proof concepts about significance of mass media impact on human individual consciousness (Winterhoff-Spurk, Bandura, Zinchenko, Matveeva, Sobkin).
ON THE RELATIONSHIP BETWEEN REGULATORY FOCUS AND RESPONSE BIAS IN MULTIPLE CHOICE EXAMS

Julia Zuber
Barbara Stiglbauer
University of Linz (Linz, Austria)

Regulatory focus is a strong predictor for a person’s behaviour in signal detection tasks. While a promotion focus is related to a risky response strategy (hits, false alarms), a prevention focus is associated with a conservative strategy (correct rejections, misses). The present research is based upon the assumption that multiple-choice (MC) examinations represent typical signal-detection situations. It includes six studies that examined the effect of students’ regulatory focus on their test-taking response bias in MC items.

Altogether, the results provide good support for the hypothesized association between promotion focus and the tendency to make errors of commissions (rather than omissions), and conditioned evidence for the hypothesized association between promotion focus and the tendency to confirm (rather than negate) test items. Findings concerning prevention focus were heterogeneous. In sum, this research extends the generalizability of the predictions from regulatory focus theory to the context of MC examinations.

SEPARATE CLASSES FOR BOYS AND GIRLS (SEPARATE EDUCATION)

Marina Lvova
Moscow State Pedagogical University (Moscow, Russia)

The problem of education of boys and girls together has always been quite important and stressing, because many parents believe that if the classes are divided according to the gender of the children, it can increase the effectiveness of the educational process. Currently, the topic of my scientific dissertation is: "It is reasonable to teach boys and girls in separate classes". Years ago separate classes for boys and girls really existed, but today such an approach is considered to be too conservative and strict. Nevertheless, there still supporters of this manner of education and there are opponents to its and both teams try to persuade one another in the sensibility of their ideas and evidence. Actual gender studies at the modern stage of social development are specified by a number of phenomena and factors: change of gender stereotypes and gender-role interactions in the society; more active participation of females in different types of professional activity; exacerbation of marriage problems, divorces, loneliness in Russia; growing number of psychic, psycho-somatic and sexual disorders, including under influence of inadequate psycho-sexual identity. In domestic science, the issues of gender identification were covered in the works of A.V.Mudrik, V.D.Eremeeva, I.S.Kletsina, E.M.Tikhomirova, G.A.Nasledova, L.N.Nadolinskaya, P.I.Tretyakov, L.V.Popova, A.I.Antonov, E.P.Ilyina, D.N.Isaeva, V.E.Kagan, I.S.Kon, A.V.Libin, I.V. Romanova, P.V. Khodyreva.
AGE NORMS AND TIMETABLES ABOUT SEXUAL BEHAVIORS AMONG JAPANESE UNIVERSITY STUDENTS

Yoshinori Wakao
Nippon Sport Science University (Tokyo, Japan)

Yoichi Amano
Tokyo Metropolitan University (Tokyo, Japan)

In Japan, the experience rate of sexual behaviors of adolescent has declined since the late 2000s. This study investigated the age norm and timetable of sexual behavior among Japanese university students and examined the change in their consciousness since the survey in 2008. Six hundred sixty-three Japanese university students (300 men, 345 women, 18 unknown) responded to the questionnaire in 2015. The mean age of participants was 19.8 years (SD = 3.19). For each of date, romantic relationship, and sexual intercourse, we investigated whether the consciousness of the lower limit age (i.e., it is not good to have sexual intercourse at such an early age) and the upper limit age (i.e., it is not good not to have sexual intercourse beyond that age) are shared. In addition, we investigated how old Japanese young adults thought the upper limit age and the lower limit age were. As for the lower limit age, only 10% to 30% of the participants approved age norms for date and romantic relationship, but more than 70% for sexual intercourse. Compared to the 2008 survey, the approval rate of age norm for sexual behavior other than romantic relationship has increased in males. As for the upper limit age, 50% of males and 40% of females approved age norms for date and romantic relationship, 40% of males and 30% of females for sexual intercourse. Consciousness about the upper limit age has not changed since the 2008 survey. Male participants answered as 13.2, 13.0, and 16.0 years old for the lower limit age of date, romantic relationship, and sexual intercourse, respectively. Female participants answered as 12.8, 14.0, and 16.0 years old for the lower limit age of sexual behaviors. As the upper limit age, male participants answered as 23.7, 24.7, and 26.7 years old, female participants answered as 24.6, 25.8, and 27.7 years old. Compared to about 10 years ago, the approval rate of the lower limit age had decreased. This result suggests that changes in age norm and timetable influenced the decline in the actual experience rate of sexual behavior among Japanese young adults.
EFFECTS OF GROUP-BASED MUSIC TUITION ON SUCCESSFUL PSYCHOLOGICAL ADAPTATION IN YOUNG MALE REFUGEES

Jasmin Chantah
Goethe University Frankfurt (Main) (Frankfurt (Main), Germany)

Emily Frankenberg
Frankfurt University Hospital (Frankfurt (Main), Germany)

Stephan Bongard
Goethe University (Frankfurt (Main), Germany)

In the years 2015 and 2016, over one million individuals fled their home countries to seek refuge in Germany. For refugees, successful adaptation to acculturation-related challenges may be complicated by traumatic experiences and a lack of psychological and social resources. Music provides socio-emotional support in coping with everyday life and critical life events and serves as an effective tool to augment one’s capacity for adaptive emotional and cognitive processing. Especially musical activity in groups has been repeatedly attributed to a wide range of beneficial effects on psychological processing critical for well-being and adaptive acculturative processes. The present study investigates the effects of a group-based music intervention on parameters of successful psychological adaptation, such as psychological well-being, emotion regulation, resilience and acculturation in a sample of male refugees in young adulthood. A total of 86 participants (mean age = 23.6; SD = 4.5) were randomly assigned to a music group and a wait list control group. Participants in the music group received weekly two-hour music training sessions for 6 months. The Emotion Regulation Questionnaire, Perceived Stress Scale, Connor-Davidson-Resilience Scale, General Health Questionnaire, Frankfurt Acculturation Scale, and a German language test were administered in the beginning, middle and the end of the intervention and during a follow-up. Preliminary results indicate an increased use of adaptive strategies for emotion regulation (cognitive reappraisal) and a decrease of perceived stress for the music group but not for controls. Moreover, music group participants showed greater benefits in terms of psychological health and resilience than those who waited. Furthermore, analyses revealed an increase in orientation towards host culture and German language skills. Thus, musical activity in groups may foster the capacity for coping with the venture of migrating to a foreign culture and contribute to a successful and sustainable integration of young refugees.
PECULIARITIES OF SEMANTIC STRUCTURE OF THE WORLDVIEW OF ETHNIC GROUPS

Shin Khyan Ri
Sakhalin State University (Yuzhno-Sakhalinsk, Russia)

The meaning of life is a philosophical problem of human existence. Many doctrines of meaning are found through the times. Jaspers says that before you understand the soul you need to see the meaning. Sartre writes about the comprehension which explains the action through its final meaning. Adler considers that no one can escape from the meaning. The study of meaning as a life task is presented in detail by Frankl’s theory of personality. He believes that each person’s desire is to find the meaning of his life as a motivational component which is the main impetus to the development of personality. According to K. Jung, the meaning of life is associated with spiritual and cultural goals necessary for mental health. The concept of the archetype became one of Jung’s fundamental psychological theories. Jung is sure that historically created categories, archetypes and symbols are considered to be forms which give the meaning to life. Historical archetypes and symbols have a huge impact on formation of life images and meanings, moreover, on formation of the worldview of ethnic groups. In our research we mean formation of life images and meanings of Russians and Koreans. In our study we used the method of ultimate meanings developed by D. Leontiev. The purpose of his method is to find non-standard approaches to study dynamic semantic systems of consciousness. A qualitative and quantitative analysis of content-semantic structure of worldview is used where the aim is to identify the ethnic peculiarities of content-semantic structure of Russians and Koreans who live on Sakhalin. According to structural analysis the experimental group of Russians has a more mature and developed individual worldview. According to content analysis, the Korean group reflects reality more through categories of physical nature, such as financial prosperity and physical comfort. However, according to the index of negativity, a group of Russians is more sensitive and anxious. Thus, despite different ethnic groups live in the same territory the semantic structure of the worldview is quite different. As Jung said, historical memory plays a huge role in the formation of ethnic thought.
Nursery schools are an important area for child development support, but little consideration has been given to the significance of continuous psychological support. In this research, ongoing consultations were conducted at nursery schools and the following points were investigated:

1. Childcare perspective on the development of children
2. Characteristics of children to be supported

Through 1 and 2, psychological support utilizing daily daycare frameworks was discussed. In this research, consultations were conducted for 2 years at a rate of once every 3 months for 1 nursery school in Kagoshima city. Over 2 years, 32 caregivers and 40 children were consulted, though caregivers and children often overlapped. In consultation, childcare records were sent in advance. On the day, we shared information on children to be supported at a preliminary meeting and exchanged opinions on caregivers' development support after the nursery scene was observed. Regarding 1 and 2, records of care staff and pre- and post-meetings with teachers were analyzed. For 3, post-meeting results were analyzed. As a result of category analysis by text mining, the following points were indicated. Regarding 1, as a point of view of children's understanding of childcare, there was a gap from the so-called average development about participation verbally and in group activities. For 2, there was a high rate of children with autistic features and children with hyperactivity / impulsivity issues. Children with a relatively slow pace of intellectual development follow. In addition, there were a small number of children with short-term difficulties, however, they were able to catch up in a short period of time. For 3, it was shown that it is effective to convey the reasons for children's actions according to disability characteristics as a viewpoint of child understanding. Furthermore, while the teaching method at the nursery school emphasized verbal instructions, case studies show that providing concrete methods such as modeling and use of picture cards, according to children's behavioral characteristics have a positive impact. In conclusion, ongoing support showed that child carers showed greater flexibility and turned more of their attention to children's growth.
THAT OLE DEVIL CALLED STATISTICS: STATISTICS ANXIETY AND RELATED FACTORS

Melita Puklek Levpušček
Maja Cukon
University of Ljubljana Department of Psychology
(Ljubljana, Slovenia)

The study investigated relationships between statistics anxiety, academic procrastination, and trait anxiety in university students. There were 512 students of University of Ljubljana (UL) who completed the following questionnaires: the Statistics Anxiety Rating Scale (Cruise et al., 1985), Academic Procrastination Scale (McCloskey, 2011), and State—Trait Anxiety Inventory (Spielberger et al., 1983). The results showed that UL students experienced statistics anxiety and procrastinated with academic obligations below average levels. Student females reported higher trait anxiety and statistics anxiety than males, but they procrastinated less. Gender and trait anxiety were significant predictors of statistics anxiety. The results also showed that students differed in experiencing statistics anxiety according to their perceptions of mathematics and statistics as a threat or a challenge. Students of different faculties of UL differed in experiencing statistics anxiety. In the study, we translated the questionnaire for measuring statistics anxiety to Slovenian language. The confirmatory factor analysis confirmed the six-factor structure of the questionnaire. The results provide basis for further research on statistics anxiety and further validation of the STARS questionnaire.

CHARACTERIZATION OF THE ORGANIZATIONAL CLIMATE OF A CHILEAN B-COMPANY

Julio Lavarello
Universidad de Valencia (Santiago, Chile)

The objective of this study was to characterize the Organizational Climate of a Chilean B Corp. For this, a measurement instrument was designed consisting of 44 items grouped into 6 dimensions: Leadership, Unity, Company, Prestige, Clarity and Concern. The instrument was applied to 1,013 people, obtaining positive results of reliability and validity. Positive results were generally obtained in favor of a good organizational climate, where Clarity and Leadership stood out. At the same time a better perception of the men of the sample and people with age between 43 and 52 years was estimated. The possibility of continuing to use this instrument in a context of B corps is suggested.
A CRITIQUE OF PSYCHOANALYTIC SOCIAL THEORY OF KAREN HORNEY

Sayed Mansour Emamjomezade
(Isfahan, Iran)

According to Karen Horney, acting contrary to the common culture of the society in which one lives, is called nervousness. Based on this definition and given the cultural differences of different societies, it is obvious that different nerve diseases must exist in different societies with different cultures. But what is seen in reality is the uniformity of neurological complications and behaviors in different cultures, which is exactly the opposite of Karen Horney’s words. Therefore, a new definition of neuroticism, personality and neural behavior is needed. In this research, qualitative method was used and information was gathered through library, field and internet studies. The two behaviors of jealousy and anger that Karen Horney considered as neurotic behaviors were selected as samples and analyzed with four criteria of place, time, gender and age of these behaviors, and then the information obtained was studied based on the emergence of these behaviors in different times, places, gender, and ages. From around 2000 years ago, the two selected nervous behaviors in different cultures and times have been constant among people of different ages, among men and women, and have been known to be inappropriate behaviors throughout these times. According to the findings, it is concluded that the reason for the creation of the nervous behavior is not behaving contrary to the current culture of the society in which the individual lives, but behaving contrary to the factor that is present in all human beings regardless of their culture and time of life, age and gender and is called “human innate temperament”. Therefore, nervousness means acting contrary to human temperament, i.e. any behavior that is contrary to human nature. Neurotic behavior and the person who acts like this is called the nervous one.
PSYCHOLOGICAL TRAUMA AND PROFESSIONAL CHOICE. A BIDIRECTIONAL RELATIONSHIP.

Smaragda Skordi
Greek Open University (Thessaloniki, Greece)

Psychological trauma is a situation with which, we, mental health professionals are often confronted with. On the other hand, the selection of career is often related to past personal, sometimes traumatic experiences. This piece of writing aims to describe the ways psychological trauma defines professional choices and also to delineate the consequences of dealing with traumatized "clients" or "patients". Through literature review, an effort is made to discover various options of trauma, such as vicarious trauma or motivation of health professionals related to their life events. Past hurting experiences may motivate the individual to find a job that is committed to improve demanding life conditions. In addition, practice of specific occupations, such that of psychotherapist, may be impeded by personal difficulties or psychological "troubles" of the therapist. Consequently, mental health professionals need support, supervision and help to overcome their personal problems without hindering their healing work. There is also a need to further explore the involvement of past traumatic experiences in other professions. Indicative References: Bessel A. van der Kolk, Susan Roth, David Pelcovitz, Phyllis N. Black, Dorothy Jeffreys & Elizabeth Kennedy Hartley "Personal History of Psychosocial Trauma in the Early Life of Social Work and Business Students" journal of Social Work Education Vol. 29, No. 2 (Spring/Summer 1993) Sharon Rae Jenkins, Jessica L. Mitchell, Stephanie Baird, Sarah Roby Whitfield, and Heather Lynn Meyer (2011)"The Counselor’s Trauma as Counseling Motivation: Vulnerability or Stress Inoculation?" Journal of Interpersonal Violence 26(12) 2392–2412
This study is part of the dissertation about the development of the Architecture's creativity test and aims to present one of validity evidence was reached in accordance with the Standard for Educational and Psychological Testing for AERA-APA and NCME (1999). This validity evidence, achieved through a correlation between the score of Architecture's creativity test with two values of different subjects (Studio Architecture II and Design Architecture II). Two value of the subject is considered of a criterion-related validity that has the predictive function. One of the graduation requirement of both subjects is the ability of creativity. Researchers assumed that the more creative the participants will be increasingly higher value both their that subjects. The participants of the research consisted of two groups, there were students in the second grade of Architecture department Universitas 17 Agustus 1945 Surabaya who attended the subject of Studio Architecture II and second-grade students in the Architecture department of Universitas Pembangunan Nasional Surabaya, which attended the subject of Design Architecture II. The first group of participants was 62 students and the second group was 37 students. The data analyzed by Pearson's correlation techniques that are processed with SPSS series 20 IBM for Windows. The results of the research showed that there is a very significant correlation between the Architecture creativity test score with the Design Architectural II (r = 0.604; α = 0.000), and there is a significant correlation between the score test with Studio Architecture II (r = 0.246; α = 0.027). Both of the correlation results means that the test score of Architect’s creativity is proven capable of predicting the success of the participant in both subjects of assessment demanding individuals potential creativity. Results of the study also prove that the Architecture's creativity test has a good criterion validity.
Insight, Eureka, Aha effect – different names of a sudden solution of the problem seems random decision, since the course of thinking is unconscious. Insight causes a vivid emotional reaction accompanying the decision making. Insight refers to the common human experience of suddenly understanding a previously incomprehensible problem or concept in high level of uncertainty. It is usually opposed to the analytic problem solving. In our study we identified the moment of the onset of the insight with the threshold of image recognition under conditions of uncertainty. The effect of uncertainty, the stage of pre-accumulation and emotional support of the recognition threshold is important attributes of insight. The aim of our study was to develop a new experimental model, and investigate human brain neuronal structures which are involved in insight effect. As a tool for studying insight, we selected a method for determining the threshold for recognizing incomplete fragmented images, the computerized method of the Gollin-test. Methods of digital synthesis of the visual dynamic Gollin-tests images and fMRI brain image processing have been used to analyze the activity of large-scale neural networks of the human brain in threshold recognition conditions. The activity of large-scale neural networks in subthreshold, threshold and above-threshold conditions is shown in the case of observing synthesized dynamic images. Our psychophysical experiments give an analysis of the interconnection of the optical properties of incomplete (fragmented) images and the psychophysical recognition thresholds. We claim that the perceptual threshold of objects recognition can be associated with appearance of insight. The perceptual threshold is important part of the appearance of visual insight. The next necessary condition for insight is appearance of emotional component. We measure emotional component by psychological and psychophysiological methods and it was strong just at that moment. We have shown for the first time the dynamics of the BOLD signal in fMRI study from at the under threshold, threshold above-threshold levels. It grows to the threshold level and fall down above threshold. The multi-level process of decision-making on conflicting assessments, shown experimentally, is realized in the opponent’s human brain structures.
CONSTRUCTING INDONESIAN IDEOLOGICAL PREFERENCE SCALE

Fendy Suhariadi
Rizky Zein
Ilham Nuralfian
Cholichul Hadi
Airlangga University (Surabaya, Indonesia)

Prior to 2019 presidential election, the tense between supporters of two competing candidates becomes unbearable. Although polarization is vivid, no empirical research provides any evidence that political behavior is ideologically-driven, because most previous research argue that Indonesian politics are no less than a venue of cartelization. We were interested in developing a psychological measurement that concerns on how Indonesian positions themselves in political ideology spectrum. The 7-point Likert scale contains 34 items with two subscales (nationalist & conservative). To check its psychometric properties, we perform confirmatory factor analysis and correlate the factor scores to Right-Wing Authoritarianism (RWA) scale and Social Dominance Orientation scale (SDO) scale for checking its divergence/convergence validity (multi-trait multi-method). We also perform time-invariant analysis to investigate construct stability. We are collecting data to 388 participants in three time points, which are late November 2018, late January and late May 2019. To ensure time-invariance, we will be performing multigroup confirmatory factor analysis using lavaan package in R. Our study is pre-registered in https://osf.io/dqjce/

SELF-ESTEEM STATE OF EMPLOYEES IN THE WORKPLACE IN TERMS OF ORGANIZATIONAL CHANGES

Aida Mutalimova
Dagestan State University, Dagestan State Pedagogical University (Mahachkala, Russia)

This study examines the dynamics of changes in the state of employees (heads of departments) of a medical organization in connection with the change of management. The order and soteriological diagnostics of leadership qualities in relation to job satisfaction and self-assessment of employees of their condition in the workplace, evaluation of their own efficiency, subjective well-being and psychological readiness for organizational changes is presented. An attempt is made to build a model of a new organizational culture at three socio-psychological levels (leader’s personality, management team and the organization as a whole).
PERSONALITY PROFESSIONAL ASPIRATIONS OF RECRUITMENT AGENCY CLIENTS
Nurzhagan Kazieva
Dagestan State University (Mahachkala, Russia)

In this study it was revealed that on the statistically important level the level of person-professional aspirations goes with search firm customers’ different psychological characteristics and individual-psychological peculiarities (sex, professional potential, work search time, dominancy, identity in the sphere of inner world, social-psychological adaptation, and self-acceptance, self-concept, achievement and failure avoidance motivation).

THE EFFECTS OF PERSONALITY CHARACTERISTICS, METACOGNITION AND INTERNET USAGE FUNCTIONS ON NON-FUNCTIONAL COGNITIONS ABOUT INTERNET USAGE
Gamze Kılıç
Nesibe Olgun Kaval
Nimet Serap Görgü Akçay
Ege University Psychology Department (Izmir, Turkey)

The transformation of Internet use into some disruptive patterns of behavior and cognitions results in Pathological Internet Use (Davis, 2002). For this reason, individuals’ cognition about Internet use gains importance. Metacognition and personality are frequently used concepts to explain the nature of psychopathology. The aim of this study is to investigate the effects of personality characteristics, metacognition and Internet usage functions on non-functional cognitions related to Internet usage in university students. 687 Turkish university students (521 girls, 164 boys and 2 other and aged mean 20.13) is participated. The Big Five Inventory (BFI: Benet-Martínez & John, 1998), Metacognitions Questionnaire-30 (MCQ-30; Wells & Cartwright-Hatton, 2004), Internet Use Function Questionnaire (IUFQ; Ju, 2000), Online Cognition Scale (OCS; Davis, Flett & Besser, 2002) and a demographic form were used in this study. Regression analysis results showed that the non-functional cognitions related to Internet usage were significantly predicted by personality traits, metacognition and Internet usage functions. In addition, metacognition has a fully mediated role in the predictive effect of personality on non-functional cognitions related to Internet usage. The non-functional cognitions related to Internet usage was found to be correlated with some personality dimensions (e.g. Neuroticism) (Durak & Şenol-Durak, 2014). In the present study, the relationship between personality and the non-functional cognitions related to Internet usage is mediated by metacognition. It is stated that the reason for this situation may be negative metacognitions which can not be controlled and contain dangerous thoughts with positive metacognitions including behaviors related to control of thought and emotion (Casale, Caplan & Fioravanti, 2016; Spada, Caselli, Nikcevic & Wells, 2015). It has been found that all dimensions of metacognition predicted Pathological Internet Use (Spada, Langston, Nikcevic & Moneta, 2008). The Internet usage functions (social, leisure and virtual) were important for the Pathological Internet Use (Bozoğlan, Demirer & Şahin, 2014; Ceyhan, 2010).
BULLYING, EMPATHY AND ANXIETY: A SHORT-TERM LONGITUDINAL STUDY

Militsa Nikiforou
University of Central Lancashire (Larnaca, Cyprus)

The purpose of the present study was to investigate the direction of effects between personal characteristics (empathy and anxiety) and children’s involvement in bullying and victimization at school. The participants were 710 Greek Cypriot elementary students 10-12 years old. The children completed the Revised Bullying and Victimization Questionnaire, the Basic Empathy Scale, and the Spence Children’s Anxiety Scale. Data were collected in two time points with a 6-month interval. The structural equation model showed that anxiety at Time 1 (T1) positively predicted victimization at Time 2 (T2), while bullying at T1 positively predicted cognitive empathy at T2. In addition, bullying at T1 positively predicted children’s anxiety at T2. The results confirmed that the relationship between children’s empathy and anxiety and bullying is reciprocal. The findings are discussed with the framework of bullying, exploring the pathways that explain the association between personal characteristics and bullying/victimization during late childhood.

ARE ALZHEIMER PATIENTS APPROPRIATE IN THE INTERPRETATION OF EMOTIONAL SITUATION?

Domenico Passafiume
Federica Guerra
Jessica Ranieri
Dine Di Giacomo
University of L’Aquila Dep of life, health and environmental science (L’Aquila, Italy)

Patients with Alzheimer’s disease are reported to be not adapted in daily living emotional situations, some time showing inappropriate emotional reaction to the situation. It is widely reported in the literature that AD Patients have deficit in emotion processing. Aim of this study was to explore the ability of Alzheimer’s patients (AD) in recognizing the emotional significance of events, as this might cause inappropriate emotional reaction. Twenty eight AD patients (experimental group age range 60-78 yo, education 5-13) were compared to 28 healthy subjects (Health Control Group — HG) matched to AD. All participants were submitted to a neuropsychological battery and to three experimental tasks: 1) Interpretation of Emotional Situation Task, composed by 60 black and white drawings depicting emotional situations to be associate to pictures of the appropriate facial expression, 2) Emotion Naming Task, 20 pictures of facial emotion expression to be named 3) Emotion Recognition Task: 20 items each presenting pictures of two different facial emotion expressions to be distinguished. The percentage of correct choice were analysed. Analysis of Variance showed a significant effect (p< 0.001) on groups, tasks and group x tasks. Our findings suggest that the experimental group was less efficient than HC group in processing emotion; furthermore, within the experimental group, MCI were better than AD subgroup.
SYNCHRONIZATION OF TEMPO WITH HEART RATE

Nickolay Almayev
Olga Murasheva
Institute of Psychology of Russian Academy of Sciences
(Moscow, Russia)

This topic is widely discussed in psychological and physiological literature that is dedicated to the search of the mechanisms of music’s influence on human organism. Within our study of the effect of primitive rhythms (pulsations) on CNS heart rate was measured alongside with EEG. Six stimuli (adapted from Almayev and Skorik, 2015) those varied both in tempo and loudness were administered quasi randomly to 26 persons (12 male, 14 female). Duration of active phase of all stimuli was 150 msec., while pauses were 100, 500 and 1200 msec., that correspond to 240 bpm (prestissimo), 80bpm (andante) and 44bpm (largo); the levels of loudness were 70 dB and 90 dB. Amplitude envelope of signal was rectangular, so it didn’t sound musically but as noise. Heart rate was registered by poly channel of Mitsar 202 encephalograph, R-R distances were counted. Subjectively stimuli varied significantly (see Almayev and Skorik, 2015). No between group variance that could be compared to within group variance was detected, one way ANOVA shows $F=0.0006121$ for the six stimuli and for each pair of stimuli relations are the like. Absence of the affect of tempo on heart rate in the experimental conditions with subjects seating still must be stated. Further investigation may include: 1) change of noise like stimuli into chords (major and minor); 2) complication of inner structure of stimuli from pulsations to rhythms in the proper sense with inner irregularities formed by the pauses between beats. Importance of specific amplitude envelope of musical sounds for perception of major and minor was demonstrated in Skorik, Almayev & Bessonova (2018), while importance of pauses for the forming of expectations was found in Almayev & Skorik (2015). This work was supported by RFBR grant # 16-06-00487.
The scheme of honorific is so naturally embedded in social lives that we are hardly aware of it. But, when foreigners reside not so long, they develop their schema and notice cultural differences. The aim of this study was to compare characteristics between Japanese and Chinese by Analysis of Personal Attitude Construct. This was created to research one subject operationally and objectively. The subject was a female Chinese international student. The procedure was 1) presented the stimulus sentences about Japanese honorific expression, 2) required to order cards of association by importance, 3) instructed to estimate the distance of similarity intuitively, 4) Cluster Analysis by Ward was done, and 5) asked to describe the image about clusters. The same procedure was done about Chinese honorific.

Results: in Japan, 1) they bow, talk sincerely and use honorific to higher. 2) They use ordinary language to same age or rank. They talk to lower with plain language or instruction. 3) They use term of respect in formal dress to superior. The higher can speak of their opinion freely. Japanese change fashions of speaking according to intimacy. 4) In service job, they show polite expression. In China, 1) they use honorific to higher. Chinese compromise themselves to appeal of higher. But generally, they speak and answer assertively. In same sex, they often hug each other. They insist on important things first (Japanese last). They talk to lower with plain language or instruction. 2) When Chinese hit different opinions, women cease talking or become angry, but men sometimes argue with each other. 3) When they talk, they look at eyes of the other. They speak to superior after greeting. They use respect term to unfamiliar person. These results were obtained operationally and objectively, though one subject. It suggested Japanese have complicated systems of honorific which correspond to social hierarchy. Japanese pump and dump the level of honorific according to rank and sex. Their communication is not assertive but confusion. Japanese need to gauge other’s words and expression. In China, they talk frankly and express their feeling. Sex and superiority in rank have less effect.
THE RATIO OF VOLUNTARY ATTENTION IN THE PERFORMANCE OF TASKS AND SELF-CONTROL OF PROFESSIONAL ACTIVITY

Natalya Mihaylova
Olga Noskova
Lomonosov Moscow State University (Moscow, Russia)

For the purpose of assessing and forecasting the professional reliability of employees of locomotive brigades at Russian Railways, behavioral tests are used. The characteristics of voluntary attention in such tests are used to predict the infallibility of professional activity, they are applied to all consciously controlled processes of the employee. V.V. Serikov (2018) notes the absence of a correlation between the success rates of behavioral tests and the amount of errors in the professional work of railway drivers for the year, but at the same time some of their personal indicators (general internality of the personality, etc.) are associated with this characteristic. The aim of our work was to consider the ratio of indices of voluntary attention when performing test tasks and self-monitoring behavior assessed according to the survey data. This data can be explained by the fact that the mechanisms of mental regulation of the test task and professional activities are different: in the first case, voluntary attention can be provided by varying adaptation mechanisms, while in the second, relatively stable personal regulators are involved. In our study, a group of respondents was identified — 14% of the total number, who had a high level of voluntary attention on the results of test tasks and a level of self-control behavior (according to survey data) was low. When predicting the reliability and accuracy of the driver for a relatively long period (1 year), it is necessary to evaluate not only variable functional properties, but also relatively stable personal characteristics of the worker and among them self-control as a conscious, personal regulator of professional activity.
There are 450 thousand cases of strokes are registered in Russia every year and intracerebral hemorrhages constitute 9-20% of them. Hemorrhagic strokes have very serious clinical, psychological, and social consequences, including high rate of disability and mortality. Thalamic lesions lead to neurological deficit and also abnormalities of neuropsychological functioning. Studying of specifics of thalamic lesions will help to determine goals of rehabilitation that improves quality of life and social functioning. Study aim: to discover neuropsychological abnormalities in acute period of left thalamic hemorrhages. There were 31 patients (19 males and 12 females), age 38-80 (mean age — 60.74) from Regional Vascular Center at Regional Clinical Hospital #1 in the period of 2015-2018. The following patients were not included in the study group: patients with ischemic stroke in thalamus; patients with CT evidence of old strokes; and also patients with combined thalamic stroke (lesions in thalamus and different parts of brain — brain stem, ventricles, and cortex of occipital or ior temporal lobes). The study included the complex of clinical, instrumental (CT), and neuropsychological methods (Luria neuropsychological battery). Analysis of the neuropsychological profiles of patients in acute period of left thalamic hemorrhage has shown abnormalities in speech, reading, writing, counting, memory, praxis, and visual-spatial gnosis and neurodynamic disorders. Cognitive disturbances are complex and complicated by neurological symptoms: pseudo bulbar disturbances, motor deficit, hypesthesia, and oculomotor disturbances. Neuropsychological changes range from moderate to severe. Neuropsychological syndromes in left thalamic strokes are clinically similar to lesions of cortical regions of the left ior frontal, parietal, and temporal lobes. Such combination of cognitive and neurodynamic changes requires involvement of neuropsychologist in complex neurorehabilitation.
At present, in the professional selection of employees of locomotive brigades in the Russian Railways system, it’s used mainly data on the health status of candidates and the results of behavioral tests, and the assessment of the personal characteristics of future employees is not taken into account. We have suggested that there is a relationship between the reliability of workers’ activities (which can be measured by the sum of errors in professional activities made by the employee for the year — $\sum \text{err}$) and such individual personal characteristics as personal maturity (PM), reflexivity (RFL) and self-regulation (SR). Personality maturity is defined as a multidimensional systemic education, the level of which presumably reflects the individual’s assimilation of social norms, however, in the established theory and practice of ensuring human reliability, its role remains little studied.

The sample of our research included 348 employees of locomotive brigades of “Russian Railways”, men; age: from 23 to 56 years. The study used rank correlation analysis (for Spearman). Results: A negative correlation was established between the general indicator PM (test questionnaire by Y. Gilbukh) and $\sum \text{err}$: $R = -0.748; \ p \leq 0.000$. A negative correlation relationship was obtained for RFL (V.N. Karandashev’s reflection evaluation method) with $\sum \text{err}$: $R = -0.628; \ p \leq 0.000$. The interrelation of SR (a general indicator of personality self-regulation according to the questionnaire “Style of self-regulation of behavior” by V.I. Morosanova) and $\sum \text{err}$: $R = -0.579; \ p \leq 0.000$. So, “unreliable” specialists characterize the deficiency of resources of conscious self-regulation, reflection and a reduced level of personal maturity. It has been established that all these indicators do not change with age, since there are no corresponding reliable correlations. Conclusion: the studied individual-personal characteristics can be used as psychological predictors of the normativity and safety of the activities of workers in hazardous occupations, and the leading place here belongs to indicators of personal maturity.
THE EFFECT OF SITUATIONAL STRENGTH ON APPLICANT ATTRACTION: MODERATED BY PERSONALITY

Reyhan Bilgiç
Hazal Arpaci
Seyit Can Bahar
Gülsüm Özge Şengil
Middle East Technical University (Ankara, Turkey)

The purpose of the present study is to examine the relationship between situational strength and applicant attraction as the personality, measured by big five factors, as moderator variable. Environmental factors play an important role in applicant attraction (Chapman et. al, 2005). Although situational strength is an important environmental factor (Meyer, Dalal, & Hermida, 2010), its effects on applicant attraction has not been studied much in the literature. The purpose of this study is to fill this gap in the literature and have a new perspective on the applicant attraction. Situational strength is effective on the manifestation of personality traits at work environment. Therefore, this study will try to assess the possible effect of situational strength on applicant attraction and any possible moderation by personality characteristics. Situational strength will be manipulated by job advertisements that were created by researchers in respect to three of the four facets (clarity, consistency, constrains) proposed by previous literature. Personality will be assessed by Turkish version of conscientiousness and openness to experience scales. Moreover, applicant attraction will be measured with job pursuit intention and perceived person-organization fit scales. One-hundred and fifty participants who are either senior year students or recently graduated will be participating in this study. Each participant will be exposed to two types of job advertisement. One job advertised as strong situation as described by the three types of situational strength factor and the other as week. Manipulation check was conducted by a sample of junior and senior university students in order to make sure that situational strength was manipulated. It is expected that when situational strength is manipulated, applicant attraction will change and this association will be influenced by personality traits. Specifically, it is expected that those who are conscientious will attract more to strong situations whereas those who are high in openness will be attracted to the jobs with week situation, namely less constrained, less clear and less consistent situations. The results were discussed and suggestions for future research were made.
THE VARIABILITY OF INDICATORS OF PERSONAL RELIABILITY REPRESENTATIVES OF HAZARDOUS OCCUPATIONS WITH AGE

Olga Noskova
Kristina Yakimenko
Lomonosov Moscow State University (Moscow, Russia)

In the work of V.V. Serikov (“The World of Psychology”, 2018, No. 4) was found a correlation between some personal properties and the amount of labor errors of train drivers per year. The set of personal qualities important for the prediction of safe behavior is designated by him as personal reliability. The goal of our study was to determine the possible variability with age of personal properties that may be predictors of dangerous / safe behavior of workers. We used 2 methods: “The level of subjective control” (USK) by J. Rotter (adaptation by E.F. Bazhin and others) and the questionnaire 16 PF R. Cattell. In total, the study involved 500 men (drivers and their assistants), age: 19-55 years. Pearson’s correlation analysis was used (notation: * — perrors < 0.05; ** — perrors < 0.01; *** — perrors < 0.001). It was established that with age the internality in the area of failures increases (r = 0.13**), other indicators of the level of subjective control do not change with age. According to the questionnaire 16 PF R. Cattell, it was found that in older groups of machinists personal characteristics change under the influence of professional requirements, people become more serious and cautious — factors F (r = -0.10*) and H (r = -0.16***), more conservative — factor Q1 (r = -0.12***), more responsible — factor O (r = 0.16***), increased motivation, concentration, activity despite fatigue — factor Q4 (r = 0.16***). A number of important personal characteristics do not change with age: C (emotional stability), Q3 (self-discipline), G (moral standard), N (diplomacy). When predicting the professional reliability of representatives of hazardous occupations, it is important to take into account the age-related variability of individual personal qualities and, first of all, professional-important properties that are stable during long periods of life.
INDIRECT METHODS OF ASSESSING PERSONAL CHARACTERISTICS OF WORKERS AS PREDICTORS OF SAFE BEHAVIOR IN ORGANIZATIONS

Olga Noskova
Roman Balbekov
Lomonosov Moscow State University (Moscow, Russia)

From the point of view of assessing the level of security in organizations, not all personal properties are important, but only those that affect the behavior of employees and are stable at different age stages, such personal properties include moral qualities and personal maturity. As part of the study of moral qualities and the level of personal maturity, we assessed the validity of the VAAL(R) method as an indirect method of assessing personal properties. Assessment of the validity of the methodology VAAL(R) was conducted on the data with the methods: «LSC», «Test-questionnaire of personal maturity of Gil’buh Y. Z.», Molchanov S. V. 'Justice care'. The study involved 50 people. As a result of the correlation analysis (by Spearman) of the relationship of indicators on the scales of VAAL(R) methodology with the «LSC» methodology, the following was revealed: scales of «General internality» (r=0,365), «internality in the field of achievements» (r=0,408), «internality in the field of failures» (r=0,365), «internality in the field of family relations» (r=0,365), «internality in the field of industrial relations» (r=0,365) and «internality in the field of interpersonal relations» (r=0,365) have a significant average positive correlation at a high level of significance (p < 0.05). As a result of the correlation analysis (Spearman) of the relationship of indicators on the scales of VAAL (R) methodology with the technique of «Test-questionnaire of personal maturity» was revealed the following: there is a relationship with the following scales: the ratio of self (R=0,337), and Practicality (r=0,409), at a high level of significance (p < 0.05). As a result of the correlation analysis (by Spearman) of the relationship of indicators on the scales of VAAL (R) methodology with the method of «Justice-Care» S. V. Molchanov no significant indicators were obtained. When assessing the retest reliability of the used scales of the VAAL(R) system, high rates were obtained. Thus, an acceptable level of validity of the selected scales of the system of VAAL(R) for an indirect assessment of a number of personal properties that reflect the level of personal maturity in the context of safe behavior is established.
One of the main tasks in the development of modern clinical psychology is how to raise the effectiveness of rehabilitation centers during all stages of prevention, diagnostics and correction. At present, because the situation with drug addiction is tense, the study of the clinical and psychological characteristics of the drug-addicted individual is very important. In particular, the reasons for emotional disturbances should be revealed and how they are to be corrected are factors that play a great role not only in the process of rehabilitation, but in the prevention of recurrences in drug-addicted patients. Study aim: comparative study of the interplay of depression, alexithymia and aggression in drug-addicted individuals. There were 159 persons in the group under research: two experimental groups consisting of 106 persons (24 female and 82 male patients) aged from 16 to 45 (average age — 27) diagnosed as having ICD-10 (Russian) F1x.2 “Addiction Syndrome”, who were in the process of rehabilitation. The following methods were used in accordance with the purpose of research: aimed clinical talk, Zung depression test, TAS, Wagner’s Hand-Test. Results: the study proved the fact that drug addiction is in most cases accompanied by depression. Analysis of the level of depression in drug-addicted patients showed signs of depression, especially during the first months of rehabilitation. But the growth of the depressive symptoms in patients is closely connected with the growth of the level of alexithymia. It is possible to say that the level of alexithymia influences the degree and appearance of depressive symptoms.
Various types of attention derangements can be seen in children with hyperactive disorder but when diagnosing only attention deficit is registered. It reflects the characteristics of behaviour mentioned as criteria in international classifications such as DSM-V and ICD-10. The main attention characteristics can have various indexes depending on the character of the activity. The changes in the indexes of those characteristics are accompanied with the activation of the corresponding structure and that allows building up hypotheses specifying the character of attention derangement caused by certain CNS pathology. Studying this issue leads to designing either more specific intervention programs or effective recommendations for organizing learning activity for such children. The research aim is analyzing the characteristics of voluntary visual attention of children in the age from nine to eleven years with hyperactive disorder with attention deficit. The research sample consists of 50 children, 25 of them with a diagnosis code F90.0 Attention deficit hyperactivity disorder. The control group includes 25 children with neither neurological nor psychiatric diseases in anamnesis, with good progress at school and no sufficient complaints of their parents and teachers on child’s behaviour. The research methods include six consequent techniques, given in the following order: Bourdon test, Comparison of characteristics (Cohen’s Test), Schulte table test; Ray’s twisted lines test; Pieron-Rouser test; shortened five-minute Toulouse-Pieron attention test. The research shows that the children with ADHD demonstrate derangements in concentration degree, stableness, distribution, volume and shift of attention comparing with the children of the control group. The fatigue as a result of a series of several consequent tasks reflecting various attention characteristics comes sooner to the children with ADHD than to the children of the control group. That can be seen in more pronounced deterioration of stableness and concentration in the end of experiment. This fatigue effects mainly the attention concentration whereas the children with normative development just slow the activity and change the strategy, still keeping concentration at the same level.
THE IMPACT OF SHARING SOCIAL REPRESENTATIONS ON SOCIAL IDENTITY

Nataliia Shalaeva
Jean Louis Tavani
Patrick Mollaret
University of Paris VIII (Paris, France)
Alla Gudzovskaya
Institute of Research on Social Phenomena (Samara, Russia)

Social memory is a set of social representations about the past that means collective souvenirs (Licata et al, 2007). Social representations would participate in the construction of a positive social identity and they would have a particularly important identity function. The relations between social identity and social representations are bilateral: identity influences the construction of representations and representations contribute to the construction of identity. Assumption: The target who shares the same souvenir as the participants will be evaluated more favorably than a target who does not share souvenir. The target — a member of the in-group, which involves a central element of the representation, will be devalued compared to a target, a member of the out-group, involving the same element. 8 experimental conditions with 3 independent variables: the group membership of the target (out-group vs. in-group), the elements of social representation (central vs. peripheral), the souvenir (normative vs counter-normative). Participants were introduced to a fictional testimony. They assessed the target-source of a testimony on the Likert scale of 7 points operationalizing perceived similarity, sociability and competence. Population: 238 French (78.02% women, Mage = 21.98, SDage = 5.28) and 275 Russians (80.07% women, Mage = 30.40, SDage = 9.74). Statistical analysis: ANOVA. Regression analysis. For the French group the interaction is significant between belonging, element and the souvenir on perceived sociability (F(1,230) = 3,985, p = 0.047, \( \eta^2_p = 0.017 \)). For the Russian group, the interaction is significant between the element and the souvenir on perceived similarity (F  (1,267) = 9,476, p = 0.002, \( \eta^2_p = 0.034 \)) and skill (F(1,267) = 4,963, p = 0.027, \( \eta^2_p = 0.018 \)). The target evoking the normative memories was evaluated more favorably than the target evoking the counter-normative souvenir. The effect of memory is more important in the in-group if it goes in the direction of the central element of representation than in the sense of the peripheral element. The effect of souvenir is more important in the out-group if it goes in the direction of the peripheral element than of the central element.
PSYCHOSEMANTIC ANALYSIS OF THE IMPACT OF CINEMA ON YOUNG VIEWERS

Tina Kubrak  
Institute of Psychology, Russian Academy of Sciences (Moscow, Russia)

Cinema, as one of the influential mass media, plays an important role in the life of modern society, being a very popular leisure activity. Movies affect the viewer’s motivation, values, stereotypes, activities and mental representations of reality. The current study is devoted to the problem of the impact on young people, whose ideas about the surrounding reality are most subject to change. The aim was to determine the effects of the impact of the movie on young viewers. A total of 75 individuals participated in the study. The average age was 23. We selected a film in which the main characters were the elderly, open to new experiences and new opportunities. It was assumed that this film would influence the representations of young people about the elderly, and would make it possible to take a fresh look at them. Psychosemantics method was used to identify the representations. The measure included 25 scales developed particularly to detect the representations of the young audience about senior people (Lemish V.). The viewers scaled seniors’ personal traits before, after and two weeks later after watching the film; in addition, they evaluated young people on the same scales too. Original Movie Preferences Measure (Kubrak T., Grebenschikova T.) was used to identify viewers’ movie preferences. Such variables as gender, the attractiveness of the movie and role of movies in leisure were taken into account. The factorization of assessments was carried out in order to build semantic spaces, to determine the content of images and the direction of their changes. Transformation of the semantic spaces showed changes in the ratings of seniors in the cognitive, emotional and regulatory spheres. The various effects of the movie about senior people on young viewers’ corresponding representations are discussed. The gender differences after the movie became more distinct and women revealed higher sensitivity. The effect was not long-term for the majority of scales. The current issue demonstrated the importance of complex approach toward the predicting influence of cinema.
In the scientific domain, several million research papers in many different languages are published throughout the globe every year. Accessing these articles would not only avoid duplicate research efforts, but also provide better counseling, health care, reduce human and animal testing, and so forth. Basing research solely on results published in dominant languages such as English bears the risk of drawing conclusions on narrow subpopulations than on broader grounds. Monolingualism ignores cultural diversity and crosscultural variability. National journals play an important role in disseminating research results in more locally-oriented (sub-) disciplines. In a survey conducted in 2008 among members of all European national psychology associations, 76% of respondents would welcome a facilitation of the language barrier in scientific publishing. Therefore, the Leibniz Institute for Psychology Information and its partners in 2013 have created PubPsych (http://www.pubpsych.eu/), an open access portal for psychological literature, tests, treatment programs and research data. Pub-Psych offers multilingual content in English, French, German and Spanish. However, cross-lingual (CL) search is very limited as of now, since no translation services are built into PubPsych. In order to improve multilingual access to relevant material, the research project Cross-Lingual Bibliographic Search (CLuBS), supported by the Leibniz-Gemeinschaft, aims at providing a solution to overcoming the language barrier in multilingual data collections. The goal is to test, demonstrate, and evaluate different Cross Language Information Retrieval (CLIR) solutions, which should deliver (1) high recall and precision and (2) a satisfying user experience. Cross Language Information Retrieval (CLIR) allows users of PubPsych to specify their information needs in their preferred language while retrieving relevant documents matching their needs in languages different from the query language. Results show that queries in PubPsych are typical for academic search engines especially regarding the occurrence of domain-specific terminology. About 88% of the queries are informational and need to be translated for CL search. Term mappings with the help of multilingual thesauri could be successfully applied to maximize the retrieval recall. This approach handles domain-specific terminology very well, but the general domain vocabulary remains a problem. Solutions are presented to overcome the limitation of dictionary-based methods.
The research and management practice have shown that traditional corporate culture (CC) and leadership models do not satisfy the requirements of the constant changes in modern organizations. This situation urgently calls for new scientific approaches that meet modern challenges. Fast economic development of Asian countries has already brought to life intensive discussions about eastern type of CC and leadership. For many centuries Europe has provided the World with productive models of CC and leadership. Now when there is an urgent need for promoting effective CC and leadership in Europe, scientists and management experts should do their best to consolidate the long-term experience and achievements. A new CC and leadership concept, opening wide research and applied opportunities is suggested. Empirically validated, new three dimensional leadership model facilitates to better organizational activities helping organizations to develop effective CC, achieve synergy and gain the most ambitious goals. Traditionally two basic factors determining effective leader’s behavior have been outlined: task-orientation and concern for people (Blake & Mouton, 1963; 1985). The suggested leadership model includes additional value/cultural orientation factor, comprising basic values extracted from corporate codexes and corporate culture of leading companies. These values are trust, fairness, responsibility, openness and commitment. The value/cultural orientation factor indicates how leader’s values match values of ideal corporate culture. A new typology of leadership styles takes in consideration not only personality and behavioral characteristics of leadership, but the specific aspects of corporate culture and power distribution in organization as well. CC is considered as the vector of the organizational development. On the basis of the model a new three level (individual-group-organization) program of organizational development and training is elaborated and successfully used in organizations in Germany, Austria, Bulgaria, Poland and Russia.
SELECTION AND IMPLEMENTATION OF MEANING FORMATION STRATEGIES: THE TRIALECTIC APPROACH

Irina Abakumova
Anastasia Grishina
Denis Penkov
Don State Technical University Dean (Rostov-on-Don, Russia)
Michail Godunov
Shkola Sotvorchestva (Rostov-on-Don, Russia)

The modern activity-based approach considers meanings as polymodal images of causal order. The strategy of meanings creation reflects a look into the present from the future, aimed at creating new reasons for human self-improvement. Such a choice and purposeful programming of situations is necessary for their qualitative change and overcoming the resistance of the personal environment (I.V. Abakumova, 2014). The strategy of meaning formation is a dynamic vector that has an application point, meaningful content and a trajectory of person's semantic sphere transformation. In previous studies, meaning formation was studied from the standpoint of polar assessment and semantic dissonance as two strategies: adaptive and developmental (D.A. Leontiev, 2007). For a more complete modeling of semantic reality, it is necessary to move from dual to trilectic level and consider three strategies of meaning formation: 1) Hypo-adaptive strategy—based on formal preferences, a method of forming causal images, aimed at passive interconnection and driven movement in a layer of personal meanings, given by insuperable circumstances of vital activity without their actual awareness. 2) Hyper-adaptive strategy—based on personal experience and stereotypical pre-assumption of achieved goals, the method of forming causal images, aimed at maintaining the unchanged content of personal meanings using all available resources for this purpose and discarding new opportunities for the semantic sphere development. 3) Preadaptive strategy—method of forming causal images focused on awareness of motives and generating actual goals, directed to the generation of perspective personal meanings and their timely transformation to realize the possibility of spiritual growth under the influence of internal and external circumstances, which are evaluated as surmountable conditions of life situations during individual self-determination activities. On the basis of these strategies, it is possible to identify a psychological portrait as actually manifested personality traits. They will show not a static imprint, but a flow of dynamic processes of meaning formation accompanying personal development. The proposed trialectic approach allows a more multifaceted consideration of situational human interactions’ features. It is the manifestation of actual personality traits in various life situations, including crisis situations, that manifests the uniqueness of ideological position for understanding the experiencing subject’s inner world.
PERSONAL CHARACTERISTICS OF EXTREMIST YOUTH

Eugenia Pchelkina
Tatyana Razuvaeva
Elena Kozhevnikova
Svetlana Pitka
Svetlana Hashaeva
National Research University "Belgorod State University" (Belgorod, Russia)

Our goal is to identify the socio-psychological characteristics of students prone to extremism, and to develop recommendations for the prevention of extremism at the university. In the modern world, the level of terrorist activity is increasing. Scientists are studying the causes of involvement in extremist and even terrorist groups of young people, including students (Yu.V. Bykhovets, K.Yu. Galkin, A.V. Klyuev, M.Sh. Magomet-Eminov, A.A. Mkrtychyan, N.A.Ozova, D.V. Olshansky, N.V. Tarabrina, E.A. Tyugashev, G.Ya. Chaganova et al., as well as S. Galea, T.A. Grieger, L.E. Delisi, G. Keinan, C.S. North, B. Pfefferbaum, E. Ruth, A. Speckhard, and others). The study has been conducted since 2015. The value orientations were studied (methods of E.B. Fantalova), suicidal risk (V.B. Nikishin’s test), aggressiveness (test L.G. Pochebut), self-attitude (V.V. Stolin), attitude to another and attitude to terrorism (author’s questionnaire) in 30 men, aged from 18 to 45 years old, imprisoned four prisons of Kurdistan, former members of terrorist groups. We obtained the results: the contradictory combination of constructive and destructive values, their undifferentiation, the presence of an intrapersonal value conflict, the gap between the high significance of all values and the lack of accessibility of their implementation, the presence of suicidal risk, the average level of aggressiveness, the high degree of self-attitude indicators and the low relation to others, contradictory attitude to terrorism (justification is closely related to reprobation). The collected material is of great value due to the exclusive nature of the sample. It needs to be analyzed in more detail. We will also make a comparison with the results of the survey of university students in connection with the developed socio-psychological model of the personality of an extremist, we will reveal the effectiveness of the program for the prevention of extremism at the university.
THE IN-LAWS: HOW MUCH THEY AFFECT MARITAL SATISFACTION IN WOMEN?

Marina Nekić  
University of Zadar Department of psychology (Zadar, Croatia)

Antonia Trošelj  
(Zagreb, Croatia)

Ivana Tucak Junaković

Marina Vidaković  
University of Zadar Department of psychology (Zadar, Croatia)

Although the relationship with the in-laws plays a significant role in the lives of married couples, still these relations were mainly examined qualitatively, i.e. through interviews. Considering that there is no adequate instrument to assess the perception of quality of relationship with the partner’s parents, the main purpose of this research was to construct and validate the new measure. Furthermore, some studies have found that the marital satisfaction is related to the quality of relationships with partner’s parents. Therefore, the second aim of this research was to examine to what extent relationships with partner’s parents play a significant role in marital satisfaction in women. Research was conducted on 403 female participants. On average, they were 30 years old, and have been married for 4 years. Majority of women had at least one child. Marital satisfaction was assessed with The Marital Satisfaction Scale from The Perception of Marital Quality Questionnaire, and relations with partner’s parents were examined with newly constructed questionnaire The Relationship Quality with Partner’s Parents Questionnaire. Results of the CFA have shown the two-factor model (positive and negative aspects of relationship) for the relationship quality with mother-in-law and father-in-law. Positive aspects of the relationship with partner’s parents reflected the perception that parents’ in-law intentions were benevolent, that mother/father-in-law was helpful and caring. On the other hand, negative aspects of the relationship with partners’ parents included the perception that mother/father-in-law was intrusive, possessive and disrespectful. As predicted, in general perception of partner’s parents as caring and helpful was a significant positive predictor for marital satisfaction, while negative aspects of relationship only with mother-in-law were a significant negative predictor for marital satisfaction. Results of this study show that relations with in-laws (especially mother-in-law) had a significant role in marital satisfaction. In fact, negative aspects of the relationship with mother-in-law were the stronger predictor of marital satisfaction. This research only included daughters’ in-law perception, so it is still an open area to study dyadic relations.
INTOLERANCE OF UNCERTAINTY AND MINDFULNESS AS DETERMINANTS OF ANXIETY AND DEPRESSION IN FEMALE

Marina Nekić
Severina Mamić
University of Zadar Department of Psychology (Zadar, Croatia)

Intolerance of uncertainty is most commonly defined as the tendency to be afraid of the unknown and react negatively when faced with ambiguous everyday situations. It interferes with problem-solving because it leads an individual to impulsive behavior which decreases uncertainty but does not solve the problem. Even though it is mostly considered as an important factor in anxiety disorders, studies have shown that intolerance of uncertainty is a transdiagnostic vulnerability factor for the development and maintenance of both anxiety and depression. One construct that emerges as being potentially beneficial for the psychological health of both clinical and non-clinical samples, and is negatively associated with intolerance of uncertainty, is mindfulness. Therefore, we sought to examine the contribution of intolerance of uncertainty and mindfulness in explaining the symptoms of depression and anxiety in a sample of college students. 282 female college students aged 21 participated in the study. In order to assess these constructs, we used three scales which were administered online: Intolerance of Uncertainty Scale, Mindful Attention Awareness Scale, and Depression, Anxiety and Stress Scale. Results have shown that students were on average intolerant of uncertainty and mindful. We found that students had moderate levels of anxiety and depression. Furthermore, the results of two hierarchical regression analyses have shown that intolerance of uncertainty and mindfulness significantly predict anxiety and depression in female students. In fact, results of HRA have shown that relation between intolerance of uncertainty and anxiety/depression in female students was partially mediated by mindfulness. Taken together, we can conclude that individuals’ inability to stay calm when faced with uncertainty can predict the onset of anxiety/depression and that this process is partially due to their inability to decentre from negative thoughts and sensations. These findings have practical implication for Student Counselling Centres which can promote mindfulness training and offer workshops on how students can develop tolerance of uncertainty.

DEPRESSION, PERSONALITY AND FUTURE TIME PERSPECTIVE IN INTERNET ADDICTION

Aneta Przepiorka
Agata Blachnio
Andrzej Cudo
The John Paul II Catholic University of Lublin (Lublin, Poland)

The participants in the study were 798 individuals aged 12 to 30 (M = 17.65, SD = 3.71). There were two groups: 430 adolescents (aged 12–17 years, M = 14.69 years, SD = 0.99; 49% females) and 368 emerging adults (aged 18–30 years, M = 21.11 years, SD = 2.55; 63% females). The respondents completed: the Polish versions of Young’s Internet Addiction Test (IAT), the Center for Epidemiologic Studies Depression Scale (CES-D), the IPIP-BFM-20 questionnaire measuring the Big Five, and the Future Time Perspective Questionnaire. The results showed that
depression had the highest predictive power for IA. Personality traits were related to Internet addiction. In both groups, conscientiousness and agreeableness had negative contribution to Internet addiction. In the group of adolescents extraversion was a positive predictor of IA, whereas in emerging adults intellect was a negative predictor of IA. FTP long and FTP goals were negative predictors of IA in the group of emerging adults.

SCHWARTZ VALUE CLUSTERS IN RUSSIAN STUDENTS

Olga Maslova
Dmitry Shlyakhta
Peoples’ Friendship University of Russia (Moscow, Russia)

Mikhail Yanitskiy
Kemerovo State University (Kemerovo, Russia)

Background. This study was carried out using the framework of S. Schwartz’s theory of basic human values.

The study was aimed at establishment of subgroups among contemporary university students based on their values hierarchy with the use of the Schwartz Values Inventory.

Methods. The sample included 1239 students from different regions of Russia and Ukraine were given the SVS and PVQ, Russian version by Karandashev (2004), designed to measure the structure and hierarchy of basic human values on the two levels, known as the Normative Ideals level and the level of Behavioral Priorities.

Results. In the first group of students, comprising 37 per cent of the whole sample, the most important in the hierarchy of values were the following: Tradition, Universalism, Benevolence, Conformity, Security. The values of Hedonism and Power were the least important for them. The score at the Normative Ideals level is higher than at the Behavioral Priorities level in this group. We called this group “Traditionalists-Universalists”. The subjects in the second group attached less significance to all kinds of values. The most important were Tradition, Conformity, Universalism, Benevolence. The least significant values for them were Achievement and Power. These values were expressed more at Behavioral Priorities than at the Normative Ideals level. We call this group which comprised 35 per cent of the sample, “Traditionalists-Conformists”.

The hierarchy of values in the third group looks as an antipode of two other groups. The most important values here were Power, Achievement, and Hedonism, with the value of Tradition being the least significant at both levels. We called this group “Social Superiority Seekers “, and it comprised 28 per cent of the sample.

Conclusion. The University students proved to be generally polarized in the respect of acceptance of ‘values of Conservation’ and ‘values of Self-Enhancement’. The majority of respondents who took part in the study, attached the utmost significance to the ‘values of Conservation’ including Traditions, Conformity, Security, as opposed to Power and Achievements; while 28 per cent of the respondents, in contrast, value most of all ‘Self-Enhancement values’ denying the ‘values of Conservation’.

Keywords: personal values, values clusters
Domestic Violence against women is very common in both developing and developed countries and is a complex and multidimensional phenomenon. Intimate partner violence is an important global health problem that policy makers seek to address by a variety of interventions, including efforts to promote "women empowerment." Domestic violence can take many forms, including physical abuse, sexual abuse, and emotional, economic and psychological abuse." However, domestic violence by intimate partners, in particular, is very common in both developed and developing countries. One would think that women who are empowered are more able to stand up for their rights. As a consequence, they experience less domestic violence. But this conclusion may not be necessarily true. More empowered women may diverge from the traditional gender roles in their relationships/marriage which hurt their men’s ego. The men who feel threatened or undermined by this, may use violence as a way to restore their ego, power or dominance in the relationship. This paper sought to examine the association between domestic violence against women empowerment in intimate partner violence. Through the use of semi-structured questionnaires, in face to face interviews, five clinical psychologists, five counselling psychologists, five social workers and five psychiatrists were interviewed to obtain their perceptions and experiences of the efficacy of psychotherapy/counselling in empowering women who experience intimate partner violence and its impact in intimate partner violence. The conclusion was that abused women who have been empowered through psychotherapy experienced more domestic violence.
DYNAMICS OF CULTURE AND LANGUAGE AMONGST ENGLISH SPEAKING CLINICAL PSYCHOLOGISTS IN KWAZULU-NATAL

Constance Ntombifuthi Mkhize

Частная практика (Durban-Umhlanga, South Africa)

The purpose of this presentation is to share some ideas on the continuing challenges facing English speaking psychologists in the province of KwaZulu Natal working inter-racially and how it affects the therapeutic relationship as a whole. A discourse analytic approach was employed to understand the complicated language phenomenon in sharing sensitive and confidential material. The rationale of the study was to look at the extent to which psychologists from different cultural and diverse language backgrounds make sense of language and cultural diversity in their therapeutic relationship. There were interesting dynamics that came up from the data collected as follows: From the results it was identified that patients are disadvantaged of the psychological services because of the language they do and do not speak. In general, the study found that English speaking psychologists experience serious challenges when they have to conduct psychotherapy and other related activities with non-English speaking patients or clients. The study found that the issue of working with interpreters continues to be faced with many uncertainties. While the interpretation process is by no means ideal for carrying out psychotherapeutic work, however, it can go a long way in creating access to psychological services. This study has demonstrated that psychotherapy can be implemented successfully through using interpreters, until such time that the system is able to produce psychologists that are adequately proficient in different indigenous languages spoken in South Africa. Finally, the researcher hopes that this study will offer suggestions to psychology as a profession and find means to deal with the cultural and language challenges that psychology is faced with in order for psychologists to have efficient psychotherapy and subsequent to that work inter-racially. It was hoped that the study would play a positive role in increasing psychologist’s sensitivity to issues of racism. Furthermore, it was hoped that the findings of this study would help promote culturally respectful programmes and strategies among psychologists and other health-care professionals in KwaZulu Natal.
Does Temporal/Sequential Grouping Improve Visuospatial Working Memory?

Visuospatial working memory (VSWM) has been traditionally defined as a system of limited capacity that allows the maintenance and manipulation of visual and spatial information. However, some perceptual features like Gestalt grouping could improve VSWM effectiveness. In two different experiments, we aimed to explore how the presence of elements grouped by color similarity affects the recognition of both, grouped and non-grouped items. We employed a change detection task in which the individual elements were presented sequentially over the time. In Experiment 1, a sequence of 6 items (colored circles) was presented within the same spatial location (200 ms each with an ISI of 100 ms and final retention interval of 1200 ms). In Experiment 2, items followed the same temporal sequence, but were randomly presented along 6 different spatial locations arranged in a circular configuration. Congruent with previous studies in which the items presentation is simultaneous, the recognition of grouped items was more accurate than the recognition of non-grouped items. In addition, the performance in the change detection task for non-grouped items was influenced by the presence/absence of grouped items within the same array, particularly when a non-grouped probe shared the color of a grouped item. The results will be discussed in relation to the exogenous attentional capture exerted by perceptual grouping and its influence on the encoding, maintenance and recovery of the non-grouped items in visual working memory.
EVERYDAY STRESS AND COPING IN FAMILIES WHERE CHILD SUFFERS WITH TYPE 1 DIABETES

Anastasia Krasko
Nadezhda Mikhailova
Saint Petersburg State University (Saint Petersburg, Russia)

In this study everyday stress, coping and family functioning in families where child suffers with Type 1 diabetes were analyzed. The sample consists of 23 mothers, 4 fathers and 21 adolescents. Participants were asked to pass the following surveys: the scale of perceived stress — 10 (ShVS-10), validated by Ababkov, the questionnaire «Parent-child interaction(VRR)» by Markovskaya, Lazarus coping test, questionnaire «Scale of family adaptation and cohesion (FACES-3 Questionnaire / Olson test)», a questionnaire of everyday stress and stressors associated with diabetes. Also we collected information about conditions of the disease. Statistical processing of the results included frequency analysis and Mann — Whitney U-test. The study showed that the child’s illness affects not only every member’s of the family system, including the patient himself and his parents, stress, but also family functioning in general. Most frequent stressors for adolescents with diabetes and their parents were identified. Statistical distinction in parental everyday stress, level of perceived stress, coping behavior, family functioning depending on the age of the child, age and level of compensation of the decease, way of the therapy, complications, dieting, physical exercises and blood glucose, doses of medication and diet monitoring were found. Statistical distinction in adolescents’ everyday stress, level of perceived stress, coping behavior, family functioning depending on the age, gender, level of compensation of the decease, way of the therapy, complications, dieting, physical exercises and blood glucose, doses of medication and diet monitoring were found. Predictors of overstrain, resistance to stress and perceived stress, coping behavior and family functioning in parents and adolescents were identified. Type 1 diabetes is a chronic disease, that influences not only the person, who have to cope with illness-related stress, but the whole family system, which had to encounter such problem, and nowadays more and more families faces this problem. In this regard, the study of the stress of everyday life and coping in the families of adolescents with diabetes is important both in theoretical and practical terms.
CROSS-CULTURAL SPECIFIC OF SELF-DIFFERENTIATION AT RUSSIAN AND VIETNAMESE YOUNG PEOPLE

Elena Chebotareva 
Moscow State University of Psychology and Education / National Research University “Higher School of Economics” (Moscow, Russia)

Marina Volk 
Peoples’ Friendship University of Russia (Moscow, Russia)

Huyen Trieu 
Peoples’ Friendship University of Russia (Hanoi, Vietnam) (Moscow, Russia)

Bowen’s concept of self-differentiation denotes: 1) the ability to separate thinking from feeling; 2) the capacity of a person to achieve emotional maturity and independence without losing the ability to connect emotionally with others. Formulated on the basis of the values of individualism and independence, the theory, according to M. Bowen, is universal. However, collectivistic cultures may have some other models for providing the ability to support good close relationships in couples and families. Very little empirical research has examined it from a cross-cultural perspective. The comparative analyses of level of self-differentiation and its intercorrelations with interpersonal dependence at Russian and Vietnamese young persons was performed. The participants of the study were 30 Vietnamese and 42 Russians of 20-28 y.o. Methods: Interpersonal Dependency Inventory (Hirschfeld et al.), Relationship Profile Test (R.Bornstein), Differentiation of Self Inventory (E. Skowron, M. Friedlander); Mann-Whitney U-test, Exploratory factor analysis using the principal components method (PCA) and eigenvalue and varimax rotation. Differences of high statistical significance in the General level of differentiation and in all its aspects were revealed between the two ethnic groups. While the overall level of differentiation and most of its indicators are higher among Vietnamese, Russians have a higher level of “I position”, i.e. the ability to recognize their needs in interpersonal relationships and a higher level of interpersonal dependence. The revealed factor models of structure of self-differentiation and interpersonal dependence for Russians and Vietnamese consist of 3 factors, which together account from 73 to 82% of total variance, respectively. Vietnamese self-differentiation is built on emotional restraint and positive attitude to interpersonal dependence. Emotional reactivity is mainly associated with a weak I-position. For Russians, the central element of self-differentiation is destructive over-dependence in combination with the I-position weakness and the desire for autonomy, combined with a tendency to an emotional cut-off. Emotional reactivity is mostly associated with over-dependence. Thus, the results show that the concept of self-differentiation can be applied for a deeper understanding of the functioning of close interpersonal relationships in different cultures, as well as for developing effective culturally-sensitive techniques for couple psychotherapy.
CONSUMER DECISION AND SATISFACTION: HOW SENSORY SCIENCE PREDICT CONSUMERS’ SATISFACTION

Nobuyuki Sakai
Tohoku University (Sendai, Japan)

The preceding studies suggested that the satisfaction with choice behaviour of a product is dumped to the satisfaction with the chosen product. This study is aimed to reveal the cognitive mechanisms underlying this dumping effect with the methods in sensory sciences. The study consisted of two sub-studies; a products study and an odour study. In a products study, the participants are required to select one product from 4~6 products, and to evaluate predicted satisfaction with the product. One week later, the participants are required to be back to the laboratory, and are asked to evaluate the products based on the experience of the product. Then, they were asked to evaluate the other unchosen products. In an odour study, participants are required to solve an arithmetic problem for 30 minutes under an odour condition; no odour, given odour or chosen odour. After solving problems, participants were asked to evaluate the odour (odour conditions only), and to answer the questionnaire about their mental stresses. In a products study, the satisfaction with the products was evaluated higher in the chosen products than the unchosen products. There were also correlations between the personality and the satisfactions; maximizers evaluated the selected items less than the satisficers (Schwartz et al., 2002). The odour study failed to show any statistical differences among odour conditions. These results showed the dumping effect of choice behaviour on the products evaluations, but the effect is limited because the effect was not shown in an odour study. The products study revealed that the regret after decision and the less well-being of the maximizers are based on their personalities. The maximizers took more time to decide which item should be selected. The latter results suggested that this cognitive load for decision makes maximizers less happy for their lives.
The purpose of this study is to examine the ways how to give the conflicts between mothers and children by statistical analyses displayed in the elementary school texts in Japan, China, Taiwan, Korea, Germany, France and Italy published in 2010. Though the conflict styles would be said to be different between East Asia and Europe, is such cultural dichotomy theory right? The 147 case families in the texts were analyzed by the qualitative-analysis method. The results were as follows: 1) Japanese, French and Italian mothers did not give conflicts intentionally to their children. The case that mothers could not concern their children by mothers’ sickness and pregnancy often brought conflicts between the mothers and children in these three countries. These mothers might be expected to behave in harmony with their children by avoidance of conflict. On the other hand, Chinese, Taiwanese, Korean and German mothers give conflicts to their children intentionally as scolding. 2) Japanese and Chinese children did not give conflicts intentionally to their parents. Both of Japanese mothers and children might be expected to behave in harmony with each other by avoidance of conflict. 3) Though French and Italian mothers did not give conflicts to their children intentionally, their children give conflicts to their mothers intentionally. French and Italian mothers might be expected to catch their children’s resistance as an adult. 4) German mothers and children give conflicts intentionally each other. German mothers told their opposite opinions to their children directly and clearly. German children also resisted their mothers directly. Both of German mothers and children might be expected to express their opinion clearly each other and to behave by an equal relation. These results indicate that conflict styles show various tendencies even in the European Union and even in East Asia. The different conflict styles are related to the role of a parent and emotional intimacy between mother and child.
PROFESSIONAL BURNOUT SYNDROME IN HEALTH CARE WORKERS

Liudmila Aksenovskaya
Saratov State University (Saratov, Russia)

Aida Mutalimova
Dagestan State Pedagogical University (Makhachkala, Russia)

Irayganat Koychueva
Dagestan State Pedagogical University, State Budgetary Institution ‘City Clinical Hospital №1’ (Makhachkala, Russia)

The main objectives of medical institutions are focused on improving the quality of medical care, its accessibility and effectiveness, it is an important part of public health policy. In this regard, in accordance with the needs of the population of the Republic of Dagestan, it is planned to develop the existing system of providing inpatient medical care, based on the existing specialization of bed capacity, further modernization not only of the material and technical base, and information support, as well as the organizational and methodological mechanism of the industry, but also human resources, in particular the motivation of staff to work effectively. It is worth noting that the labor motivation of health workers is a certain problem.

In his studies, V.L. Malygin and A. B. Iskandirova noted that 67.6% of physicians suffer from burnout syndrome, and 10.5% are at the stage of the formation of the disease. Burnout syndrome was noted in 46.6% of the examined surgeons, 75.3% of neuropathologists, 50.0% of therapists, 50.0% of dentists, 43.3% of psychiatrists, and 56.6% of narcologists. Professional burnout syndrome is a multidimensional phenomenon, manifested in mental and physiological manifestations, reactions to a wide range of situations in the work activities of a Russian doctor. It is considered on several levels – the results of labor, the mental and physical health of the specialists themselves.
PERFECTIONISM AND BODY ESTEEM AS PREDICTORS OF PHYSICAL ACTIVITY AMONG WOMEN

Laura Kaliczyńska
Agata H. Świątek
Daria Madej
Iga Bajkowska
Małgorzata Szczęśniak

University of Szczecin (Szczecin, Poland)

Adults’ participation in physical activity is affected by a diverse range of personal, social, and environmental factors (Trost et al., 2002). Research has shown that perceived self-efficacy is mentioned as its strongest and most consistent determinant. Other areas have identified genetic factors that contribute to the propensity to be physically active (Bauman et al., 2012). Moreover, some researchers have found that functional perfectionism (Gotwals et al., 2012; Luszczyńska et al., 2015) and body esteem (Smith, 2005) correlate with physical activity. The purpose of this study was to verify if there is a direct association between women’s physical activity and perfectionism or body esteem, and if the both are its predictors. The research was conducted on the group of 190 women who completed the Body Esteem Scale (adap. Lipowska & Lipowski, 2013) and PAMPQ (adaptive and maladaptive perfectionism; Szczucka, 2010). The mean age of the respondents was M=23.65 with SD=8.555. The mean time of physical activity during a week was almost 2 hours (M=1.84; SD=.906). The results illustrate a correlation between time dedicated to physical activity and adaptive perfectionism (r=0.21**), physical condition (r=0.18**), and weight concern (tendency with r=0.130 and p=0.074). A linear regression shows that both correlating factors are predictors of physical activity and explain the dependent variable in 9% (cR²=0.094; R=0.314; F189,1=16.446; p=0.001). The findings from the present study suggest that women who characterize themselves by adaptive perfectionism, expressed through self-acceptance (regardless of the results of task activity), have the ability to distinguish between important and less important matters, focus on their physical condition and are prompt to spend more time on physical activities. The outcomes are consistent with previous research. Longbottom and colleagues (2010) found that adaptive perfectionism was positively related to adaptive behavioral and cognitive aspects of motivation which reflect persistence in physical activity. The pursuit of high personal standards, typical to adaptive perfectionism, facilitates and maintains achievement striving through tenacity in sport training. Moreover, the physical condition that represents qualities of personal strength, agility, and energy, that are not typically evaluated by others, helps in performing physical activity (Varnes et al., 2014).
PHYSICAL ACTIVITY IN MOTION: ADAPTIVE PERFECTIONISM, UPPER BODY STRENGTH, AND VARIETY SEEKING TENDENCY AS PREDICTORS OF PHYSICAL ACTIVITY IN MALES

Laura Kaliczyńska
Agata H. Świątek
Grażyna Bielecka
Alexander Linke
Małgorzata Szczęśniak
University of Szczecin (Szczecin, Poland)

Although evidence reveals that body esteem is a concern primarily for women, body concerns are also reported by males (MacKinnon et al., 2003) as they are attentive to physical attractiveness, body strength, and physical condition (Franzoi & Shields, 1984). Some findings (Davis et al., 1991) indicate that men body dissatisfaction and physical activity participation are negatively related. Moreover, some researchers (Flett & Hewitt, 2005) emphasize that perfectionism is mostly a negative factor that contributes to maladaptive outcomes among exercisers. Finally, variety seeking tendency has been acknowledged as a crucial exercising inspiration factor and a determinant in training (Sharma et al., 2006). The purpose of this study was to verify if there is a direct association between men’s physical activity and perfectionism, body esteem, and variety seeking tendency with respect to foods.

The research was conducted on the group of 56 men who completed the Body Esteem Scale (adapt. Lipowska & Lipowski, 2013), PAMPQ (perfectionism; Szczucka, 2010), and Variety Seeking Tendency Scale (van Trijp & Steenkamp, 1991). The mean age of the respondents was M=22.12 with SD=6.135. The mean time of physical activity during a week was almost 2 hours (M=1.98; SD=.944). The results illustrate a significant correlation between time dedicated to physical activity and: maladaptive perfectionism (r=-0.34**), adaptive perfectionism (r=0.49**), variety seeking (r=-0.31**), physical attractiveness (r=0.40**), body strength (r=0.58**), and physical condition (r=0.39**). A linear regression shows that body strength, adaptive perfectionism, and variety seeking are predictors of physical activity and explain the dependent variable in 44% (cR²=0.441; R=0.686; F55,3=15.442; p=0.001). Therefore, it seems that men who rate their upper body, display self-acceptance, and have intrinsic desire for variety respect to foods, devote more time to exercises.

The findings of the present study are consistent with previous research. Franzoi & Herzog (1986) underline that the body strength tends to be positively related to amount of muscle activity. Longbottom and colleagues (2010) indicate that maladaptive perfectionism is associated with avoidance of physical activity. Finally, less time engagement in physical activity is related to food addiction (Tan Ed Li et al., 2018), confirming that caring for diet goes together with sport exercising.
THE STUDY OF PARENT-CHILD RELATIONSHIPS USING THE FLANNEL-GRAPH IN CHILDREN WITH AUTISM SPECTRUM DISORDERS

Alexey Koval-Zaytsev  
Mental Health Research Center (Moscow, Russia)

Ekaterina Furaeva  
Moscow State School №2200 (Moscow, Russia)

Identification of problems of parent-child relations in families raising children with autism spectrum disorders (ASD), timely psychological assistance to such families, especially mothers, in recent years, have increased. The analysis of parent-child relationships on the example of maternal behavior in an experimental game situation, in families raising children with ASD. Two groups of mothers were studied: 30 tested mothers of children with ASD and 30 tested mothers of children with the typical normal pattern of development. The age of children is 6-8 years. Methods: testing, flannel-graph; descriptive qualitative and quantitative analysis. 1. Questionnaire "Interaction of parents with the child" ("CDF") by I. Markovsky to identify the features of the parent-child relationship in families. 2. Test "The Scale of Rejection of the Child" (SHOR) Barkan. 3. The study of parent-child relationships using the flannel-graph; a board with figures from the fairy tale Board was presented, the tale was read, the plot was restored by the child and his parent. The independence of the child, joint activity, activity of the parent were noted. Children with the typical normal pattern of development coped with the task in most cases independently. In the group of children with ASD, in a quarter of cases (26%) mothers refused to help the child, and the experimenter was involved in the process. 30% of children who have not coped with the task in connection with the severity of their disease. According to three scales of the questionnaire of BP, statistically significant differences were revealed — satisfaction with relationships in the family; emotional distance-proximity; educational confrontation in the family. Studies on the method of SHOR showed that 13% of mothers of children with ASD expressed rejection of children in a significant way, which is unfavorable for the child in the family. The study of parent-child relationships using the flannel-graph in terms of children with ASD allows you to use this method when planning a complex research in pediatric clinical psychology. Along with the diagnostic component, the use of flannel-graph; allows to schedule individual psychocorrectional work with children suffering from ASD using the zone of proximal development of the child.
SEXUAL ASSAULT AND EARLY DROP-OUT FROM PSYCHOTHERAPY: 
A QUALITATIVE ANALYSIS

Burcu Korkmaz  
Bursa Uludag University (Bursa, Turkey)

Gonca Soygüt Pekak  
İstanbul Şehir University (İstanbul, Turkey)

Examining the drop-out is one of the most important issues for psychotherapy research. Although some researchers (Wierzbicki and Pekarik, 1993) identified some demographic variables that predict drop-out, the others (Sharf, Primavera, and Diener, 2010) concluded that there was a strong relationship between therapeutic relationship and drop out. On the other hand, Gülüm, Soygüt and Safran (2016) used qualitative method to examine drop-out and concluded that the type and frequency of rupture in therapy and therapists’ positive and negative behaviors are also important other variables. This finding indicates that with qualitative research, psychotherapy processes can be examined deeply. Sexual assault is one of the experiences that is highly destructive, can reveal the symptoms of PTSD and can cause significant harm to the psychological health of the person. However, although psychotherapy studies conducted with this group may show us drop-out rates (Hembree et al., 2003), they cannot show why individuals with PTSD symptoms drop-out early. Qualitative research is needed in order to examine these factors. Therefore in this study, it is aimed to examine the factors underlying the early drop-out with the sample of sexually assaulted women with a qualitative method, thematic analysis. The sample of the study consisted of 10 women who were exposed to sexual assault. The necessary permissions were obtained from the participants and the sessions were recorded. While 6 of the women completed the psychotherapy process, 4 of them drop-out after the first two sessions. First, sessions and the transcription were conducted by the first researcher. Then, the data was analyzed by inductive thematic analysis method according to the suggestions of Braun and Clarke. At this point, the data will be examined within the therapeutic alliance, the rupture moments and the therapist’s reactions, and the themes that newly discovered and specific to PTSD will be explained. As far as it is known, there is no study examining the factors underlying the drop-out in women who are exposed to sexual assault with a qualitative method. It is thought that the study will provide an important and unique contribution.
PSYCHOLOGY OF ISLAM AND MUSLIMS: RUSSIAN DISCOURSE

Olga Pavlova
Moscow State University of Psychology (Moscow, Russia)

Scientific understanding of topics related to the psychology of Russian Muslims requires interdisciplinary research of all social, cultural, medical, theological, historical, and psychological factors that affect it. The context of “realization of religion in a person or piousness” (embodiment or manifestation of ideal religion in each real person) is very important for psychologists. In Russia targeted research and practical psychological activities in the Muslim community are carried out by the specialists of the Association of Psychological Assistance to Muslims created in 2017. An annual scientific-practical conference “Islam: psychological stability as the basis of personal and social well-being” held in Moscow, round tables on the most critical issues, refresher courses and seminars, webinars and online discussions are held as part of association’s activities. It’s important to carefully select research tools and carefully interpret results of an empirical research, since the vast majority of modern psychological methods which are aimed at studying religion, religious identity and religious fundamentalism are created for a Christian research sample or consider religion from a secular point of view. In this regard, the methods must be adapted for the Muslim research sample and when interpreting the results, the Islamic view of a Muslim person should be taken into account. The Association of Psychological Assistance to Muslims in Russia is aimed at solving the problem of applying scientific approaches to the psychological counseling of Muslims. For a deep understanding of the psychology of a Muslim and, accordingly, the implementation of psychological counseling in the Islamic paradigm, it is necessary to rely on the ideas of the personality development that have been formed in Islam. The specifics of Islamic psychological counseling should be given sustained attention. What amount of Islamic knowledge should a professional psychological counselor have in order to provide psychological support to a Muslim? Can an Islamic psychologist be a non-practicing Muslim? Or practice other religion? Or can he be an atheist, who takes into account the religious identity of his client? Currently these questions are debatable. In its work, the newly-established Russian Association relies on the experience of foreign colleagues, first of all, International Association of Islamic Psychology and International Association of Muslim Psychologist.
PSYCHOLOGICAL TYPOLOGY OF LANGUAGE PATTERNS TRANSLATION AS A COMPONENT OF LINGUISTIC ABILITIES

Alexey Dyachkov
Novosibirsk State University of Architecture, Design and Arts (Novosibirsk, Russia)

Natalya Bolshunova
Novosibirsk State Pedagogical University (Novosibirsk, Russia)

The study of such psychological individualities as linguistic abilities (LA), by the Teplov consensus group (Golubeva, Kabardov, Artsishevskaya, Izyumova, Bolshunova, etc.) provides an opportunity to discuss the following questions:

- special human types of Higher Nervous Activity (by Pavlov) («artistic», «thinking», «medium»);
- Kabardov’s conception about individual variation of LA types («linguistic», «communicative» and «mixed» ones);
- the LA variability during pronouncing (the syntactic component and paradigmatic and syntagmatic tactics of associative reactions (by Demina). However, the individual and psychological features of translating as part of LA are insufficiently studied yet. Individually-oriented teaching methods have not been developed either. Such techniques as: Wechsler Adult Intelligence Scale and Borisova test were used to identify artistic and thinking types. The authorial techniques which reveal individual specificity of interpreter’s activity («Translation of English and Russian Pseudophrases», «Translation of Idioms», «Character Description» etc.) were specially developed as well. Mathematical processing was carried out by means of factor analysis and U-Mann-Whitney. It became clear that individual psychological diversity in translating foreign language patterns is associated with I and II signaling systems (by Pavlov). Moreover, «thinking» type persons (II signaling system) are more successful in translating such language patterns than «artistic» ones (I signaling system). At the same time, the peculiarities of translating correspond to the individual and typological characteristics of LA, discovered by Kabardov («communicative» and «linguistic» ones).

«Thinking» type persons try to analyze the given language patterns from the morphological and grammatical points of views. They try to find logical and grammatical connection between words in sentences. Persons of an «artistic» type, try to synthesize the emotional, figurative and cultural meaning of the language patterns while translating. They rely on subjectively significant information and mainly extra-linguistic techniques, sometimes neglecting the linguistic rules. It was demonstrated that while translating, persons belonging to different linguistic types can compensate the components of their abilities which are not well developed with the developed ones to make up some language tasks. In this case, rather successful results could be achieved.
TWINSHIP SELFOBJECT ENVIRONMENT IN PSYCHOTHERAPY: A CASE PRESENTATION

Burçin Cihan
Deniz Çınarbaş Canel
Middle East Technical University (Ankara, Turkey)

In the framework of Kohutian psychoanalytic self psychology, in this presentation, twinship type selfobject tie between therapist and patient (a woman patient who was a victim of a bombing attack happened in our city center, Ankara, Turkey) will be presented. Nonconscious, implicit process during the therapy sessions will be exemplified based on the therapist’s prereflective experiences. Therefore, dyadic interactions within the therapy dyad will be conceptualized in the context of “the many faces of twinship” and new insights coming from mother-infant studies related to nonverbal procedural implicit aspects of the adult face to face psychotherapy. Further, implications of conducting therapy process in an unsafe environment (because of bombing attacks) are also presented. Key words: twinship, nonconscious, implicit, prereflective, living in an unsafe environment.

CORTICAL ACTIVATION DURING WALKING WHILE SMARTPHONE TEXTING: A DUAL TASK BASED FNIRS STUDY

Kun Wang
Zhangyan Deng
Tao Huang
Zuosong Chen
Shanghai Jiao Tong University (Shanghai, China)

The purpose of the study was to investigate the cortical activation during a dual task of walking while smartphone texting in young healthy adults using the functional near-infrared spectroscopy (fNIRS). In a crossover study design, 39 righthanded college students (21.3 ± 2.5 years, 46.1% females) randomly undertook the following three task conditions separated by a minimum of 48 hours: smartphone texting only (T task), walking only (W task), and dual task of smartphone texting while walking (TW task). Cortical oxygenation during the three tasks was monitored using a 38-channel fNIRS (NIRx Medical Technologies LLC, USA). Walking was conducted on a treadmill with a speed of 2.0 km/hour. Texting task was performed with a typing APP on a smartphone. There was no significant difference in texting speed between T task and TW task (71.7 ± 10.4 vs. 71.0 ± 12.9 chars/min, P >0.05). Texting enhanced hemodynamic response in frontopolar area (e.g., Ch1T task vs. W task, 0.24±0.43 vs. -0.15±0.42 a.u, P < 0.01; Ch6TW task vs. W task 0.21±0.33 vs. -0.15±0.42 a.u, P<0.01) and Broca’s area (e.g., Ch35TW task vs. W task 0.99±0.81 vs. 0.47±0.75 a.u, P < 0.01). In addition, W task evoked an increased activation in temporopolar area (e.g., Ch8 T task vs. W task 0.04±0.12 vs. 0.75±1.30 a.u, P < 0.01) and superior temporal gyrus (e.g., Ch15 T task vs. W task 0.22±0.64 vs. 0.76±0.84 a.u, P < 0.01) than T task. There were no significant differences in those regions between T task and TW task. The findings indicated that walking on a low speed requires less cognitive resources from the prefrontal cortex, while the temporal lobe is involved. When walking while texting on a smartphone, the brain areas (temporopolar area and superior temporal gyrus) involved in gait were activated, and areas in prefrontal cortex were also activated. Thus, more cognitive resources were allocated to smartphone texting during the dual task.
A PSYCHOANALYTIC SELF PSYCHOLOGY ORIENTED THERAPY PROCESS WITH "FLOWER OF DESERT"

Burçin Cihan  
Middle East Technical University (Ankara, Turkey)

In this presentation, a psychotherapy process with a patient who was in a lifeless psychological state when she applied to therapy will be presented. The presentation will be aimed to represent creative responses to two crises in the therapy process. These are temporary accommodation problem to the therapy framework and an anger attack of the patient that threatened the safety of the patient. Unusual creative solutions that are out of the line of therapy framework were used in order to fulfill the patient’s mobilized mirroring selfobject needs. The end of one and a half year, the secure therapeutic relationship was shaped with a generosity to provide care, protection, and admiration for the sake of the patient. The patient has become a "flower of the desert". The name of the revival process was inspired by a gift from the patient to the therapy process, a little cactus plant. The process is conceptualized as the restoration of the self as defined by Heinz Kohut.

FOOD CONSUMPTION HABITS IN ROMANIAN FAMILIES AND ADOLESCENTS

Violeta-Stefania Rotarescu  
University of Bucharest (Bucharest, Romania)

Food habits have changed in Romania and in the rest of the world, in the last decades. These changes regard both the quantity and the quality of the food ingested, and have a big impact on the quality of life and health. Many studies report an increase in the incidents of cancer, for example, connected to the life style, and especially nutrition. In this study, I investigated the food consumption habits in a number of N=282 Romanian families, with or without children (out of which N=191 were adolescents). Two questionnaires were used – one for food habits in adolescents, and one for family regular food consumption, plus an index of regular food consumption per classes of food, completed by the adult responsible of food purchase and cooking in the family. The results show a significant change in food habits, compared to results found by Petrovici and Ritson (2000), both at the family level, and at teenage level. The level of meat consumption increased, whereas the vegetables and fruit consumption decreased in adolescents, even more, compared to the rest of the family. These results forecast further changes in food habits for the following years, and raises the need of a more dedicated research regarding food habits, with direct implication on health and quality of life.
UNDERSTANDING THE ADJUSTMENT OF CHILDREN WITH SPECIAL NEEDS: A FAMILY SYSTEMS PERSPECTIVE

Chun Bun Lam
Kevin Kien Hoa Chung
The Education University of Hong Kong (Hong Kong, Hongkong)

According to a family system perspective, children are shaped by multiple, interrelated socialization forces, nested within the parents, the parent-child relationship, the inter-parental relationship, and the larger family. Empirically, however, the unique contributions of different family subsystems to the adjustment of children, especially those with special needs (SNs), are rarely tested. Using cross-sectional data collected from Chinese families with kindergarten-aged children with SNs, the present study examined whether paternal and maternal depressive symptoms, father- and mother-child conflict, inter-parental conflict, and family economic pressure were independently linked to child internalizing symptoms and externalizing behaviors. Participants were 98 fathers and 98 mothers from 98 families with children with SNs, recruited from 20 integrated kindergarten-cum-child care centres in Hong Kong, China. These centres aimed to educate typically developing children and children with SNs in a more integrated setting. Major types of SNs included global developmental delay, speech and language developmental delay, motor developmental delay, autistic spectrum disorder, and attention deficit and hyperactivity disorder.

Participating fathers and mothers independently provided demographic information, including child gender and age, and completed questionnaires on family relationships and child adjustment. The mean age of children in our sample was 61.89 months (SD = 10.51). Seventy-four percent of these children were boys (n = 71). Fathers’ and mothers’ reports of inter-parental conflict, family economic pressure, and child adjustment problems were averaged due to high correlations (rs > .60). Multiple regression analyses indicated that, controlling for child gender and age, maternal depressive symptoms (b = .30; t = 2.42; p < .05) and family economic pressure (b = .42; t = 2.90; p < .01) were uniquely and positively linked to child internalizing symptoms. Moreover, father-child conflict (b = .35; t = 3.17; p < .01) and mother-child conflict (b = .24; t = 2.19; p < .05) were uniquely and positively linked to child externalizing symptoms. Discussion focused on the utility of using a family systems perspective to examine the adjustment of children with SNs, and the importance of supporting these children by targeting their fathers and mothers, as well as their families as wholes.
EXECUTIVE FUNCTION PERFORMANCE AND PREFRONTAL ACTIVATION WHEN CYCLING ON AN ACTIVE WORKSTATION IN YOUNG ADULTS

Tao Huang
Qian Gu
Zhangyan Deng
Zuosong Chen
Kun Wang
Shanghai Jiao Tong University (Shanghai, China)

Previous studies suggested that exercise on an active workstation while working may be a promising intervention strategy for reducing sedentary time at workplace. The influence of using active workstation on cognitive function are not well studied and the existing studies yielded mixed findings. The purpose of the study was to examine the effects of self-paced cycling on an active workstation on executive function and prefrontal cortex activation in young adults. In a cross-over study design, 35 young adults (mean age = 21.4 ± 2.6 years, 45.7% females) were randomly assigned to the following two task conditions separated by 48 hours: performing cognitive tests while sitting (SIT) and performing cognitive tests while cycling on an active workstation (ACTIVE). Executive function was assessed by a task-switching paradigm and Stroop Color and Word Test (SCWT) programmed using E-Prime 2 professional (Psychology Software Tools, Inc., Sharpsburg, PA, USA), respectively. Stroop effects, global switch costs, and local switch costs were derived and used as the behavioral outcomes of the two tasks. Prefrontal activation was monitored using a 38-channel fNIRS system (NIRx Medical Technologies LLC, USA). The behavioral results showed that there were no significant differences on Stroop effects (112.61±136.66 vs.136.57±122.24, P=0.19) between SIT and ACTIVE conditions. The global switch costs (463.19 ± 35.47 vs. 452.77 ± 28.65, p = 0.73) and local switch costs (-6.14 ± 29.88 vs. 9.97 ± 26.77, P = 0.70) also did not differ. For the fNIRS results, compared with SIT, the oxy-Hb in response to Stroop interference in Channel 5, 10 and 12 was decreased during the ACTIVE condition (Ch5:0.40 ± 1.25 vs. -0.21 ± 0.88, Ch10: 0.41 ± 0.88 vs. -0.05 ± 0.72, Ch12: 0.31 ± 0.77 vs. -0.11 ± 0.58, all P<0.05). The three channel was located at frontopolar area and left-dorsolateral prefrontal cortex (left-DLPFC). The oxy-Hb in all channels related to task-switching was not different between the conditions (P>0.05). The results suggests that the behavioral performances on Stroop task and task-switching were not influenced by cycling on an active workstation; however, the cognitive resources for performing executive function may be reduced.
THE EFFECTS OF DOHSA-HOU RELAXATION SKILL TRAINING ON INDICATORS OF MOOD STATE REGULATION IN JAPANESE JUNIOR HIGH SCHOOL STUDENTS

Yu Kawamata
Takuya Fujikawa
Yuka Mizuno
Xinyi Liu
Yutaka Haramaki
Hiroshima University (Higashihiroshima, Japan)

This study aims to investigate the effect of Dohsa-hou on the mood states of Japanese junior high school students. Dohsa-hou is an original Japanese psychotherapy that focuses on stabilizing the body as a means to change the mind by relaxing physical strain and controlling the self. This study aimed to offer relaxation skills to junior high school students in response to a principal’s request to facilitate ways to regulate behavior and allow students to concentrate on learning. We carried out a workshop for 41 Japanese junior high school students to experience relaxation through Dohsa-hou. All participants completed the Profile of Mood States-Youth-2 (POMS2-Y) before and after the relaxation task. The POMS2-Y simultaneously measures six mood states (Depression-Dejection, Vigor, Anger-Hostility, Fatigue, Tension-Anxiety, and Confusion). Participants were instructed to raise and lower their shoulders by themselves and in pairs while seated. As a result of paired sample t-tests, scores for all mood states decreased. The effect size was especially larger in Fatigue (t (77) = 5.324, p < 0.01; Cohen’s d = 0.514), Tension-Anxiety (t (77) = 6.477, p < 0.01; Cohen’s d = 0.683), and Confusion (t (77)=5.656, p < 0.01; Cohen’s d = 0.574)”. This decrease was also observed for Total Mood Disturbance (TMD) (t (77) = 5.948, p < 0.01; Cohen’s d = 0.559). These results show that mood states related to negative feelings decreased at post-test as a result of the relaxation experience using Dohsa-hou and indicated an overall change to a more stable mood state. This study showed that Dohsa-hou demonstrated specific effects for lowering negative mood states and stabilizing TMD in a non-clinical sample of junior high school students. In general, children are thought to experience stress from schoolwork and interpersonal relationships in junior high school, as it is a time when various problems such as school refusal and bullying are known to occur. This application of Dohsa-hou has shown some capacity to contribute to such efforts by providing a skill to improve the mood states of children who may encounter these issues or benefit from behavioral self-regulation.
CAMBRIDGE NEUROPSYCHOLOGICAL TEST AUTOMATED BATTERY: COMPARING COGNITIVE IMPAIRMENT IN SCHIZOPHRENIA AND BIPOLAR DISORDER

Lejla Hasandedić-Dapo  
Akdeniz University (Antalya, Turkey), (Antalya Bosnia and Herzegovina)

Schizophrenia (SZ) and bipolar disorder (BD) are frequently occurring and impairing disorders that affect around 1% of the population. Schizophrenia is associated with significant cognitive impairment. Bipolar disorder also presents with cognitive deficits that are similar to but less severe, than those reported in schizophrenia. Over the last decade, the Cambridge Neuropsychological Test Automated Battery (CANTAB) has been utilized in cognitive studies mostly of schizophrenia but also of bipolar disorder. The aim of this study was to compare cognitive impairment between SZ, BD patients and healthy controls using CANTAB. 105 SZ and 45 BD patients were recruited from the Psychiatry Department, Clinical Center, University of Sarajevo, Bosnia and Herzegovina. They were compared with 48 healthy controls (CT) on CANTAB that included: Simple reaction time (SRT), Choice reaction time (CRT), Stop signal task (SST), Cambridge gambling task (CGT), Information sampling test (IST), Stocking of Cambridge (SOC) and Intra/Extradimensional set shift (IED) tests. These tests measure four different functions: attention, response, decision making and executive function, working memory and planning. In SRT and CRT tests we found statistically significant difference between SZ and BD patients compared to CT. Also we found statistically significant differences between SZ and BD patients suggesting us that SZ patients’ attention is slower and they show more impulsiveness and inaccuracy in their performance. SST test shows statistically significant different between SZ and BD compared to controls, but there were no any differences in responses between SZ and BD patients. Speed of decision making was measured using CGT and IST tests and results indicate that BD patients may have cognitive impairments and problems with decision making but still they perform slightly faster than SZ patients on this task. Lastly we measured executive functions, working memory and planning ability using SOC and IED tests were we found statistically significant differences between BD and SZ compared to controls and between SZ and BD patients. We can conclude that we found more cognitive impairments in SZ than in BD patients. In the end it is important to mention that this is the first research study of this kind done in B&H.
SENSE AND MEANING OF CARING. PSYCHOLOGICAL AND ETHICAL ASPECTS OF SOCIAL AND HEALTH EDUCATION

Chiara D’Alessio
University of Salerno (Salerno, Italy)

Petrosino Luisa
Order of the Campania Psychologists (Salerno, Italy)

The research focuses on highlighting the main problematic issues related to the quality of psychological care in the health facilities and the training needs of the staff in order to ensure the highest level of wellness both to patients and to the carers. This idea is combined in the context of a multidimensional concept of health that requires greater disclosure, since the contemporary social and health structure are still far from acquiring this concept in its fullness. Our perspective is the humanization of medical care, within which the human sciences play a central role. The first part consists of an excursus on the existing literature on the themes of empathy and the relationship with reference to interpersonal neurobiology (Siegel, 2013). It continues with the analysis of stress factors in the treatment process and the level of empathy of the operators, perceived by patients and trainees using the narrative interview method. Structured scales (Jefferson's Scale of Empathy) will also be used to measure the degree of empathy towards patients. Evidencing the neurobiological aspects of the patient-caregiver relationship, evidence relating to the management of patient anxiety and the effects of compliance in the use of drugs (Benedetti, 2015). Highlighting stress factors in the patient and in the caregiver, identifying preventive modalities and treatment paths for both. The results highlight the important effect of the positive relationships on the psychophysical wellness of the patient and the caregiver showing, as deduced from the collection of testimonies of trainees and patients, that these aspects are strongly disregarded in some Italian public health facilities, that the level of stress operators is very high and this has a major impact on the progress of the treatment process. Therefore further studies would be necessary to further deepen the role of protective factors in this context, for the purpose of implementing preventive and corrective actions in the health facilities.
DIAGNOSTIC POSSIBILITIES OF MOTIVATION AND SEMANTIC FORMATIONS IN PREVENTION OF DEVIANT BEHAVIOR

Elena Kozhevnikova
Elena Kartashova
Voronezh State University of Engineering Technology (Voronezh, Russia)

Tatyana Razuvaeva
Belgorod National Research University (Belgorod, Russia)

The relevance of a research is connected with increase in cases of deviant behavior among youth and with necessity of preventive actions that will give the chance the available tendency will be not realize in socially undesirable behavior. The problem of a research is expressed in a contradiction between a lack of the mechanism of diagnostics of indicators of tendency to deviant behavior and a possibility of practical application of prevention of asocial behavior by means of development of motivation and semantic formations at youthful age. Our research is directed to study the motivation of tendency to realize the socially undesirable behavior of young men and women. The research confirmed students with the high need for domination have high tendency to aggressive behavior. The students with the high need for relationship are less inclined to aggression and violence; examinees with higher satisfaction with the social relations are less inclined to addictive behavior. The students with the high need for achievement are less inclined to different types of deviant behavior. The tendency to overcoming norms and rules, to commission of illegal acts has the negative correlation of a responsible attitude to educational activity. Students who consider the education important show socially approved behavior more often. Other study correlated tendency to deviant behavior and educational progress of students. In group with high academic results the indicators of tendency to overcoming norms and rules, to delinquent behavior for girls is higher than for young men, but girls demonstrate lower extent of strong-willed control of emotional reactions than young men. The study confirmed a lack of differences in motivation of tendency to realize the deviant behavior between the examinees who study in college and at the university.
CHARACTERIZATION OF SELF-DEFINING MEMORIES IN ANTISOCIAL PERSONALITY DISORDER

Audrey Lavallee
Marie-Charlotte Gandolphe
Xavier Saloppé
Jean-Louis Nandrino
SCALab UMR CNRS 9193 and University of Mons (Villeneuve d’Ascq, France)

Thierry Pham
University of Mons (Mons, Belgium)

Autobiographical memory (AM) refers to memory of personal experiences, an ability that allows individuals to define themselves, construct a life story and attribute meaning to it. A particular type of autobiographical memory has been described as more relevant in pursuit of personal goals: the self-defining memories (SDM). SDM are distinguished from other AM processes to delineate those associated with the sense of personal identity and continuity in one’s individual history. Several studies have identified modification in SDM construction in different pathological populations such as people suffering from schizophrenia, depression or post-traumatic syndrome. According to the numerous aversive events experienced by individuals suffering from antisocial personality disorder (ASPD), the present study aimed to explore SDM in individuals with ASPD to examine and understand the construct of their identity through the characterization of the SDMs. The aim of this study was to characterize the SDMs of 24 men hospitalized in forensic hospital suffering from ASPD in comparison to SDMs of healthy male participants. According to the Singer and Blagov method (Singer & Blagov, 2000; 2001), SDMs were analyzed in terms of specificity, emotional valence and integrative meaning dimensions. Results showed that participants with ASPD recalled as much specific memories as control participants. Moreover, participants with ASPD preferentially recalled specific memory with multiple single-events (Type 3). Concerning emotional valence of SDMs, participants with ASPD recalled more neutral memories and less positive memories in comparison to control participants. Finally, participants with ASPD also retrieved less integrated memories compared to controls. Our findings suggest that individuals with ASPD do not present overgenerality bias but have difficulties in selecting specific single event. This phenomenon could be related to inhibition or emotion regulation deficits. Moreover, their inability to take lesson from past experiences or to express emotions when they retrieved events could play a main role in their social functioning and in their identity construction and could constitute a major target for clinical interventions.
EMOTIONAL AGING: THE INFLUENCE OF FEAR AND DISGUST STIMULI ON RECOGNITION MEMORY OF YOUNGER VS. OLDER ADULTS

Merve Boga  
Burcu Günay  
Aycan Kapucu  
Ege University (Izmir, Turkey)

The effects of emotional stimuli on memory in older adults are often addressed in terms of socio-emotional selectivity theory and the valence dimension. Older adults usually remember positive stimuli better than negative stimuli (Carstensen & Mikels, 2005) due to age-related shifts in their goals and motivations. However, studies examining the effects of negative categorical emotions on the elderly are still limited (e.g., Mather & Carstensen, 2003). In younger adults, disgust-related pictures were shown to enhance memory compared to fear-related ones because disgust-related materials must be remembered to avoid contamination (Chapman et al., 2012), but it is not clear whether or not this effect could also be generalized to the older adults. Recent studies suggest that older adults experience disgust to a lesser extent than younger adults (Kunzmann, Kupperbusch, & Levenson, 2005), in contrast, with the loss of physical health, older adults may experience fear more than younger adults (Teachman & Gordon, 2009). The present study examined the effects of negative categorical stimuli (fear vs. disgust) on recognition memory of older and younger adults in two experiments. In light of previous findings we hypothesized that, older adults would remember fear-related stimuli better than disgust-related stimuli, whereas younger adults would show the opposite pattern. 24 younger (age: 18-30) and 18 older adults (age: 60-72) first studied 15 happiness-, 15 disgust- and 15 fear-related photos and half an hour later were given a recognition memory test including old photos mixed with new ones. For each item, they made an old/new judgment on a confidence rating scale. Experiment 1’s results showed that age groups did not significantly differ on accuracy and response bias measures for recognition of emotional stimuli. Examination of the ROC curves suggested that older participants had a liberal response bias for both disgust and fear stimuli. Following these results, Experiment 2 was planned to include a neutral control condition, add a personal relevance dimension in the procedure and to match recognition lists for content. Findings from two experiments will be discussed within the framework of categorical vs. dimensional models of emotion.
PSYCHOMETRIC PROPERTIES OF METHOD FOR ASSESSMENT OF EXECUTIVE FUNCTIONS: RELATIONS WITH RISKY DRIVING BEHAVIOR

Rositsa Racheva
Zornitsa Totkova
Bulgarian Academy of Sciences (Sofia, Bulgaria)

The quality of drivers’ performance is one of the crucial components related to road safety. Amongst the main areas studied in this regard is the psychological aptitude of people to drive. One of the key cognitive characteristics related to ability to drive safe are executive functions. The method Trace-Route task is constructed to evaluate the executive functions of drivers. The present article discusses the results of two consecutive studies. Study one aims to assess the potential of the method to measure disturbances in executive functions. It includes 134 participants, equally divided in two groups — people with and without disturbances in executive functions. Study two aims to assess the ability of the method to distinguish drivers with risky behavior. It includes 1440 participants divided in two groups — people with and without actual risky behavior. The results show that the method has significant and high levels of validity and reliability. The data provides sound evidence for the aptitude of the Trace-route task to distinguish people with disturbances in executive functions and people with potential risky driving behavior. These results reveal the capacity of the method for implementation both in the areas of clinical and traffic psychology.

SACCADIC ATTENTION NETWORKS TASK

Elena Gorina
Joseph MacInnes
Alena Kulikova
Vision Modelling Laboratory (Moscow, Russia)

One of the experimental paradigms that allow studying attention as a system of networks is the Attentional Networks Test with manual response (ANT-M) (Fan et al., 2002). The test combines alertness (auditory warning), orienting (peripheral onset) and executive control (flanker arrows) in a single design to explore interactions between the networks. In this study, we extend the classical ANT with a saccadic response (ANT-S) to test the networks with the involvement of the oculomotor system, and we modified the executive control task to be more suited for saccadic responses (SR). In ANT-S subjects responded with a prosaccade in the direction of a green arrow and an antisaccade opposite to the direction of a red arrow pointing towards one of the two target locations. Using an endogenously generated antisaccade is a novel method that allowed us to test the executive network without confound from the peripherally generated orienting effect. Similar to the ANT-M, trials also included combinations of the three types of visual cueing (valid, neutral, invalid), and one of two alerting audial types (sound, no sound). Each experiment had an equal number of trials per condition. Twenty volunteers (13 — female, 7- male) aged from 20 to 35, with normal or corrected to normal vision were recruited for the experiment and contributed to both the ANT-M and the ANT-S. We observed strong main effects of all three attention networks in both experiments, but only the ANT-M showed a single interaction where alerting enhanced the orienting effect. The within-subject design, along with the novel endogenous anti-saccade allowed us to directly compare this classic test across response modalities. The endo antisaccade, in particular, allows us to match the SR compatibility of the original ANT-M without the additional oculomotor inhibition that usually accompanies this executive task.
EXAMINING APOLOGY AND CULTURE:
INTERPERSONAL AND INTERGROUP APOLOGIES IN TURKEY

Veyesel Mehmet Elgin
Bolu Abant Izzet Baysal University (Bolu, Turkey)

Ayse Uskul
University of Kent (Canterbury, United Kingdom)

Apology is a significant tool for reconciliation (Lazare, 2004). However, the prevalence and perception of apologies may differ across cultural groups. Accordingly, this research examines apologies within an honor culture (Turkey) where positive social image and reputation of strength are important driving sources of psychological processes (Nisbett & Cohen, 1996; Uskul & Cross, 2018). Offering an apology may be perceived as a threat to one’s social image, implying a weak position (Mills, 2001; Schumann, 2018). Given the importance of positive social image in honor cultures, members of such cultures may view apology offers negative and use them infrequently. To test this prediction, we conducted three studies using different methods. First, we content analyzed proverbs and idioms as cultural artefacts reflecting important cultural characteristics, retrieving them from two main Turkish proverb and idiom books (Aksoy, 2014, 2015). This analysis revealed that out of 2667 proverbs and 6310 idioms, only two idioms contained a direct reference to apology. However, there were others (n = 25) that implied apologizing in some other forms (e.g., seeking forgiveness). Second, we screened Turkish news published in Google and the main Turkish news agency (Anadolu Agency) in the first five months of 2018 to search for news referring to an apology offered by individuals or groups in Turkey. This revealed 136 apologies. Coding of these apologies by source revealed that politicians were significantly less likely to offer apologies (individual or collective) compared with non-politicians. Third, the findings from a quantitative study with Turkish undergraduate students as participants (n = 196) showed that i) offering apology is considered to be a moral virtue, ii) offering apology is seen as weakness, iii) offering an apology for a wrongdoing is not common in Turkey, and iv) collective honor is negatively associated with offering collective apologies. Findings are discussed within the framework of honor culture.
It is possible to assume that the socio-political structure, which is one of the systems surrounding the individual, may have individual effects in the context of mental health and functionality. Emotional climate is one of the characteristics that may originate from socio-political conditions. It refers to the predominant collective emotions generated through the social interaction between members of society and social-political factors in a particular milieu (de Rivera, 1992, 2007). In this study, it is aimed to determine the collective emotions, the socio-political factors associated with these emotions, and how these emotions affect individuals subjectively. The sample of the study consists of eight people who are satisfied/dissatisfied about the current political system and course, as well as young and middle age and low and high education groups. For the purpose of the study, semi-structured interviews were conducted that asked the emotions about living in Turkey, emotions toward to other people in the community, psychosocial factors about these emotions and their individual effects. The contents were analyzed via MAXQDA 18 by creating upper and sub codes. Coding within a general structure method was used. As a result of analyses, it was found that most common collective emotions were anger, worry, sadness, fear, oppression, resentment, polarization. It was seen that the feelings towards other people in the community were predominantly negative due to the perception of ostracizing, oppression and inequality. The factors that give rise to collective emotions were grouped in injustice, unpredictability, problems in social policies, violence, threat against the existence and oppression. The individual effects of these collective emotions and their sources were some feelings such as anger, numbness, resistance and also, desire to isolation, positive contribution to identity formation, preoccupation with political issues. Mental health is an integrated situation which contains emotional, psychological and social well-being (Keyes, 2005). The findings of this study indicate that socio-political factors affect well-being and functionality in various ways. Studies in this area contribute to the establishment of mental health in the social framework and provide evidence for social policies to protect mental health and to prevent psychological disorders.
THE CONTRIBUTION OF CONSUMPTION IN THE GENERAL EMOTIONAL STATE OF YOUNG PEOPLE

Viktoriya Nagornova
Tatyana Folomeeva
Lomonosov Moscow State University (Moscow, Russia)

At the end of the last century, modern society was given the label “consumer society”, but over the past decades this trend has only intensified. The goal of the study: to find out the mechanisms of young people’s daily consumption, in particular, how they are related with their emotional sphere. We collected 514 diary records (N=73, M = 19.6, sd=1.63). The dairy includes quantitative assessment of mood, a qualitative description of its causes, an assessment of each spending (positive, neutral or negative) and the emotion that best describes their consumer behavior in general (happy, surprise, contempt, sadness, fear, disgust, anger).

Qualitative-quantitative methods were used for the analysis: content analysis and thematic modeling (latent placement of Dirichlet). All records based on quantitative subjective assessments were divided into 4 groups: negative emotions (100 entries from -50 to -1), neutral (150 entries from 0 to 14), positive (121 entries from 15 to 30), brightly positive (143 records from 31 to 50). We obtain that more positively consumed days are characterized by more active consumption. For young people, there are two main consumer drives that bring satisfaction: procedural, as some kind of ritual, and complete absence of spending. Any spending assessed as typical, complying with family and friends’ standards and also perceived as approved by these groups, becomes part of everyday consumption and ceases to be a source of positive emotions. For negative emotional states revealed consumer pattern: visiting a cafe or restaurant with a friend and an average check of about 200 rubles and the emergence of such category as alcohol/cigarettes. In the absence of any spending, which is more characteristic of negatively assessed days, one’s own economic behavior was assessed through the prism of a general emotional state. The design of our study doesn’t imply the relationships directions, but on the basis of obtained data, we can draw conclusions about the close relationship of everyday consumption and the general emotional state of young people. Also for our further research, a hypothesis was put forward about the regulatory function of everyday consumption for the general emotional state of young people.
WORK-FAMILY CONFLICT EXPECTATIONS AMONG FEMALE BUSINESS STUDENTS: THE INFLUENCE OF PARENTAL ROLE MODELLING, SELF-EFFICACY TO MANAGE WORK-FAMILY CONFLICT AND POSITIVE AFFECTIVITY

Jeffrey Bagraim
Tamlyn Schwartz
University of Cape Town (Cape Town, South Africa)

Anticipated work-family conflict (AWFC) refers to the work-family conflict that young adults expect to experience between their future work and family roles. We investigated the influence of self-efficacy to manage work-family conflict, positive affectivity, and three forms of parental role modelling (i.e., parental employment, perceived work-family coping of parents) on female business students’ AWFC. Survey responses from female business university students in South Africa (N = 256) who had responded to a larger study on work-family issues were analysed. Our findings evidence the bi-directionality of the anticipated work-family conflict construct; with the directions respectively labelled anticipated work-to-family conflict (AW2FC) and anticipated family-to-work conflict (AF2WC). The female business students that responded to the online survey expected higher levels of future work-to-family conflict (AW2FC) than future family-to-work conflict (AF2WC). Of the different forms of parental role modelling investigated, only maternal employment and egalitarian role sharing of housework helped predict significant variance in AW2FC. No form of parental role modelling was significantly related to AF2WC. Contrary to expectations, the female business students’ self-efficacy to manage future work-family conflict did not moderate the relationship between maternal employment and either direction of their AWFC. Self-efficacy to manage future work-family conflict and positive affectivity predicted significant variance in AWFC, indicating the importance of personal characteristics and dispositions in the appraisal of future work-family dynamics. These findings have implications for vocational counselling, organizational selection, human resources policy development, and future work-family research.
EMOTION REGULATION AMONG INDIVIDUALS WITH LAW AND HIGH NEUROTICISM

Maria Padun  
Institute of Psychology, Russian Academy of Sciences  
(Moscow, Russia)  

Anna Zelyanina  
Northern (Arctic) Federal University named after M. V. Lomonosov (Arkhangelsk, Russia)  

Neuroticism is a personality trait characterized by a tendency to experience frequent and intense negative emotions. Modern concepts of the genesis of emotional disorders agree that neuroticism is the main diathesis factor for all anxiety and depressive disorders. Neuroscience data confirms that amygdala hyperreactivity in combination with reduced controlling activity of the prefrontal brain regions is characteristic of both depressive and anxiety disorders. The same pattern was found in individuals without clinical diagnoses, but with high rates of neuroticism. We proposed that the links between emotion regulation strategies, personality traits, and the severity of positive-negative emotional states vary in individuals with high and low neuroticism. Participants were students of universities of Arkhangelsk (N = 263); 139 men and 124 women. Emotion regulation strategies (cognitive reappraisal and emotional suppression) were measured by Emotional Regulation Questionnaire; neuroticism was assessed by Neo Personality Inventory. Positive and negative affect scale was used to assess emotional states. In accordance with the hypotheses of the study, two contrast groups were selected: “high neuroticism” (N = 54) and “low neuroticism” (N = 93). It has been shown that the level of neuroticism is a predictor of differences in the ability to change attitudes towards an emotional situation in order to regulate emotions: individuals with high neuroticism are less able to reappraise negative experiences. However, the tendency to suppress emotions does not depend on the neuroticism. Regardless of neuroticism scores, individuals capable of cognitive reappraisal experience more positive emotions. This fact emphasizes mediating role of cognitive reappraisal in the relationships between neuroticism and positive affect. There is a positive relationship between the suppression of emotions and the severity of negative emotional states in individuals with low and medium level of neuroticism. This connection disappears in the sample with high neuroticism. The need of additional resources for persons with high neuroticism (for example, developing skills of constructive expression of emotions) is discussed.
HELPING SYRIAN REFUGEES: IDENTITY EFFECTS ON POLITICAL SUPPORT, HELPING INTENTIONS, AND HELPING BEHAVIOUR

Nihan Aydemir
London School of Economics and Political Science
(London, United Kingdom)

The need for international community support, coupled with a lack of funding for that support, are recurrent features of refugee emergencies, including those from Syria. Thus, this research aims to identify some factors that affect individual helping responses towards refugee emergencies. In doing so, it employs a social identity approach to examine ingroup/outgroup helping towards refugees, by specifically focusing on religious identity. In Study 1 (N = 621), the religion of Syrian refugees was manipulated (i.e. control, Christian, and Muslim). The effects of religious fit between British non-Muslims and Syrian refugees on perceived similarity, political support, helping intentions, and helping behaviour were scrutinised. In Study 2 (N = 337), the predicting role of perceived similarity on political support and helping intentions was explored, in a quasi-experimental design with three different participant groups (British non-Muslims, British Muslims, and Turkish Muslims). Data was collected through online surveys in both studies. Study 1 showed that Christians were more likely to help Christian Syrian refugees than control and Muslim Syrian refugees whereas for nonbelievers, there was no difference in terms of helping control, Christian, and Muslim Syrian refugees. Study 2 showed that compared to British non-Muslims, Turkish Muslims and British Muslims were more likely to help Syrian refugees and this difference was mainly driven by different levels of perceived similarity. The instability of governmental supports suggests an important role for research examining individual efforts to help Syrian refugees. In the light of this, the results of this research shows that different strategies should be used for different potential helper groups. More specifically, considering the ingroup/outgroup identity of refugees to be helped and improving potential helpers’ perception of similarity with refugees could yield more effective outcomes for promoting help and support for refugees.
DOES PARENTAL ALEXITHYMIA PREDICT PARENTAL BURNOUT AND CHILD PSYCHOLOGICAL PROBLEMS?

Sena Cure Acer  
Meltem Ustundag Budak  
Bahcesehir University (Istanbul, Turkey)  
Gizem Arikan  
Ozyegin University (Istanbul, Turkey)

Previous studies have found that, 14% of parents may possibly be affected by parental burnout (Raes, 2018), and it may lead to some damaging consequences for the family members (Mikolajczak & Roskam, 2018). There are also some other factors that affect family dynamics negatively, including lack of affective responsiveness (Ryngala, 2006), which was found to be related with parental alexithymia. This study investigated the relationship between parental alexithymia, parental burnout and child psychological problems (internalizing symptoms, externalizing symptoms, anxiety and depression, somatic complaints, and withdrawal). The effect of gender, age, education level and family type were also controlled. Among the participants (145 couples; 290 parents)(Xage= ; Education levels changed 5 to 26 years), 64.8% were from intact families, 7.2% were from extended families, 5.5% were from single-parent families, and 1% was from other types of families. The data were collected through Toronto Alexithymia Scale, Parental Burnout Scale, and Child Behavior Checklist. Linear regression analyses showed that parental alexithymia predict parental burnout \( R^2= .10, F(1, 288)= 32.00, \beta= .32, p< .001 \) and child psychological symptoms \( [e.g, \text{ for internalizing symptoms } R^2= .06, F(1, 288)= 18.77, \beta= .25, p< .001 \] \). The results also showed a positive relationship between parents’ education level and parental burnout \( (r= .14, p< .05) \); and a negative relationship between parents’ education level and child psychological symptoms \( (e.g., r= -.26, p< .01) \). However, child psychological symptoms did not predict parental burnout \( (p>.05) \). Since parents with alexithymia are unable to identify and explain emotions, parent-child relationship might be affected by this situation, which in turn may affect children’s psychological states. Also, because the participants of this study were parents, the results of child psychological symptoms might have been affected by their own perception about their children’s psychological states. Although parental alexithymia predicted parental burnout, it is only one of the predictors of parental burnout. Thus, further investigation on the predictors of burnout appears to be important to support families.
The death of a close person is one of the most universal, highly stressful and often even traumatic life experiences. Despite this irrefutable fact, most people feel helpless and incompetent when they are in the company of somebody who is grieving the loss of a loved one, because they don't know how to act, or what to say. In the recent decades social support in the bereavement process represents an important and newly emerging scientific field of study, focusing on the topic of comforting message research. However, within the framework of Serbian national science surprisingly little empirical work has examined how supportive communication can affect the grieving process. This research is the part of the project “The effects of existential insecurity on individuals and families in Serbia” supported by the Ministry of education, science and technological development of the Republic of Serbia. The main objective of this study was to determine which categories of supportive messages are perceived as most helpful for the bereaved. The second aim of this study was to determine whether the concept of person centeredness of these messages explains their helpfulness. Person centeredness refers to the extent to which a specific comforting message explicitly acknowledges, elaborates, legitimizes and contextualizes the emotions and perspectives of a grieving person. Supportive messages can exhibit high, moderate or low person centeredness. The participants (301 adults, average age 29.16) assessed the helpfulness of comforting messages for the bereaved, by completing the 77-item Bereaved Support Questionnaire, designed by the authors themselves. These messages were coded for their degree of person centeredness by three independent experts in psychology. The results indicate that supportive messages for the bereaved instantiated five different strategies: Social support, Minimizing feelings, Providing a religious perspective, Complimenting the deceased and normalizing feelings, and Offering practical help. Social support was evaluated as the most helpful strategy, whereas the least positively evaluated strategy includes providing a religious perspective. The person-centered quality of supporting strategies was positively associated with participants’ evaluations of the helpfulness of these strategies.
DOES PERCEIVED SOCIAL SUPPORT PREDICTS POST-RELEASE EXPECTATIONS IN CONVICTS?

Hüseyin Nergiz  
Sedat Işıklı  
Hacettepe University (Ankara, Turkey)

The fact that the convicts’ post-release plans reduces the re-arrest rates (Dickson, Polaschek, & Casey, 2013) and the perceptions on social support were also related to the crime situation (Naser and La Vigne, 2006; Ullrich and Coid, 2011). In this study, it has been investigated whether the individuals who have been convicted of physical violence (wounding or murder) are predicted by the perceived social support and the level of expectation after release.

The study sample consisted of 414 male convicts (age mean=37.23, SD=10.61 who were sentenced in open and closed prisons in 4 different cities (Turkey). The self-report information form (such as how old when they first committed crimes), Multidimensional Scale of Perceived Social Support, and Upon-Release Future Expectations Scale were used. Regression analysis was performed to test the predictive levels of perceived social support. Correlation analysis was performed before regression analysis and only significant variables were used as predictors.

Results showed that, perceived social support total score was the only significant predictor of assumptions about future conditions and confidence in coping. There were no significant predictor of perceived risks.

When the findings are evaluated, it is thought that ensuring individual’s communication with social resources and perceived social support can affect the post-release expectations positively and reduce the possibility of re-offending.
Infantile autism (IA) — F84.02 occupies a key position in the typology of autism spectrum disorders (ASD), which determines the relevance of clinical and pathopsychological diagnosis of IA, comorbid hyperkinetic disorder. The examination of 102 patients with IA with hyperkinetic syndrome (HS) shows visible differences both from healthy peers and from children with ADHD. The depth of autism is determined using the CARS scale. It turned out that in psychosis the total score averaged 37.2 points (lower limit of severe autism), and in remission — the final score was significantly reduced (32.8 points). On the PEP scale, positive dynamics of cognitive functions (on average from 49 to 57.7 points) and autistic manifestations (on average from 16.5 to 22.7 points) was found in patients in the process of habilitation in remission, there was an improvement of cognitive functions in all PEP sub-scales by 15-30%. The exception was the sphere of fine motor skills and visual-motor coordination, which seems to be associated with acquired motor disorders in the form of HS. The severity of autistic manifestations decreased by 20-55%. GS in IA has pathopsychological markers in the form of cognitive dysontogenesis, as evidenced by the data obtained using pathopsychological techniques (Liper Figures, shape identification, small subject classification, object design, drawing itself). The cognitive development of children with ASD differs from the norm, there is a peculiarity that manifests itself as cognitive dysontogenesis (manifested in a combination of advance, normative and delayed level of development of the cognitive sphere). In the process of pathopsychological examination in children with ASD there are different profiles (types of cognitive dysontogenesis). Each of the selected types of cognitive dysontogenesis corresponds to its level of depth of autism manifestations: (mild and moderate levels for a distorted type of cognitive dysontogenesis; severe level for a deficient type of cognitive dysontogenesis; extremely severe level for a regressive type with an emerging defect of cognitive dysontogenesis). The use of techniques aimed at the evaluation of arbitrary and involuntary attention provides additional data for the diagnosis, differentiation and social functioning of children with ASD and ADHD.
THE INDIVIDUAL AND PSYCHOLOGICAL PECULIARITIES OF THE CADETS OF THE NATIONAL GUARD

Mikhail Fedorishin
Natalia Bol’shunova
Alexander Pomerlian

I. K. Yakovlev Novosibirsk military Institute of the national guard of the adyunkt adyunktury voennogo instituta (Novosibirsk, Russia)

The main mission of cadets’ study is the development of the self-regulation, which is the base of the adequate and successful behavior of the military man in extreme conditions. The activity of the military man is characterized by the readiness to independent and responsible actions and strict regulations and orders. These factors influence the development and individual style of self-regulation in a negative way. Self-regulation as an initiation of human activity and control means the individual distinction of self-regulation and the process of its achievement (Morosanova, Osnitskiy, Golubeva) and the necessity of the individual peculiarities in the process of study. During the study of the individual peculiarities of self-regulation (60 cadets of NVI at the age of 19-21) the following methods are used: «The style of self-regulation of behavior» by V.I. Morosanova, the resilience test (D.A. Leont’ev, E.I. Rasskazova), «The hierarchy of values» by G.V. Rezapkina, etc. The cluster analysis defines three groups: with high, medium and low level of self-regulation, in the sufficient level of self-regulation in total and relatively low levels of reflection. The regression analysis describes the positive influence of such factors as «commitment», «responsibility», «independance», «control» (the resilience test), wealth, family in family relations, the importance of creation, rest and service. Some data are very contradictory and very difficult to interprete, because of the low level of integrity and systematization in the military service and daily routine of the cadets. These data reflect the peculiarities of the cadets who have been analyzed and the specific features of the military profession which is based on the military regulations and orders. They can suppress the individual abilities of the cadets. Our results can be used in the development of programs which train self-regulation of cadets, the individualization of the process of study in the system of military education.
In this study, we focused mainly on 1) tolerance, 2) positive and negative contact, and 3) attitudes towards the Vietnamese minority. Majority members judged three separate behaviors performed by the Vietnamese Czechs. Tolerance was conceptualized as an acceptance of negatively perceived behavior. Attitudes toward minority members were measured using a feeling thermometer. The main goal was to inspect whether positive and negative contact associates with acceptance of behavior taking into account the evaluation of the behavior. Moreover, we tested whether attitudes toward minority members mediated the link between intergroup contact and acceptance of the behavior. We employed the structural equation modeling using the Czech sample (N = 7,498). Our results showed that attitudes toward minority members are negatively associated with the tolerance among those who did not perceive the behavior positively. Consequently, the indirect effect of positive contact on the tolerance was negative regardless of how the behavior was perceived. The effect of negative contact on the tolerance was positive among those who perceived the behavior negatively. In the case of one behavior, negative contact was negatively and directly associated with tolerance. Our findings suggest that the direct effect of negative contact on tolerance may be present. However, the indirect effect via attitudes to minority members may be paradoxical because these attitudes were negatively linked with tolerance.
CHRONOTYPE AND BDNF VAL66MET POLYMORPHISM INFLUENCE ON AWAKENING CORTISOL AND TRAIT ANXIETY IN YOUNG ADULTS

Alev Ecevitoglu
Nilay Ateşyakar
Elif Aysimi Duman
Boğaziçi University (Istanbul, Turkey)

Previous studies yielded conflicting findings on the relationships between chronotype, cortisol and anxiety. Some studies associated eveningness with higher trait anxiety, while others did not. Similarly, higher morningness was associated with higher morning cortisol in some studies but not others. One possible contributor to these conflicting results may be the influence of genetic polymorphisms, such as the brain-derived neurotrophic factor (BDNF) Val66Met polymorphism. This polymorphism was previously linked to differences in sleep characteristics and anxiety-related traits. Met-allele was consistently associated with higher anxiety-like behaviors in animals, although not always replicated in humans. In relation to cortisol response, both Val-allele and Met-allele were associated with increased cortisol reactivity to different paradigms, requiring further investigation. In this study, we investigate for the first time the interaction between chronotype and BDNF Val66Met polymorphism on trait-anxiety and awakening cortisol. We hypothesize that Met-allele carriers with higher eveningness would yield higher trait-anxiety and lower awakening cortisol, while an opposite pattern would be observed in Val-homozygotes. Participants were 237 undergraduates from Bogazici University, Turkey (49% female; Mage = 20.49, SDage = 1.73). Chronotype and trait anxiety were measured by the Morningness-Eveningness Questionnaire and State-Trait Anxiety Inventory, respectively. BDNF Val66Met genotype was determined from salivary DNA and individuals were grouped as Val-homozygotes and Met-carriers. Awakening salivary cortisol was measured across two weekdays. A regression analysis showed a significant chronotype by BDNF genotype interaction only in males (p < .05). Met-carrier males with higher eveningness exhibited higher trait anxiety compared to Val-homozygote males. On the other hand, females had higher trait anxiety independent of chronotype or BDNF genotype (p = .01). The same interaction was not observed on awakening cortisol. However, we found significant main effects of chronotype and gender (ps < .05), such that higher morning cortisol was observed in females and in participants with higher morningness. Our results indicate that Met-carrier males with higher eveningness show higher trait anxiety. On the other hand, higher morningness and being female was associated with higher morning cortisol independent of BDNF genotype. This study is supported by BAP-8249 and TUBITAK-115S532 grants awarded to EAD.
COMPONENTS OF THERAPEUTIC CHANGE: AN EVALUATION IN THE CONTEXT OF COGNITIVE BEHAVIORAL THERAPY

Gözde Gökçe
Ankara University (Ankara, Turkey)

Esra Güven
Baskent University (Ankara, Turkey)

Understanding the components of therapeutic change is an important way of examining the effectiveness and efficacy of psychotherapy. An evaluation bare of therapeutic change components may lead to labor, time, and material loss at the individual and institutional level, which may damage the reliance of psychotherapy specialists and methods. In this framework, we aimed at examination the components of change in the context of CBT. In this review, the research articles, reviews, and meta-analysis that have been published between 1961 and 2016 have been reached. The most frequently addressed components of therapeutic change are the mechanism and mediating factors. The cognitive mechanism in the CBT includes perceptions, interpretations, and explanations of the self, the environment, the experiences and the future of the individual. Changes in attitudes, thoughts, and beliefs mediate the effect of therapeutic interventions on symptoms. The behavioral mechanism encompasses reinforced, customized, or exacerbated behavior of the person with the problem area based on learning theories (Dobson 2009). The behavioral mechanism of CBT contributes to therapeutic change through behavioral interventions such as, exposure, response prevention, and behavioral activation. In studies comparing cognitive and behavioral interventions in depression shows that cognitive change in depression may not be a mechanism in terms of changes in symptoms (Longmore and Worrell 2007, Lorenzo-Luaces et al 2015). In the case of generalized anxiety disorder, addition of behavioral techniques such as relaxation exercise and exposure to cognitive techniques have been found to give better results than merely behavioral techniques (Hoyer et al 2009, Siev and Chambless 2007). It is difficult to determine whether these indirect effects are caused by the fact that the symptoms that lead to the decrease are indirect effects or because the symptoms are decreasing. For this reason, it may not always be the best way to compare the therapeutic processes or mechanisms in terms of changes in symptoms. While comparing the changes on the symptoms, it may be useful to make an operational definition of the mechanisms and mediators that are intervened by the approach and to discuss the results in the context of confounding variables.
The extremist activity of nationalist, religious, ethnic and other organizations is considered one of the main risk factors to violation of unity, territorial integrity and social situation in the country. Alongside with the political, social and legal measures of counteraction to extremism psychological researches directed on its inter- and intra-psychological sources determination and assessment play an important role in prevention of extremist actions. We present the results of the author’s questionnaire of military personnel tolerance to extremist ideology standardization and approbation. The main objectives of the research were: (a) to analyze the diagnostic approaches and methods of evaluation of individual susceptibility to extremist ideology, (b) to approve the author’s questionnaire on a military personnel sample, (c) to make the statistical assessment of the questionnaire’s diagnostic opportunities in comparison with other standardized tests. The sample included 60 military men (18-27 years old): 48 were on call-up duty, and 12 served under the contract. The diagnostic tools included: the author’s questionnaire “Tolerance Assessment to Extremist Ideology Manifestations”, “Scale of Social Distance” (by E. Bogardus); “Scale of Fascism” (by T. Adorno, E. Frenkel-Brunswick, D. Levinson, R. Sanford); “Predisposition to Prejudice Measuring” (by G. Allport, B. Kramer); the questionnaire “Types of ethnic identity” (by G.U. Soldatova, S.V. Ryzhova) and expert evaluation. To process the empirical data we used frequency, correlation and factor analyses. Through comparing the results of tests and expert evaluation, some statistically significant indicators of military personnel tolerance to extremist ideology were established. The individual propensity to the ideology of extremism might be assessed by means of such diagnostic parameters as “social distance”, “conservatism”, “authoritarian subordination”, “aggression”, “destructiveness and cynicism”, “exaggeration of the importance of force” etc. As a result of factor analysis, four psychological factors of military personnel tolerance to extremist ideology, such as, “Intolerance”, “Extremist ideology commitment”, “Negative ethnic attitudes” and “Intolerant beliefs” were defined. They determined 84.8% of general dispersion of inter-correlation matrix. The study confirmed the diagnostic capabilities of the questionnaire “Tolerance Assessment to Extremist Ideology Manifestations” and permitted to define the general factors and special indicators of military personnel sensibility to extremist ideology.
IMAGE OF THE WORLD CHARACTERISTICS AS PROFESSIONAL ACTIVITY DETERMINANTS IN MUSICAL SPECIALISTS

Mehirban Abdullaeva
Oksana Korneva
Lomonosov Moscow State University (Moscow, Russia)

Nowadays the sphere of musical professions is a combination of typical and novel activities. The new ones emerged with the development of social representations and technical capabilities [1]. The aim of the research was finding key characteristics of music sphere representatives’ image of the world, which may detect differences between workers within the cognate professions [2]. Psychosemantic method was used to assess clime attitude to professional activity. A shortened version of the questionnaire "Job diagnostic survey" (JDS) was used. And then respondents evaluated the professions of "musician" and "sound engineer" by using the new modification of the semantic differential "My Work". Two different types of musical workers were chosen as participants: audio engineers (n=38), musicians (n=42). Also a group of non-musicians (n=42) was invited. In total, 122 professionals participated in the research. Mann-Whitney test and factor analysis were used. The results obtained demonstrated similar representations of the world in different groups. Factor analysis of semantic differential scales (74% of the variance) detected the availability of the same factor for two professional groups during the assessment of their own activities ("subjective acceptance"). However, there were specific intergroup differences in the assessment of their own and others’ professions. Discrepancies in semantic profiles in the image of professional activity unobserved aspects related to the dynamics of the work process (with a p<0.04 and higher) and its significance (a p<0.03 and higher) was revealed for all groups. The JDS demonstrated a significant difference (z=-2.825, p<0.006) on the "Significance" scale between musicians and sound engineers. Sound engineers evaluated their work more meaningfully, which is presumably associated with the content of the work. The obtained data allowed us to specify an understanding of the connection between the image of the world and professional activity and to reveal its psychosemantic features. References: 1. Sofronov F.M. (2014). Russian music of the two recent decades. The Journal of Russian Society for Theory of Music. №, 7, 2. Leontiev, A.N. (1983). Image of the world. Izbrannye psihologicheskie proizvedeniya, 2, 251-262.
PERCEPTION OF DESTINY IN TURKEY: AN INVESTIGATION THROUGH THE PSYCHOLOGY AND SOCIOLOGY DISCIPLINES

Veysel Mehmet Elgin
Nahide Konak
Ibrahim Biri
Bolu Abant Izzet Baysal University (Bolu, Turkey)

The perception of destiny is an important topic that deeply affects people's psychological processes, and this effect is even much higher for people living in Turkey. As the significant novelty and contribution, the current study aims to examine a form of destiny—named "kısmet" in Turkish—through the integration of psychology and sociology disciplines. In detail, within the framework of cultural psychology, social psychology and Weberian sociological conceptualizations, we analyzed the perception of destiny (i.e., "kısmet") in daily life in Turkey. The total number of 100 undergraduates at an Anatolian university (M_age = 22.24, S_age = 2.90) participated in this study. Participants were asked to respond questions related with "kısmet" through a paper-pencil study, and then the collected data were analyzed through the thematic analysis. The general findings revealed that destiny (i.e. "kısmet") is a central issue in Turkey. Specifically, i) it reflects the cultural characteristics of collectivistic culture such as low independence, connectedness and harmony, ii) it fulfills many psychological needs such as security, control, reduction of ambiguity, reduction of cognitive burden, construction of meaning and psychological relief, iii) it is directly related with social psychological mechanisms such as self regulation, external attribution, locus of control, and system justification, iv) it is related with Weberian sociological social action theory (i.e., traditional actions), and v) it is highly related with religion. In addition, it was also found that the perception of destiny shows similarities with another cultural concept and destiny-related concept named evil eye (i.e., "nazar" in Turkish) in Turkey (Elgin & Gezici-Yalcin, 2017). The findings are also discussed within the framework of honor culture literature in general (Nisbett & Cohen, 1996) and the honor culture literature in Turkey (Elgin, 2013; Uskul & Cross, 2018). Finally, the future studies and the possible benefits of integrating psychology and sociology in examining social and cultural psychological topics are discussed.
COMPARING THE CONSOLIDATION OF EMOTIONAL VS. NEUTRAL WORDS BASED ON RETENTION INTERVALS, INTERFERENCE AND LIST TYPE

Sinem Söylemez
Celal Bayar University (Izmir, Turkey)
Berk Yaşuk
Mesut Tanko
Aycan Kapucu
Ege University (Izmir, Turkey)

Consolidation of information in memory is a process that depends on time. Previous research have suggested that emotional stimuli are consolidated better because they are more resistant to interference tasks throughout the consolidation process. In the current study, we conducted two experiments in order to determine possible factors that might affect this consolidation difference between emotional and neutral stimuli. Experiment 1 tested the effects of different retention intervals, and presence or absence of an interference task on the consolidation of emotional and neutral stimuli. One hundred-twenty participants first studied 30 highly-arousing and 30 neutral words. Immediately after encoding, half of the participants were given a nonverbal interference task, while the other half were sent out from the laboratory to later come back for the recognition memory test. Retention interval between encoding and recognition test was manipulated between-subjects as either 10, 30, or 60 minutes depending on their assigned conditions. Recognition test included previously-studied 60 words mixed with 60 new words (30 highly-arousing, 30 neutral). For each test word, participants were asked to make an old-new judgment on a confidence rating scale. Based on ROC analysis, results showed that liberal response bias effect of emotion was found in all conditions as expected. Furthermore, there was a significant three-way interaction between emotion, time interval and interference on memory accuracy. That is, in the absence of the interference task, participants were more sensitive to neutral stimuli than highly-arousing stimuli at 10 min. interval. Also, in the presence of the interference task, participants were more sensitive to neutral stimuli than highly-arousing stimuli at 30 min. interval. In contrast to our hypothesis, neutral words were consolidated better than highly-arousing words. One possible reason for better consolidation of neutral words could be presentation of mixed lists in Experiment 1, which might have led to carry-over effect of emotion. Thus, Experiment 2 is designed as a follow-up to replicate the first experiment and test this possible explanation with pure lists including only highly-arousing or only neutral words. Results from two experiments will be discussed in light of previous literature on emotional memory consolidation.
Irrational health beliefs (IHB), defined as a person’s tendency to process health-related information in a distorted manner, have been repeatedly found to be associated with lack of medical adherence. However, little is known about the underlying cognitive processes behind IHB, or how IHB are related to other types of cognitive distortions. Therefore, the aim of this study was to assess the relationship between IHB and cognitive reflection, i.e., the ability to suppress incorrect intuitive responses and engage in further reflection to find correct answers. Data were collected online in Slovakia in 2018 among university students (N = 100; 76% women; average age 22.9 years; SD 2.8 years). Cognitive reflection was measured by the extended version of Cognitive Reflection Test (CRT7), consisting of seven brief performance tasks. Additionally, previous exposure to CRT7 and its predecessor was measured as a control variable. IHB were assessed by Irrational Health Belief Scale, a self-report measure. It consists of 20 vignettes describing appraisals of specific health situations and experiences, and a subsequent hypothetical rationalisation of unhealthy behaviour. The relationship was assessed using a linear regression model. A weak negative relationship between IHB and cognitive reflection was found, but it did not reach the .05 level of statistical significance (β=−.19; p = .087). IHB and lack of cognitive reflection, as assessed by their respective most frequently used measures, seem to constitute two very distinct types of cognitive failure. However, more research is needed on bigger samples and in various cultural settings to confirm our findings.
Several studies show that memory performance is enhanced when the material is processed in terms of its survival relevance (Nairne, Thompson, & Pandeirada, 2007). However, the effects of studying to-be-remembered material in other fitness related domains (e.g., jealousy processing) has generally been neglected. To date, no studies attempted to examine the effects of jealousy processing in respect to sexual and emotional infidelity on memory of concrete nouns in as much threatful scenario as the survival scenario. The present study investigated recall and recognition memory of neutral concrete nouns which were encoded in either survival, emotional jealousy, sexual jealousy, or pleasantness (control) conditions in different groups of participants. All groups of participants studied the same words by processing them in different scenarios. In the study phase, participants in the pleasantness group rated the pleasantness of each word, while those in the survival group studied words by evaluating how relevant each word was for their survival in an imaginary grassland of a foreign land. In the two jealousy groups, participants studied words while evaluating how relevant each word was for detecting the partners’ potential sexual or emotional infidelity, depending on their particular conditions. In order to assure that the amount of threat in the jealousy scenarios is comparable to that of the survival scenario, the sexual/emotional jealousy scenarios included three sexual/emotional infidelity cues which were previously shown to activate jealousy mechanisms (Schützwohl, 2005). After study phase, participants first engaged in a free recall task, and then they made old/new recognition judgments on a confidence rating scale. For each group, accuracy and response bias parameters were estimated via ROC analyses. Participants in the survival processing and jealousy processing conditions are expected to have higher memory accuracy compared to those in the control group. Preliminary results suggested that there is an advantage of fitness-related processing in memory accuracy. The results will be discussed in evolutionary perspective, particularly in relation to the beneficial effects of fitness-relevant processing on memory.
An increasing level of students’ academic mobility in modern education is accompanied by an increased number of students coming not only from nearby cities and regions but also from other countries. This mobility determines the difficulties of hall residence students’ adaptation. Hall residence students struggle with difficulties of new educational forms (new forms of control, requirements, methods of education), they also have to adapt to new living conditions. Problems could be characterized by lack of independence skills, cross-cultural competencies, skills to distribute and plan personal time, inability to organize life in a residence hall. In order to determine the factors hindering the satisfaction of students’ basic needs, as well as identifying resources aimed at improving living conditions in the student residence hall, a phased work of psychological facilitation was organized. At the diagnostic stage, factors hindering the satisfaction of the students’ basic needs were determined. 133 hall residence students of Perm State National Research University took part in the research, among them 35 men and 98 women. The method of free description was used in accordance with the approach of D. Walker, F. Reicheld. An author fact-finding questionnaire was developed for this study. The questionnaire is based on the A.V. Lyubin approach, aimed at exploring living conditions in the residence hall; the theory of conflict causes and its’ dynamic among students by E.N. Pogodina. Analysis of the data showed that students note the factors of space organization in common areas, the reparation and furniture renovation needs as a problem area. Accession mode, conflict in relations with the administration, the lack of feedback mechanisms, and the absence of personal space serve as an acute problem for students. The next stage was the development of a psychological facilitation program. It was shown that assistance in a higher education can be implemented in two main areas: the provision of systematic, unspecialized psychological assistance provided by various officials for the purpose of prevention; provision of specialized psychological assistance directly by psychologists. The provision of specialized psychological assistance is implemented through the main activities of the psychologist: diagnostics, psychological counseling, psycho-correction, psychological enlightenment.
This study was prompted by a social request which consists in the necessity to consolidate society in the fight against corruption, as well by people’s tolerance to widespread lower forms of corruption, which is now registered by scientists. The main concern is young people who already in the process of education and mastering activities form their attitudes to bribery. The contents of such attitudes can influence their standards of behavior in various spheres of life and determine future of the country. Based on the V.N. Myasishchev’s views on the structure of personality’s psychological attitudes, as well as on the developed by us ideas about the value-semantic personality’s attitudes, we have conducted research aimed at establishing the contents of the types of value-semantic attitudes to bribery among urban studying and working youths. Subject of the research: psychological attitudes to bribery among 126 schoolchildren, 107 college students, 120 university students and 102 working young people. Cross-sectional method, testing, the survey (the author’s questionnaire making it possible to evaluate the contents of each component of attitude to bribery), the content analysis; statistical methods were used. Results showed types of attitudes to bribery as an Unlawful act, as a Business commercial transaction, as Immoral behavior have been established among schoolchildren and college students; the types of attitudes to bribery as Instrumental value; as a Business commercial transaction have been established among students and working respondents. The contents of cognitive (bribe definition and functions), conative (causes of giving and receiving bribes), and emotionally evaluative (feelings of respondents about bribery; evaluation of influence of bribe on the country, social groups, people; preventive measures) components have been disclosed for each type of attitude. In the interval “school-college-university-professional activity” evolution of types of attitudes to bribery among studying and working youths has been established. From the school educational stage to real professional activity stage the attitude to bribery as an immoral behavior is being reduced, the attitude to bribery as an instrumental value tends to prevail, and the attitude to bribery as a Business commercial transaction remains unchanged.
TIMING OF TONALITY AND PROGRESSION: ANTICIPATION-RELATED AROUSAL AND MINOR TONALITY SPEEDS UP SUBJECTIVE TIME

Hakan Karşılıar
Özyeğin University (İstanbul, Turkey)

Accurate perception of time in the supra-second range underlies most cognitive functions such as decision-making, foraging and motor preparation. Prominent information-processing models of interval timing propose a pacemaker-accumulator model of temporal perception, which can successfully account for the sense of the passage of time within both sub-second and supra-second ranges. These computational models also allow for the modifiability of the pacemaker rate in relation to external (e.g. properties of the stimulus being timed) as well as internal (e.g. the emotional/cognitive state of the timing agent) variables; a phenomenon which has been consistently demonstrated, albeit with no clear description of the underlying mechanistic dynamics. In this study, we have attempted to elucidate the relationship between rhythm-based anticipation, chord tonality and time perception. In three complementary experiments, participants judged the duration between two tones as "short" or "long" (1.4 v 3.4 secs in Exp 1 & 2; 2.1 v 5.1 secs in Exp 3), with a third tone presented at varying points in between the first and the last tone. In experiments 1 and 2, this tone triad also formed a minor or minor chord (in the form of an upwards arpeggio), whereas in experiment 3, all tones of the triad were of identical notes. We hypothesized that the earlier the second tone is presented in a note sequence (i.e. closer to the first tone), the longer the interval between the first and the third note will be judged to be, possibly due to increased pacemaker rate caused by the arousal in anticipation of the final note; an effect which should be parametrically indexed by the temporal location of the second tone. Additionally, based on previous research demonstrating the relationship between negative emotions and lengthened subjective time, we hypothesized that the minor triads would be perceived to last longer than major ones in Experiments 1 & 2. Both of our hypotheses were confirmed, providing further support for the modifiable internal-clock hypothesis, whilst specifying the stimulus conditions under which the "clock" in our brain can be sped up or slowed down with tonality and anticipation.
NEUROPSYCHOLOGICAL SYNDROMES IN CHILDREN WITH VARIOUS DISORDERS OF MENTAL DEVELOPMENT

Alfiya Sultanova

Institute of Childhood, Family and Education of the Russian Academy of Education (Moscow, Russia)

In recent decades, the number of children with various developmental disorders has increased significantly. The neuropsychological syndromic analysis allows revealing the mechanisms of deviating mental ontogenesis and developing effective corrective methods. The purpose of this study was to identify the main neuropsychological syndromes that are characteristic of various types of mental developmental disorders. Our research involved 30 children 5-10 years old with autism spectrum disorder (ASD), 60 children 6-10 years old with attention deficit hyperactivity disorder (ADHD), 50 children 6-10 years old with focal epilepsy, and 50 children 4-8 years old with a delay of mental development of cerebral organic genesis. We used neuropsychological Luria tests that have been adapted for children, conducted an interview of parents and teachers about the peculiarities of children's behavior, and analyzed electroencephalogram reports. The neuropsychological syndrome in children with ASD included a severe insufficiency of the functions of the left hemisphere, almost preserved functions of the right hemisphere against the background of insufficiently developed inter-hemispheric interaction and dysfunctions of the subcortical structures of the brain. Children with ADHD were divided into three groups. Group 1: children with primary dysfunctions of subcortical brain structures and secondary impairment of the functional development of the prefrontal areas (70%). Group 2: children with dysfunctions of subcortical structures of the brain and impaired functional development of the basal regions of the frontal lobes (20%). Group 3: children with primary functional insufficiency of the prefrontal cortex (10%). All children with delayed mental development had dysfunction of subcortical structures, which in the majority of children (78%) was combined with a delay in the formation of functions of the frontal lobes. Also, the failure of the left lower parietal area of the cortex (54%), and left temporal regions (60%) was most often observed. Dysfunctions of the subcortical-stem structures of the brain were also found in all children with focal epilepsy. Neuropsychological research has always revealed a deficiency or a severe delay in the development of the functions of that part of the cerebral cortex that was associated with the epileptic focus.
THE STRUCTURE OF HAPPINESS REPRESENTATION IN AMERICAN AND RUSSIAN CULTURE (BASED ON A STUDENT SAMPLE)

Anna Pecherkina
Svetlana Zhdanova
Perm State National Research University (Perm, Russia)

The aspects of positive personality functioning, subjective well-being and happiness become of particular interest in modern psychology. Last researches reveal significant differences in the indicators of happiness and life satisfaction among representatives of different cultures, but this comparison is carried out in the context of a quantitative approach. In such methodological approach, the boundaries between the structural elements of happiness and its prerequisites, the influencing factors are blurred, which creates obstacles to the delineation of this concept and the analysis of its internal structure in connection with a culture. In this regard, it seems relevant to study the representation of the state of happiness in connection with a culture, in particular, in American and Russian ones. In order to explore the representation of the happiness’ state in Russian and American culture, to identify invariable and variable components in the structure of representation an empirical study was conducted. The study involved 76 Russian students from Perm State National Research University and 50 American students from Lyndon State College and Delta State University. The method of retrospective self-report was used in the research. Respondents were asked to recall the situation when they felt happy and to describe it. All the stories were recorded on video with the permission of the participants, and then verbal and non-verbal characteristics of the representation were analyzed on the basis of video interviews. At the next stage, the content analysis and K. Muller method of gestural units’ analysis were used for verbal and nonverbal components of representation. Statistical data analysis was based on the application of the Fisher $\phi$-angular transform coefficient, the $\phi$ correlation coefficient, and cluster analysis. Three multimodal clusters were identified. It was shown that the structure includes verbal and non-verbal characteristics of happiness’ representation, individual characteristics (gender, age). According to the results of the research, these clusters are invariant and are manifested in the representation of the state of happiness, regardless of culture. Invariable and variable components in the structure of representation of happiness’ state at verbal and non-verbal levels in Russian and American culture were identified.
COMPARING THE ATTITUDES TOWARDS PSYCHOLOGICAL HELP SEEKING BETWEEN PSYCHOLOGY STUDENTS AND GENERAL TURKISH SAMPLE

Cansel Dinar
Özden Yalçınkaya-Alkar
Ankara Yıldırım Beyazıt University (Ankara, Turkey)

Sometimes individuals may find it difficult to cope with their problems and need professional help. However, the Turkey Mental Health Profile Report (Erol, Kilic, Ulusoy, Kececi and Simsek, 1998) and another studies (Andrews, Issakidis and Carter, 2001; Arslantaş, Dereboy, Aștı and Pektekin, 2011) show that the rate of seeking psychological help from a mental health professional is low. The fact that individuals do not seek psychological help for their serious problems which can lead to more seriousness of the individual's problem and may increase the burden of illness. Turkey National Burden of Disease Report (2004) shows that mental disorder is ranked second disease burden. Besides, the attitudes of the individual are affected by the environment therefore cultural framework is important to understand attitudes towards psychological help seeking. It is considered that understanding the variables affecting the attitudes of the individual to receive help is important for interventions that increase the attitudes of individuals to seek psychological help. It was aimed to examine the attitudes toward psychological help seeking among Turkish people. For this reason in addition to attitudes toward psychological help seeking variable related psychological variables, cultural values, social stigma, self-stigma, self-concealment, psychological distress and demographic variables were included in the study. The second purpose of this study is to comparing attitudes of the two Turkish samples, psychology students and general sample, regarding the attitudes towards psychological help seeking. Demographic Information Form, The Scale of Attitudes Toward Seeking Psychological Help-Shortened, Social Stigma Scale for Receiving Psychological Help, Multi-Dimensional Social Values Scale (family value, religion value, traditional value), Self-Stigma of Seeking Psychological Help Scale, Self-Concealment Scale and Brief Symptom Inventory were used as the data collection instrument in the study. T-Test, analysis of variance and regression analyses will be used for the analysis of the data. The results will be discussed within the scope of literature. Andrews, G., Issakidis, C., & Carter, G. (2001). Shortfall in mental health service utilisation. The British Journal of Psychiatry, 179(5), 417-425. Arslantaş, H., Dereboy, İ. F., Aştı, N., & Pektekin, Ç. (2011). Yetişkinlerde profesyonel psikolojik yardım arama tutumu ve bunu etkileyen faktörler. ADÜ Tip Fakültesi Dergisi, 12(1), 17 – 23. Erol, N., Kilic, C., Ulusoy, M., Kececi, M. & Simsek, Z. (1998). Türkiye Ruh Sağlığı Profili Raporu [Turkey Mental Health Profile Report]. T.C.Sağlık Bakanlığı, Ankara. Ulusal Hastalık Yüku Final Raporu [National Burden of Disease Report]. (2004). Ulusal Hastalık Yüku ve Maliyet Etkililik Projesi, Başkent Üniversitesi. VANDAL BEHAVIOR OF RESIDENTS IN THE MEGALOPOLIS: ECONOMIC, INFRASTRUCTURAL, PERSONAL PREDICTORS. PREVENTION OPTIONS

Alena Obolenskaya
Ural State Pedagogical University (Ekaterinburg, Russia)

The future of social psychology in large-scale studies of residence places. The study causes of the urban residents behavior as a result of their manifest the non-verbalized voices for closest environment, themselves and the state. The purpose of the study is to determine the basics of vandal behavior in urban space. The study of the reactions of young people to megacities in the study of species associated with nature and the microenvironment in order to ensure the possibility of protection. Because vandal activity damages both the environment and the individual. The destruction of the personality of both the residents-spectators of vandalism and vandals takes place. Mustafa E., 2017, Kruzhkova O.V., 2018 and other authors point to a significant emotional component. The research design was carried out in a megapolis in the center of Russia in Ekaterinburg city, more than 6,000 photos of vandal acts were taken, cartography was done. Young people were surveyed on the quality of life in the city (N = 1503). The methods of statistical and econometric analysis processed the data of field research. The index method showed that the influence of environmental comfort to vandal activity in the city. Conversely, the presence of vandal acts in the territory of residence leads to the assessment of the territory as unfavorable, undesirable for living. The method of chain substitutions showed that the presence of modern infrastructure and the possibilities of organized leisure reduce the vandal activity of citizens. Correlation analysis also showed some influence of the "freedom" factor on vandal activity. A deterministic four-factor model of predictors of vandal behavior was obtained. Also, vandal activity reduces the quality of life of the population and is important when choosing a place of residence. The level of vandal activity in further studies is interesting to correlate with the cost of the actor’s resources spent on the vandal act. Municipal authorities, in addition to solving the problem of "broken window theory" — quick elimination of consequences, it is also important to pay attention to the organization of leisure activities for citizens.
THE ROLE OF CLIMATE CHANGE DENIAL IN THE PRO-ENVIRONMENTAL COLLECTIVE ACTION MODEL

Gözde Kiral Ucar
Gamze Özdemir
Çanakkale Onsekiz Mart University (Çanakkale, Turkey)

Meral Gezici Yalcın
Bolu Abant Izzet Baysal University (Bolu, Turkey)

Although climate change has been scientifically proven, this fact is continued to be rejected and preventive actions are not enough. In the present study, the role of climate change denial as a legitimization mechanism on pro-environmental collective action was investigated by modifying the model proposed by the collective action researchers (e.g., van Zomeren, Saguy, & Schellhaas, 2012). Because, we observe that despite climate changes, only a small amount of people initiates campaigns and protests against this. Therefore, we assumed that when people deny climate change, they would not feel the responsibility to eradicate that, and consequently, the climate change denial would decrease the efficacy perceptions. Then, we assumed that the extent to participate in pro-environmentalist collective actions would increase when identification with environmentalists increase. Thus, a two-staged mediation model was developed. The study included 275 Turkish participants (Female = 194; Male =81) aged between 18 and 78 years (Mage = 28.57; SD = 10.36). The participants were asked to complete the scales of Environmentalist Identity and Pro-environmental Collective Action adapted from Gezici Yalçın, Uluğ, and Çakal (2017). In addition, the scales of Individual/Participative-Group Efficacy adapted from van Zomeren et al. (2012) and Climate Change Denial (Häkkinen & Akrami, 2014) were applied online. Path analysis was run by AMOS 23 (IBM, 2015). According to fit indices, the hypothesized model fit in the data well ($\chi^2 = 2.819, df = 1, p = .093; CMIN/DF = 2.82, GFI = .99, CFI = .99, RMSEA = .08, SRMR = .008$). Results indicated that climate change denial predicted group efficacy ($\beta = -.19, p < .01$), but not individual/participative efficacy. Whereas group efficacy beliefs predicted pro-environmentalist collective action via environmentalist identity, individual/participative efficacy beliefs had indirect (via environmentalist identity) and direct effect ($\beta = .17, p < .01$) on pro-environmentalist collective action (both participation in protests and in petition campaigns). The results concur with the findings of van Zomeren et al. (2012) that believing in "making difference" to collective efforts is a unique predictor of pro-environmentalist collective action.
LONGITUDINAL STUDYING OF COGNITIVE DEFICITS IN CHILDREN AND ADOLESCENTS WITH SCHIZOPHRENIA SPECTRUM DISORDERS

Anton Khromov
Moscow State University of Psychology and Education (Moscow, Russia); Mental Health Research Center Psychology (MSUPE)

Natalia Zvereva
Mental Health Research Center (Moscow, Russia); Moscow State University of Psychology and Education (Moscow, Russia)

There are evidences of cognitive impairment in adult patients associated with schizophrenia onset and observed later in their lives. Studies of dynamics of cognitive deficits in children and adolescents with early onset schizophrenia are rare. The aim of present study is to longitudinally assess dynamics of cognitive deficit in children and adolescents. Cognitive deficits of 24 patients (14 males, mean age 12.1 ± 1.9 years on baseline) with schizophrenia spectrum disorders (childhood onset schizophrenia, schizotypal disorder, and undifferentiated schizophrenia) were assessed twice with average interval 1.5 years (from 0.3 to 3.7 years). Pathopsychological methods were used to assess cognitive functions (memorizing, attention and conventionality of thinking) then transformed to parameters of cognitive deficits (with z-transformation comparing the healthy peer’s values). Parameters of cognitive deficits (z-values) were combined into several types of cognitive development (Zvereva, Khromov, 2014): severe deficit, mild deficit, normal, distorted and surpassed. Patients maintained stable levels of cognitive deficits during follow-up period. Majority of the patients with severe deficit at baseline kept severe deficit in follow-up (82%), only two of them improved their parameters (mild deficit and normal). Patients with mild deficit at baseline demonstrated multidirectional dynamics: 4 patients (57%) improved to normal or surpassed, others remained their level or impaired to severe deficit. Patients with normal cognitive development at baseline remained that cognitive type (67%) or impaired into mild deficit (33%). In overall 38% of patients retained severe deficit. Paired comparison didn’t show significant changes in average level of cognitive deficit over time in neither parameter nor any linkage of deficit level with duration of follow-up was found. Despite the complexity of interaction between continuing cognitive development and psychopathology process in children and adolescents with schizophrenia disorders one might expect cognitive impairing in the course of time. Our findings suggest two possible interpretations: 1) patients with severe cognitive impairment retain stable deficiency over time; 2) patients with mild or partial cognitive deficit have better prognosis but the trajectory of their development needs more detailed investigation taking into account such factors as sex, age of illness onset, diagnosis progression, psychopathological syndrome etc.
EXAMINATION OF THE RELATIONSHIP BETWEEN THE VEHICLE SEGMENT USED AND HUMAN FACTORS IN DRIVING

Derya Azık
Emel Yüzer Günay
Ayşe Nur Yüce
Bahar Öz
Middle East Technical University (Ankara, Turkey)

Road traffic accidents are important health problems globally and each year approximately 1.3 million people lose their lives and 50 million people get severely injured on the world’s roads as a result of traffic accidents (WHO, 2015). A growing body of the literature investigates accident related under three categories of human, vehicle, and environment (Shinar, 2007). Although there are many studies that investigated the relationship with between human, vehicle and environmental factors and accident causation separately, there is little known about how those broad categories could interact with each other in relation to accident causation. Therefore, the purpose of this study is to focus on a vehicle-related factor as being related to human factors in driving. It is known that the capacity of a vehicle (size, weight or motor power of a vehicle) influences drivers’ choices to make violations and/or errors in traffic or more specifically to behave aggressively during the drive. Therefore, more specifically, this study aims to investigate how vehicle segment is related to driver behaviors and driver skills. The current study was conducted with 183 drivers between the ages of 20 and 62. A web-based questionnaire containing a demographic information form, the DBQ (Driver Behavior Questionnaire) — (Reason et al., 1990), and the DSI (Driver Skill Inventory) — (Lajunen & Summala, 1995) were distributed to the participants via e-mail and social media. Bivariate correlation analysis was conducted in order to test the correlations between variables. Correlation analysis showed that only Perceptual Motor Skills and Vehicle Segments were positively correlated. Further research with ANOVA also showed that there is a statistically significant difference between Perceptual Motor Skills and Vehicle Segments and it is found that drivers who prefer higher vehicle segments show more Perceptual Motor Skills than other drivers. The predicted results in relation to driver skills especially perceptual motor skills and vehicle segment selection could support the idea that how vehicle-related factors interact with human-related factors, on the other hand, the relationship between aberrant driver behaviors and vehicle segments could not be found.
THE EFFECTS OF OCCUPATIONAL GENDER STEREOTYPE AND POSITIVE/NEGATIVE INFORMATION ON PERCEIVED OCCUPATIONAL COMPETENCY

Hui Min Lin  
Wen Cheng  
National Sun Yat-sen University (Kaohsiung, Taiwan)

The occupational gender stereotype is the extension of the stereotype of gender roles (such as female nurse, male truck drivers, the male outside and female owners, etc.), and is generated by occupational types. Most descriptions of careers are derived from personal impression, evaluation and image of the careers. For example, the statement "child caregivers should be careful and warm" is a positive information description. On the other hand, if the statement is that "child caregivers are impatient and careless," which is negative information description. This study wanted to understand whether the consistency and inconsistency of occupational gender stereotypes would affect the suitability of occupational stereotypes and social gender perceptions. Conversely, if the negative message description is added, whether it would enhance the effect of its professional fitness. There were 520 participants included in this study (including 188 male participants and 331 female participants). The study was a 2

(Occupational gender stereotype: consistency and inconsistency) X 2 (target object personality traits: positive, positive plus a negative) X 2 (Contextual gender: male, female) experimental design. The results showed that positive traits had a significant effect when occupational gender stereotypes were inconsistent, such as when child caregivers were male (gender stereotypes were inconsistent) and were careful and patient (positive trait messages), which were more acceptable when judged to be suitable for the career of child caregivers. The study found that inconsistent occupational stereotypes (i.e., the child caregivers were male), the targets were considered to be more suitable for the profession, which was not the same as the general social cognition. Perhaps the current study measures were filling of the surface attitude (explicit attitude), in view of this finding can further explore the differences of the impact on explicit attitude and implicit attitude.
THE EXPERIENCE OF CAREGIVER BURDEN IN WIVES AND DAUGHTERS OF INDIVIDUALS WITH ALZHEIMER’S DISEASE

Wojciech Rodzeń
Magdalena Leszko
Rafał Iwański
Agnieszka Malinowska
University of Szczecin (Szczecin, Poland)

This study compared psychological response profiles of wives versus adult daughters caring for a person with Alzheimer’s disease (AD). Caregiving is an area of research that has inspired both scholarly research and health care practitioners. Investigating caregiver burden has very important practical implications. Although the detrimental effects of caregiver burden on psychological and physical well-being are well-documented, there have been inconsistent findings regarding psychological response to caregiving depending on whether a primary caregiver is a wife or a daughter. More research is needed to investigate the differences between wives and daughters and give a comprehensive portrait of a caregiver. We analyzed data from a sample of 60 caregivers (adult-daughter, n = 25 and spouse caregivers, n = 25). We conducted semi-structured interviews in order to gain insight into the caregiving experience. Participants were also asked to complete the Alzheimer’s Knowledge Scale, Beck Depression Inventory, and the Burden Scale for Family Caregivers. The results revealed interesting contrasts between wives and daughters. Spousal caregivers reported spending significantly more hours per week providing care than daughters. Educational attainment was negatively correlated with knowledge about Alzheimer’s disease (r = -.299, p < .05). Daughters reported greater levels of depression and less satisfaction from providing care in comparison to wives. The burden of providing care has different effects on physical and mental health of caregivers of individuals with AD. Both, qualitative and quantitative results from this study offer important insights into the caregiving experience for both psychologist and other healthcare professionals.
Multiple studies show cognitive deficits in alcohol addicts and its relation to vulnerability to relapse and to treatment outcomes. However, there is no unique and commonly used method of cognitive assessment in alcohol addicts that may be partially explained by existing contradiction in leading cognitive deficits in alcohol addicts. Authors distinguish 3 main hypotheses of cognitive dysfunction in alcohol use disorder: frontal lobe hypothesis, laterality hypothesis, hypothesis of diffuse brain dysfunction. The study aimed to evaluate usability of the Brief Assessment of Cognition in Affective disorder Scale (BAC-A) in the revealing of different cognitive deficits in alcohol addicts. We administrated the BAC-A to 118 detoxificated patients (32 female, mean age 42.19(8.7) M(σ)) diagnosed with alcohol use disorder. The obtained data were compared with normative values by using t-test. The presence of cognitive domains and its relation to clinical parameters were evaluated by using Structural Equation Modeling. Compared with normative values, alcohol addicts were impaired on all subtests (p<0.001) excluding affective interference test (total neutral and emotional worlds) and emotional Stroop test (reading). The best fitted model of cognitive functions included parameters: decision making (Tower of London task), working memory (digit sequencing task), global cognition (factor including resting subtests). Decision making and working memory parameters influenced global cognition in the case (RMSEA=0.055). The model revealing the relation between cognitive and clinical parameters included global cognition, working memory, heredity (presence of family history of alcohol-related problem) and duration of alcohol addiction. Heredity and duration of the disease parameters influenced on global cognition, and this connection was mediated by working memory parameter (RMSEA=0.000). The BAC-A use in alcohol addicts: 1) reveals existence of cognitive deficits in alcohol addicts; 2) shows appropriate structure of cognitive dysfunction in AUD with prevailing of control functions. Thus, the BAC-A use enables the evaluation of functions corresponding to frontal lobe and diffuse brain hypotheses. However, the BAC-A do not include visuospatial task, which prevents the assessment of laterality hypothesis’s functions. In the same time the data confirming the laterality hypothesis are contradictory, which can partially compensate the incompleteness of BAC-A.
PSYCHOLOGICAL PECULIARITIES OF BILINGUALISM

Elena Stakanova
Southern Federal University (Rostov-on-Don, Russia)

The present study explores psychological characteristics of bi- or trilingual people that differ from those of the monolingual people based on the level of prominence and usage of foreign language (-s) in their various psychological spheres. The experiment was conducted, aimed at finding out which language the test subjects use in each of their psychological spheres and measuring the psychological variables, connected to the spheres in question. We utilized the plethora of tests of H. Eysenck, A. A. Alexeyev, L. A. Gromova, the Thomas-Kilman test, and the Big Five test. In this study, we compared two experimental groups of bilingual students with the monolingual control group. The first bilingual group was overseas students studying in Russia; the second group of subjects was Russian bilingual students. All subjects participated in two working memory tasks (verbal, visuospatial), and two attention tasks (selective attention, interference suppression). The psychological characteristics of bi- and trilingual people seem to differ, based upon the level of proficiency in a language, and the level of importance it occupies in a person’s life. To emphasize, language can be used in cognitive, emotive, and social spheres, meaning that one can use language to perform cognitive tasks, to reach emotional states or to communicate with others. When first learning a new language, we have to actively ignore our easily accessible native language words while struggling to express our thoughts in a novel language. The problem of bilingualism is especially relevant in modern society, bent on globalism, expansion, and international communications. The current research explains the idea of bi- or trilingualism and psycholinguistics, i.e. the way the logic and mentality of speakers of one language or another differ from those of the others. The results of the proposed research can be used into both creating a proper working space for bi- or trilingual people, able to make full use of their abilities and talents, and also create teaching programs for people in a way that wouldn’t strain them or make them stop learning the language.
EVALUATING YOUR OWN FACE RECOGNITION ABILITY: VALIDATION OF THE STIRLING FACE RECOGNITION SCALE IN A TURKISH SAMPLE

Aysegul Aydinlik
Senem Oren
Aycan Kapucu
Sonia Amado
Ege University (Izmir, Turkey)

Individual differences in the ability to recognize unfamiliar faces have been well documented with the recent discovery of super-recognizers who are individuals with extraordinary face recognition skills. However, little is known whether people have accurate insights into their face recognition abilities or to what extent people’s self-evaluations regarding to their own performance of recognizing unfamiliar faces can be measured. In order to address these issues, the most comprehensive self-assessment measure has been developed is the Stirling Face Recognition Scale (SFRS). However, reliability and validity of this scale for Turkish sample have not been assessed. Therefore, the primary goal of the present study is evaluating the validity and the reliability of the SFRS for Turkish sample. In addition to this, it is also aimed to examine the relationship between individuals’ perceived and actual face recognition performances. In order to achieve these goals, a Turkish version of SFRS (SFRS-T) was constructed via following translation-back translation procedure and adaptation of SFRS -T is conducted with a sample of 200 university students. Reliability and validity analyses were carried for SFRS-T. In the second phase of the study, a sample of 50 university students were asked to complete Cambridge Face Memory Test (CFMT) and Glasgow Face Matching Test (GFMT) as well as SFRS-T. In order to evaluate the accuracy of self-evaluations of individuals, the relationship between the total scores obtained from SFRS-T, CFMT and GFMT will be examined. Analyses are still in progress and the results will be discussed on the basis of the previous findings regarding to the relationship between individuals’ perceived and actual face recognition performances.
EMOTIONAL INTELLIGENCE IN THE STRUCTURE OF SUCCESSFUL ENTREPRENEURIAL ACTIVITY

Irina Kotlyarova
Belgorodskiy Gosudarstvennyy Nacionalnyy Issledovatelskiy Universitet (Belgorod, Russia)

At the Davos world Forum emotional intelligence was included in the top 10 necessary qualities of entrepreneurs. This is due to progressive changes in the business environment. The hierarchical structure of the entrepreneur’s activity, which denies the manifestation of emotions in the workplace, is replaced by the need to take into account the “human factor”. Emotional intelligence becomes a key component of a successful entrepreneur’s personality. The structure of emotional intelligence (EQ), according to domestic and foreign (I. N. Andreeva, V. S. Yurkevich, R. Bar-On, D. Goulman, K. Schwab, etc.) psychologists, is a complex of multidirectional parameters, including: the comprehension and regulation of their own emotions and goals, and with this recognition of other people’s emotions and influence on their behavior. According to the statement of neuropsychologists (E. d. Chomsky, a. b.), emotions are not just a reaction of the nervous system, but an important part of the intellect. Emotions contain information, competent understanding and the use of which will lead to increased productivity, as opposed to ignoring and suppressing emotions, lowering EQ. In business, the basis of activity is intellectual work. Emotional intelligence — an internal resource to increase productivity, a kind of lifting force for the development of the production team. The need for the development of emotional intelligence of the entrepreneur due to factors such as: — rapid growth of changes in society, — change of product competition to quality service competition — changes in the organizational structure of the production team — change of values of owners and managers: the need for self-realization, the company’s mission, autonomy, — changing the requirements for the ideal employee. The experimental study of the influence of the emotional intelligence of the Manager on the success of entrepreneurial activity will create a clear model of an effective entrepreneur.
PERSONALITY TRAITS AND GRATITUDE: THE MEDIATING ROLE OF POSITIVE THINKING

Agnieszka Malinowska
Wojciech Rodzeń
Małgorzata Pastusiak
Natalia Wojtczak
Małgorzata Szcześniak
University of Szczecin (Szczecin, Poland)

In recent years researchers have revealed that gratitude, conceptualized as an empathetic and social emotion, is positively correlated with extraversion, agreeableness, and consciousness, and negatively related to neuroticism (McCullough et al., 2002, 2004). Personality traits also predict unique variance in grateful disposition. Thus, grateful people characterize themselves by being active and energetic, warm and cooperative, self-disciplined, and less prone to psychological stress. However, it can be hypothesized that relationship between personality and gratitude might be more complex than a simple bivariate relation. Therefore, the purpose of this study was twofold. First, we assessed personality correlates and determinants of gratitude. Second, we focused on the mediating role of optimism between personality traits and gratitude, assuming that being optimistic might modify direct association between those variables. The research was conducted on the group of 161 participants who completed IPIP-BFM-20 (personality traits; Topolewska-Siedzik et al., 2014), OPEB (optimism; Czerw, 2001), and GQ-6 (gratitude; Kossakowska and Kwiatek, 2014). The mean age of the respondents was M=23.82 with SD=8.470 (range=18-60 years). Most were women (80%).

The results illustrate a significant correlation between gratitude and personality traits (extraversion r=0.36**; emotional stability r=0.22**; and agreeableness r=0.51**), gratitude and all the dimensions of optimism (achievement orientation r=0.41**; incaution r=0.16*; positive thinking r=0.63**; openness r=0.24**). A linear regression shows that correlating traits are predictors of gratitude and explain the dependent variable in almost 32% (cR²=0.316; R=0.573; F163,3=25.597; p=0.001). Accordingly, the results of the stepwise analysis suggest that individuals who are kind and sympathetic, imperturbable and calm, gregarious and talkative tend to be more appreciative and grateful. Finally, investigation of the mediating role of optimism reveals that agreeableness (β=0.508 → β=0.316, z=1.992, p=.046), emotional stability (β=0.223 → β=0.147, z=3.214, p=.001), and extraversion (β=0.361 → β=0.133, z=2.936, p=.003) were significantly reduced upon the inclusion of positive thinking. Engaging in positive thinking may explain why extraversion, emotional stability, and agreeableness do not necessarily translate into the development of grateful behaviors. It seems that gratitude may depend also on the hope that fate, other people or the world favor us regardless of our own actions (Czerw, 2015).
The current trends in childhood change bring up the problem of the well-being of a child's personal development. The transformation of the children's play culture serves as the basis for understanding the conditions for the successful development and positive socialization of the child. The appeal of our study to the older preschool age is determined by its fundamental importance for the successful adaptation to a new social development situation in the younger school age (L. I. Bozhovich, L. S. Vygotsky, A. N. Leontyev, D. B. Elkonin, etc.). As L. I. Bozhovich notes, the nature of these changes in a child's life will largely depend on "what the child comes to at this age stage...". Achievements in the development at the previous age stage are a condition for the well-being of the child in subsequent periods of life. The aim of our study was to study the formation of self-regulation in play activity in children of senior preschool age. For this, we used the method of U. V. Ufenkova. The sample of the study consisted of 220 pupils from pre-school institutions of the Republic of Belarus aged 5-7 years (107 boys, 113 girls). The results of the study showed that in the majority of children in the sample studied, the second (44%) and third (30.5%) levels of self-regulation were revealed. While the first and fourth levels of self-regulation are formed in older preschoolers much less frequently: 19% and 5%, respectively. The extreme degree of general mental immaturity (fifth level) was demonstrated by 1.5% of the subjects. Despite the fact that the distribution of the characteristic of self-regulation differs from the uniform one, we obtained statistically significant correlation coefficients between the level of formation of self-regulation and the level of development of the subject-role-playing game (with p <0.01). Significant differences were also found according to the Kruskol-Wallis H-test in the levels of self-regulation among preschoolers with different levels of development of the role-playing plot game (with p <0.001). This confirms the fact that playing activity remains an important condition for the development of the child's arbitrariness and his well-being.
STUDY OF THERAPEUTIC DROPOUT IN A UNIVERSITY CLINIC, ARE THE EFFECTS MAINTAINED?

Alba Luque González
Cristina Casadevante de la Fuente
Universidad Autónoma de Madrid (Madrid, Spain)

Therapeutic dropout is a phenomenon that frequently occurs in psychological services. Scientific literature tends to study therapeutic success rather than dropout. In addition, there is no consensus on the definition of the term dropout, which makes difficulties over the dropout’s study and on the other hand, when the dropout occurs, we do not usually have too much information why it occurs, so it is difficult to make an analysis about it. In this research the dropout will be understood as the therapeutic term decided unilaterally by the patient without having fulfilled the majority of the objectives that were raised in the evaluation based on the functional analysis previously performed. This perspective coincides with the dropout therapeutic definition proposed by Hatchett and Park (2003). The aim of this study is to investigate the factors that can influence the dropout, as well as if these factors are temporarily maintained. The research replicates a previous investigation with the data from the 2014 onwards. At the Applied Psychology Clinic of the Autonomus University of Madrid (CPA-UAM) there is approximately an average of 120 annual cases. Approximately 30% of patients abandon therapy before finalizing it. The results of the research help us to understand and anticipate possible dropouts, so that we can act therapeutically to prevent the patient from leaving the therapy prematurely.
GENETIC AND ENVIRONMENTAL COMPONENTS OF THE INDIVIDUAL DIFFERENCES IN RESPONSE TIME DISTRIBUTION

Liya Merzon
National Research University Higher School of Economics (Moscow, Russia)

Ivan Voronin
Psychological Institute of Russian Academy of Education (Moscow, Russia)

Speed of information processing is an important characteristic that affects both current and long-term information accumulation and processing. Shorter response time (RT) in relatively simple choice tasks is associated with larger working memory capacity and higher level of intelligence. The strength of this association varies depending on complexity of the task. The distribution of RT across trial in a task is usually described as an ex-Gaussian distribution, a mix of normal and exponential distributions. The exponential part captures the number of slow responses which are known to be better associated with complex cognitive abilities. Our study aimed to implement a behavior genetic analysis of the variation in characteristics of RT distribution.

Methods
The sample included 54 MZ and 82 DZ twin pairs from Russia, mean age 12.9 years, SD=2.6 years. The twins were assessed individually with Cambridge Neuropsychological Test Automated Battery (CANTAB) on a tablet PC with touch screen. We used the RT data from ‘Reaction Time’ (RTI) and ‘Pattern Recognition Memory’ (PRM) tests to estimate mean RT, variation of RT and number of slow responses. To compute genetic and environmental variation we applied a univariate twin model that provides the estimates of: genetic effects, shared environmental effects and non-shared environmental effects. Findings
We discovered low cross-twin similarity in both MZ and DZ twins, under 0.4. High variability of similarity measures suggests that situational environmental factors (or non-shared environment) may dominate in individual differences of RT distribution across tasks. The twin analysis supported this assumption: for most distribution indices at least 75% of the individual differences were accounted for non-shared environment. The exception was mean RT in PRM task where genetic and non-shared environmental effects explained same amount of variation (about 50%). Discussion
Our results show that CANTAB is not a particularly suitable tool for the study of the properties of RT distribution. The main limitation is a small number of trials in each test (24 or less) that is not sufficient for reliable assessment of mean, variation and proportion of slow responses. The research was supported by the grant 17-36-01135 from the Russian Foundation for Basic Research.
The aims of the present study were a) to validate a new version of the Emotional Stroop task containing colored emotional expressions pictures in 18 females (Experiment 1), and b) to explore the influence menstrual cycle -follicular and luteal phases- on the performance of this task (Experiment 2; 18 females). The task of the participants was to detect whether two faces were colored with the same or different color (red vs. blue), regardless of the emotional expression (happiness vs anger). The results showed a congruence effect from the color in both experiments and a differential performance pattern in the Stroop task depending on the degree of interference by color and/or emotional expression. Finally, the results point at the existence of differences in the performance according to the menstrual cycle phase, particularly, on the luteal phase between incongruent trials in color and emotional expression, and incongruent trials in color but congruent in facial expressions. This pattern is in line with other studies that reported a poor performance to recognize emotional expressions during the luteal phase.
REVIVAL, THE EUROPEAN PROJECT. THE EXPERIENCE OF SPAZIO DONNA ASSOCIATION’S PSYCHOLOGISTS ADOPTING EUROPEAN PROCEDURES FOR HO

Marica Vicale
Ilenia Sanzo
Ilaria Boccagna
Spazio Donna (Caserta, Italy)

The project aims to collect the testing of a working group of psychologists on innovative methods for the protection of women who are victims of gender violence, the management of new services dedicated to them and health care procedures. It is crucial to start from research on current best practices against gender violence taken in each partner country to define the intervention model and to share among all member countries of the project (Italy, Spain, Bulgaria). The aim is to define, conceptualize and systematize good practices of hosting and taking care of victims and to analyse existing protocols in the different member states. The project is divided into several phases: the first step to improve the implementation and the definition of solutions and innovative intervention policies against gender violence is the analysis of the results, processing of important research on the topic and the collection of accurate data at regional level. Afterwards, mapping of existing services operating in support of women in the legal, social and health area among the partner countries and analysis of the difficulties and the local cultural and communication barriers obstructing the reporting of violence by women, in order to detect the problems and the needs of services and interventions that ensure access to justice. The research designs an innovative model of intervention which consists of: The definition of psychological reporting, as an innovative tool to assess the mental state of the victim, can be useful to indicate the risk of lethality for the victim; The setting up of the Trust Centre, as a meeting space, mutual information, planning decisions for all operators involved in the support and treatment of women victims of violence and as counselling space for women too; The opening of the new Pink Emergency Room in Hospitals, as a space dedicated to women victims of violence which provides integration between medical specialist and psychological-social intervention. The exchange of innovative practices will be guaranteed by a Handbook describing the REVIVAL model, including guidelines, operative procedures and activities, tool box for professionals shared online.
EVALUATION OF EARLY CHILDHOOD BILINGUAL LEARNING ENVIRONMENT AND CHILD DEVELOPMENT

Evgeniya Shishova
Kazan Federal University (Kazan, Russia)

Bilingual education becomes increasingly important having broad perspectives in the modern educational system. To improve the bilingual development in children and their communicative competence in a multicultural education, we need to create a system of integrated psychological and pedagogical support for the formation of early bilingualism. The purpose of our research is theoretical substantiation, development and empirical approbation of the educational environment evaluation model, which will contribute to the effective bilingual education of preschool children. The model has practical significance for improving the quality of bilingual education, one of its tasks being the development of the child’s personality. This work is based on the research by Bialystok and Martin (2004), showing that bilinguals outperform monolinguals, the study by Protasova (2005), which considers the factors, influencing early childhood multilingualism, and the works on a positive impact of bilingualism on cognitive development (Belyanin, 2009). The analysis of the data is based on theoretical foundations of sociocultural studies devoted to the educational environment as a source of a person’s mental development (Vygotsky, 1962; Bronfenbrenner, 1999). Our study of the early childhood bilingual learning environment was conducted in eight bilingual pre-school education institutions in the Republic of Tatarstan (part of Russia), mostly populated by the Tatars and Russians, in a megalopolis with a population of more than one million people, on a study sample of 528 people (24 teachers and 504 preschoolers). For diagnostic purposes were used international criteria for assessing the quality of preschool education, ECERS and the children were tested on well known measures of executive function. We established that the formation of a strong bilingualism is determined by the specifics of the socio-cultural conditions, in which children’s speech is developed. Here, the significant factors are: children’s cognitive development and their age, the level of proficiency in the native language and their personal qualities, especially their communicative features. We have specified a set of indicators of psychological evaluation by summarizing the results of our previously collected data analysis. Among the main components we can name multicultural, cognitive and activity-based, and communicative components.
A MODEL OF PERSONAL DISCOURSE ACQUISITION: METHODS, APPROACHES, AND PRELIMINARY INSIGHTS

Ingrida Balčiūnienė  
Vytautas Magnus University (Kaunas, Lithuania)

Alexandr Kornev  
Saint-Petersburg State Pediatric Medical University (Saint-Petersburg, Russia)

Background. Development of early communication skills is an important part of personality formation. Personal narrative competence is closely related to identity construction and ‘autobiographical self’ development (Bruner, 2004). But we still lack studies in the early conversational discourse acquisition, its individual variability, and relation with the development of personal cognitive resources. One more problem is to build an optimal methodology for elicitation different genres of oral discourse in different communicative contexts. One of the key questions is: how are oral personal discourse competence and everyday life experience interacting?

Methods. The subjects of the study were 24 Russian typically-developing preschool-age children with normal nonverbal IQ, without hearing or vision disorders.

In this presentation, we focus on the first wave of a longitudinal study when the mean age of the subjects was 49 months, i.e. the initial stage of the most critical period for the personal discourse development. During this stage of the study, psycholinguistic and pragmalinguistic approach to discourse production was employed. Three genres of personal discourse were elicited: 1) personal narratives were collected according to the Conversational Map Elicitation Procedure (Peterson, McCabe, 1983); 2) fictional narratives were collected according to strongly structured procedure of story-telling and retelling (Balčiūnienė, Kornev, 2016); and 3) daily conversations were elicited according to a method of joint activity. The sessions were audio-recorded and transcribed by means of the CHAT tools for pragmalinguistic analysis.

Findings. Our results proved that at the age of fourth, the children were able already for the proper modification of speech and communicative strategies in accordance with the requirements of the communicative and social situation, but these skills still depended on the interlocutors’ communicative behavior. In the presentation, macrostructural and discursive similarities and differences between the genres of the personal discourse will be further discussed.

Discussion. Although the study is still at the initial stage, the results shed a light on the first emergence of narratives in the context of the daily conversation and revealed a complexity and variety of different linguistic and communicative skills necessary for personal discourse development.

The study was supported by a research grant No.18-18-00114 from the Russian Science Foundation.
ELABORATION OF SCREENING SCALES FOR EARLY DETECTION OF DEVELOPMENTAL DELAY IN RUSSIAN PRESCHOOL CHILDREN

Andrey Nasledov
Sergey Miroshnikov
Liubov Tkacheva
Saint-Petersburg State University (Saint-Petersburg, Russia)

There are lots of screenings of cognitive development of children which are used worldwide for timely detection of developmental delays (DD), but not in Russia. The aim of the study was to develop screening scales to identify the risk group for DD among preschool children. The study involved 1708 children aged 4-6 years. The tool “Multifactor study of cognitive development” (Miroshnikov, 2001) was used for data collection. A peculiarity of this tool is reflected in an initially wide range of the test tasks, selected by the experts in accordance with the calendar age of the child. More than 200 tasks were used for each age (4-5-6-year-olds). Factor and discriminant analysis were carried out to construct scales according to each age (6 — 7 points in each), which most accurately predict the Diagnosis (Norm/DD). Structural equation modeling (SEM) was used to verify the prediction model. The analysis was carried out in the same sequence separately for each age. The key variables were selected according to the following requirements: each of the remaining variables was included in only one factor with a load of at least 0.4; each factor included at least 5 of these variables; calculated factors together provided the maximum accuracy of the Diagnosis prediction (DA); variables included in each factor, formed a reliable scale for internal consistency (Cronbach’s alpha); factor validity scales was verified byConfirmatory factor analysis. For each age, a set of 3 factors, satisfying all the requirements, was obtained. The factors coincided by the type of variables united in each of them regardless of age (for the younger — simpler, for the older — more complex): 1) “General awareness”; 2) “Motor skills; 3) “Logical reasoning”. SEM confirmed that the selected scales are indicators of the General ability factor, which is the main predictor of the Diagnosis. Thus short scales for rapid diagnosis of DD in preschool children were constructed, characterized by high sensitivity and specificity of the forecast. The study was supported by the RFBR grant #17-06-00989-ОГН
MENTAL ILLNESS AS A CONSEQUENCE OF PSYCHOLOGICAL TRAUMAS

Sergio Salvatore Amico
Ordine degli Psicologi della Regione Siciliana (Catania, Italy)

To understand mental illness, we must consider our Autonomic Nervous System Emotional Regulation, and we must also focus on brain’s Neuroplasticity and our evolutionary tendency to adaptation. Freud, Ferenczi and Alexander, proposed two opposite terms: Alloplastic and Autoplastic. In the alloplastic adaptation the external situation is changed. In the autoplastic adaptation the person changes together with his internal environment, adapting himself to the situation. When we react to an adversity, we can modify the environment in order to solve it (alloplastic adaptation), or we can modify ourselves (autoplastic adaptation), learning from that situation. A third process is here explained: it occurs when we can’t deal with a situation, when an event is too much for our nervous system so that our Autonomic Nervous System brings out an ancient dorsal-vagal strategy, which is Dissociation. Dissociation is a protective blocking defensive mechanism, an autoplastic reaction, but it is a self-alienation instead of being adaptive, because it inhibits emotionally overwhelmed nerve circuits! This type of protection may actively change, in many ways, up to block our natural flow of mental processes. This third way is described as a protecting autoplastic ALIENATION, and Dissociation is explained as a Dissociative Protective Double Caution. The first caution is TO REMEMBER, while the second caution is TO FORGET!

Emotional self-regulation is affected by Dissociation, resulting in an emotional dysregulation, involving an excess of activation or a deficit of activation. For this reason, anxiolytics and antidepressants are widely used drugs. Psychological trauma is an autoplastic, natural, adaptive, defensive, protective, but extreme response. A subjective reaction to an adverse, overwhelming event, involving a Dissociative Protective Double Caution, which causes the Post-Traumatic Dys-Regulation. It is "too much" for the nervous system, it is a critical collapse of the personal feeling of safety and leads to a protecting autoplastic ALIENATION, leading to Dissociation. Trauma consequences can be treated and solved. But, as long as they are active, they absorb psychic energies. Working on the feeling of safety is crucial.

Post-Traumatic Dys-Regulation is reversible! So the Reversible Post-Traumatic Dys-Regulation (RPTDR) is here proposed as the only mental illness.

THE SELF-REPAIRING RETELLING IN THE FIGURATIVE ARTS

Filomena Annigliato
Ordine degli Psicologi della Campania (Napoli, Italy)

This work is based on a new dream theory. The work is taken from a chapter of Dr. Giovanni Madonna and his collaborators’book, and it is the attempt to apply the new theory of Dr. Giovanni Madonna’s dream to artistic production and above all to painting. The attempt is to search in artistic works and especially in painting the signs of a natural and self-generating inner work aimed at self-repairing and self-healing that every creature puts into action when there are organic wounds as well as psychological wounds. In this work there are no numbers or scientific experiments in the strict sense, but new hypotheses for working in psychotherapy. So the author analyzed some paintings by Caravaggio and hypothesized that the wound created in his mind concerned a clear separation, a split, between the sacred and the profane, and she hypothesized that Caravaggio worked inwardly and unconsciously to recompose the fracture
that generated him suffering in life and in relationships. Then the author analyzed some paintings by Van Gogh and hypothesized that the separation that generated suffering for him, concerned a profound split between two parts of himself. He felt the separation between belonging to the world and the difficulty of being in the world, the strangeness of the world that seemed hostile to him. Both Caravaggio and Van Gogh find a way through painting to recompose the lacerations created in their ecology of mind. Both artists after having painted the last works in which the recomposition of mental lacerations is revealed, died; it almost seems as if they had recomposed and also settled their debt with the world of the living.

EXAMINING RELATIONSHIPS BETWEEN BODY MOVEMENT EXPERIENCES AND PROACTIVE AND REACTIVE COGNITIVE CONTROL

Russell Sarwar Kabir
Xinyi Liu
Yu Kawamata
Yutaka Haramaki
Fujikawa Takuya
Hiroshima University (Higashihiroshima, Japan)

Dohsa-hou is an original Japanese psychotherapy that connects motor action to psychology through a theorized process of intention, effort, and enacted body movement. In the approach, the therapist assists in identifying set points that are thought to be conducive to various changes in cognitive, emotional, and behavioral regulation. The experience of body movements that result in these changes have been stipulated as comprising movement quality components: appraisals of the performance itself that relate to a sense of body control and that of the feeling states that accompany the sense of having performed the movement attentively. This theory suggests the use of cognitive resources in movement enactment, and a study revealed that Dohsa-hou improved response inhibition in cognitive control as understood by Stroop task performance. However, the types or strategies of associated cognitive control are still unclear. This study experimentally examined relationships of clinically-applied Dohsa-hou body movements and proactive (maintaining and preparing for goals) and reactive (responding flexibly to the environment) mode of cognitive control. Following two shoulder elevation tasks (with guided attention to movement performance and without), participants (N = 30) completed the Dohsa-hou Movement Experiences Scale (Takeuchi, 2017) and performed the AX version of the Continuous Performance Task (Braver et al., 2009) to assess the dominance of proactive or reactive control mode between task types. The results of regression analyses showed that a factor of internal attention to the body in the Dohsa-hou Movement Experiences Scale predicted proactive control (β = 1.651, p < .05, R² = .769) and another factor for performing the movement with a sense of ownership over the body predicted reactive control (β = -1.849, p < .05, R² = .769). This study preliminarily suggested that control mode dominance is associated with differences in the type of subjective experience of feeling states associated with movement either accompanying or evaluated by the user performing the task. This indicates a possible specificity in cognitive control modes based on movement experience quality and goal maintenance in the movement tasks, which may underpin their utility in clinical applications.
CASE REPORT OF RELAXATION EXPERIENCE TO SUPPORT BODY-MEDIATED COMMUNICATION IN MOTHER-CHILD INTERACTIONS COMPARED BY FREE PLAY

Yuka Mizuno
Xinyi Liu
Russell Kabir
Yutaka Haramaki
Hiroshima University (Higashihiroshima, Japan)
Akari Fujii
Specified Medical Corporation Sakuragaoka Hospital (Kumamoto, Japan)

Mother-child relationships are made up of cumulative interactions. Direct interactions begin with evolved bonding instincts such as the rooting reflex and develop from nonverbal communication into coarse and fine motor skills, and eventually through language. The developmentally foundational nature of bodily expression through movement represents a basis for body-mediated communication. Using a recently described psychotherapeutic approach known as Self-Active Relaxation Therapy (SART) that draws attention to body-mediated communication through a set system of relaxation tasks, we conducted a case study designed to gain insight into the dynamics of reciprocal understanding between mothers and their children. The focus of behavioral description was set to the interactions between one mother (28 years old) and her son (2 years and 5 months old). The study was conducted as a support program implementation in an ABA research design in which the A phase consisted of a mother-child free play session as a pre-test, followed by a first B phase experience of SART body-oriented relaxation tasks between the practitioner and the mother, then a second B phase of SART between the mother and her son, and ending with a second mother-child free play session as a post-test A phase for comparison. Qualitative analysis and comparison of the free play sessions revealed some observable changes in behavioral tendencies. The pre-SART session indicated that the child generally led the play session. In the first B phase, it was observed that the mother gradually moved her body actively and at her own pace. In the second B phase, the mother communicated the movements and demonstrated them with incremental understanding of the self-activeness of her child, and the child participated in the movements actively in response. In the post-SART A phase session, the mother was notably invited by the son to play together while illustrating some mutually raised and recognized awareness about each other during play. From the behavioral changes in free play tendencies, this case report provides some initial observation in a support setting that experience with SART as a body-mediated communication tool facilitated some positive mutual interactions between a mother and child.
The main purpose of this study was to examine the effectiveness of maternal emotion regulation strategies on toddlers’ negative affect. Effectiveness was defined as strategies that down-regulated toddler’s negative affect intensity within 10 seconds. Following previous research, we differentiated six maternal strategies. We predicted that strategies involving distraction and verbal warmth would be more effective than other regulatory strategies. We also expected interdyadic variations regarding the effectiveness of maternal strategies. Therefore, we also aimed to explore whether child (e.g. temperament, intensity of negative emotions), maternal (e.g., education) or dyadic characteristics (e.g., timing of contingency) explain some of these interdyadic variations. The sample consisted of 52 American mother-toddler dyads, who participated in a delay-of-gratification task. The task had a duration of four minutes and was video recorded for coding purposes. Research assistants coded the presence of maternal strategies and the intensity of a child’s negative affect (0 to 3) for every five-second epoch. The strategies were categorized into six categories: distraction, physical warmth, verbal warmth, positive, task-appropriate, and negative control. We computed contingency tables in SPSS to determine whether any maternal strategy used was associated with a decrease of toddler’s negative affect. Temperament (Negative Affectivity, Surgency, Effortful Control) was assessed with the Early Childhood Behavior Questionnaire (Putnam & Rothbart, 2006). Preliminary results show that for most toddlers one or two maternal strategies were effective and these strategies varied across dyads. Intrusive and negative control were least effective. It seems that physical warmth and positive control were most effective in decreasing negative affect in toddlers. The interdyadic variations of the effective strategy could be partly explained by child and interdyadic variables. The results partially confirmed our prediction. Verbal warmth was an effective maternal strategy in decreasing toddler negative affect. In addition, physical warmth was effective and, unexpectedly, distraction led to no significant change in the emotional intensity of toddlers. Furthermore, the maternal emotion regulation strategies do not function uniformly across toddlers, as the effectiveness varies. Temperament explained some variation but it seems that mothers mostly adjust their strategies to the child’s task-related characteristics. The relevance of such microgenetic analyses will be discussed.
INFLUENCE OF COLLABORATIVE LEARNING ON THE ACQUISITION OF METACOGNITIVE SKILLS VIA LEARNERS’ SOCIAL SKILLS

Tomohiro Nabeta
Taro Murakami
Sawako Nakamura
Mikiya Taniguchi
Kyushu Women’s University (Kitakyushu, Japan)

Collaborative learning is an educational process by which a group of students works together to solve a problem, create a product, or pursue a goal. Collaborative learning is designed to facilitate students’ metacognitive abilities. The present study examined the effect of collaborative learning on metacognition in a collaborative process (i.e., critical thinking disposition and belief in cooperation). We hypothesized that collaborative learning would facilitate the acquisition of metacognitive skills via the social skills of students such that it would have a positive effect on the metacognitive skills of learners with high, but not those with low, levels of social skills. A pre-test/post-test design was employed. In total, 101 university students participated in a 3-month collaborative learning program. Questionnaires addressing social skills (Kikuchi, 1988), belief in cooperation (Nagahama et al., 2009), and critical thinking disposition (Hirayama & Kusumi, 2004) were used. Belief in cooperation was measured in terms of three constructs: usefulness of cooperation, individual orientation, and inequality. Critical thinking disposition was measured in terms of four constructs: awareness of logical thinking, inquiry-mind, objectiveness, and evidence-based judgment. Awareness of logical thinking (a construct subsumed by critical thinking disposition) was marginally higher in the post-test than in the pre-test. The collaborative learning program enhanced learners’ awareness of logical thinking. The inequality scores (a construct subsumed by belief in cooperation) were higher in the post-test than in the pre-test. That is, collaborative learning increased learners’ inequality. We also categorized learners into four categories based on social skills. The individual orientation (a construct subsumed by belief in cooperation that measures individualism) of those with the highest level of social skills was higher in the post-test than in the pre-test. High scores on individual orientation indicate a belief in the ineffectiveness of cooperation as a method of problem solving. Specifically, our results suggest that those with the highest level of social skills viewed cooperation with others as an ineffective approach to problem solving following their participation in the collaborative learning program.
The attribution of the cause of poverty plays one of the key roles in the decision to help the poor. Past research revealed that attributing poverty to external factors increases willingness to help the poor, while dispositional attributions decrease it [Kluegel, Smith, 1986; Weiner, 2004, 2015]. Although these findings advance our knowledge on the factors that inform the decisions to help the poor, in real life, such decisions are rarely based on a single piece of information. Past studies rarely considered the role of other relevant information in the decisions to help the poor along with the information about the cause of poverty. One such variable is the coping strategies used by the economically disadvantaged individuals to overcome their situation of poverty. In an attempt to bridge this gap, our study considers both the information about the cause of poverty and coping strategies of the poor and aims to assess their individual effects, as well as their interaction, in the decision to help. 200 participants recruited online will read four fictitious descriptions representing an individual in a situation of economic disadvantage. These descriptions will include the information about (1) the cause of poverty (dispositional vs. external) and (2) individual's coping strategies to overcome the situation (active coping vs. passive coping). Upon reading each description, the participants will assess their willingness to help the described person. The results will add to the existing literature on the mechanism underlying the decisions to help the poor.

Several studies have demonstrated that pictures of a human capture our attention. However, the stimuli used in most of these studies were artificial, such as circular arrays of objects against white backgrounds. The aim of the current study was to investigate whether persons capture stimulus-driven attention even in natural scenes. The participants were asked to detect a cat or a person in a natural scene, which contained a cat and/or a person, or not either of them. While performing the tasks, their eye movements were measured. The results showed that cats were detected as quickly as persons, and that irrelevant persons did not interfere with search for cats. However, the irrelevant persons were fixated more frequently when cats were required to detect than the irrelevant cats when persons were required to detect. It suggested that persons capture attention in certain cases but not always.
Childhood maltreatment has a devastating impact on children mental health. Much research has found as main consequence the presence of Posttraumatic Stress Disorder (PTSD) and behavioral problems in abused children, with diagnostic of Developmental Trauma Disorder (DTD). Aims The main purpose of this study was to provide empirical evidence about the effectiveness of cognitive behavioral therapy (CBT) and Focused Trauma-CBT (FT-CBT) for complex posttraumatic stress disorder treatment in maltreated children and adolescents in residential or foster care. For this purpose, the effectiveness of treatment protocol based on the TF-CBT model (Cohen, Mannarino & Deblinger, 2006) was analyzed, with the inclusion of Virtual Reality. Method The final sample consisted of 46 children aged between 6 and 16 years (54% boys and 47.8% girls), of which 67.4% were in residential child care situation and 32.6% in foster care. All the children resented symptoms of complex post-traumatic stress disorder, characterized by affective, physiological, attentional, behavioral and relational deregulations, with PTSD symptoms and deterioration in their daily functioning or maladaptation. Efficacy was analyzed using the "t" Student test and effect size index of the standardized mean difference (d). Results The results showed moderate effect sizes before treatment conditions for indicators of PTSD and deregulations. Conclusions In sum, the overall objective in this investigation has been reached, hence the empirical evidence of the effectiveness of CBT treatment protocols on improving the mental health of abused children is proved. Therefore this research becomes an empirical study in Spain examining the effectiveness of CBT and TF-CBT in the treatment of children adolescents with complex trauma who have been victims of child maltreatment.
Background: Despite the fact that the death of a loved one has traumatic effects on the course of life, a number of studies indicated that many bereaved people can succeed to adapt their changing lives after the natural process of mourning. However, sometimes some bereaved people might continue to experience considerable mourning and suffer from “complicated grief” although the long period of time is passed after a loss (Prigerson, H. G., Vanderwerker, L. C., & Maciejewski, 2008). When the destructive impact of complicated grief on human functionality and psychological well-being is considered, it becomes crucial to figure out the underlying mechanisms explaining why some people are more prone to experience complicated grief. In the light of literature, it is expected that the loss-related factors including age of the deceased, cause of death, time since loss, and subjective closeness with deceased could be risk factors for the development of complicated grief. Therefore, the main aim of the present study was to identify subgroups among bereaved people and to indicate how these subgroups differed from each other depending on loss-related variables and psychological outcomes of experience of loss.

Method: The sample consisted of 384 bereaved people with loss of a significant person in their life within five years. The participants were asked to complete a socio-demographic information form including loss-related variables, Traumatic Grief Inventory-Self Report Version (TGI), Impact of Event Scale-Revised (IES), and Depression, Anxiety and Stress Scale (DASS).

Findings: Latent class analysis was conducted to identify latent classes in terms of the intensity of grief via Latent Gold 4.0 and these groups were compared according to the loss-related variables and psychological outcomes by using ANOVA. Three latent classes (i.e., resilient, traumatic grief, and non-traumatic grief group) were identified. All subgroups differed in almost all lost-related variables (i.e., the age of deceased, the quality of relationship, subjective closeness, and frequency of contact) except time since loss, and in the level of depression, anxiety, stress, and the impact of event.

Discussion: The person-centered analysis of responses to the loss experience is thought to offer deep insight into the distinguishing features of the subgroups of bereaved people. These findings will be examined in the light of literature.
TRAUMA SYMPTOMATOLOGY IN A CLINICAL SAMPLE REFERRED AND ABUSED CHILDREN

Concepción López-Soler
Isabel Cervera-Pérez
V. Arrixaca Hospital (Murcia, Spain)
Antonia Martinez-Pérez
Checa-Solueta Silvia
Sonia Hernández
Universidad de Murcia (Murcia, Spain)

Intimate, domestic or familiar abuse or maltreatment occurs during long lasting periods, when children and adolescents remain ensnared complex and conditioned by large and varied stressing circumstances. Developmental Trauma Disorder (Van der Kolk et al., 2009) collects the most important alterations presented by children and adolescents exposed to multiple trauma and whose develop complex trauma symptomatology, being included in seven main areas (being previously described by Cook et al., 2005): attachment and affective relationships, biology (physic and psychosomatic reactions), affective regulation and self-regulation, awareness (dissociative symptoms), conduct control, cognition and self-concept. The purpose was to estimate the complex trauma symptomatology prevalence and to observe differences between clinical and abused children. Minors abused during childhood by their caregivers will present higher prevalence rates of PTSD and complex trauma symptomatology than those from the clinical sample. The sample was constituted by 115 minors, of whom 74 came from a clinical unit and 41 were maltreated (children in care), all of them evaluated at the Pediatric Psychology Unit of the Clinical University Hospital “Virgen de la Arrixaca” (Murcia, Spain), due to emotional or behavioral symptoms presented. Percentage was calculated for both subsamples, and potential differences between them have been analyzed by Student’s t-test. The complex trauma symptomatology prevalence is much higher and statistically significant at the children in care subsample. These data support the idea of posttraumatic reactions due to family-context maltreatment determine a pathology non included in current diagnoses, leaving more severe minors without a proper diagnosis.
COGNITIVE NEURAL MECHANISMS OF MORAL JUDGMENT IN SPORTS IN CHINESE ATHLETES: A STUDY BASED ON ERPS

Zuosong Chen
Dong Wang
Kun Wang
Shanghai Jiao Tong University (Shanghai, China)

Previous studies of moral judgment in sports mainly focused on the antecedents of moral judgment in sports and the relationship between moral judgment and moral behavior in sports. The underlying neural mechanisms remains to be elucidated. The purpose of the study was to investigate the cognitive neural mechanisms underlying sport moral judgment in Chinese athletes. The article consists of four studies. Study 1 sought to investigate the types and characteristics of moral misconduct behaviors gathered from the Internet and interviews with 90 athletes (age=20.7±1.9 years, 54.4% females), using Nvivo8.0. Based on the study 1, study 2 developed four types of 160 materials of moral judgment in sports. Study 3 (187 athletes, aged 20.8±1.5 years) examined the validity of four types of materials of moral judgment in sports from percentages of affirmative responses, decision times, moral conflicts, moral acceptability, emotional valence and arousal valence. Study 4 (19 athletes, aged 20.0 ± 1.4 years), using event-related potential (ERPs), investigated the cognitive neural mechanisms of different type's moral judgment in Chinese athletes. Types of moral misconduct behaviors in Chinese athletes can be mainly divided into violent behavior, doping, match-fixing or tanking, and self-reported dishonesty. The validity of the experimental materials for the four types of moral judgment in sports was acceptable. Rate of participants’ agreement to the proposed resolution and decision time were not different among the four types of moral judgment (both \( P<0.01 \)). The ERPs results showed that no significant differences were observed between the four types of moral judgment in stimulating lock and reaction lock in which induced every ERP components, and anterior cingulate cortex (i.e. BA10 and BA25) were activated by four types of moral judgment. The findings indicated that the developed experimental materials of moral judgment can be used in researching cognitive neural mechanisms of moral judgment in sports. The four types of moral judgment showed the same cognitive neural mechanisms, which supports the dual-process theory of moral judgment.
THE NEED FOR PSYCHOLOGISTS IN SPORTS

Monica Monaco
Graziella Palmina Zitelli
Fulvio Giardina
Ordine degli Psicologi Regione Siciliana (Palermo, Italy)

Many studies have focused on the effects of psychological intervention on athletic performance and on well-being of athletes, emphasizing the importance of constantly support technical and physical training with sport and exercise psychology. The aim of this study (103 subjects) is to analyze the need for psychologists in sport. In this way it will be possible to encourage the use of this professional support for well-being of athletes, improving their performances through a global training of all their skills. In order to obtain a mapping an action-research was carried with a questionnaire on knowledge of psychologist profession. The sample was selected from sicilian sports operators (eg associations, federations and promotion society) and athletes practicing different disciplines. At the same time, psychologists who deal with sports psychology have been surveyed, gathering information on their training and their experiences. From the first results we observe the persistence of a tendency to assimilate the psychologist’s interventions in sports contexts to those carried out in the clinical setting. Therefore it seems important to design campaigns promoting a better knowledge of all potential of the psychologist in sports. At the same time, there is a low propensity of sicilian psychologists to train on sport psychology and to work routinely in this area. Consequently, it seems important to increase university training on sport psychology developing the specific professional skills most requested.
MULTI-SCALE WAVELET KERNEL EXTREME LEARNING MACHINE FOR DETECTION OF CONCEALED INFORMATION

Qi Liu
Liu Hongguang
People's Public Security University of China (Beijing, China)

Concealed information detection is getting more and more attention in fields of psychophysiological detection and cognitive psychology, especially methods based on machine learning and P300 component, not only for better efficiency and accuracy, but also for electroencephalogram (EEG) signals cannot be controlled by human intentions. For that, a novel kernel extreme learning machine algorithm is proposed and applied in a mock crime scenario. In order to be closer to practical cases, there are three kinds of subjects needed to be discriminated, which is much complex than binary classification task. DPCTP protocol is adopted using designed words as stimulus series. 36 healthy subjects (26 males, 10 females) were selected from college students and divided into three groups: 15 guilty ones, 7 innocent ones and 14 informed ones. 64-channel EEG signals were recorded. After preprocessing, a channel selected process is utilized in this paper to reduce the dimension of feature vectors. Then, the discrete wavelet packet decomposition is used to extract features. Finally, the multi-scale wavelet kernel extreme learning machine classifier is proposed to recognize group that a single subject belongs to. Experimental results show that the proposed algorithm achieves good recognition performance and has low computational burden. Without regard to informed subjects, the accuracy of group identification rate of a single subject is 100% under the threshold [0.1, 0.8]. With informed group, 1 guilty was wrongly judged as informed; 1 informed was wrongly judged as guilty and another informed was wrongly judged as innocent; two innocent were wrongly judged as informed. The case-related information of the simulated theft case can be well recognized, and the efficiency and accuracy is much higher than conventional methods. In addition, with the participation of the informed group, there are several misjudgments, which just illustrate the necessity of three groups. Moreover, the proposed classifier has high approximation capacity which makes it more convenient to use.
PROCRASTINATION AS A RISK FACTOR OF THE PSYCHOLOGICAL SAFETY OF EDUCATIONAL ENVIRONMENT

Anna Litvinova
Aleksej Kokurin
Anna Koteneva
Valentina Ekimova
Vyacheslav Pozdnyakov
Moscow State University of Psychology & Education (Moscow, Russia)

Procrastination, as the conscious delay and non-performance by the subject of the planned affairs, is usually followed by feeling of internal discomfort and unpleasant emotional experiences connected with expectation of negative consequences (P. Steele, K. Lay). Constant putting off impending tasks by students may result in reduced motivation and satisfaction with study process and relations with teachers and classmates, i.e. the psychological safety of educational environment reduction. The main objective was evaluation of psychological safety, interpersonal relations and motivation of students with different levels of procrastination. 95 students of Humanities (23 men and 72 women, mean age — 18.2) participated in the research. The diagnostic methods were "Students Procrastination Scale" (by K.Lay), "Academic Motivation Scale" (by R.J. Vallerand), the questionnaire "Self-Esteem of Study Motivation" (by N.A. Bakshaeva, A.A. Verbitzkiy) and the questionnaire "Quality of Interpersonal Relations in Education Environment". Statistical data analyses included variance analysis, statistical hypothesis testing (Mann-Whitney U Test), and correlation analysis (rank correlation coefficient). 53.3% of students appeared to have a high level of procrastination, and 46.7% had a mediate one. In the group of students with mediate procrastination interpersonal interactions were more friendly and the levels of their study, cognitive and professional motivation significantly higher than those of the students with high procrastination. In mediate procrastination group statistically significant positive correlations (p=0.05) were identified between friendliness and motivation of self-development, negative correlations — between friendliness and introjected and extrinsic motivation. At the same time, positive relationship and self-development intensions created the psychological safety of education environment. In high procrastination group dominated conflict relations, introjected motivation, and amotivation. The more friendly students were, the lower level of cognitive motivation they had, and more they accepted the other, the less they were motivated for success. In this group hostility and manipulative relations positively correlated (p=0.01) with introjected and intrinsic motivation, and amotivation. In conclusion, the high level of procrastination is undoubted risk factor of the psychological safety of educational environment. Students with high procrastination are inclined for conflict, manipulative relations and hostility, correlated in turn with introjected and extrinsic motivation, and amotivation.
ONLINE DATING SITES: HOW PEOPLE PRESENT THEMSELVES AND HOW SCHEMAS ARE RELATED?

Gülşah Durna  
Özlem Serap Özkan  
Arzu Araz  
Dokuz Eylül University (Izmir, Turkey)

Online dating sites are services that allow people to create a personal profile on the Internet and help them find friends or romantic partners via this profile. While using these profiles, people represent themselves in a way they want to create certain image of themselves by playing certain roles and exhibiting strategic activities. Self-presentation tactics allow people to determine which personal information is given or not and how it is transferred in social networks. When related literature reviewed, although self-presentation tactics used in social networks such as Facebook, Twitter and Instagram have been widely investigated in Turkey, such research in the context of online dating sites is rarely conducted. Schema modes represent early childhood schemas, which are activated at the moment and are defined as emotional and cognitive patterns, which shape individual’s behavior. It is thought that individual’ schema modes may be the determinant construct of the self-presentation tactics they used in online dating sites. According to self-monitoring theory, some people might observe and control their behavior by using clues that indicate which expressions or behaviors are appropriate.

Literature indicated that there is a significant relationship between self-presentation tactics and self-monitoring. Accordingly, the present study aims to investigate the moderator role of self-monitoring on the relationship between schema modes and self-presentation tactics. The sample will consist of at least 250 online dating site (e.g.: Tinder, Okcupid, Connected2.me, etc.) users. The instrument set including Demographic Information Form, Schema Mode Inventory (Lobbestael, van Vreeswijk, Spinhoven, Schouten & Arntz, 2010), Self-Monitoring Scale (Lennox & Wolfe, 1984) and Self-Presentation Tactics Scale (Lee, Quigley, Nesler, Corbett & Tedeschi, 1999) will be administrated to the participant. Descriptive, correlational, moderator analyses will be conducted. The results will be discussed within the scope of related literature. Present study is the first that combines social and clinical psychology in terms of studied variables. Relating self-presentation tactics with schema modes and self-monitoring will provide important contributions to the field.
AN ATTACHMENT THEORY PERSPECTIVE ON RELATIONSHIPS WITH PET: ATTACHMENT STYLE AND HUMAN–PET ATTACHMENT

Kumiko Fujioka
Yamagata University (Yamagata, Japan)

A pet is a natural object of attachment. Recent research has focused on human-pet relationship from the perspective of Bowlby’s attachment theory. Zilcha-Mano et al. (2012) examined the extent to which pets function as attachment figures and reported that pets are capable of providing safe-haven and secure-base for their owners. Kurdek (2009) also suggested that the likelihood that owners turned to their pet dogs as safe-haven, rather than family members. These studies revealed that pets can serve as attachment figures. However, association between human attachment and pet attachment remains unclear. The purpose of the present study was to examine the adult attachment style differences in features of human-pet attachment. Four hundred eighty-four Japanese college students completed the questionnaire, consisted of measures of attachment functions of a pet and a best friend, attachment style, and attachment behaviors of pet. One hundred forty-one students of them were pet owners. Items for attachment function scale were obtained from Dog Attachment Measure and Attachment Function Scale for Children and were modified to apply two attachment figures—a best friend and a pet. Both measures consisted of four subscales; proximity maintenance, safe haven, separation distress, and secure base. Attachment style was assessed with Japanese version of the Experiences in Close Relationships scale (ECR, Brennan et al., 1998) was used. Pet owners were divided into four attachment styles (secure, dismissive-avoidant, preoccupied, and fearful-avoidant). ANOVA revealed the attachment style difference for attachment behavior of pet (F(3,55)=4.87, p<.05). Dismissive-avoidant owners and secure owners rated higher than fearful-avoidant owners. Thus, fearful-avoidant owners recognized their pets less show attachment behavior to them than dismissive-avoidant owners and secure owners. Attachment style differences were not found for attachment function of pets. Owners’ attachment style caused no difference in the extent to which they regard their pets as secure base and safe haven, and to which they prefer to be near their pets. Fearful-avoidant owners have less confidence that their pets attach to them, in spite of their attachment orientation to pet. These findings were discussed in terms of mental health implications.
Recent studies revealed that desire thinking have specific role on addiction, eating and impulse control problems. Desire thinking can be explained as a cognitive process involving verbal and imaginal elaboration of a desired activity or object in voluntary way. In addition to this, metacognitions have a role in the precipitation and maintenance of desire thinking process. Current study aims to adaptation of Desire Thinking Questionnaire (DTQ) and Metacognitions about Desire Thinking Questionnaire (MDTQ) into Turkish among Turkish alcohol users. The study is cross-sectional design. Four hundred alcohol users responded an online survey in order to investigate psychometric properties of DTQ and MCDTQ. Exploratory Factor Analysis, Confirmatory Factor Analysis and also Regression Analysis were conducted. In the study DTQ, MCDTQ, The Alcohol Use Disorders Identification Test (AUDIT), The Hospital Anxiety and Depression Scale (HADS), Penn Alcohol Craving Scale (PACS), Social Desirability Scale (SDS) were used. Results showed a two-factor structure of DTQ and a three-factor structure for MDTQ as it is in the original versions. Both scales revealed good internal reliability and temporal stability. Social desirability were used as a control variable. Psychometric properties of DTQ and MDTQ were found to be good. The current study also showed that positive and negative metacognitive beliefs about alcohol use is associated with alcohol use in a Turkish Sample. References Caselli, G., & Spada, M. M. (2011). The desire thinking questionnaire: Development and psychometric properties. Addictive Behaviors, 36(11), 1061-1067. Caselli, G., & Spada, M. M. (2013). The metacognitions about desire thinking questionnaire: development and psychometric properties. Journal of Clinical Psychology, 69(12), 1284-1298.
MEDIATOR ROLE OF PSYCHOLOGICAL FLEXIBILITY IN THE RELATIONSHIP BETWEEN TRAUMATIC GRIEF AND PSYCHOLOGICAL SYMPTOMS

Samet Bas
Selva Ülbe
Dokuz Eylül University (İzmir, Turkey)

Özge Yüksel-Şengün
Izmir University of Economics (İzmir, Turkey)

Duygu Güngör
Dokuz Eylül University (İzmir, Turkey)

Background: When a loved person is lost, grief related feelings such as sadness, anxiety, pain and emptiness are inevitably experienced. In general, bereaved people can successfully deal with grieving process over time. However, especially when the loss is traumatic, it can be difficult to adapt to changing life and maintain mental health. In this regard, some of the recent research indicated that the acceptance of such a traumatic event or showing psychological flexibility, which is a main factor of Acceptance and Commitment Therapy (ACT), could be considered as a protective factor against complicated grief and negative psychological symptoms. Therefore, the present study aims at testing whether psychological flexibility is a mediator of the relationship between traumatic grief and negative psychological symptoms in a Turkish sample.

Methods: The sample in the present study consists of 384 bereaved individuals who experienced loss of a significant other (i.e. a parent, child, sibling, or romantic partner etc.) and live in different cities of Turkey. Participants completed Turkish version of Traumatic Grief Inventory-Self Report Version, Acceptance and Action Questionnaire-II, and Depression, Anxiety and Stress Scale. Psychological flexibility will be measured by Acceptance and Action Questionnaire-II. The mediator role of psychological flexibility in the relationship between traumatic grief and negative psychological symptoms was analyzed with PROCESS macro (Hayes, 2013).

Results: Three separate mediation analyses indicated that psychological flexibility (partially) mediated all relationships between traumatic grief with depression ($\beta = .09, p < .01, 95\%CI = .07, .12, R^2 = .32$), anxiety ($\beta = .07, p < .01, 95\%CI = .06, .10, R^2 = .27$) and stress ($\beta = .08, p < .01, 95\%CI = .06, .10, R^2 = .26$). Psychological flexibility partially explained the relationship between grief intensity and psychological symptoms.

Discussion: Such findings emphasize the critical role of psychological flexibility as a protective factor against to psychological symptoms for bereaved individuals at risk of traumatic grief. In this regard, psychotherapeutic tools of ACT based interventions appear as a new alternative treatment option for bereaved individuals.
Emotion regulation is defined as the ability to reduce, increase or maintain the emotions of individuals by changing the usual flow of emotions (Gross, 2001; Koole, 2009). On the other hand, researches showed that there were relationship between difficulty in emotion regulation and some psychological problems. Internet addiction can be defined as the use of Internet by individuals to disrupt the functionality, lead to excessive mental occupation and reach the situation where control is lost (Young, 1998). The Internet use function shows the individuals for which they use the Internet (e.g. information or friendship) (Kesici and Şahin, 2009). The aim of this study was to determine whether Internet use functions have mediating effect between the difficulty of emotion regulation and Internet addiction in adolescents. The sample of the study consisted of 436 adolescents (girl: 253, boy:183) aged 14-18 years in Turkey. Internet Addiction Scale (IAS), Internet Use Function Questionnaire (IUFQ- four sub-scales: social, information, leisure time and virtual emotional functions) and Difficulties in Emotion Regulation Scale (DERS) were used to collect data. Results showed that IAS total score was predicted by DERS total score and all of the subscales scores of IUFQ. And results also indicated that social and virtual emotional functions (IUFQ subscales) was significant mediators in the relationship between DERS and IAS total scores. Previously, there were studies that revealed the relationship between emotion regulation and Internet addiction (Yu, Kim & Hay, 2013; Akın, 2014; Casale, Caplan & Fioravanti, 2016). There are also studies on the significance of the relationship between Internet addiction and Internet usage function (Li & Chung, 2006; Kesici & Şahin, 2009). However, there is no research on the mediating effect of Internet usage function between emotion regulation and Internet addiction.
A CIVILIZATIONAL TRACK FOR FUTURE DEVELOPMENT OF RUSSIA THROUGH THE EYES OF RUSSIAN YOUNG PEOPLE

Lidiya Matveeva
Tatiana Anikeeva
Julia Mochalova
Aleksandra Makalatiya
Lomonosov Moscow State University (Moscow, Russia)

Media globalization mainstreamed intensification and heartening of communication between countries, and, at the same time, aggravation of conflicts between countries and civilizations. Russia comes to embrace the civilization of Slavic culture-historical type. As N.Ya.Danilevsky put it, its territory, geographically and ethnically, is bordering the western European civilization, on the one hand, and the Asian, eastern civilization on the other. Which track Russia will assume—that depends on civilizational identity of its peoples, and most notably, the young people from different regions of the country. Within the present research we interrogated 260 young people residing in European and Asian parts of the country. Applying the method of psycho-semantic scaling we studied categorical structure of their apprehension of countries which lie within the European civilization, and those within the eastern civilization, as well as the image of Russia, present and future. Processing of results was implemented with the method of factor analysis, followed by correlation analysis of categorical structures of apprehension for all countries in the focus of our investigation. It was revealed that categorical structure of apprehension of the countries brings out, among others, two factors which describe a civilizational component in their image: the factor of "native — alien" country and that of "western civilization — eastern civilization". It appears that the youth believes that the eastern civilization is distinguished by spirituality, purity, chastity, originality, and eternality; as for the western civilization, it is described as dissociated, similar to others, earthly, and temporal. It is essential that the image of present-day Russia, for example, in Perm correlates (at the level of 0,05) with that of united Europe (0,333) and China (0,293). The image of future Russia correlates (at the level of 0,01) with that of united Europe (0,750), China (0,548), Japan (0,582), the USA (0,446), and with the image of present-day Russia (0,703). This may lead to a conclusion that the image of future Russia is apprehended by the youth as a combination of features exposed by western and eastern civilizations. Furthermore, the young people admit a third track (individual or native-grown) of evolution for our civilization.
Multiple Sclerosis (MS) is an immune mediated process affecting a person’s central nervous system. This illness has a significant impact in social relationships, autonomy, or psychological wellbeing reducing the quality of life of those who suffer the illness. Nevertheless, studies have shown that people with MS may also find positive aspects, or benefits, from the illness. These relate to survival strategies based on the search for meaning aimed towards improving Quality of life (QoL) defined as a subjective and objective feeling of general wellbeing or satisfaction regarding important aspects of one's life. The way people use cognitive and behavioral strategies and mechanisms to try to master, minimize or adapt to stressful situations is termed coping. The aim of this study was to analyze the mediating role of coping strategies in the relationship between perceived benefits of MS and Quality of Life. 250 participants took part in the study with a mean age of 41.74 years (sd = 10,34). Participants answered the following measures: Functional Assessment of Multiple Sclerosis (FAMS) (Cella et al.,1996). The Brief COPE-28 (Carver, 1997: problem based, emotional based and other coping strategies). The Psychosocial impact of multiple sclerosis (Mohr et al., 1999; only the benefits of MS subscale). SPSS v.24 and Process v. 3 were used in the analysis. Results from the mediation analysis showed that benefits had no direct effect on QoL. Benefits did have a positive significant effect on emotional support, planning and self-distraction, and marginal and positive on acceptance. Acceptance and emotional support had a positive effect on QoL while denial, planning and self-distraction had a negative effect on QoL. Indirect effects of the mediation show that denial had no significant mediating role, and that acceptance and emotional support positively mediated between benefits and QoL improving the latter. Planning and self-distraction negatively mediated the relationship between benefits and QoL. This study shows that the idea that positive growth from MS can improve QoL is only found when emotional, and not problem, based, coping mechanisms, are used. These results render support for flexibility theories regarding the adaptive nature of coping strategies or mechanisms.
CUBES OR PELLETS: HOW MUCH DOES THE STIMULUS MATERIAL INFLUENCE THE GENDER DIFFERENCES IN A MENTAL-ROTATION TEST?

Martina Rahe
University of Koblenz-Landau (Koblenz, Germany)

In a psychometric mental-rotation test (MRT), males mostly outperform females when the stimulus material consists of cube figures. Discussed reasons for these gender differences are hormones, gender-role socialisation, or experience with spatial abilities. Besides these, task characteristics of the test itself, like rotational axis, stimulus material or familiarity with the rotational objects could influence the performance of males and females. To what extent is the stimulus material responsible for these gender differences? In the present study, 92 undergraduate students (age: M = 20.68, SD = 3.11, 76% females) solved the MRT either with cube figures (C-MRT) or with pellet figures (P-MRT). The P-MRT was structurally equal to the C-MRT with a pellet replacing each cube. Participants had to solve 12 items in 3 minutes and subsequently filled out a questionnaire about their perceived performance. For correctly solved items, the effect of gender was large for the C-MRT (F(1,88) = 16.321; p = .000; eta2 = .156) and small for the P-MRT (F(1,88) = 4.708; p = .033; eta2 = .051). For the number of tried items, males significantly outperformed females only in the C-MRT (F(1,88) = 12.851; p = .001; eta2 = .127) but not in the P-MRT (F(1,88) = 2.599; p = .111; eta2 = .029). In both versions of the test, males rated their performance better than females (C-MRT: F(1,88) = 11.132; p = .001; eta2 = .112, P-MRT: F(1,88) = 6.431; p = .013; eta2 = .068). Possible reasons for the different performances of males and females in both versions of the test could be the perceived stereotypical nature of the cube and pellet figures or the familiarity with these objects. The stimulus material in a test can influence males and females performance and therefore, should be considered carefully in a test or diagnostic setting.

ANCHORING AND ECO-LABELING EFFECTS ON INFERENCE AND PREFERENCE JUDGEMENTS

Hanna Andersson
Ulla Ahonen-Jonnarth
Fredrik Bökman
University of Gävle (Uppsala, Sweden)

Research has shown that several biases are at play when we make judgements about facts or values. Previous studies investigating the anchoring effect suggest that when a question is asked with a reference value our judgement will be affected by the value. This effect occurs in a variety of different domains. However, is this effect of relevance when we make judgements about products with and without organic labels? It is important to understand the psychological mechanisms that underpin how we make judgements about products with an organic label. A deeper understanding about these effects could potentially be a key to promote sustainable consumer behavior and widen our understanding of what affects our reasoning in environmental decisions. The aim of the present study is to investigate the interaction between the anchoring and organic labeling effects. In the first experiment the questions were asked as inference questions. In the second experiment the participants answered questions regarding their preferences. In both experiments participants also answered an environmental concern survey with twelve questions. A computer-based questionnaire was used to collect data. The results will be presented at the conference. The present study contributes to the knowledge if an anchor and organic label could influence when we judge and make environmental decisions.
THE EFFECT OF COLOR CONTRAST BETWEEN CENTER AND SURROUND GRATING ON THE TILT ILLUSION

Jiyeon Jung South
Woo Hyun Jung South
Chungbuk National University (Cheongju, South Korea)

The orientation of center grating could be misperceived due to the orientation of surrounding gratings. This is an example of the tilt illusion. Some studies have investigated whether color could influence on the tilt illusion. However, the effect of color contrast on tilt illusion confounded with lightness contrast in those studies. In this study, lightness contrast of every color grating is the same. It was investigated whether intensity of the tilt illusion could changed depending on color contrast and lightness reversal between center and surround gratings. The color of dark parts and light parts in the grating stimuli were different. The hue of the center and surround grating was matched or not matched. The lightness of the center and surround grating was not reversed or reversed. The results show that the tilt illusion was the largest when hue was matched and lightness was not reversed between center and surround grating. There was no difference in the conditions that hue did not match or lightness was reversed between center and surround grating. In the tilt illusion, it appears to be important that whether center and surround gratings are composed by the same color or not. It seems that both hue and lightness are important factors in orientation perception, but rather than lightness contrast. These results suggest that color contrast can influence on orientation perception independently from lightness contrast.

THE ROLE OF AMBIGUITY IN RECOGNITION OF EMOTIONAL FACIAL EXPRESSIONS ON THE USE OF BODILY CONTEXTUAL INFORMATION

Aslan Karaaslan
Belkıs Durmuş
Sonia Amado
Ege University (Izmir, Turkey)

Recent research has shown that emotion recognition is based not only on facial cues but also on contextual information (body posture, voice, scene...). However, the extent of automatic processing of contextual information and the role ambiguity in the facial expression is still a plausible question. From this point of view, we tested the effect of body postures at different levels of ambiguity (%25, %50, %75 and %100) with a brief presentation of bodily context. In order to test the effect of context, body postures that are emotionally congruent and incongruent with facial expression were used. Facial and bodily stimuli were selected from three emotion categories (angry, sad, disgust). In the procedure, participants were first presented with emotionally congruent/incongruent face-body stimuli (33ms); after a visual mask (80ms) the same face stimuli were present again (150ms) at various levels of ambiguity without body posture. In the test phase, participants had to decide whether the facial stimulus is angry, disgusted or sad. We predicted that the context effect would increase, as the level of ambiguity increased in the facial expression. In addition, recognition of angry facial expressions will be affected more by disgusted body expression (and vice versa) rather than sad body expression. Statistical analyzes are still in progress. The results will be discussed within the framework of the physical similarity approach of emotions.
RELATIONSHIP BETWEEN MINDFULNESS AND ABSTINENCE EFFICACY IN ALCOHOLICS: MEDIATING EFFECTS OF EMOTIONAL PERCEPTION CLARITY AND MEANING OF LIFE

Yun-Hee Choi
Hyun-Kyun Shin
Chonnam National University (Kwangju, South Korea)

This study examined the mediating effects of emotional perception clarity and meaning of life in the relationship between mindfulness and abstinence efficacy. For this study, a total of 180 alcoholics inpatients (mean age=49.13, SD=10.88), 129 males (mean age=50.02, SD=10.62) and 51 females (mean age=46.88, SD=11.31) participated in the survey. The data were analyzed using correlation and multiple regression analysis. The results of this study were as follows: First, mindfulness and abstinence efficacy (r= .35, p<.01), meaning of life and abstinence efficacy (r=.58, p <.01), emotional perception clarity and abstinence efficacy (r=.48, p<.01), emotional perception clarity and meaning of life (r= .56, p<.01), emotion recognition clarity and mindfulness (r= .51, p <.00), mindfulness and meaning of life (r= .40, p<.01) were significantly correlated. And mindfulness (β = .345, p<.001), emotional perception clarity (β = .199, p<.05) and meaning of life (β = .447, p<.001) showed significant mediating effects on relationship between mindfulness and abstinence efficacy(sobel-test: Z=1.730, p< .05). This study clarified the relationship between mindfulness and abstinence efficacy and the mediating variables, thus suggest therapeutic implications of the role and pathway of mindfulness, emotional perception and meaning of life in order to increase abstinence efficacy in alcoholic patients.

CHARACTERISTICS OF PSYCHOLOGICAL EFFECT ON FOLLOWERS OF DESTRUCTIVE CULTS

Liubov Ryumshina
Southern Federal University (Rostov-on-Don, Russia)

In today’s world, the issue of totalitarianism as a form of spiritual and psychological violence, which is based on a variety of techniques that let one control and subdue a large number of people, is still relevant. This is true both with respect to the political regimes and individual communities, among which a special place is occupied by destructive cults. In order to find the specific ways of psychological effect on the followers, we analyzed the speech utterances of cult leaders based on recordings made during the service, and the texts of the weekly newspaper, published by the cult. The content analysis was selected as the main method. The results showed that the methods implemented by the cult leaders directly and indirectly (in the press), in general, are different. But they complement each other and collectively make it possible to keep the followers in cult. The newspaper provides a preparatory stage for it, while preaching is designed to consolidate the effect. They create a sense of chosenness and belonging to the community at the expense of repetitions, imperative utterances, and others. The results give a better understanding of the specific effect on the mass consciousness under totalitarianism and a more meaningful approach to the psychological rehabilitation of its victims.
DYNAMICS OF THE SELF-ASSESSMENT OF SCHOOL STUDENTS OF 6-10 YEARS DUE TO THEIR SATISFACTION WITH THE SOCIAL SITUATION OF DEVELOPMENT

Olga Moskvitina
Psychological Institute of the Russian Academy of Education (Moscow, Russia)

The self-assessment of children of younger school age changes throughout training at elementary school, in many respects depends on achievements in training and the developing person for this age a social situation of development: significant for people around is what pupil is the younger schooler student.

Research objective is identification of features of dynamics of a self-assessment of children of 6-10 years that corresponds to 1-3 classes of comprehensive school, in connection with satisfaction of their age requirements. The scaling method was applied to achievement of a goal: a technique of studying of a self-assessment Dembo-Rubenstein and a technique "Gold age" of Z. Zazzo in modification A.M. Prikhozhan. Results are received by means of the quantitative and qualitative analysis, nonparametric criterion of Kraskella-Uolis, percentage calculations. Self-assessment indicators in all classes very high: values of a median more than 90. To the third class some decrease is planned, but they are in high range. The most significant parameters of a self-assessment are allocated: themselves pupils highly appreciate in the "Friends" parameter 1st and 3rd classes, pupils of 2nd class estimate "Mood"; conditionally low self-assessment in the "Accuracy" parameter — in 1 class, "Health" — in the 2nd class, "Mind" — in the 3rd class.

Identification with age: in 1st class of 30.9% of elections in the long-term future, 18.2% — coincidence with age, 16.4% in the near future. In the 2nd class: a tendency to choose the age which is brought closer to the — 22.5% and 13.5%, but also elections of age significantly younger — 15.3% appear. In the 3rd class the choice of age approaches the — 14.8% and 40.7% and coincides — 18.5%. It is shown that become the main socially caused personally significant qualities accuracy, ability to be on friendly terms, good mood. A self-assessment correspond to adaptation to school requirements, further satisfaction of age requirements with a social situation of development and to the 3rd class — the maximum approach to the age and increase in criticality concerning assessment of the qualities. The received results can be used by teachers, psychologists and parents of pupils of 1-3 classes.
ADAPTATION AND VALIDATION OF THE TURKISH VERSION OF EMOTIONAL PROCESSING SCALE (EPS25)

Cennet Yastibas  
Duygu Gungor Culha  
Gulay Dirik  
Dokuz Eylul University (Izmir, Turkey)

Emotional processing is firstly described by Rachman (1980) as "a process whereby emotional disturbances are absorbed and decline to the extent that other experiences and behavior can proceed without disruption". Although interest on research about role of emotional processing for clinical field has been increasing, Baker et al. (2007) highlighted that there is a lack of psychometrically comprehensive assessment tool and in Turkish literature, there has no available scale to measure emotional processing. Thus, the aim of this study is to adapt EPS25 for the Turkish population and to test psychometric properties of the scale. To test assessment of reliability, Internal consistency was tested by Cronbach’s alpha coefficient and “test-re-test” procedure was applied. Turkish Version of Twenty-Item Toronto Alexithymia Scale and the Turkish version of Courtauld Emotional Control Scale and Turkish Version of Brief Symptom Inventory were used to test validity. Data collecting process is still going on. Preliminary data analysis was undertaken using SPSS Version 23 and LISREL software was used to perform confirmatory factor analysis. 243 undergraduate students from various department were recruited. Mean age of the participants was 21.3 and 57.4% were female (n=139) and 42.6% (n=103) were male. Reliability was tested using Cronbach’s Alpha internal-consistency coefficient and structure validity was assessed with exploratory factor analysis. Internal consistency of five factors was ranged between .57 and 86. It was found that factor structure of the Turkish form of scale consisted with original instrument. In conclusion, adaptation of EPS25 for use in Turkey was successful. The instrument can be used in Turkey as long as its limitations are recognized.
The purpose of this study is to explore the effect of parent-child relationship beliefs emotional blackmail tactic on obedience behavior in career planning/marriage decision-making situations. Susan Forward (1998) indicated that emotional blackmail was defined as the strategy people use to force their family members, partners and close friends to do what they want. The effect of emotional blackmail could be moderated by children’s belief about life origin. Chen (2018) proposed two kinds of parent-child relationship beliefs: the belief of life origin stated that parents were origins of children’s live; the unity view of life stated that parents and their children were unity. Those who scored high in belief of life origin and unity view of life would be more inclined to succumb to pressure of parental emotional blackmail. Research design was a 2 x 2 x 2 x 2 completely between-subject design. The independent variables included two kinds of parent-child beliefs (the belief of life origin/the unity view of life), situations (career planning/marriage), and parental emotional blackmail tactics (evoking child’s debt for parents / breaking up with child). The dependent variables were obedience behaviors (verbal obedience/ decision obedience). Convenience sampling was conducted and recruited 251 participants, including 62 males and 189 females, 106 married and 137 unmarried. The average age of participants was 36.87 years old. The results showed that decision obedience was more likely when parents used breaking-up-with-child tactic than evoking-child’s-debt-for-parents tactic. Individuals with high unity view of life were more likely to perform decision obedience than those with low unity view of life. It was found that on marriage situation, both verbal and decision obedience of the high unity view of life group were higher than that of lower group. Decision obedience of low unity view of life group were higher in career situation than in marriage situation.
SPECIFICITY OF BRAIN ACTIVITY IN RESPONSE TO ACOUSTIC STIMULATION

Nickolay Almayev
Olga Murasheva
Yulia Bessonova
Alexei Medincev
Institute of Psychology Russian Academy of Sciences
(Moscow, Russia)

This work is devoted to the search of the mechanisms of music’s influence on human organism. Key feature of our approach is the isolated variation of one-two characteristics of sound while experimental control of all of the other. Affect of the primitive rhythms (pulsations) on CNS was measured by EEG. Six stimuli (adapted from Almayev and Skorik, 2015) those varied both in tempo and loudness were administered quasi randomly to 26 persons (12 male, 14 female). Duration of active phase of all stimuli was 100 msec, while pauses were 100, 500 and 1200 msec, the levels of loudness were 90 dB and70 dB, duration of whole stimulus 33 sec. Stimuli got numbers 1 (100 msec pause, 90 dB), 2 (500 msec, 90 dB), 3 (1200 msec, 90 dB), 4 (100 msec., 70 dB), 5 (500 msec, 70 dB) and 6 (1200 msec, 70 dB). EEG was registered by Mitsar 202 encephalograph, according to 10-20 scheme. Below only comparisons of the power of EEG signals at each electrode during the whole sound administration are presented. Delta rhythm dominates in frontal area FP1, FPZ, FP2 especially during presentation of stimulus 2. Theta rhythm is the most powerful during the presentation of stimuli 4 and 5 at FZ, CZ, PZ, FPZ, F3 and FP1. Alfa rhythm is the most prominent while stimulus 3 especially at PZ, P3, P4 and O2. Beta1 rhythm is expectedly connected to stimulus 1 (that produces the greatest subjective tension) but only at F8 and T3 (4-3 times greater than the other stimuli). Beta2 rhythm has its top at T6 and FPZ during presentation of the stimulus 5, at O1 while stimuli 2 and 5 (same tempo but different loudness ), stimuli 2, 3 and 5 at O2. Pattern of Gamma rhythm activity is generally close to that of Beta 2 rhythm. Even most primitive acoustic stimuli varying in tempo and loudness cause rather specific differences in brain activity. This work was supported by RFBR grant 16-06-00487.
The aim is to show the disintegration of a personality by analyzing the fragment of "Confession" by St Augustine. It allows us to come from the phenomenological description of personality transformation process to means of psychological defense. By solving the questions of love St Augustine uses hidden rhetorical constructions, which reflect his emotional processes in the most adequate way. They should be analyzed and clarified. The psychological aspect of this transformation can be reconstructed from that part of "Confession" where Augustine describes his Carthage impressions. He suffers psychological chaos: he "ran into love", "loving love". Augustine finally summarizes these impressions by saying "I loved not yet, yet I loved to love". So, "I love you" is normal expression. By strengthening the predicate we come to formula "I love, love, love..." and it is what Augustine meant by saying "I loved to love", thesis becomes antithesis and that is the circle — F(f). Wittgenstein wrote in "Tractatus Logico-philosophicus"(in German 1921, in English 1922; revised 1933, 1961): "3.333. A function cannot be its own argument, because the functional sign already contains the prototype of its own argument and it cannot contain itself" — F(f). This thesis was discussed in detail by H. Mounce (1981), V. Rudnev (2005), M. Morris (2008). In "Remarks on the Foundations of Mathematics" (1942) Wittgenstein returns to this topic. For the description of this contradiction Wittgenstein proposes a kind of function: "F(F), where F(ξ) = — ξ(ξ)". It is "a shimmering concept". Contradiction is part of logical symbolism, but topologically, the figures of contradictions, which use Augustine and Wittgenstein are different. They describe a variety of psychological processes.

DEVELOPMENT AND VALIDATION OF THE ONLINE DISINHIBITION SCALE

Online disinhibition is proven to contribute to various abusive actions in online communication such as cyberbullying, flaming, etc. But online disinhibition scales (ODS) have been developed and validated with adolescent samples, which need to be an area for further clarification if used in adult samples. This study aims to develop and validate ODS that can be used in adulthood and work environments. This study carried out exploratory factor analysis (EFA) and confirmatory factor analysis (CFA) using a sample of 227 Indonesian workers in early adulthood (mean age 32.87). EFA yielded two factors subsequently named 'benign disinhibition' and 'toxic disinhibition'. Results from CFA supported the acceptable two factor solution and model fit.
THE SPECIFICS OF THE COGNITIVE DEVELOPMENT OF PRESCHOOLERS ATTENDING VARIOUS TYPES OF PRESCHOOL INSTITUTIONS

Yuliya Tushnova  
Don State Technical University (Rostov-on-Don, Russia)

Elena Krischenko  
South Federal University (Rostov-on-Don, Russia)

In modern psychology the basic concepts defining success of cognitive activity of the person are such concepts as intelligence, creativity and abilities. The creative heritage of Russian and foreign psychologists on research of the problem of intelligence and creativity is great and manifold. The object of an empirical research were children of 5-6 years attending municipal preschool educational institutions of Rostov-on-Don that are working according to the educational program of preschool education "From birth to school" (N.E. Veraksa, T.S. Komarova, M.A. Vasilyeva) and the preschool children of 5-6 years attending private preschool developing children's centers working on M. Montessori's system and not attending educational institutions of other types. As methodical tools Wexler's test (children's version) and the test of creativity of E.P. Torrence have been used. Empirical indicators on the studied intelligence scales in group of the preschool children attending municipal preschool institutions (MBPEI) are higher, than with the preschool children attending the private developing children's centers (CC). According to the analysis of intelligence and creativity of the senior preschool children attending the children's developing center and kindergarten, it is possible to draw the following conclusions: There are significant differences in empirical indicators of intelligence between the preschool children visiting MBPEI and their peers attending the children's developing center. The senior preschool children attending the children's developing center have average and above an average the levels of development of creativity and intellectual activity. The senior preschool children attending kindergarten have the average level of creativity and intellectual activity. There are significant distinctions in creativity indicators "Flexibility" and "Originality" between the senior preschool children visiting the children's developing center and the senior preschool children attending kindergarten.
THE ROLE OF PERSONAL QUALITIES OF A TEACHER IN THE DEVELOPMENT OF SCHOOLCHILDREN GIFTED

Yuliya Tushnova
Anna Korochentseva
Yuliya Tushnova
Don State Technical University (Rostov-on-Don, Russia)

Long-term research giftedness shows that every child can be potentially gifted, as under favorable conditions, hidden reserves develop and turn into real abilities. At the same time, adverse environmental conditions, even with pronounced inclinations, can negate all their possible manifestations. A. Maslow (1958) wrote that giftedness is a creative orientation, inherent in everyone, but lost by the majority under the influence of the environment. G.V. Plekhanov (1956) said that talents are everywhere and always, where and when there are social conditions favorable to their development. L.S. Vygotsky (1997) regards children's giftedness as "the ability to be creative," which is genetically determined, developed in the relevant activity or degraded in its absence. Modern studies also emphasize the role of the teacher in the educational process. It is noted that an important task of the teacher is the organization of active independent cognitive activity, the creation of conditions conducive to the disclosure of students’ potential opportunities, the development of their creative abilities. Since the starting point for the development of giftedness is learning, of particular importance is the teacher, who is an integral part of the environment, contributing to finding an individual way, peculiar only to this child the way of development of his talents. A huge role here is played by the personal characteristics of the teacher. The purpose of this study was to study schoolchildren’s perceptions about the personal characteristics of a teacher who is able to develop students, creative abilities and the ability to think in a non-standard way. The research sample consisted of 48 pupils of 9 classes of a comprehensive school. The research method is testing (personal semantic differential), statistical data processing was carried out by counting the Pearson rank correlation coefficient. According to the results of the study, personal profiles of a teacher promoting the development of creative potential and the ability of the schoolchildren not to think in a standard way, and a teacher hindering this, were compiled. The authors (material) — the winners of the Scholarship program of Vladimir Potanin 2017/2018 (contract grant No. GSGC- 60/18).
CINEMA AS A DYNAMIC SYSTEM OF PERCEPTION OF VISUAL IMAGES

Mariia Zvereva
Svetlana Voronova
Mental Health Research Center (Moscow, Russia)

Cinema combines two forms: image and text. During process of film perception, there are interaction of film narrative, spectator’s personal experience and the cultural and historical context as well. The spectator’s understanding of common sense and everyday realities have an important role in process of film perception. To get an idea of the interaction of simultaneous perception of video sequence and sound, spectator has to be placed in a historical context. General psychological structure of perception could also not be ignored. A simple assessment of the images’s visual characteristics reduces the task, turning the variety of perception processes to physical characteristics. To get an idea of the process of film perception, it’s necessary to take into account what functions the film’s visual component performed in the system of spectator’s views. The main method of cinema is film editing as a way of organizing visual attention. Aims of film editing: capture, organization and direction of spectator’s sight; focusing of spectator’s attention; removal of unnecessary material; drawing spectator’s attraction by high-rapid video. Process of film perception includes voluntary and involuntary perception. Involuntary attention focuses spectator’s sight at something unusual: loud sounds, sudden movements, unusual clothes, etc. Voluntary attention is associated with a spectator’s personality: during watching film he relies on his expectations and therefore focuses his attention on those elements of film which interest him. Using cinematographic techniques (such as the "close-up") director transforms spectator's involuntary attention into voluntary: he forces spectator to focus on things he would not pay attention to in normal circumstances. Spectator's attention and perception which were organized by director line up images in space and time in order to discover the point of their interconnection and to take a complete story. The image and its perception have an otherwise status in cinema. Image in cinema is an analogue of sign in cultural-historical psychology, it reveals the symbolic meaning of objects and connections between them in the story. The sign characterizes the causal relationship of things, and the image gives only an idea of them, without using strict causal relationships.
MARKERS OF CHILD COMMUNICATION SIGNALS: BEHAVIORAL ASPECT

Tatiana Shinina
Moscow State University of Psychology and Education
(Moscow, Russia)

Olga Mitina
Lomonosov Moscow State University (Moscow, Russia)

We observe a current surge in research activities focusing on studying the interaction by video recordings and observation scales. The NCAST (Nursing Child Assessment Satellite Training) evaluation of parent-child interaction studies the ability to produce clear and clean signals to adults (Thomas J.C., Letourneau N., Campbell T.S., 2017). The MACI (Manchester Assessment of Caregiver-Infant) scale notes child behavior by three variables: child’s attentiveness to a parent, child’s positive affect, and child’s vivacity (Green J., Pickles A., Pasco G., Bedford R., Wan M.W., 2017). In Russia, one of the most advanced and sophisticated methods of standardized observation of adult-child interaction is the approach developed at the School of Ontogenesis of Communication by Maya I. Lisina (Lisina, 1986, 2009; Smirnova, Galiguzova, Ermolova, Meshcheryakova, 2002). The aim of the study was to observe toddler communication signals during spontaneous playing to build a system of evaluation metrics and define the dynamics of the intensity of the signal to the significant adult. Toddler communication signals were assessed using the Evaluation of Child-Parent Interaction (ECPI) technique (Galasyuk, Shinina, 2017, 2018). The research spanned over 60 families with toddlers and included ethical conventions with parents. The data from the analysis of video recordings were processed with Observer XT-14 software. Age features enable us to define two main lines of toddler behavior aimed at communication with adults and at substantive activity. Toddler behavior was coded in two ways. First, for Child-Object Communication Signals, five markers for the evaluation of a toddler’s independent investigative activity towards an object were suggested. Second, Child-Object-Adult Communication Signals were examined using five markers for the evaluation of a child’s signals aimed at interaction with an adult. The research shows the effect of responsiveness of the significant adult on a child’s being independent and initiative, and on the intensity of the crisis of three years. The research resulted in a system of metrics for evaluation of child communication signals enabling the assessment of intensity of signals by toddlers in interaction with the significant adult using various parameters.
PRODUCTIVE SPEECH AND THINKING FEATURES IN ADOLESCENTS WITH SCHIZOPHRENIA AND THEIR NORMOTYPAL PEERS

Natalia Zvereva
Eugene Shvedovsky
Mental Health Research Center (Moscow, Russia)

The problem of differential diagnosis of pubertal crisis and endogenous psychic diseases, especially schizophrenia is quite acute for adolescence age (Iovchuk et al., 2006). Active puberty may cause an increase of negative and positive symptoms of disease. A number of studies have shown that adolescents with schizophrenia and their normative peers come closer along the profile of cognitive functioning, the selectivity of cognitive activity (Zvereva et al., 2014), depending on the severity of the disease. The aim of present study is to identify and specify the productive speech and thinking in schizophrenia of adolescent age. The local aim was also to form the standard normative data for the “Syllabic technique” — method used for the study (Kritskaja, 1966). The “Syllabic technique” used, created on methodological basis of Russian pathopsychology school. It consists of 50 verbal stimuli, 30 are two-letter, 20 are three-letter syllables which presented verbally with instruction “Complete the proposed syllable so that the word appears”. The following parameters used: standard coefficient (SC), latent response time (LRT). Sample: 42 patients (DS: F20.xx, F21.xx), mean age − 14, 2; 48 normotypal peers, mean age − 14,3. To analyze the data obtained the t-criteria used (software — IBM SPSS 21). All parameters analyzed separately for two-letter (SC_1, LRT_1), three-letter blocks (SC_2, LRT_2) and in general (SC_g, LRT_g). In two-letter block SC_1, (avg. = 0.65, 0.35; t=14.6; p≤0.01), LRT_1 (avg. = 3,17, 2.76; t=1.3, p≤0.05), as we see standard coefficient differences significantly, rather than latent response time not differ significantly. In three-letter block we have SC_2 (avg.= 0.68, 0.35; t=15.4; p≤0.01), LRT_2 (avg.= 4,20, 3.10; t=8.3; p≤0.01), here we can see significant differences in both parameters. In SC_g and LRT_g data are t=5.7; p≤0.01, which is significant and t=2, which is uncertain. According to the data, it was shown that in adolescents with schizophrenia, the productivity of speech expression is reduce and there is less amount of standard response. One of the possible reasons may be the lack of actualization of language connections based on past experience, previously identified in adult patients.
CATEGORICAL PERCEPTION OF EMOTIONAL EXPRESSIONS: KEY RESULTS

Alexander Zhegallo
Institute of Psychology Russian Academy of Sciences
(Moscow, Russia)

Existing studies of the categorical perception of facial expressions give mixed results. Expected maximum of accuracy in ABX discrimination task is ill-conditioned and only partially explained by results of identification task. Additional analysis of the results of research (5 experiments, up to 500 subjects, different stimulus sets) show the following important results. 1. Categories, related to facial expressions are experiential prototypical, according to E. Rosh theory, not categories, defined by feature set. The position of the border between categories varies individually. 2. Perceptual category prototypes show the perceptual magnet effect. In discrimination task it, expressed in preferred choice of the answers, more similar to the prototype. For the pair of images (A, B) in ABX discrimination task this effect may be expressed as $Kerr = (N_{err_B} - N_{err_A}) / (N_{err_A} + N_{err_B})$. Here $N_{err_A}$ is number of error answers A and $N_{err_B}$ is number of error answers B. Distribution of $Kerr$ on a row of stimulus in discrimination task is approximately slant line (significantly less than 0 on one side of row and significantly greater than 0 on other side). 3. Perceptual category prototypes may differ in perceptual magnet "strength". Relative "strength" of the pair of prototypes may be measured directly in special variant of discrimination task. 4. Discrimination task may be solved, based not only on face on the whole, but on the partial features of face. The way of processing related to analytical / holistic style of perception. 5. Morphing, as procedure of construction of transitional row of stimulus, produce stimulus, equidistant in sense of point-to-point differences between images (Pearson correlation). In the same time discrimination efficiency of stimulus related to generalized differences (global and intermediate wavelet coefficients). 6. Conditions of discrimination task are specially established to reach efficiency slightly exceeding choice level. For different participants the level of difficulty may vary. Generally, we believe, that the perception of facial expressions directed to individually specific communication signals, not universal.

Supported by The Ministry of Science and Higher Education of the Russian Federation, topic № 0159-2019-0009 (Multidimensionality of cognitive processes in communication).
Belief in a just world theory emphasizes that people want to perceive the world as a fair place. In this regard, they tend to think good things happen to good people and bad things happen to bad people (Lerner, 1980). This perspective is closely related to victim blaming. In the literature, there are findings supporting that just world belief predicts the judgements toward the victim (Pinciotti & Orcutt, 2017). More specifically there is evidence that high just World belief predicts negative judgements toward the victim from men and low just World belief predicts negative judgements toward the victim from women (Kleinke & Meyer, 1990). On the other hand, studies support that emotional disclosure can prevent victim blaming and it reduces blaming of victims across genders (Harber, Podolski, & Williams, 2015). In the light of these studies, we hypothesized that there is a moderator role of just world belief on the relationship between emotional disclosure and victim blaming. To test this relationship, we will conduct moderation analysis (see, Hayes’ Process Model 1, 2018). To identify the level of just world belief, we use the Turkish version of Belief in a Just World Scale (Şahin, 2005) and to assess emotional disclosure, we use The Emotional Self-Disclosure Scale (Snell, Miller, & Belk, 2013). Victim blaming is measured through the scenarios. Analyzes are currently conducted. According to expected results, we think that high emotional disclosure will predict low victim blaming in the Turkish sample, however, we expect that the effect of victim blaming will increase when just world belief increases. The results will be discussed according to the literature.
Air accidents are extremely rare events and aviation is the safest mode of transportation. On the other hand, the risk is always present whenever any flights take place (Janic, 2000). Therefore, even identifying the main causes of one accident could be very critical for preventing future crashes that could occur at any point and any time. Therefore, the aim of this study is to investigate the root causes of one of the deadliest accidents in the history of Air France that 228 occupants including the crew and the passengers lost their lives – Accident of Air France Flight 447 in 2009. The root causes investigation started with detecting problem and the information gathered through official reports and media was examined via timeline and information mapping tools. After this step, the possible causes were investigated in terms of environmental, vehicle and human-related factors. The problems were detected as pitot tube blockage, improper actions of pilots in an emergency situation and task sharing problems of the crew. In order to find root causes behind these problems, 2 type of root cause analysis were used – 5 Why Technique and then Fish Bone Technique. The results showed that mainly human factors dominated the problems related to accident causations and there was human-related improper actions even behind the mechanical failures. Therefore, at the end of this analysis, it could be said that the needs of the crew should be always evaluated in detail by the organizations. Moreover, training and instructions should be clear and adequate in order to support human-machine interaction, especially during emergency situations. Lastly, hierarchical relationships could have negative effects on the appropriate behaviors of the crew members in emergency situations.
DIALOGUE WITH A PUPPET AS A MEANS OF THE DEVELOPMENT OF INDIVIDUALITY AND "I-IMAGE"

Olga Ustinova
Novokuzneckiy Filial (Institute) (Novokuzneck, Russia)

Natalia Bolsunova
Novosibirsk State Pedagogical University (Novokuzneck, Russia)

Childhood is a special period of human life. In exactly this period of his life a person discovers his individuality, his "inner world" and "the other", "I-image". The discovery of one’s own image, one’s own individuality, takes place by comparing oneself with other significant images, one of which is a doll. In their statements, the children talk about the preference for the following hero dolls: "I want to be like Diana-psychotic, she’s crazy, she’s killing children", "I want to be like Leather face: he’s strong, angry and mad", "I want to be like Barbie — she is skinny and beautiful ", etc. Such toy dolls contain the danger of programming destructive forms of behavior and attitudes towards oneself and the world. A doll is the image of a person in culture. It's a bearers of a sociocultural sample as a system of values, as measures (principals)according to which a person makes his own life-path (N.Ya. Bolshunova). Therefore, it is very important what samples a child masters, what values he makes for himself significant. In our experimental study in games with children of preschool age, we began to use dolls: "Zabotushka", "Dobrynyushka." The doll "Zabotushka" keeps the warmth of the relationship between the child and the mother, teaches the child to take care of his family, relatives, and friends. "Dobrynyushka" is the image of the father, stability, spiritual security of the child in the world. Thus, through the dialogue with the doll, the child answers the question about the main thing — what is good, conscience, truth, how he has to act in a certain situation. The doll’s image sets the system of reference points in the life of the child. The doll is a carrier of spiritual and moral meanings, and also the basis of individual development and modeling of man’s own image.
CLASSICAL BALLET LESSONS AS PROTECTION FOR COGNITIVE AND PHYSICAL DECLINE

Alcyr Oliveira
Lidiane Klein
Maria Augusta Fogaça
Rayssa Steinmetz
Caren Bernardi
Federal University of Health Sciences of Porto Alegre (Porto Alegre, Brazil)

The whole aging process carries a number of cognitive and physical declines. Balance, movement, and physical resistance impoverishment are commonly observed along with attention and memory decline. Although considered normal for aging, these deterioration directly impact the quality of life of elderly people. Studies have shown that the practice of regular physical activities can improve or maintain these cognitive functions as well as the physical. The objective of this study was to evaluate the effects of classical ballet lessons over physical, cognitive and emotional aspects in healthy elderly women. The study was approved under the University Ethical Guidelines Committee. Thirty-one participants from 60 to 80 years-old were randomly arranged in two groups to receive classical ballet lessons (n=20), and perform assisted walking (n=11). Both group activities happened simultaneously for nine weeks, twice a week, and one hour per session. The data was analyzed comparing both groups and within repeated measures ANOVA. Cognitive and physical effects were assessed through the following tests (applied in two time points): Rivermead Behavioral Memory Test (version A & B; p=0.001 both groups improved), Cambraia Concentrated Attention Test (Ballet= CCAT1=-1.60 ≠ CCAT2=-0.81; p=0.05; no ≠ between groups p=0.42), Rey Auditory Verbal Learning Test (Ballet: A1= -0.76 ≠ -0.50; p=0.001; no ≠ between groups p=0.39), Geriatric Depression Scale (Ballet= 2.3 ≠ 1.35; p=0.03; no ≠ between groups p=0.35). In the physical assessment the Time Up and Go (Walking TUG1= 8.618 ≠ TUG2= 7.583; p=0.013), Berg Balance Scale (both groups improved p=0.005), and Functional Reach Test (both groups improved p=0.009). The results showed that both activities provided benefits to physical balance and to cognition improving the ability to memorize. This study points out a possible efficacy of classical ballet practice for maintenance of cognitive function in elderly people. The ballet activity has specific characteristics which involve spatial control, attention to body balance and focus on body movement and force. Besides, the ballet group was formed by untrained participants. In contrast, the walking goes up on aerobic function and reduced cognitive effort to be performed since the walkers were certainly more familiar to such activity.
THE EFFECTS OF PERCEIVED PARENTAL ACCEPTANCE-REJECTION AND COGNITIVE EMOTION REGULATION STRATEGIES ON THE DEPRESSIVE AND ANXETITY SYMPTOMS

Yagizcan Kurt
Tekinsav Sutcu Gunay Serap
Ege University (Izmir, Turkey)

Perceived parental rejection was found to be related with different kinds of psychopathology, such as depression, anxiety and behavioral problems (Rohner, Khaleque, & Cournoyer, 2005). On the other hand, cognitive emotion regulation strategies were found to be related with depressive and anxiety symptoms (Garnefski, Kraaij, & Spinhoven, 2001; Martin, & Dahlen, 2005). However, how cognitive emotion regulation strategies contribute to the association between parental acceptance-rejection and depressive and anxiety symptoms have not been well-addressed in the literature. The aim of the current study is to examine the mediator role of cognitive emotion regulation strategies between parental acceptance-rejection and depressive and anxiety symptoms. Participants are planned to consist of approximately 500 undergraduate university students from different fields and levels in Turkey. Adult Parental Acceptance/Rejection Questionnaire (Short Form), Cognitive Emotion Regulation Questionnaire, Beck Depression Inventory, Trait Anxiety Subscale of the State-Trait Anxiety Inventory and a Socio-demographic form are used to collect data. Data collection process of the study is still in progress. First of all it was hypothesized that there were significant positive correlations between the perceived parental rejection and the depressive and anxiety symptoms, and also between maladaptive cognitive emotion regulation strategies and the depressive and anxiety symptoms. In addition, it was hypothesized that maladaptive cognitive emotion regulation strategies mediated the relationship between parental rejection and the depressive and anxiety symptoms. The findings will be discussed in terms of related literature. It can provide valuable information to the clinicians to focus on maladaptive cognitive emotion regulation strategies for the treatment or prevention of depressive and anxiety symptoms. IMMERSIVE VIRTUAL REALITY EFFECTS ON BALANCE AND COGNITION IN PARKINSON’S DISEASE

Alcry Oliveira
Marilley Jaen
Djulli Peixoto
Federal University of Health Sciences of Porto Alegre
(Porto Alegre, Brazil)

Parkinson’s disease is a neurodegenerative disorder that disrupts the postural control and mobility of the patients. In addition to the typically characterized motor symptoms (bradykinesia, rigidity and resting tremor), it also manifests cognitive disturbances and dysfunctional behaviors that need to be properly managed. The best therapeutic approach for this condition is the combination of pharmacotherapy and physiotherapy at a regular basis. In this context, virtual reality can be used as an additional rehabilitating tool that adds technological value to the traditional approaches. The aim of this study was to evaluate the effects of a training using virtual reality as a strategy to rehabilitate the balance, motor coordination and gait of patients with Parkinson’s disease. Twenty-three patients were randomized to receive one of three training protocols. The experimental group (n = 11) was exposed to a training using immersive virtual reality glasses where they had to walk on a virtual “tightrope”. The lecture group (n = 6) received educational sessions on how to avoid falls and ways to improve their physical condition. Finally, the control group (n = 6) attended their regular controls at the neurologist’s office. All participants were assessed pre and post training using 8 instruments. The Mini-Mental State Examination (MMSE), subscale of the State-Trait Anxiety Inventory (STAI) and the Rivermead Behavioral Memory Test (RBMT) were used to assess the cognitive status while the Hoehn & Yahr scale, scale Berg, Timed Up and Go Test (TUG), Walk 10 meter test, Unified Parkinson’s Disease Rating Scale III (UPDRS III) assessed the balance, coordination and gait. The results showed no significant difference between the three groups on the cognitive assessments. Contrarily, there was a significant difference between the experimental group and the other training groups in the walk 10 meters test and the UPDRS III. In conclusion, patients in the experimental group showed a better motor feedback level compared to the lecture and the control group. Considering that Parkinson’s disease is greatly complex, it is advisable to increase the sample size in future studies to further clarify the complex relationship between the disease and neurological dysfunctions observed.
CONTRIBUTING FACTORS TO DEPRESSIVE SYMPTOMS: ALIENATION AND INTERPERSONAL SENSITIVITY

Seda Sapmaz Yurtsever
Ege University (Izmir, Turkey)

Alienation, in general, is a sense of alienation from society (Nettl, 1957). Alienation, which means that the person is splitting from the environment and the process, has generally been studied in the fields of sociology and work life (Seeman, 1959; Bansal, 2017). However, it can be said that alienation within the society can cause or strengthened the feeling of isolation and loneliness in depression. However, interpersonal sensitivity, which is not only alienation but also an individual factor, can thought to be determinant in this negative affect. Interpersonal sensitivity is a situation which causes to misinterpret such as believing s/he does not care behaviors of others in interpersonal relations. (Boyce and Parker, 1989). Therefore, the negative affect of people may be caused by their own interpretation and the level of commitment to society. In this respect, this study aims to investigate the effects of environmental and individual factors on depression. Data were collected from 406 (%19 male) undergraduate students. To measure alienation, depression and the hyper sensitivity to interpersonal situations "Interpersonal Sensitivity Measure (IPSM) which is developed by Boyce and Parker (1989)"; "Alienation Scale developed by Dean (1961)" and "Beck Depression Inventory (BDI) developed by Beck (1961)" are used. Regression analysis are conducted in order to determine the role of alienation and interpersonal sensitivity on depression. Results of the analysis showed that all three dimensions of alienation (powerlessness, normlessness and social isolation) and two dimension of interpersonal sensitivity (interpersonal worry and dependency, low self-esteem; except unassertive interpersonal behaviour) significantly predicted to depression. (R2=.37 , F (6, 399) =40.25, p < .001). It can be inferred from this result not only the personal sensitivity but also the social connectedness can contribute the depressive symptoms. Social alienation could be related with political or economic welfare, for this reason the peculiar role of interpersonal sensitivity should be investigated to treat depressive symptoms in non-changeable environment.
FEATURES OF CAREER CHOICE OF WORKING AND UNEMPLOYED YOUNG PEOPLE WITH DIFFERENT SEVERITY OF THEIR PERSONAL MATURITY OR PERSONAL IMMATURITY

Elena Suroedova
Yulia Raschupkina
Don State Technical University (Rostov-on-Don, Russia)

In modern society very important for youth is the career choice. For this category of people career choice is of great importance, because it affects the further development of their personality, forms their life and determines the future way of life of the youth of the country. The intellectual potential of the country will depend on how correct the career choice will be for youth, conscious and meaningful, independent and confident. All this actualizes the problem of studying career choices of working and unemployed youth taking into account their personal maturity/immaturity in the modern world. In the framework of this study, career choice is understood as a different degree of conscious process of personal decision-making about a career content — professional skills, vocation, remuneration, new positions, superiors, people around them, etc. In psychology, they consider career choice as the main life choice of a person (E.A.Klimov, A.A.Komlev, L.M.Mitina, N.S. Prjazhnikov, A.Maslow), the characteristics features of career choice depending on the respondents gender are studied (S.T.Canarian, L.A.Zaitseva, O.M.Razumnikova, D.A.Luzzo), the meaningfulness and independence of life choice in connection with the subject age are considered (A.L.Schebetova), and also studied the dependence of the uniqueness of life the personality of its maturity (D.A.Leontiev, V.I.Nikolaev, N.V.Pilipko, K.Rogers). The research purpose was to study the career choice features of working and unemployed youth with different severity of a particular type of personal maturity/immaturity. The sample consisted of 165 respondents, unemployed school graduates (n=79) and working graduates (n=86) aged 16-22 years. The study used the diagnostic method and the survey method (questionnaire), statistical methods (factor and correlation analyses, criteria: binomial, Wilcoxon, Mann-Whitney). The study results revealed of the personal maturity / immaturity types in working and unemployed youth ("social and emotional maturity", "maturity as awareness of their social roles", "immaturity as accentuation of the values of individualization" for working youth; "immaturity as expressed reflexivity", "immaturity as contemplation", "maturity as self-realization" for unemployed youth). The procedural characteristics features of career choice of working and unemployed youth with different severity of this or that type of personal maturity or personal immaturity were described.
CONTINUING BONDS EXPRESSIONS AFTER LOSS: ROLE OF BEREAVEMENT TYPE AND IMPACT OF EVENT

Ozge Yuksel Sengun  
Izmir University of Economics (Izmir, Turkey)

Samet Baş  
Selva Ülbe  
Duygu Güngör  
Dokuz Eylül University (Izmir, Turkey)

Background: Continuing bonds (CB) are defined as efforts to continue an emotional connection to the deceased. Although some research report that maintaining an ongoing connection with deceased loved one is comforting (see Klass, Silverman, & Nickman, 1996), some other research report that CB is associated with more severe bereavement-related symptomatology (Stroebe & Schut, 2005). In this respect, the aim of this study is to explore CB expressions considering the impact of the event and complexity of bereavement.

Methods: 423 bereaved people (%77 females) participated in the study. They completed the demographic information form and Turkish versions of Traumatic Grief Inventory-Self Report Version (TGI) (Boelen & et al., 2019), Impact of Event Scale-Revised (IES) (Weiss & Marmar, 1997), Continuing Bond Interview (CBI) (Field, Packman & Carmack, 2007).

Findings: Participants reported a high frequency of CB utilization in the past month, with the most commonly endorsed reminiscing the deceased with others (%83,5) and focusing fond memories (%83,5). Notably, binary logistic regressions showed that severity of grief is predictive of the use of all types of CB except having dreams and intrusions. Although, there is no significant relationship with the CB endorsement and impact of event, regression analysis showed that unexpectedness of loss is predictive of severity of the grief (E=.96, W=14.16, p=.00).

Besides, 53 (%12,5) participants reported they carried out an activity dedicated to the memory of the deceased. The average score of this group on the TGI is 58 (SD=18,7) as scores of 30 and higher indicate the presence of clinically significant grief. Specifically, the most common activities are to get a memorial tattoo and naming children after someone who passed away.

Discussion: Although the majority of CB were viewed as comforting following the loss, participants with severe grief symptoms more likely to report CB expressions without regard to impact of event. As such, we noted an inconsistency in the literature regarding the adaptiveness of relinquishing the bonds to the deceased person. Turkish religious rituals and customs regarding the grief may be an explanation of this outcome that mainly do not promote continuing emotional connection to the deceased.
SUBJECTIVE WELL-BEING AND ATTITUDE TOWARDS EXTERNAL APPEARANCE

Larisa Popova
Southern Federal University (Rostov-on-Don, Russia)

In recent decades, the problem of subjective well-being has become increasingly relevant in the research of psychologists. This is caused by the acute need for psychological science and practice in determining what serves as the basis for the inner balance of the personality, what it consists of, what emotional-evaluative relationships underlie it, how it participates in the regulation of behavior, how the individual can be helped in solving the problem of well-being. In modern Russian reality in the conditions of the economic crisis, the question of the reaction of citizens to instability, constantly changing and unpredictable living conditions is relevant. The problems of subjective well-being have been studied by many scholars from various points of view: the eudemonistic approach to understanding happiness, advanced by Aristotle; ideas about happiness M. Argyle, I.A. Dzhidaryan; the concept of psychological well-being N. Bradburn; the model of subjective well-being of E. Diener; the six-component concept of psychological well-being K. Ryff; understanding of the structure of subjective well-being proposed by E.N. Panina, G.V. Puchkova, L.V. Kulikov; N.K. Bakhareva, A.O. Prokhorov; model of development of subjective well-being O.V. Lucova; theoretical model of personal well-being N.A. Baturin, S.A. Bashkatova and N.V. Gafarova; the concept of subjective well-being R.M. Shamionov. In our understanding, subjective well-being is the response of the subject to external and internal stimulus, is associated with mental processes and properties, has certain temporal boundaries and is characterized by integrity. We decided to study the phenomenon of subjective well-being, based on the developed by V.A. Labunskaya "multifactor socio-psychological model for studying attitudes toward appearance", based on integral cultural-psychological and socio-psychological factors. In this model, subjective well-being is one of the factors, since, on the one hand, it is a subject, and, on the other hand, its formation is due to the sociocultural conditions of human existence.
THE INTERVIEW METHOD AND QUALITATIVE RESEARCH WITHIN THE STUDY OF LEGAL CONSCIOUSNESS

Viktoriya Molotova
Alexander Molotov
Altai State University (Barnaul, Russia)

There is no universal meaning of legal consciousness in the modern psychology, besides there is a lack of integrity between empirical data and theoretical concepts. The existing theoretical model of legal consciousness functional structure by A.R. Ratinov, the concept of legal consciousness as the system of attitudes by O.S. Gulevich, in our opinion, do not offer a systematic concept of this phenomenon. We rely on the hypothesis by L.S. Vygotsky for conceptual and notional structure of consciousness to become a universal key to understanding of the legal consciousness psychological aspects. For the purpose of emphasizing of previously un researched legal awareness analysis units of meaning and theoretical colligation of their specific features, the method of qualitative data research has been decided on, and a study procedure with the half-structured interview method has been introduced. The structure of an interview comprises of six issue-related conceptual blocks. The processing of the received data included the range of coherent analytical procedures, such as an interview text reduction, notional segments accentuation and coding, subjective meaning system reconstruction; alongside with the category relation scheme establishing among the accentuated notional segments, based on the deductive strategies. Subsequently, basic generalizations have been performed and a hypothesis for notional structure of individual legal awareness and for necessity to expand the theoretical model of legal awareness constituent elements and their features has been developed. The qualitative interview data analysis has allowed to determine the differences in the individual notional systems of the tested, to (preliminary) distinguish different levels of legal awareness (superficial, advanced, profound); levels of legal literacy; level of significance of rights and freedoms; to determine the difference in the private and public concerns, and in the tolerance towards illegal behavior; to differentiate the level of alert towards a misconduct. The results of the performed categorization have been summarized as the matrix category schemes, interpreted and theoretically conceptualized. It is worth mentioning that the study of the connections between the accentuated units of analysis demand further and deeper review and examination by the methods of quantitative data research.
TESTING RUSSIAN VERSION OF POSITIVE THINKING SCALE: SOME PRELIMINARY RESULTS

Lada Aleksandrova
Moscow State University of Psychology and Education (Moscow, Russia)

Inna Lvova
Kuzbass Regional Institute of Teachers’ Training and Retraining (Kemerovo, Russia)

The study is based on integration of methodological approaches of positive psychology and self-determination theory with contemporary ideas of Russian psychology. The study pursued several purposes. First, we tested the Russian version of Positive Thinking Scale (Diener, 2009). 235 teachers of elementary and secondary schools and 110 first year university students of Kuzbass, one of Siberian regions, participated in the study. As a central method Russian version of Positive Thinking Scale (PTS) was used, with all its original 22 items grouped into two subscales: first scale of positively and second one negatively formulated statements. PTS was used in two ways: as separate subscales and as a sum of both scales. we applied four-level Likert-type scale, checking the level of respondents’ agreement with items. SPSS was used for data statistical analysis. Cronbach’s alpha= 0.72 for positively formulated items’ scale and Cronbach’s alpha= 0.67 for negatively formulated items’ scale were found. Additionally, several inventories to assess well-being and personality resources were applied: SWLS — satisfaction with life scale (Diener, Emmons, Larsen, Griffin, 1985); Dispositional subjective vitality scale (Ryan, Frederick, 1997); Noetic orientations test (Leontiev, 1992); Hardiness Survey (Maddi, 2001) · MSTAT-I Multiple Stimulus Types Ambiguity Tolerance-1) (McLain 1993); COPE ( Carver, Scheier, Weintraub, 1989); Generalized self-efficacy scale (Schwarzer, R., & Jerusalem,1995). Both scales and their sum showed predictable significant interconnections with SWLS, Dispositional subjective vitality, Noetic orientations, Generalized self-efficacy Hardiness Survey scales, Positive copings scores. Significant differences were found comparing respondents of different age. The Russian version of PTS scale showed itself as promising instrument to assess prevalence positive versus negative thinking style, wellbeing and personal resource for effective coping with adversities of different kind in teachers but needs further studies at various settings, samples and cross-cultural contexts.
ASSESSMENT OF POSITIVE DEVELOPMENT IN MEXICAN ADOLESCENTS

Diana Betancourt-Ocampo
Alejandro González-González
Universidad Anáhuac México (City of México, Mexico)

María Cristina Pérez Agüero
Universidad Nacional Autónoma de México (City of México, Mexico)

The Positive Development of Youth (PDY) emerges as a new perspective for the study of adolescence, which was traditionally focused on understanding this period of life as a chaotic period and where adolescents engage in behaviors that put at their health at risk. One of the PYD models that has empirical support is that of the 5 C’s, which was proposed by Lerner, who suggests that the five characteristics that define a young person with a positive development are: Competence, Confidence, Connection, Character, Care/Compassion. They also consider that young people who incorporate these five C’s would be able to demonstrate a sixth C called Contribution, that is, they could contribute to themselves, their family, their community and civil society; while young people who own little of the five C’s, could be at risk of presenting personal, social and behavioral problems. Although different instruments have been developed to evaluate the positive development from the 5 C’s model, some authors suggest that the instruments should be designed for the context of the population to be evaluated and in Mexico there are no instruments that work with this model so far. The objective of this study was to design and measure psychometrically an instrument that assesses the positive development of Mexican adolescents. To this end, a non-probabilistic sample of 400 adolescents was used, selected from secondary school students, 57% were men and 43% were women, with an average age of 13.52 years. Based on the review of the literature, an instrument was designed based on the proposal of Lerner et al., (2004), which comprises 59 items that are grouped into five scales that evaluate the 5 C’s: Competence (13 items), Care (6 items), Confidence (11 items), Connection (17 items) and Character (12 items); all scales were Likert type with five response options. The results showed that the instrument has adequate psychometric properties. The discussion analyzes the utility of the instrument in the Mexican adolescent population for the assessment of positive development and as an instrument to evaluate the effectiveness of programs promoting healthy development in adolescents.
THE EFFECT OF PERINATAL STRESS ON THE REPRODUCTIVE SYSTEM

Elena Pechnikova
Medico-Psychological Clinic "Family Plus" (Moscow, Russia)

In today's world, full of various stressors, the first place goes to psychological stressors — emotional and information, as well as environmental. In the new man-made conditions, the health of future generations, which are still laid in utero, remains important. Stress is a modifying factor and element of evolutionary selection. However, the term "prenatal stress" (Ward, 1972, 1984), which appeared in the 70s of the XX century, was filled with new content. In addition to the physiological consequences of the adaptation syndrome of the fetus, which occurs during perinatal stress and leads to intrauterine programming of adult diseases, the influence of perinatal stress on the psychological components of the reproductive sphere is significant. In women, this is manifested in a change in sexual behavior, gender-role distortion. In men-feminization, changes in psychological status and behavior, in both sexes there is a tendency to decrease in stress resistance and rapid depletion. Violations of the subsequent stages of ontogenesis are superimposed on the formed consequences of perinatal stress and leads to a wide range of violations in the psychological and physiological sphere of men and women. It is necessary to prevent perinatal stress in order to preserve the health of future generations: further development of ideas about perinatal stress and methods of its diagnosis; informing and educating the population about preventive measures.
PSYCHOLOGY STUDENTS’ EXTREME STRESS-RESISTANCE ABILITIES
Valentina Ekimova
Alexey Kokurin
Anna Koteneva
Tatiana Berezina
Anna Litvinova
Moscow State University of Psychology and Education (Moscow, Russia)

Extreme environment and extreme situations are common vocational settings in high-risk professions. Psychologists of extreme profile have to deal with the psychological consequences of accidents, disasters, military conflicts, terrorism, crimes etc. Under such circumstances, stress resistance and self-control are the key abilities for the adequate stress-response and professional efficacy of a specialist. The research has two objectives: 1) to access the psychological students’ resistance to extreme situations, and 2) to define psychological factors correlated with the individual extreme stress-resistance. 60 students of Extreme Psychology Department (18 men and 42 women, mean age — 22.4) participated in the research. The diagnostic methods used were the symptomatic questionnaire “Resistance to Extreme Situations” (by N.E. Vodopianova), “Research of Volitional Self-Regulation” (by A.V. Zverjkov and E.V. Ejdman), the questionnaire “Ability of Self-Government” (by N.M. Pejsakhov), the questionnaire “Self-Control in Emotional Sphere, Activities and Behavior” (by G.S. Nikiforov, V.K. Vasiliev, and S.V. Firsov), and “Resilience of Adults Test” (by A.V. Makhnach). Descriptive statistics, correlation and principle components analysis of empirical data were used. The majority of psychology students of extreme profile appeared to be resistant to extreme situations (57% — on the high level, 36% — on the medium level). The risk-factor was detected by the scale “violation of volitional regulation”, on which only 20% of students had the results of a high level. The sufficient part of students faced problems with persistence (31%) and self-regulation (5%), with quality estimation (30%) and decision making (35%), with planning (30%), goal setting (32%) and forecasting (20%). Principle component analysis of the empirical data revealed five-factor structure of psychology students’ extreme stress-resistance abilities. It comprised “Pathological Response to Extreme Situations” factor (1), “Psychological Resilience and Adaptability” factor (2), “Volitional Self-Regulation” factor (3), “Self-Control” factor (4), and “Spirituality” factor (5). These factors explained 64% of the inter-correlation matrix dispersion. The most significant correlations (p=0.001) confirmed the prevalence of volitional regulation in the functional system of extreme stress-resistance. The research revealed the variety of psychological skills and abilities required for the psychologist’s efficient functioning in the extreme situations, and the majority of them should be acquired via university education.
The aim of the study was to reveal the peculiarities of young men and women's images of their parents and their romantic partners depending on the characteristics of their attachment to the beloved ones. The study was focused on the following particular objectives: 1. To identify the link between attachment to parents and attachment to the romantic partner and the perception of stylistic characteristics of the partner and the parents. 2. Identify the relationship between the characteristics of attachment (avoidance and anxiety) and similarities or differences in views about parents and romantic partners as attachment objects. 3. To identify the differences between young men and women in the nature of the relationship of attachment and in the perception of stylistic characteristics of the partner and the parents. The following instruments were employed: Experience in Close Relationships Questionnaire by Brennan, Clark, Shaver (1998), Inventory of Peer and Parent Attachment (IPPA) by Greenberg and Armsden (1987) modified by Sabelnikova and Leary’s Interpersonal Behavior Circle Inventory modified by Sobchik (1994). Fifty young men and women aged 19-22 (M=20.5) took part in the investigation. The results showed the interrelations of the features of attachment to mother, father, romantic partner with young men and women's representations of parents and the partner. Implications of the study are discussed.
MEMORY SHARING PRACTICES IN TURKISH FAMILIES: THE EFFECTS OF PARENTING STYLES ON MEMORY SHARING PRACTICES

Nur Başakhan Uzun
İnci Boyacıoğlu
Gizem Naz Gezgin
PSIKARE Work Group
Dokuz Eylül University (Izmir, Turkey)

Autobiographical memory (AM) is a special type of memory strongly linked to emotions (Conway and Pleydell-Pearce 2000) and AMs can be simply defined as the recollection of personal events from one’s own past (Tulving 1972). Recently, issues related to autobiographical memory such as collective memory, the parent-child conversation styles during recollection, reminiscing differences across cultures have also been examined from a social psychological perspective, there is a limited number of studies on memory sharing practices. On the other hand, family conversations about the past events have important role in socialization of children, sharing values and information from one generation to next generation, and constructing collective memories. In the present studies, we aim to describe memory sharing practices in Turkish families in terms of the time and place memory conversations took place in families, the roles of family members during these conversations, the content and the themes of shared memories etc. Moreover, the effect of parenting styles on memory sharing practices was tested by performing a series of regression analyses. Study 1 consisted of parents (N = 223) between the ages of 40 and 65 living in Aegean Region and Study 2 was carried out with university students (N = 182) aged between 18 and 25 years. The content of shared memories and differences in narrator and listener roles were examined in the context of family roles (e.g. mother, father, daughter, or son). Results revealed that the parenting styles had a significant effect on the contributions of children to family conversations about the past events and the content of shared memories. Gender also seems as an important predictor of memory sharing practices in Turkish families due to traditional gender roles. The findings of the present studies may contribute to future studies on memory sharing practices in different cultures via establishing a theoretical and methodological basis. Acknowledgement: Authors thank to PSIKARE Work Group members including Ecem Erten, Halil İbrahim Ayar, Muzaffer Şen, Nur Başakhan Uzun, Safiye Sena Dökmeci, Seher Gül, Aybüke Güven and Deniz Nur for their time and effort.
In Mexico, according to the 2016 National Health and Nutrition Survey, only a fifth of children between 10 and 14 are physically active, in addition to the increase in diseases such as obesity, cardiovascular problems, heart attacks, high cholesterol levels or Kidney failure in children, adolescents and adults. In 2013, The Aspen Institute Sports & Society suggests the ProjectPlay initiative, which presents the development of a PlayBook where solutions are proposed to the barriers faced by the children population in terms of physical inactivity problems in the United States. In 2018, the need arises in Mexico to carry out a study to develop the PlayBook version according to our population. To this end, two phases were carried out, in the first one, seven focus groups were held with 40 leaders from public and private sports institutions, media, and Olympic athletes; where, through a guide with four questions, information was obtained on: the possible barriers, solutions, and sectors involved to solve the lack of physical activity in children, in addition data was obtained on the possible programs that have been successful in promoting physical activity. In the second phase, information was obtained from 300 children between 5 and 12 years of age through a questionnaire of 12 questions about the sports they practice and in under what conditions. The results of both phases provided information on 10 barriers that influence children not to engage in physical activity: discouraging early experiences, limited options, lack of adults as healthy models, unsafe and inaccessible contexts for children, deficiencies in educational plans and programs , lack of an inclusive perspective, deficiencies in the integral formation of human resources for physical culture, lack of evaluation and monitoring systems, a lack of involvement of the media and the use of new technologies to promote physical activity, and lack of research on physical activity and / or sports. Based on the information obtained, the PlayBook is being developed for the Mexican population.
PERFORMATIVE PATTERNS FOR SOCIAL INNOVATION: THE POWER OF IMPLICIT AND TACIT KNOWING IN SOCIAL SYSTEMS

Wolfgang Stark
Steinbeis Center Innovation and Sustainable Leadership
(Paehl, Germany)

Based on the notion that social systems, communities, and organizations have to deal with accelerated complexity and growing uncertainties and ambiguities, this paper will discuss show the contradictive tension between rational process thinking and the improvisational field in contemporary societies. The approach offers a path to develop tools for dealing with complexity in communities and other social systems. By using Alexander’s ‘pattern language’ and the art of improvisation, we develop Organizational Actions Patterns (OAP) and Community Action Patterns (CAPs) to be used for change and innovation processes. OAPs/CAPs are based on experiential knowing and improvisation theory and aim to allow people to use implicit and tacit knowledge in social systems to increase their flexibility, creativity and performance in settings of uncertainty and ambiguity. These kinds of settings provide the culture where innovative approaches emerge. In order to enhance the creative potential of innovation processes, the pattern approach (Alexander et al 2012) will be linked with concepts of ‘tacit knowing’ (Polanyi) and ‘experiential learning’ (Dewey). They emphasize on the hidden, experience-based wisdom of good practice which very often is neglected in a rational world. Together with a creative artist’s view which allows to come to light ‘what wants to emerge’, a performative pattern language in a practical and playful way helps to develop social innovations and a world of beauty. Like many other tools in modern society, the approach of design patterns in architecture, organizational and community development and other fields in most cases originally have been meant to increase effectiveness and reduce complexity. As a consequence, new approaches unintentionally quite often reduce options instead of widening options. This is why we focus on the experience-based pattern approach as a high potential to set a new basis for social change and innovation and, consequently, to widen the concept of applied psychology as a linking science and strengthen the link with other disciplines.
PREDICTORS OF DEPRESSION, ANXIETY, ANTICIPATORY GRIEF AND GROWTH IN TURKISH OFFSPRING AS CAREGIVERS OF PARENTS WITH ALZHEIMER’S DISEASE

Yagmur Ar-Karci
TED University (Ankara, Turkey)

Ayşe Nuray Karanci
Middle East Technical University (Ankara, Turkey)

The negative impacts of Alzheimer’s disease caregiving on informal caregivers have been largely investigated from a stress-coping paradigm. However, recent studies pointed out that examining “ambiguous losses” associated with the unique pathology of the disease is essential to understand the multidimensional nature of Alzheimer’s caregiving. Besides, cross-cultural studies have criticized the stress-coping paradigm as the negative and positive caregiving experiences might exist side by side in a complimentary manner in some cultures. Hence, this study aimed to explore the roles of various background/contextual variables, primary stressors/disease-related factors, secondary stressors, exacerbating or mitigating factors in predicting negative (i.e. depression, anxiety, anticipatory grief) and positive (i.e. growth) caregiver outcomes. Data was collected from 190 informal adult children caregivers of AD.

Hierarchical regression analyses revealed that different sets of variables were influential in predicting different caregiver outcomes. While burden, optimistic/seeking-social support, helplessness-coping and perceived social support were associated with caregiver depression and anxiety, only subjective burden and helplessness coping were associated with pre-death grief responses. Additionally, among all other variables, only optimistic/seeking social support was positively associated with growth scores of the caregivers. Hayes and Matthes macro was used in order to perform moderation analyses. Results revealed that perceived social support had moderated the relationship between caregiver burden and various caregiving outcomes including growth. Besides, problem-solving coping buffered the negative impact of subjective burden on caregiver depression.
Optimism is usually described in terms of positive expectations about future events (Sharpe et al., 2011). Different studies have confirmed that optimists are satisfied with life, inclined to have better physical health, and involved in adaptive behaviors. However, the relationship between optimism and other well-established personality factors is less well-understood as the majority of research has centered on neuroticism and extraversion. Therefore, the purpose of the present study was to examine optimism in the context of the Big Five traits. Based on previous outcomes, optimism was assumed to be positively related to extraversion, agreeableness, openness to experience, emotional stability, and consciousness. The research was conducted on the group of 161 participants who completed IPIP-BFM-20 (personality traits; Topolewska-Siedzik et al., 2014) and OPEB (optimism and four its dimensions: achievement orientation, incaution, positive thinking, and openness; Czerw, 2001). The mean age of the respondents was M=23.82 with SD=8.470 (range=18-60 years). Most were women (80%). A linear regression shows that: (1) general optimism is predicted by emotional stability (β=0.534) and extraversion (β=0.262) that explain the dependent variable in 50% (cR²=0.501; R=0.717; F160,2=83.363; p=0.001); (2) achievement orientation is predicted by emotional stability (β=0.547) and extraversion (β=0.262) that explain the dependent variable in 35% (cR²=0.439; R=0.668; F160,2=63.630; p=0.001); (3) incaution is predicted by emotional stability (β=0.385), consciousness (β=0.298), extraversion (β=0.300), and intellect (β=-0.147) that explain the dependent variable in 35% (cR²=0.355; R=0.609; F160,4=22.983; p=0.001); (4) positive thinking is predicted by emotional stability (β=0.472), agreeableness (β=0.314), and extraversion (β=0.161) that explain the dependent variable in 41% (cR²=0.415; R=0.653; F160,3=38.817; p=0.001); (5) openness is predicted by extraversion (β=0.328), emotional stability (β=0.298), and intellect (β=0.196) that explain the dependent variable in 29% (cR²=0.298; R=0.558; F160,3=23.635; p=0.001).

The outcomes of the present study allow to presume that individuals who are active, not prone to negative emotions, trustful, cooperative, and helpful, have also positive expectations about future events (“global optimism”). However, in the case of incaution two predictors are of negative character. Therefore, combination of lower consciousness and lower cognitive activity, and higher extraversion and higher emotional stability might lead to the behavior that can be called “cautious optimism”.
EYE MOVEMENTS AND MENTAL ATTENTIONAL CAPACITY IN CHILDREN AND ADULTS

Valentina Bachurina
Marie Arsalidou
Higher School of Economics (Moscow, Russia)

Eye-tracking is a non-invasive measure that has been repeatedly used for studying attention and related cognitive processes. While eye-tracking is not a direct measure of brain activity, it has been shown to reveal information about mental processes, that may not be easily accessible through other measures, such as problem solving strategies. Mental attentional capacity corresponds to the amount of information an individual can maintain and manipulate in mind (Pascual-Leone, J., 1970); it is considered the central maturational component of working memory (Arsalidou, M., Pascual-Leone, J., & Johnson, J., 2010). This construct has been found to be closely related to other aspects of cognitive competence and intelligence (Johnson et al., 2003). Research into relation between eye movements and mental attentional capacity across development at the moment is sparse and fragmented and no eye tracking studies have been conducted so far with parametric developmental measures, such as the colour matching tasks (Arsalidou, M., Pascual-Leone, J., & Johnson, J., 2010), which would allow to dissociate changes in saccades and fixations related to working memory load (n = 6) from those related to interference control and trace the maturation of these two processes. The purpose of this study is to investigate the relation between eye-tracking indices (e.g., number of fixations) and mental attentional capacity. Data from adult participants showed significant differences between number of fixations per trial for different levels of mental attentional load. Additionally, analysis revealed significant negative correlation between number and duration of fixations and accuracy for both the balloons and the clowns versions of the task, with the correlation being stronger for the clowns version, which contains interference. Interestingly, for each difficulty level, children generate a similar number of fixations regardless of interfering features, whereas adults make fewer fixations when the task has less interfering features. This suggests that adults may have different strategies depending on the task. Increased number of fixations may indicate that children favor a visual-spatial strategy, whereas adults favor a verbal strategy.
THE CATEGORIZATION OF PERCEIVED THREAT: PROTOTYPICALITY OF IN-GROUP AND OUT-GROUP

Tolga Ergiyen
Istanbul Kultur University (Istanbul, Turkey)

Güncce Yavuz
Izmir University of Economics (Izmir, Turkey)

The aim of the present study is to investigate the physical appearance similarity on the eye gaze behavior around the face, depending on the saliency on ethnic identity (by labeling). Social identity approach which includes self-categorization theory assumed that we are categorizing ourselves into a group which triggers the depersonalization process. Therefore, we have a redefinition of the self in terms of group membership. The categorization mostly bases on similarities (physical appearance, norms, past etc.). Naturally, we have a tendency to create an in-group/out-group through the categorization process. The evolutionary basis of in-group/out-group categorization indicates that less information about out-group members creates perceived threat for in-group members. Previous studies indicate a difference in eye-gaze behavior through prejudiced other race and own race (Walker-Smith, Gale, & Findlay, 1977). Found that, White Caucasians’ eye-gaze behavior mostly followed a T-like pattern with fixating more on eyes for White Caucasian faces, and mouth for the Black faces. Physical differences’ of different races can be easily detected. However, there are some groups that can not be detected easily from their physical appearance. In this study, the effect of physical similarities of in-group and out-group on the perceived threat is investigated. A total of 30 Turkish with high perceived threat (symbolic/realistic) of Syrian refugees (between the age of 18 to 28) took part. All stimuli were presented via SMI (SensoMotoric Instruments) Eye-Tracking Device including two different ethnic backgrounds with 2 different labeling; Turkish (labeled as Turkish), Turkish (labeled as Syrian) and Syrian (labeled as Turkish) and Syrian (labeled as Syrian). 24 different pictures are shown; 6 prototypical Turkish, 6 non-prototypical Turkish, 6 prototypical Syrian, and 6 non-prototypical Syrian (perceived similarity/difference of all faces are determined with a pilot study). Eye-gaze behavior of the participants differed between in-group and out-group. When participants see the pictures with non-prototypical in-group showed a similar pattern with prototypical in-group. The social categorization is affecting our perception and does not only depend on physical appearance. Even though the in-group member is not seen as a prototypical face, eye-gaze behavior shows that individuals tend to pretend as an in-group member because of categorization.
VISUAL ANALYSIS IN RESEARCH ON SOCIAL REPRESENTATIONS OF HAPPINESS

Sofia Izbasarova
Olga Melnikova
Lomonosov Moscow State University (Moscow, Russia)

The interaction between a person and social environment is mediated by visual information usually placed in electronic gadgets. Therefore, a photograph is a unique source of information we can apply to social phenomena research. In response to the question: “what is happiness?” a person refers to the knowledge of common sense: its’ content, functions and reproduction of this knowledge are socially determined. Therefore it would be appropriate to consider the notion of happiness within the concept of social representations. In this study the visual analysis of social representations of happiness was conducted. It revealed the research potential of the method and allowed us to get closer to the understanding of what people call “happiness”. The methodological purpose of the present study was to reveal the research potential of visual analysis in the investigation of social representations of happiness. The empirical aim of the study was to describe the content of social representations of happiness. We used visual analysis (P. Sztompka). The sample (n=7) consisted of young people from a variety of fields. The analysis of photo reports on the theme “happiness” was realized. The interpretation of an image consisted of four stages: hermeneutic, semiotic, structural and discursive. The emotional component of representations can be traced by warm and bright colors. The visual data interpretation reflected meaningful interrelations of the phenomenon and revealed the structure of social representations of happiness: 1. The core of the social concept of happiness is significant others: family, friends, romantic partner, children, pets. 2. The periphery of representation is traveling, spiritual development, creative self-realization, success in favourite work. The present analysis of the photographs allowed us to identify the component which ties together the contents of social representations of happiness. This element is the material well-being of the person. The methodological conclusion is that it is necessary to use the visual method of research when we study deep and complex socio-psychological phenomena. It is possible when the combination of discourse and non-verbalized information is realized. The second conclusion is that the social representation of happiness is a phenomenon with certain emotional variations and complex structure.
STEREOTYPE CONTENTS OF SOCIAL GROUPS IN TURKEY AND STEREOTYPE CONTENTS LINK TO INDIVIDUAL VALUES

Fatma Kahraman
Acıbadem Mehmet Ali Aydınlar University (İstanbul, Turkey)

The present research aims to examine the relations between stereotype contents and perceived social contextual factors toward social groups in the context of the dimensions suggested in the Stereotype Content Model and individual values within Schwartz’s model. To achieve this purpose, the study includes two related sections, one of which involves a preliminary study. In the first section of the research (N =153), the most commonly mentioned social groups in society were defined by the respondents. In the second section (N = 856), measuring stereotype content dimensions, and status-competitiveness scales, measuring perceived social structure, were tested for 36 different social groups in Turkey. Relations between hypothesized social contextual factors and values on stereotype content dimensions were examined. Two levels of analysis were conducted which are group and individual levels. As the results show, 32 out of 36 groups were perceived ambivalently and evaluated significantly differently across the dimensions of warmth and competence, as either high competence but low warmth, or low competence and low warmth. At the group level of regression analysis, perceived group status predicted competence, and perceived competition toward groups predicted lack of warmth. Individual-level analysis replicated these results for status and competence for all groups, but not for warmth and competitiveness for 11 groups, which were mostly placed high on warmth (ie. blue collars, unemployed). Then, anxiety-based self-protection values (power, success, security, conformity, and tradition) were found related to stereotype contents for some social groups. The values were negatively correlated with perceived competence for homosexuals and man and positively correlated for disabled people and Syrians. In terms of perceived social context, the same values were negatively correlated with perceived competitiveness for Muslim, uneducated people, and Arabs. Finally, values were found negatively correlated with perceived status for some groups like homosexuals and leftists. The results show that anxiety based self-protecting values were not related to stereotype contents and perceived social contextual factors for most of the social groups. Study findings and limitations are discussed in light of the related literature. Keywords: social groups, stereotype content model, competence, warmth, anxiety-based values
NEW PERSPECTIVES AND NEW PSYCHIATRIC REHABILITATION OPERATIONS IN THE RECOVERY ORIENTED PERSPECTIVE FOR THE GROWTH OF PSYCHOSOCIAL WELL-BEING

Luisa Petrosino  
Order of the Campania Psychologists (Salerno, Italy)

Francesco Iuliano Italy Salerno

Gaetano Pinto Italy Salerno
Salerno Local Health Psychiatrist, Executive Recovery Point of Operating Unit Mental Authority Health 68 (Salerno, Italy)

Letizia Sandolo Italy Salerno

Raffaella Sica Italy Salerno
Mental Health Department — Salerno Local Health Authority (Salerno, Italy)

The concept of recovery emphasizes the importance of enhancing the active role of the person through the factors of significance common to the stories of illness, health and individual and collective life. The activation, in the month of February 2018, of the Recovery point, a space and a time, at the UOSM 68 of DSM — ASL SA (Mental Health Unit 68 of the Mental Health Department — Salerno Local Health Authority), is supported by the idea of Recovery as possibility & necessity, through the word and personal storytelling, to enhance the individual experience to allow patients, to shift the focus from the disadvantaged side, sick with its losses, to the healthy part with its values, choices, roles and life expectancy, recovering subjectivity, in the dynamism between health and the possibility of healing. Data are presented on the observation of 30 users belonging to the DSM — ASL SA, mainly followed by the UOSM 68 at the Recovery Point. They were divided into two groups (A and B) to which R.A.S. (Recovery Assessment Scale — Italian Translation, Lamonaca, D., 2013 — Original version — Corrigan P.W., Salzer M., Ralph R., Sangster Y., Keck L., Examining the factor structure of the Recovery Assessment Scale, Schizophrenia bulletin, Vol. 30, pp. 1035 — 1042, 2004) at T1-February 2018 and T2 -July 2018: GROUP A 20 users belonging to the UOSM 68, at the Recovery point with attendance of at least two meetings a week. Group B 10 users, residing in the territory, hosted in rehabilitative therapeutic Centers and Communities that have followed the activities of the Recovery Point program, at the UOSM 68, with at least 1 monthly meeting. Group A showed an increase in revenue in recovery with an increase in values in all 5 areas of the R.A.S. Group B presented mainly a small increase or even a decrease in the recovery score. It is possible to state that recovery actions have a positive effect on increasing the psycho-social well-being of people with mental illness and / or psychological distress in direct proportionality with recovery treatment actions.
COMMUNICATION STYLES AND STRATEGIES OF THE MEANING TRANSFER OF TEACHERS WHEN WORKING WITH GIFTED CHILDREN

Elena Suroedova
Don State Technical University (Rostov-on-Don, Russia)

The problem of pedagogical communication over the past fifty years is particularly relevant. Effective communication between the teacher and students has a positive developmental impact on them. Gifted children demanded an individual approach from the teacher. The aim of the study was to study the features of communication styles and strategies of the meaning transfer of teachers when working with gifted children. The theoretical basis of the study included such ideas as the personal-semantic paradigm of education (A. G. Asmolov, I. V. Abakumova), psychology of a joint thinking activity (A. K. Belousova, D. F. Dautov), ideas about the phenomenon of transfer of meaning, translation of meaning (A. K. Belousova, E. J. Artemieva, L. C. Kagermazova, E. A. Suroedova, etc.), stylistic approach (A. Adler, F. Holtzman, G. Schlesinger, J. Sternberg, J. Bruner, A. K. Belousova, A. Rean and others). The study involved teachers, women aged 25-45 years, educators and teachers. The following methods were used in the study: questionnaires, interviews, observation and methods of mathematical statistics. The study used the following research methods: "Methods for diagnostics of teacher communication styles" (N. P. Fetiskin); questionnaire "evaluation of the effectiveness of the style of pedagogical communication of teacher with children" (Y. Vonkova); methodology of "Strategies for the meaning transfer " (E. A. Suroedova). The results of the study allowed us to establish that teachers who deal with gifted children prefer active (U=60, p=0.01, n1=12, N2=20) and democratic (U=58, p=0.008, n1=12, N2=20) communication styles. The style of communication of teachers is characterized by high efficiency in working with gifted children. The majority of educators and teachers identified strategies of meaning cognitive-dominant and active. The conclusions and results of the study can be used in the process of educational activities of teachers and psychologists of educational institutions in order to form an effective transfer of meaning and communication style of educators and teachers. This will lead to an increase in the success of the educational activities of gifted students. In psychological services of various educational institutions for counseling and psychocorrection work in the educational process with gifted children.
DEVELOPMENT OF AN ICF-BASED INSTRUMENT FOR ASSESSING FUNCTIONING IN SEVERE MENTAL DISORDERS

Gomaa Said Mohamed Abdelhamid
Juana Gómez-Benito
Georgina Guillera
Maite Barrios
University of Barcelona (Barcelona, Spain)

The WHO International Classification of Functioning, Disability, and Health (ICF) represents a universally accepted framework for describing functioning in any health condition. It comprises more than 1400 categories to cover all aspects of human experience. However, in order to facilitate its implementation in daily practice, three ICF Core Sets for mental health have been developed. Based on the comprehensive ICF Core Sets for schizophrenia (Gómez-Benito et al., 2017), depression (Cieza et al., 2004), and bipolar disorder (Ayuso-Mateos et al., 2013), the current study develops a measurement instrument for assessing functioning in patients with severe mental disorders, in English and Spanish. The development of the ICF-based instrument is composed of two phases. In the first phase, all comprehensive ICF Core Sets categories from these mental health Core Sets were gathered to pre-select a set of so-called “candidate” ICF categories, retaining those ICF categories common to the three mental health Core Sets. In the second phase, common categories were converted into items. Items’ adequacy was assessed by a panel of experts. In the first phase, a total of 34 ICF categories were retained as candidate categories, i.e., common features for the three mental health Core Sets, comprising 10 categories from Body functions, 14 from Activities and participation, and 10 from Environmental factors component. In the second phase, these categories were converted into items to further be subjected to adequateness assessment. The final version of the instrument is presented to experts and a large percentage of the items are confirmed. Our study captures those common aspects on functioning in schizophrenia, depression, and bipolar disorder, and proposes a brief instrument based on the ICF framework to assess functioning in severe mental health disorders. The new instrument, called “Screening of functioning in Severe Mental Disorders (SF-SMD)” proved to be suitable in terms of content validity; however, further studies are required to assess additional psychometric properties.
THE SPECIFICS OF DYADIC COPING IN PAIRS OF PARTNERS WITH DISABILITIES

Ulyana Sevastyanova
Kostromskoy Gosudarstvennyy Universitet (Kostroma, Russia)

The specifics of the relationship in the dyad has been and remains the object of psychological research for many years. Studies of close relationships and quality of life of subjects are particularly relevant in an ever-changing world. The study of the relationship of couples with one of the partners of a disabled person is particularly relevant at the present time. The purpose of this study was to identify the features of dyadic coping of partners with disabilities. Methods included test scales, interviews. The sample consisted of 20 pairs in which a partner with a disability was included (40 people, average age 35 years). Partners with disabilities need assistance from their relatives and are oriented toward support. They pay more attention to a loved one, trying to solve the problem by dialogue. Respondents are attentive to the emotional state of the partner, diplomatic, but rigid in the distribution of functional responsibilities in the pair. Supporting a partner with a disability is negatively related to the activity of a typically developing partner (S = -0.71 with p = 0.03). A partner with a typical development spends a lot of energy on interaction in a couple, the level of his social contacts is reduced. Negative dyadic coping and communication characteristics while experiencing dyadic stress are associated with a decrease in satisfaction with relationships and functioning (S = -0.9 with p = 0.0009; S = -0.78 with p = 0.02). Satisfied with close relationships, couples are less likely to resort to hostile, ambivalent, and superficial actions / words that have detrimental intentions. The main motive of couples with one of the partners of a disabled person is to preserve the well-being of close people, first of all, it is a family, a child, as well as a manifestation of goodwill, indulgence, honesty, responsibility, maturity in daily interaction with loved ones people. Married couples with one of the partners with disabilities are characterized by increased stress tolerance, high exposure to social norms, diplomacy, high level of self-control, meaningfulness of life goals, life satisfaction. The study was supported by the RFBR (Project № 18-313-00243)
TEAM DEBRIEFING CONTENT: A COMPARISON OF TEAMWORK AND TASKWORK FOCUS

Ipek Mete
Ankara Yildirim Beyazit University (Ankara, Turkey)

Canan Sumer
Middle East Technical University (Ankara, Turkey)

Micheal T. Brannick
University of South Florida (Tampa, USA)

Debriefing (i.e., a systematic reflection on a recent experience and planning for future) has been shown effective in improving team performance (Tannenbaum & Cerasoli, 2013). While literature on debriefs investigated the moderation of various delivery methods, researchers have neglected the influence of debriefing content on team outcomes. In this study, we focus on two essential components of team functioning; taskwork (what teams do) and teamwork (how they do it together). We aim to understand whether team debriefs could benefit from focusing on either one or both of these aspects. Another question that has been rarely asked is why debriefs are effective. Thus, we also examine the mediating mechanisms (e.g., team processes) that might be differentially affected by debriefing focus. For this purpose, a lab experiment was designed where three-person student teams are randomly assigned to four experimental conditions. The study utilizes a 4 (Debrief focus: Teamwork, Taskwork, Combined, No-focus) x 2 (Trial: 1, 2) repeated measures design. Teams perform a problem-solving task that involves building a chain-reaction mechanism to accomplish a simple goal (i.e., popping a balloon). In between two trials of this task, teams perform debriefs. Team performance measurement involves the number of steps in the mechanism and goal accomplishment. An observational behavior scale was developed to measure mediating processes (coordination, backup behavior, and information-sharing). We completed pilot testing of the design with 23 teams (69 individuals). Main experiments are ongoing and will be completed with 20 teams per condition. As evidence from team development and planning literatures suggest, teams benefit when both teamwork and taskwork are included in interventions. Accordingly, we expect that debriefs which trigger discussing both aspects will improve performance more than debriefs that include either teamwork, taskwork, or none. We also expect teams that include teamwork in debrief content to have better coordination, backup, and information-sharing than other teams and these team processes will mediate the link between debriefing content and performance. Our findings would shed light on the critical components that should be included in team debriefings to get maximal benefit from these interventions and on the underlying mechanisms through which debriefs operate.
INTEGRATING PERSPECTIVES AND DEFINITIONS ON RELATIONSHIP-CENTRED CARE: A SYSTEMATIC REVIEW

Ana Virgolino
Ana Cristina Miranda
António Vaz-Carneiro
Universidade de Lisboa (Lisbon, Portugal)

Katya Sion
Roy Haex
Maastricht University (Netherlands, Maastricht)

Therapeutic success of chronic diseases is facilitated by an active collaboration between health professionals, patients and their supporting environment. Despite the increasing interest in concepts like participatory healthcare, patient-centred care (PCC) or relationship-centred care (RCC), there is no consensus about their meanings and phenomenological components. This study aims to review conceptual assumptions and constitutive elements of RCC, as an integrative effort to define and delineate the specific frontiers of this construct. A systematic review was performed following PRISMA guidelines. PubMed, PsycINFO and CINAHL electronic databases were searched. Inclusion criteria were: full papers written in English focusing on RCC. No time restrictions were applied. Search-terms were split into two blocks and combined pairwise (both free-text and MeSH terms): professional-patient relations (block 1) and dimensions associated with assessment of quality of care (block 2). Papers’ selection was based on titles and abstracts contents, and narrative synthesis was done independently by two (or, in case of disagreement, three) team members, according to pre-defined categories of analysis. From the 891 initially identified papers (269 after eliminating duplicates), 27 were considered eligible for narrative synthesis. Based on content analysis, preliminary findings suggest that the concept of RCC arise from an initial need to expand the existing health education programs to entail an integrated biomedical-psychosocial perspective. Through the years, several definitions of RCC have emerged. Although the common ground is the idea that relationships are integral to the healing process, most papers present a definition that partially overlaps the theoretical conceptualization of PCC (from which they want to detached to accommodate the perspective that care needs to be based on a partnership that involves not only the patient and the doctor, but also other surrounding elements such as nurses and other health care staff, as well as patients’ family members). There is a need to clarify the conceptual frontiers between RCC and previous related concepts, namely PCC. In this communication, we will present a new integrated definition of the concept as an attempt to create a clearer identity to the concept, allowing the definition of therapeutic actions and methods of quality-of-care assessment.
THE MOST COMMON RESPONSE PATTERNS TO WORLD HEALTH ORGANIZATION DISABILITY ASSESSMENT SCHEDULE IN PERSONS WITH SCHIZOPHRENIA

Gomaa Said Mohamed Abdelhamid
Juana Gómez-Benito
Georgina Guillera
University of Barcelona (Barcelona, Spain)

Schizophrenia is a chronic psychotic disorder characterized by many symptoms such as disorganized speech, grossly disorganized or catatonic behavior, depression, paranoid delusions, and auditory hallucinations (Wu et al., 2018). The World Health Organization Disability Assessment Schedule 2.0 (WHODAS 2.0; World Health Organization, 2000) is frequently used for measuring functional outcomes (Üstün et al., 2010). The current study aimed to identify the most common response pattern in each domain of the WHODAS 2.0 in persons with schizophrenia. The sample consisted of 352 persons with schizophrenia, according to DSM-IV-TR criteria, recruited through 40 outpatient psychiatric clinics across Spain. The complete interviewer-administered version of the WHODAS 2.0 was administered, comprising 36 items distributed across six domains: Cognition, Mobility, Self-care, Getting along, Life activities, and Participation in society. Items can be scored on a five-point scale ranging from 1 (no difficulty) to 5 (extreme difficulty/cannot do). In all domains of the WHODAS 2.0, the common response pattern consisted in scoring 1 in all the items. This pattern corresponds to not having any difficulty in doing the activities; for instance, the most common response pattern for Cognition was “111111” which means not having any difficulty in any cognition item. In addition, findings indicated that most persons with schizophrenia did not show any impairment in Self-care (69.9%) and Mobility (62.7%). Furthermore, a third of persons with schizophrenia did not show disability in the Life activities domain. The most common pattern in each domain of the WHODAS 2.0 is represented by not having any disability. However, percentages of persons showing this pattern substantially varies from domain to domain: 60-70% in Mobility and Self-care or 10-20% in Participation in society, Getting along and Cognition, suggesting that is very frequent to adequately perform in Mobility and Self-care while having problems in Participation in society, Getting along and Cognition.
INTERLINGUAL PECULIARITIES OF UNFAMILIAR OBJECT AND IMAGE NAMING

Alina Antipova
Lomonosov Moscow State University (Moscow, Russia)

Object naming has long been an issue of investigation from a variety of perspectives. In speech production models it is the part of voluntarily performed process of categorizing things and attributing them qualities that differ categorial units. In language studies it is viewed as forming word specific sequences that possess linguistic characteristics reflected in inflections. The present study summarizes the main outcomes of both approaches and is aimed at studying object naming in the framework of cultural and historical approach, activity theory and theory of gradual development of mental actions and concepts. It was hypothesized that social situation of development manifested in different cultural tools and presumably in language determines the way people of different cultural backgrounds name things. The research design presupposed sets of tasks prepared for young people (17-25, males and females) whose mother tongues were Russian (N=30), English (N=30) and German (N=30). The first task instruction was to give names to familiar objects to reveal stereotypical folded naming process and to figure out mental and linguistic categories that people of different languages use in naming. The list was then subjected to expertise and content-analysis. In the second set respondents were exposed to 7 rarely seen or used but still familiar objects. The categories were ticked by the experimenters to find out the coincidence in familiar and rare object naming. The third task instruction was to give names to artificially created images of unfamiliar objects. The study revealed that the process of object and image naming became unfolded procedural action of offering suppositions that resulted in different types of given names especially in case of total unfamiliarity. The third set required significantly more time and effort. People used different naming strategies. While Russian speaking people tended to use function specific verb-derived words with a connecting vowel sound to name unfamiliar objects according to their supposedly performed functions, English and German speaking people were more likely to emphasize obvious visual attributes such as color, shape and texture.
Current research examined the relationship between social competence and levels of the four dimensions of temperament among children of preschool age. Social Competence Scale (SCBE – LaFreinere and Dumas, 1995) and EASI questionnaire (Emotionality, Activity, Sociability, and Impulsivity Temperament Scale - Buss, Plomin and Willerman, 1973) were used to assess children’s social competence, temperament and structure of parental metaemotions. Research included preschool teachers and mothers of children five to seven years old (N=43). Results show statistically significant negative relationship between social competence and impulsivity. Results show no statistically significant relationship between social competence and three dimensions of temperament (activity, emotionality and sociability). Positive relation between dimensions of temperament emotionality and impulsivity is statistically significant as well as correlation between activity and impulsivity. Regarding the structure of parental metaemotions the mother’s personal sadness and intense anger and activity show statistically significant negative relationship between each other. Also, results show statistically significant relationship between mother’s personal sadness and intense anger and social competence of the children. Other two subscales level of awareness of personal and child’s emotions of sadness, intense anger, and the handling child’s emotions don’t show statistically significant relationship with social competence or four dimensions of temperament.
Mental Models Transformation in Educational Context During IT Studies (In-Class Activity Effectiveness Assessment)

Egor Dorokhov
Alexey Gusev
Lomonosov Moscow State University (Moscow, Russia)

Student’s comprehension of the topic during studies is never obvious for teachers. In computer science education the measurement of computer mental models (CMM) before and after each lesson is one of the frequently used techniques to reconstruct the occurring changes in understanding of the material. Unfortunately, a lot of existing methods of CMM elicitation are low structured and poorly grounded. The aim of this study is creation and approbation of valid and reliable CMM explication technique. P. Johnson-Laird’s «mental model» construct and A.N. Leontiev’s «image of the world» concept to describe structure of mental representations are used. The first stage of new measurement technique creation included two steps: (1) the collection of descriptions of computer work during group interviews with different users (pupils, N = 25; undergraduate students, N = 22; programmers, N = 24) and (2) the approbation of card sorting task as data collection technique (groups are similar to the ones of the first step, N = 65 in 3 groups). After data collection step, CMM of each group was reconstructed as multidimensional psychological space of descriptions by multidimensional scaling method. Axes of received spaces were interpreted as a latent structure of each group CMM. All CMM included «Activity — Passivity» and «Action localization» axes, CMM of adult participants also included «Social usefulness» axis. These technologies of data collection and interpretation were used during the next validation stage. Validity of developed instrument was considered as the ability to show CMM changes after thematic lessons. Empirical evaluation of instrument validity included CMM measurement before and after 4 lessons on «Role of new informational technologies in society». The comparison of CMM structure changes between experimental (N = 6) and control (N = 6, without lessons) groups showed that the representation of computers in experimental group has become more saturated and has changed in content. Terms and descriptions that have been used in educational materials become more relevant to CMM core. Thus, developed technique shows appropriate reliability and ability to show CMM changes. Described measurement technique needs systematic quality assessment, but obtained results can be used as the basis for the development of such methods.
DOES RESORT TO LEGAL REMEDIES RELATED WITH BELIEF IN A JUST WORLD AND TRAUMATIC STRESS SYMPTOMS?

Gokce Baykuzu-Gunduz
Gürol Cantürk
Ankara University (Ankara, Turkey)

The basic assumptions of the victim of a crime have been overturned. A person may not know what to believe and whom to trust. Previous experience with the justice system may not be satisfactory. Therefore, they may not trust those who are believed to represent the justice system.

In this study, the relation between traumatic experiences, post-traumatic stress symptoms (PTSS), preferences of the resort to legal remedies and belief in a just world was examined. Demographic Information Form, Life Events Check-List, Post-Traumatic Stress Symptoms Scale, Preferences of Resort to Legal Remedies Questionnaire and General and Personal Belief in a Just World Scale were used as data collection tools. 349 young adults (X=20.15, SS=1.92) took part in this study. T-test and simple regression analyses were used to analyse the data. Analyses showed that (1) there were no significant differences between the participants who had any traumatic experience and those who had no traumatic stress in terms of belief in a just world, (2) it was also shown that there was a negative correlation between the individuals who had low PTSS and who had high PTSS in terms of belief in a just world and (3) PTSS negatively predicted the belief in a just world. It can be concluded that, individuals who thought to have gained their rights in comparison with the participants who did not, believe that the world is fair.

PSYCHOSEMANTIC EVALUATION OF THE ORIGINAL AND TRANSLATIONS OF A POETIC WORK BY STUDENTS WITH DIFFERENT LEVELS OF LINGUISTIC COMPETENCE

Garnik Akopov
Catherine Savitskaya
Ekaterina Zel
Samara State University of Social Sciences and Education (Samara, Russia)

Translators of poetry into other languages is one of the most difficult tasks of textology. The main difficulty lies in the need to achieve psychological equivalence, that is, such a translation from one language to another (taking into account foreign cultural and socio-historical contexts), when readers not only perceive identical meanings, but also receive similar emotional responses, as well as a single impression about the author and conception of the work. The study from the psychological position of defining art as interpersonal communication (R. Pozner, M. Riffater, V. Semenov, and others) and based on the level structure of communication (B. Parygin, P. Vatslavik, etc.) designed a psycho-semantic scale for evaluating poetry (G. Akopov). Junior and senior students studying English were offered the text of a lyrical poem by G. Byron and two classic translations into Russian — V. Bryusov and V. Levik. Participants fixed one of the ratings in each of the 12 bipolar scales from -3 to +3, characterizing: a) emotional response; b) clarity of information; c) clarity of meaning; d) availability of the author’s intention. It was also suggested to write down in a free form — understanding by students the meaning of the poetical original and its translations. The features of emotional, informational, semantic and reflective assessment of the poetic work in English and of each of the two translations into Russian by Russian-speaking students of the initial and advanced stages of learning English are revealed.
DEPRESSION OF MOTHERS WHO GAVE A PREMATURE BIRTH, BREASTFEEDING ADEQUACY MATERNAL ATTACHMENT AND GROUP PSYCHOTHERAPY

Tuba Dursun Tuncel
Akasya Psikoloji (Istanbul, Turkey)

This study was carried out with the mothers of 20 premature babies who have been receiving inpatient care in neonatal intensive care unit of Marmara University Pendik Training and Research Hospital. To assess the mental status of mothers, Beck Depression Inventory, SCL 90, Edinburgh Postnatal Depression Scale, Beck Anxiety Inventory, Breastfeeding Self-efficacy and Maternal Attachment Scales were applied. Six-session group therapy program was conducted with five out of twenty mothers. Then, the scales which applied at the beginning were reapplied to the mothers who joined to the group therapy sessions. This study which reveals that mothers with premature babies have severe depression, postpartum depression (PPD), anxiety, breastfeeding and attachment problems aims to overcome these problems with group therapy sessions. The findings showed that 50% of mothers experienced postpartum depression following the first week of childbirth. The mothers who could breastfeed their infants within first hour of birth showed lower SCL 90 scores comparing to the mothers who could not breastfeed their babies. In addition, mothers who had enough milk for their infants and do not face breastfeeding problems revealed higher maternal attachment and their SCL 90 scores were lower than the mothers’ who have low milk supply and could not breastfeed their babies. A highly significant correlation was observed between the scores of Symptom Checklist Test and Postnatal Depression Scale. Likewise, the scores of Beck Anxiety, Beck Depression and General Symptoms showed a strong positive correlation. In addition, there was a significant moderate correlation between the scores of Interpersonal Sensitivity Measure, Phobic Anxiety, Paranoid Thoughts Scale and Psychoticism. Similarly, the scores of Anxiety and Beck Depression Inventory revealed a significant moderate correlation. After the group therapy sessions, mothers’ depression and postnatal depression symptoms either reduced or disappeared and the scores of their maternal attachment increased.
INTERCONNECTEDNESS OF VALUES AND LIFE STRATEGIES IN A CONSUMER SOCIETY

Ekaterina Klimochkina (Moscow, Russia)
Natalia Malysheva (Moscow, Russia)
Lomonosov Moscow State University (Moscow, Russia)

In modern psychology we are aware of a variety of different concepts, that explain the possible background to our decisions and judgment: some authors say, that values are managing our behaviour, others accentuate goals, needs, motives, meanings, life scripts, life strategies and etc. as the main guideline to our existence. In our research, we were interested in these questions as well, we were looking for a relation between values (S. Schwartz) and life strategies (E. Fromm), in order to understand the underlying meaning of our choices. One of the factors, that came forward as a social context, was consumer society. It's convincing that consumer society and economical inconsistency are major, modern society is dependent on material goods and this factor affects our values, choices and existence.

Objectives: the relation between values and life strategies in a consumer society. The sample (n=107) consisted of participants from a variety of fields, with higher education and consistent income. We used 1) value questionnaire ("Schwartz Value Survey", S. Schwartz), 2)life values questionnaire ("Must-test", P.N. Ivanov, E.F. Kolobova), 3) life strategy questionnaire ("System of life meanings", V.Y. Kotlyakov), 4) consumer behavior questionnaire ("Tendency for conspicuous consumption, O.S. Posypanova"), 5) quality analysis ("Thematic Apperceptive Test").

In our research, through regression analysis and following quality analysis, we discovered profiles with relations between life strategies and values: participants with "Being and Having" life strategy show significance in self-regulation (β=0.77), achievement (β=0.86) and safety (β=0.7) values; participants with "Being" life strategy show significance in achievement (β=0.78), safety (β=0.79) and goodwill (β=0.7) values; values like hedonism (β=0.81) and power (β=0.76) are significant for "Having" life strategy; "Not Being and Not Having" life strategy shows increasing level of conforming (β=0.89) and tradition (β=0.85) values. Conspicuous consumption (63%) as the consumer society commitment indicator is significant in "Having" life strategy. Gathered results showcase significant relation and interconnectedness between the concepts.

Quality analysis defined the underlying differences in comprehension values and life strategies. This gives us understanding, that there are deeper underlying processes and mechanisms (cognitions, metacognition) that are responsible for our choices, create our values and life strategies.
PARENTING STRESS AND CHILDREN’S EXTERNALIZING BEHAVIOR: MODERATION BY CHILDREN’S TEMPERAMENT AND SEROTONIN TRANSPORTER GENOTYPE

Feyza Çorapçı
Ateşyakar Nilay
Elif Aysimi Duman
Boğaziçi University (Istanbul, Turkey)

Children’s externalizing behavior is influenced by various genetic and environmental factors and their interaction (GxE). In terms of genetic factors, previous studies mostly focused on serotonin transporter polymorphism (5-HTTLPR). Some studies associated the Short (S)-allele with higher externalizing behaviors more than the Long (L)-allele homozygotes, while others failed to replicate this finding or reported it only under conditions of distress, such as parenting stress. In addition, there are conflicting findings on how 5-HTTLPR interacts with children’s temperament to influence externalizing behaviors. In this study, we aim to investigate the interaction between parenting stress, children’s temperament and 5-HTTLPR genotype on externalizing behavior. 227 preschoolers (46% girls; Mage = 61 mo, SDage = 8.30 mo) and their mothers from municipality preschools of Istanbul participated in the study. Parenting stress was measured by Parenting Stress Index with subscales of feelings of role restriction, sense of incompetency, and relationship with spouse. Temperament was measured by Children’s Behavior Questionnaire Very Short Form with the following four subscales: surgency, negative affect, effortful control, and impulsivity. Externalizing behavior was measured by the Child Behavior Checklist. 5-HTTLPR genotype was determined from salivary DNA as S/S, S/L, and L/L. A regression analysis controlling for age showed a significant interaction between parental sense of incompetency, children’s negative affectivity and 5-HTTLPR genotype on externalizing behavior only for girls. S/S girls exhibited higher externalizing behavior with higher parental sense of incompetency, only if they had high negative affectivity (p < .001). This interaction was not observed in S/L or L/L girls or in boys. Our findings revealed that negative affectivity may serve as a vulnerability factor for S/S girls in developing externalizing behaviors upon parental sense of incompetency.
DEVELOPMENT AND VALIDATION OF THE RADICAL ATTITUDES QUESTIONNAIRE IN THE NORMATIVE SAMPLE

Elena Rasskazova
Vadim Emelin
Aleksander Tkhostov
Lomonosov Moscow State University (Moscow, Russia)

Studies of cognitive factors of aggressive and intolerant patterns of interpersonal communication become especially relevant with ICT development allowing for contact across social groups and countries. In line with cognitive model we suggested a system of radical attitudes underlying these types of behavior including intention to defend own opinion at any price, "black-and-white" thinking, impulsivity in decision making, acceptability of public expression of aggression, high self-confidence and low subjective price of mistakes. The aim was to validate Radical Attitudes Questionnaire (RAQ). 218 adults (33.2% males) 18-60 years old (mean age 37.81-14.54 years old) replied 54 items of RAQ using 1-5 Likert-type scale and filled Aggression Questionnaire (Bass-Perry, 1992), Interpersonal Reactivity Index (Davis, 1983), Index of Tolerance (Psikhodiagnostika... , 2008), Antisocial scale of Beck's Personal Beliefs Questionnaire (Beck et al., 2001), Barratt Impulsiveness Scale (Barrat, 1993). Cronbach's alphas varied .72-.80 for Opinion Defending, Impulsivity in Decisions, Acceptability of Public Aggression, Self-Confidence scales and were .62 and .68 for "Black-And-White" Thinking and Low Price of Mistake scales, respectively. Factor analysis supported theoretical 6-factor structure (explaining 41.12% of variance) with only 9 items (16.6%) having cross-loadings to other factors. Any radical attitudes are related to antisocial personal beliefs (r=.28-.69, p<.01) while opinion defending, impulsivity in decisions, acceptability of aggression, self-confidence (r=.43— -.21, p<.01) and especially "black-and-white" thinking (r=.42=.39, p<.01) are related to intolerance to other people and poor perspective taking in interpersonal reactivity. Higher aggression correlates to opinion defending, acceptability of aggression expression and self-confidence (r=.35-.59, p<.01). Decision impulsivity is related to Barret's motor impulsivity component (r=.20, p<.01). Data supports consistency and factor validity of RAQ as well as relationship of almost any radical attitudes with antisocial tendencies, aggression, intolerance to others and poor interpersonal reactivity due to deficiency in perspective taking. The major exception was low price of mistake belief that was related to antisocial beliefs only. Further studies could differentiate the roles of different beliefs in different forms of aggressive, autoaggressive, intolerant behavior online and offline. Research was supported by the Russian Foundation for Fundamental Research, project 18-013-01222.
COMPLIANCE STUDY AMONG PATIENTS SUFFERING DIABETES

Tatiana Buzina
Moscow State University of Medicine and Dentistry
(Moscow, Russia)

Dmitry Miterev
Dental Clinics ALL OWN Licensing (Moscow, Russia)

The number of people suffering from diabetes in the world is increasing. Adherence to therapy and correct fulfillment of guidelines can significantly improve treatment effectiveness and further patients’ quality of life. Purpose of research was to analyze psychological factors of compliance among patients with diabetes mellitus. 50 patients with diabetes mellitus type 1 and type 2, average age of 37.56±5.41 on hospital treatment took part in the research. Test "Level of Compliance", Leontiev’s Modification of Purpose-in-Life Test were used. Results of research demonstrated that level of general compliance in the group of patients with diabetes was 69.4 points that corresponds to average level of compliance. Therefore the patients are characterized as people with neutral attitude to treatment, acting mostly according to situation. Their behavior concerning treatment depends on certain motivation and personal profit. While assessing patients’ general meaningfulness of life following results were obtained: general index of compliance reached 84.9 points, "Purpose of life" — 24.2; "The process of life" — 23.0; "The result of life" — 26.8; Locus of control "I" — 15.3; Locus of control — life -26.0. These results are reduced in comparison to normal ones, showing that patients are bent on underestimating their achievements in life, they believe that they do not sufficiently control the process of their life as well as dissatisfied with their self-realization. Correlation analysis showed that the behavioral compliance is connected with the "Goals in life" (r = 0.27; p ≤ 0.05), and social compliance is negatively associated with the "Locus of control — life" (r = 0.31; p ≤ 0.02). Patients’ general level of compliance is insufficient. Patients can underestimate significance and gravity of disease under pressure of emotions, that can lead to unfulfillment of guidelines. Following patterns are revealed: with person’s high sense of purpose, the level of behavioral compliance increases when patients perceive the disease as an obstacle to the realization of life goals. When patients’ perceptions that they are able to control their lives, to make decisions freely and implement them, prevail, these patients are less inclined to follow the doctor’s prescriptions to reach social approval.
BELIEFS ABOUT REASONS OF SLEEP DISTURBANCES AS FACTORS OF ANXIETY AND DEPRESSION IN PATIENTS WITH INSOMNIA AND SLEEP APNEA

Elena Rasskazova  
Lomonosov Moscow State University (Moscow, Russia)

Gennadii Kovrov  
Sechenov University (First Moscow State Medical University) (Moscow, Russia)

Anna Machulina  
Bakhrushins’ City Clinical Hospital Neurologist (Moscow, Russia)

Anxiety and depression are considered as negative consequences of any chronic condition while in insomnia they could be factors triggering and/or perpetuating sleep disturbances. The aim was to reveal possible factors of anxiety and depression in sleep disturbances: subjective and objective sleep quality, sleepiness and beliefs about reasons of sleep disturbances. 93 patients with chronic insomnia and 46 with sleep apnea participated in 1-night of polysomnography recording and filled checklists of symptoms and reasons for sleep disturbances (Insomnia..., 2004), Insomnia Severity Index (Morin, 1993), Hospital Anxiety and Depression Scale (Zigmond, Snaith, 1983), Epworth Sleepiness Scale (Johns, 1991). Both anxiety and depression were higher in insomnia comparing to sleep apnea (p<.01) but only in patients with sleep apnea they were related to subjective and some parameters of objective sleep quality. After control for clinical group, moderation analysis demonstrated that in both groups anxiety is predicted by poorer subjective sleep (β=-.21) and apnea index (β=.17) while subjective sleep vulnerability to stress, life events and unpleasant sensations in legs and arms (β=.11-.18) significantly improve the model (ΔR2=9.15%, p<.01). Beliefs in the role of life events is more closely related to anxiety in insomnias comparing to patients with sleep apnea (β=.26, ΔR2=3.30%, p<.01, total R2=35.14%, p<.01). Depression in both groups was marginally predicted by sleep efficacy (β=-.17, p<.07), significantly predicted by poorer subjective sleep (β=-.34, p<.05) but this effect was prominent for sleep apnea comparing to patients with insomnia (β=.31, p<.05). Sleep vulnerability to unpleasant sensations in legs and arms predicted further 3.07% of variance in depression (β=.18, p<.05, total R2=22.97%, p<.01). In chronic sleep disturbances and especially in insomnia anxiety and depression could depend more on subjective sleep appraisal and beliefs about reasons of sleep disturbances than on objective sleep. Experiencing unpleasant sensations accompanying with beliefs that they increase sleep disturbances are general predictors of both anxiety and depression in both groups. Research is supported by the Russian Foundation for Basic Research, project No. 17-06-00363.
As people live longer, quality of life becomes an important issue at the individual, family, and social policy levels. There is numerous research evidence that wellbeing is relevant to health and quality of life as people age (Steptoe, Deaton, & Stone, 2014). Life satisfaction, as an indicator of the person's wellbeing, is one of the indicators of successful psychological adaptation in later life, when a person is usually faced with changes and losses: in health, physical and cognitive functioning, social engagement, and productive activities (Smith & Ryan, 2016; Schaie, 2016). There is a growing research evidence suggesting that life satisfaction may even be a protective factor in health maintenance, reducing the risk of chronic physical illness and promoting longevity, by way of positive emotions which promote a more active lifestyle and a motivation toward self-care (Carver, Scheier, & Segerstrom, 2010). The aim of this paper is to present some psychological dimensions of an individual and the psychosocial aspects of care for the elderly related to the health, quality and length of life in old age. In order to obtain answers to these questions, we have conducted several research on aging in Croatia, from which we can recommend several conclusions. Research on life satisfaction predictors in Croatia showed that the strongest predictor of better life satisfaction in the observed set of psychosocial variables was better self-perceived health. No differences in life satisfaction were found regarding the participants' living environment, in residential institution or in own home. Also we found that combinations of multivariate analyses confirmed significant contribution of psychosocial variables to survival prediction in older adults. Implications are in the planning and adjustment of psychosocial care for future old persons to improve their quality of life.
PREFERENCE OF MASCULINE AND FEMININE GENDER ROLES AND WELL-BEING IN TRANSSEXUAL PEOPLE: COMPARING PRE-TREATMENT, HORMONAL THERAPY AND POST-SURGERY GROUPS

Elena Rasskazova
Sergei Kumchenko
Aleksander Tkhostov
Lomonosov Moscow State University (Moscow, Russia)

It seems reasonable to suggest that strong wish to change one’s gender is related to preference of the typical roles and traits of the other gender. The aim was to reveal differences in gender roles in transsexual people and their relationship to well-being on different stages of medical transition. 100 transsexual people (33% initially males) and 100 cisgender people (35% males) filled Satisfaction With Life Scale (Diener et al., 1985), Scale of Positive and Negative Experiences (Diener et al., 2010) and Gender Roles Male and Female scales from Minnesota Multiphasic Personality Inventory — 2 (Butcher et al., 2001). In transsexual group 33 initially females (FtM) and 7 initially males (MtF) were before transition, 15 FtM and 11 MtF were on hormonal therapy, 17 FtM anf 17 MtF were after some surgical operations. Masculine gender roles are less preferred by biologically females (both in transsexual and control groups) and by transsexuals (both FtM and MtF) while female gender roles are less preferred by males (F=6.68-64.12, p<.01). Subjective well-being was lower in transsexuals than in controls regardless biological gender (F=10.00-26.35, p<.01) especially in those without hormonal or surgical therapy. In all males higher satisfaction with life, positive and lower negative emotions were related to preference of masculine gender roles ($\beta$=.36, $\beta$=.28, $\beta$=-.58, p<.01). In females all three subjective well-being indicators were also higher in those preferring masculine gender roles ($\beta$=.34, $\beta$=.52, $\beta$=-.52, p<.01), positive emotions were higher in those preferring female roles ($\beta$=.24, p<.01). In both transsexual males ($\Delta R^2=5.5\%, p<.01$) and females ($\Delta R^2=5.5\%, p<.01$) after surgical operations interest to masculine gender roles less related to positive emotions than in controls. Thus, preferences in gender roles in transsexual people are relevant to those in controls with the same biological (not wished) gender. However, preference of masculine gender roles seems to be lower in transsexual people of both biological biological genders and in those after surgical operation is less related to higher positive emotions than in controls. Research is supported by the Russian Foundation for Basic Research, project No. 17-06-00849.
SELF-COMPASSION AT WORK: THE RELATIONSHIP BETWEEN SELF-COMPASSION, AND INTRINSIC MOTIVATION, JOB PERFORMANCE AND JOB SATISFACTION

Reyhan Bilgiç
Ayşe Özge Ararat
Deniz Baştak
Fulya Döner
Middle East Technical University (Ankara, Turkey)

The researchers aimed to examine the relationship between self-compassion and intrinsic motivation, job performance and job satisfaction in terms of organizational context, also age, gender, and education level contributed to these relationships. There are three research questions were asserted for understanding these relationships, these questions are (a) is there a relationship between self-compassion and intrinsic motivation, (b) is there a correlation between self-compassion and job performance and (c) is there a relationship between self-compassion and job satisfaction. Also, age, gender and education are determined as control variables. The data were obtained from several organizations from 112 participants (Female: 54, Male: 58) and the participants answered four different scales which are Self-Compassion Scale, Work Preference Inventory-Intrinsic Motivation Subscale, Self-Report Task Performance & OCB Scale, Global Job Satisfaction Subscale and the employers answered one scale which is Task Performance & OCB Scale (Supervisory Form). The results showed that self-compassion and intrinsic motivation (β=.249, p<.001), self-compassion and self-reported job performance (β=.311, p<.001) and self-compassion and job satisfaction (β=.323, p<.001) correlated positively. Besides, gender and job performance (β=-.387, p<.001) and education level and job satisfaction (β=-.323, p<.001) correlated negatively. The findings point several implications such as need for further studies such as education level differences with regards to job satisfaction and gender differences with regards to job performance.

Keywords: self-compassion, intrinsic motivation, job performance, job satisfaction
TESTING THE NUMBER-SPACE COMPATIBILITY IN A STROOP TASK

Hakan Çetinkaya
Ankara University (Ankara, Turkey)

Yavuz Günce
Seda Dural
Izmir University of Economics (Izmir, Turkey)

Number-space (NS) compatibility refers to a tendency of representing small numbers on the left side and big numbers on the right side in a left-to-right continuum. The studies of NS compatibility usually have employed the tasks that pertain excitation of a response rather than inhibition of it. Present study aimed to investigate the inhibitory response effects on NS compatibility by using a modified version of the Stroop task. Thirty right-handed university students took part in the study. The stimuli used in the task were developed regarding the (1) NS compatibility (small number on the left and big number on the right vs. small number on the right and big number on the left; NS compatible: 2 and 5, NS incompatible: 5 and 2) and (2) number-frequency congruency (whether an integer is equal to the number of its own copies; e.g. congruent: 2 2, incongruent: 2 2 2). Thus, the task consisted of four different stimulus categories: NS compatible — congruent (e.g. 22 and 55555), NS compatible — incongruent (e.g. 22222 and 55), NS incompatible — congruent (e.g. 55555 and 22), and NS incompatible — incongruent (e.g. 22222 and 55). Eight stimuli from each stimulus category were presented with 1000ms stimulus durations and 500ms inter-trial intervals. Each participant performed two tasks in counterbalanced order. One of the tasks was required the participants to identify the side of bigger number (e.g., 2 or 5) by ignoring the frequency and the other was required them to identify the side of higher frequency (e.g., 2 times or 5 times) by ignoring the magnitude of the number. Accuracy of response and reaction time were recorded as dependent variables and analyzed by using 2 (NS compatibility) x 2 (congruency) repeated ANOVA. Results indicated that the participants responded faster and more accurately when the stimulus was NS compatible — congruent for both tasks they performed. On the other hand, the task performance was reduced when the magnitude of the number was required to be ignored. This reduction in the performance clearly indicated that the NS compatibility effect remained intact even though the inhibitory control of responding was required by the task.
MULTIPLE OBJECTS TRACKING TASK COMPLEXITY FACTORS

Liubov Tkacheva
Saint-Petersburg State University (Saint-Petersburg, Russia)

Vladimir Volokhonsky
IntelliJ Labs Co.Ltd. (Saint-Petersburg, Russia)

Ekaterina Stankova
Sechenov Institute of Evolutionary Physiology and Biochemistry of Russian Academy of Sciences (Saint-Petersburg, Russia)

Mekler Alexey
Saint-Petersburg State Pediatric Medical University (Saint-Petersburg, Russia)

The factors influencing the complexity of the task of multiple object tracking (MOT) were investigated. In previous MOT studies it was shown that participants are able to track 4-5 targets moving for 7 seconds at a speed of 1.25 to 9.4 degrees/sec (Pylyshyn & Storm, 1988; Scholl & Pylyshyn, 1999). It was found out that at a stimulus velocity of 3 degrees/sec for 5 seconds, participants are able to track up to 8 objects (Alvarez & Franconeri, 2007). It is believed that the higher the speed of stimulus, the more attention resources are required for productive tracking (Feria, 2013). There are several theories, describing changes in visual attention during the tracking process. It should be noted that the results of the MOT experiments are highly dependent on the procedure conditions and therefore they are so diverse and sometimes contradictory. Consequently, there are still unresolved issues related to certain physical conditions of experiments and characteristics of targets and distractors. In our study for each participant (30 subjects were involved) 45 trials of MOT task were conducted in a randomized order. Trials differed by speed (2 modes of 1 and 1.5 degrees/sec), the number of targets (from 2 to 7), total objects number (from 10 to 14) and duration—10 or 15 seconds. Each trial complexity has been evaluated. Trial complexity measure was based on the number of targets tracked by participants successfully. The plot of sorted trials complexity (dependence of the complexity value on the position in the sorted raw) consists of two parts—slow (the simplest trials) and rapid complexity increasing (the region with the most difficult tasks). All trials, which include 6 and 7 targets belong to the “rapid” part of the plot. This study showed that the trial complexity depends mostly on the number of targets and its duration rather than on total number of objects or movement speed. When the number of targets is 6 and greater, successfulness decreases rapidly in task fulfillment. Study was supported by the RFBR grant 18-013-01086.
PSYCHO-IMMUNOLOGICAL ASPECTS OF FUNCTIONING OF LIFE SUPPORT SYSTEM ON THE EXAMPLE OF RUSSIAN WINTER SWIMMERS

Mariya Bogdanova  
Tyumen State University (Tyumen, Russia)

Tanya Fisher  
Tyumen Scientific Center of the Siberian Branch of the Russian Academy of Sciences (Tyumen, Russia)

Liubov Tkacheva  
Saint-Petersburg State University (Saint-Petersburg, Russia)

The relationship of the immune system and psychological protective and adaptive mechanisms in people involved in systematic winter swimming (cold hardening) was investigated. The study is based on the theory of the life support system (LSS), which describes the functioning of different levels of protective and adaptive mechanisms and allows a person to cope effectively facing difficulties. It was revealed that: 1) failure or underdevelopment of one of the levels leads to overvoltage of the entire system and hyper inclusion of other levels; 2) the prevalence of a certain level depends on the stage of personal development; 3) there is a range of the most effective protective and adaptive reactions for each type of a threat; 4) LSS is individual and determines the quality of adaptation; 5) the triggers of the development of LSS are life challenges and response patterns. The aim of this study was to clarify the functioning of the bodily level of LSS. 65 participants took part in the study. Immune parameters of repertory lymphokine interleukin—4 (IL-4) (marker of humoral immunity) and INF-γ (marker of cellular immunity) were measured. 

The following psychodiagnostic methods were used: Luscher test, Anxiety test (STAI), “Cognitive need” of V. S. Yurkevich, “Lifestyle index” of Kellerman-Pluchek. It was established that people engaged in cold hardening prefer bodily stimulation through physiological mechanisms with the inclusion of the immune-endocrine system to relieve psycho-emotional stress. High personal and situational anxiety is regarded as an unconscious reason for winter swimming. Usage of extreme short-term water-cold exposure reduces anxiety, increases cognitive needs and leads to enlarged activity of humoral component of the immune system in 2.6 times. Therefore, the relationship between the immune system and psychological defenses was established: if psychological defenses do not cope well with their functions, the immune system partially takes on this role. Prospects for further research lie in the investigation of the cold impact on the human body in the Arctic, the development of the tools for the selection of employees, successfully adapting and effectively working in the Arctic and the North. The study was supported by government of Tyumen region.
PSYCHOLOGICAL ASPECTS OF THE CREATIVE CRISIS

Yulia Babaeva
Yana Varvaricheva
Lomonosov Moscow State University (Moscow, Russia)

The phenomenon of creative crisis hasn’t been sufficiently studied in modern psychology, despite the relevance of its empirical and theoretical investigation. Article summarizes the research on the creative crisis phenomenon that we’ve been conducting in the Russian sample for several years. We collected and analyzed extensive phenomenological data: implicit ideas about creativity, descriptions of creative crises experience (including metaphors of creativity and crises), descriptions of emotional experience and process of coping with the crisis. Total sample included more than 200 subjects. We identified a number of positive functions of creative crises, important for its successful overcoming (signal, diagnostic, developmental (stimulating), protective and creative functions). For example, respondents who noted the developmental and signaling functions considered that the crisis could contribute to the transformation of values, motives, goals, meaningful formations, evaluation criteria, rise of new ideas. We formed a set of methods, which provide deep and complete investigation of creative crises. In addition to interviewing, it included Rokeach Value Survey; COPE Inventory, the Grounded Theory method (its prospects were substantiated in a study with V.Mazanova); and original techniques: “Symbol of creativity” and “Life line” modification for creative biography analysis. Significant variances in value of creativity were found for different groups of subjects (involved in creative activity and those who quit; authors and performers). Approaches to creative crises classification were proposed (eg. “inspiration crises” and “incarnation crises”). Coping strategies and their contribution to creative crises’ overcoming were investigated (with A. Sudyarova). Correlation analysis showed that successful overcoming of “incarnation crisis” is positively connected with active coping and planning. However, the successful overcoming of “inspiration crisis” is associated with the adoption of situation. In general, our studies show that creative crises’ overcoming depends on the type of crisis, and on the subject’s personal characteristics. The latter include biographical creative experience, including events of early childhood; subject’s implicit ideas about crises and creativity; locus of control; preferred coping strategies; value orientations; understanding of creative crisis’ positive functions. The research contributes to the enhancement of psychological support for representatives of creative professions and the prevention of creative crises’ negative effects.
AUTISTIC TRAITS MODULATE SOCIAL ATTENTION IN DYNAMIC SCENES: AN EYE TRACKING STUDY

Lucas Haraped
University of Innsbruck (Innsbruck, Austria)

Being a vigilant and cooperative species, humans in the presence of others preferentially attend to socially relevant stimuli. Paying attention to others enables us to draw conclusions about their mental states and therefore provides implications for our own behavior. Human gaze behavior has been shown to be a reliable source of information about the attentional focus of individuals. Recent findings show that individuals with autism spectrum disorder spend less time attending to social stimuli compared to healthy controls. Moreover, their social attention is most impacted when visual stimuli are high in social content (Chita-Tegmark, 2016). We investigated whether autistic traits in healthy individuals modulate attention towards social stimuli. A sample of 80 healthy, young adults, M age = 21.39 (Sd = 2.47) were eye tracked (Tobii TX300) while watching a 3-minute video of a walk through a busy shopping mall in first-person view. Social attention was measured as viewpoints on dynamic socially relevant areas of interest on depicted human bodies (i.e. front view face, front view body, behind view body). Further, autistic traits were assessed using a validated German short version of the Autism Spectrum Quotient questionnaire (ASQk). Results show that autistic traits are negatively correlates with the number of viewpoints on social stimuli in depictions of social situations. In line with earlier studies, our results show that gaze behavior in healthy individuals regarding attention towards socially relevant cues is negatively associated with autistic traits. Especially in situations with high social content, attending to social cues may be critical to understanding the social meaning of actions. Results are discussed regarding the idea that social motivation deficits play a central role in Autism Spectrum Disorders. Further, the study shows, that eye tracking with depictions of dynamic naturalistic social scenes provides a suitable measure for social attention.
LEADERSHIP PRACTICE SHAPES SOCIAL GAZE DURING NEGOTIATION

Thomas Campidell  
University of Innsbruck (Innsbruck, Austria)

Gaze behavior represents a crucial tool for communication and is therefore of vital importance in real life social interactions. Evolutionary signaling theory suggests that individuals use certain nonverbal signals, such as eye gaze, in order to convey leadership qualities to followers. We hypothesized that subjects would show increased eye signalling if put in a situation where they had to motivate others. Increased amounts of eye contact are for example related to dominance and expertise. In order to assess socially relevant leadership skills in a student population, we used the Student Leadership Practices Inventory (SLPI), a questionnaire designed to measure skills besides the typical models that describe leadership specifically for management or businesses environments. Using eye-tracking technology, we had n = 72 college students speak as leaders to a previously recorded audience of four followers. Believing that the others were live on screen, the subjects (playing the role of a leader) were told to motivate the others to invest more of their resources in a fictional negotiation game. Eye signaling was measured as fixations on dynamic areas of interest located on the eye region of the videotaped audience. Results show increased fixation counts towards the eye regions of followers in students scoring higher on SLPI. This is in line with our hypothesis and shows that leadership practices are indeed reflected in one of the most basic nonverbal behavior during social encounters. Our findings advance our understanding of the basis of leadership practice in social interactions.

INCREASED WORKING MEMORY CAPACITY PREVENTS FINANCIAL LOSSES CAUSED BY MODEL-FREE DECISION MAKING

Thomas Maran  
University of Innsbruck (Innsbruck, Austria)

Which decision-making strategy we choose fundamentally shapes both our everyday lives, and the outcomes of our financial investments. Model-free decision making, although being more common, is accompanied by an overreliance on previous rewards, and thus mostly results in suboptimal outcomes and financial losses. And yet we are biased towards this strategy, preferring it to cognitively more demanding model-based decision making, which incorporates knowledge of reward contingencies. Although both share common ground, stable interindividual preferences for one of the strategies exist. In this study we aimed to test the predictive accuracy of cognitive abilities on the choice of strategy. We expected a positive relation of working memory capacity on the usage of model-based choice behavior. 110 participants completed a two-stage Markov task as a measure of their preferred decision-making behavior. We assessed their cognitive abilities utilizing the Operation Span Task (OSPA) and the Reaction Time Paradigm to measure processing speed. Our results show that participants’ working memory capacity was able to predict an increased usage of model-based decision making. These findings, at the nexus of economic and cognitive psychology, indicate possible avenues for future research on financial decision-making.
VIEW OF THE WORLD OF ADOPTED CHILDREN AND SUBSTITUTE PARENTS: PSYCHOLOGICAL PROBLEMS

Irina Ponomareva
Chelyabinskiy Gosudartsvennyy Universitet (Chelyabinsk, Russia)

Social orphanhood is a phenomenon relevant to Russian society. This phenomenon is considered in connection with the index of the socio-psychological well-being of society, identifying such social development issues as a demographic issue, employment and unemployment, health, level of education and culture of citizens, education, socialization and morality. One of the ways to solve the acute problem of social orphanhood is the deinstitutionalization of orphans, their placement in a substitute family. In the presented study, basic beliefs are considered as psychological predictors of adaptation of adoptive children in a foster family. The basic beliefs of adoptive children and their foster parents are investigated. The features of basic beliefs and view of the world of adopted children and their foster parents in general are presented.

THE RELATIONSHIP OF THINKING STYLE AND FEATURES OF THE MOTIVATION OF SALES AND ADVERTISING MANAGERS

Alla Belousova
Yulia Mochalova
Don State Technical University (Rostov-on-Don, Russia)

The manager’s thinking is conditioned by the formed motivational peculiarities on which his personal professional success and the effectiveness of the organization’s activities depend. We assumed that the group of sales managers and advertising managers have differences in the relationship of thinking style with motivational qualities and the need for achievement. We used: A. Belousova’s method of diagnosis of thinking styles, “Scale of control over the action” J. Kul and “Need for achievement” Yu. Orlov. The sample consisted of 61 people aged from 25 to 30 years, of whom 41 were men and 20 were women from organizations involved in the sale of a technical group of goods (“A” is a group) and advertising services (“B” is a group) in Rostov-on-Don. For quantitative data processing, mathematical methods were used: Spearman’s r correlation was used. In group “A”, an analysis showed the presence of statistically significant connections: a critical thinking style has a significant relationship with the level of expression of the need to achieve; practical thinking style is statistically significantly interrelated with control over action in a situation of failure. Thus, in the group of sales managers, with increased control over the action in case of failure, practical thinking becomes more important, the critical style of thinking increases with increasing levels of need to achieve. In group “B”, an initiative, managerial, and practical style of thinking has significant correlations with the need for achievement. A practical thinking style has a negative relationship with control over the action in a situation of failure; managerial thinking style has a negative relationship with control over the action during implementation. Thus, in a group of advertising managers, with an increased need for achievement, there are increased opportunities for initiative, managerial and practical thinking styles. In a situation of failure, strengthening the control over the action reduces the practical style of thinking; in a situation of implementation, with increased control over the action, the managerial thinking style is reduced.
THE LIFE QUALITY OF ADOLESCENTS WITH SPECIAL NEEDS DEPENDING ON DEGREE OF DISEASE: PSYCHOLOGICAL SUPPORT OF THE FAMILY

Svetlana Churbanova
Olga Karabanova
Natalia Poskrebysheva
Afsana Askerli
Lomonosov Moscow State University (Moscow, Russia)
Ekaterina Voroshilova
National Medical Research Center of Endocrinology
(Moscow, Russia)

Psychological support of families with children and adolescents with complex diseases receiving treatment in hospital is considered in integrative approach that includes sociology, medicine, developmental psychology and family psychology. The models of psychological support of families in the United States and Europe are founded on interdisciplinary assessments to study the needs of families with special needs children based on comparison of sociodemographic level, socioeconomic level, life cycle of family, age and gender of the child, educational context, degree of severity (Bailey & Simeonson, 1988; Dunst et al., 2002; Felizardo & Ribeiro, 2015). The present study was designed to evaluate the needs and life quality of families with adolescents which have varying degrees of severity. 95 adolescents with diabetes mellitus type 1 aged 12-17 years (patients of National Medical Research Center of Endocrinology, Ministry of Healthcare of the Russian Federation) and 36 parents of those adolescents participated in this study. The diabetic module of the international standardized questionnaire PedsQL™ adapted from the original version (Varni et al., 2003) was used for adolescents and parents. The present study has descriptive and exploratory aspects. It will lead to better understanding of the needs of families with children and adolescents which have varying degrees of severity. The results of this investigation show that the presence of initial manifestations of complications has no significant impact on the life quality of children with type 1 diabetes and their parents, but significantly decreases with the severity of the disease. There is a positive correlation of life quality of adolescents with special needs and life quality of their parents (r=0.6; p<0.05). The implementation of additional interdisciplinary tools to assess the Russian sample, e.g. sociodemographic questionnaires and the Family Needs Survey adapted from the original version (Bailey & Simeonson, 1988) will help clarify the wide range of needs of parents in psychological information, improve the functioning of families by psychological support in behaviour regulation, communication, education and development of adolescents with varying degrees of severity, which was also confirmed in the study of Portuguese researchers (Felizardo, Ribeiro, 2018).
BILINGUAL PERSONALITY THROUGHOUT THE IMAGE OF THE WORLD PARADIGM

Ekaterina Bekasova  
Moscow State Pedagogical University (Moscow, Russia)

According to A.N. Leontiev, the analysis of the mechanisms that form the image of the world should be one of the main tasks for modern psychology, because it mediates the activities of people in the real and objective world where they operate and live. Studies of E.Y. Artemyeva, S.D. Smirnov, V.V. Petukhov and others point to the three-component structure of the World Image, it includes the nuclear, semantic, and perceptual layers. The content of the semantic layer is determined by the language that the person knows and speaks. In the case of the bilingual personality formation, the semantic layer acquires the ability to translate information in the systems of meanings among different languages. As a result, the functioning of the Image of the world as a whole is changing. The study, aimed at exploring the personal characteristics of future professional bilinguals, was attended by 443 people. We used Cattell 16PF test, The Interpersonal Diagnosis of Personality (T. Leary), The Method of Personal Differential. The results showed significant differences in bilingual groups studying German, French and Spanish. Diversities of bilinguals speaking different foreign languages are manifested in the methods and strategies of interpersonal relationships, the characteristics of personality traits and the ways of assessing the world around us, other people and ourselves.

ONTOLOGY OF SELF-AWARENESS IN PSYCHOLOGY

Valery Oleshkevich  
Applied Research Center for Child and Adolescent Mental Health named after G.E. Sukhareva (Moscow, Russia)

This research appeared when the authors began to comprehend theoretical and methodological heterogeneity of contemporary psychology and discrepancy of goals in different studies. Therefore, the authors sought to research ontological and general philosophical basis of contemporary psychology. For achieving this goal, the methods of cultural-historical psychology were used as well as sociological and phenomenological analysis of psychological knowledge and methods of its acquitting. The research was based on the results of studies conducted in child psychology, developmental psychology, history of psychotherapy, etc. The research resulted in understanding that self-awareness was an essence of awareness, the basis of intellection, emotions, behavior, etc. Self-awareness is understood as a basic structure of experience drawing on primary experience of selfhood opposed to an object projected into the external world. In the development of a person, this object is first of all an image of Other. Therefore, structure of self-awareness is a developing structure of a dialogue, both internal and external. In this sense, only self-awareness is able to develop. In the center of this ontology and methodology related to it there is an idea of development of self-awareness that can be researched both from within of its development and from without objectively. These two types of examination complete each other. Such ontology can describe reflectively then development of psychological knowledge, i.e. to describe history of psychology as an essential part of history of
the culture. Moreover, such ontology can become a fundamental ontology of contemporary psychology. Numerous studies were conducted on the basis of this methodology in history of psychology, clinical psychology, etc. and demonstrated broad perspectives of cultural-historical understanding and examination of psychological phenomena, i.e. understanding them in developmental and cultural context. Elaboration of such ontology opened up possibilities for development of general psychological, genetical and clinical-psychological research. We argue that this ontology and methods based on it break new ground in monitoring and reflection of contemporary psychology and provide us with opportunity to understand it within the framework of general trends of cultural development. Moreover, it opens up new horizons in designing new applied and practical studies in contemporary society based on psychology.

FUTURE TIME PERCEPTION AND EFFECTS OF INTOLERANCE OF UNCERTAINTY: IS HOPE DIMINISHING?

Gökçe Baykuzu-Gündüz
Hilal Kaya
Ankara University (Ankara, Turkey)

In recent years, the situation of terror and conflict in the world, economic problems, unemployment, stress as a part of daily life conditions such as people to look through life with more hope and to be more holistic and positive individuals can be affected by progress. In this study, it is planned to look at the relationship between hope and future time perception and intolerance of uncertainty then discuss with the literature. The sample of the study will be constituted from young adults and the data from the participants will be collected via the survey. The Integrative Hope Scale (Akin et al., 2012), Intolerance of Uncertainty Scale (Sarı and Dağ, 2009), Future Time Perspective Scale (Eren and Tezel, 2010) will be used as a data collection tool. It is considered that the findings of the study are important for the information that will be given about the variables believed to be related to people’s hopes about life. Key Words: intolerance to uncertainty, future time perception, hope.
THE ROLE OF JUSTICE SENSITIVITY ON PRO-SOCIAL INTENTIONS. FINDINGS FROM A ROMANIAN SAMPLE

Raluka Tomsa
Alina Chiracu
University of Bucharest (Bucharest, Romania)

Justice is a very important issue in people’s lives. Justice sensitivity is usually a construct measured from the victim’s perspective. However, episodes of injustice typically involve more perspectives, maybe a second person who benefits from the injustice passively or actively or there may be witnesses who are not directly involved. In order to better understand these roles, Schmitt et al. (2005) investigated correlations between justice sensitivity scales and socially desirable traits (empathy, role taking, social responsibility) as well as socially undesirable traits (machiavellianism, paranoia, vengeance, suspiciousness, jealousy, distrust). Victim sensitivity was positively related to socially undesirable traits and unrelated to socially desirable traits. By contrast, observer and beneficiary sensitivity were positively related to socially desirable traits and unrelated to socially undesirable traits. Researchers have found prosocial values to be a consistent predictor of helping behaviors (Penner & Finkelstein, 1998; Rioux & Penner, 2001), and more internalized prosocial "role identities" predict more persistent and long-term engagement with prosocial activities (Finkelstein & Penner, 2004; Penner, 2002). This study aims to establish the age differences in justice sensitivity levels and the role of the four dimensions of justice sensitivity (victim, observer, beneficiary, and perpetrator) on pro-social intentions. A sample of 561 students was employed to participate in this research aged 18 — 48 years (M = 20.60, SD = 4.89). The measures used were Justice Sensitivity Inventory (Schmitt, Baumert, Gollwitzer, & Maes, 2010) and Pro-social Intentions Measure (Pavey, Greitemeyer, & Sparks, 2015). The results showed that perpetrator justice sensitivity increases with age, and victim justice sensitivity decreases with age. At the same time, victim justice sensitivity negatively predicts pro-social intentions, and observer justice sensitivity positively predicts pro-social intentions. Multiple regression analysis with justice sensitivity scales as predictors and pro-social intentions as criteria suggested that although the effects were small, there was a relationship among these variables that should be further analysed. Further research is needed in order to better understand the relationship between justice sensitivity scales and pro-social intentions.
TIME PERSPECTIVE AND SEMANTIC DIFFERENTIAL OF TIME PROFILES IN PATIENTS WITH ALCOHOL USE DISORDER

Svetlana Klimanova
Anna Trusova
Anna Berezina
St. Petersburg State University/ V.M. Bekhterev National Research Medical Center for Psychiatry and Neurology (Saint-Petersburg, Russia)
Anton Gvozdetsky
St. Petersburg State University (Saint-Petersburg, Russia)

One of the major challenges in treatment of Alcohol Use Disorder (AUD) is maintenance of patients’ motivation for healthy lifestyle. Thus, understanding the mechanisms underlying motivational processes seems crucial for developing effective treatment interventions. It has been shown that individual time orientation and perception of psychological time might have significant impact on psychological health as well as tendency to adhere to healthy lifestyle. The goal of the current study is to identify profiles of time perspective and semantic differential of time in patients with Alcohol Use Disorder (AUD) and explore how they might differ from the normative scores. For the purpose of the study, 118 patients (86 men (72.9%), 32 women (27.12%)) undergoing in-patient treatment for AUD were recruited. All participants met criteria for Alcohol Dependence according to ICD-10. Average age of participants is 42.19±8.17 y.o., average age of onset of AUD is 31.18±7.14 y.o. (M±SD). The following methods were used in the study — Zimbardo Time Perspective Inventory and Semantic Differential of Time. The results were statistically analyzed using t-test and regression analysis. The time perspective profile of patients with AUD was statistically different from the optimal scores. Thus, average scores on Past Positive (3.89), Present Hedonistic (3.35), and Future (3.69) scales were significantly lower than the optimal scores, while Past Negative (3.45) and Present Fatalistic (2.89) were significantly higher (all at the level of p<0.001). Thus, the average profile of patients with AUD was inverse of the optimal profile. Every participant’s individual scores statistically differed from the optimal time perspective profile. As compared to normative scores, patients with AUD tended to describe their Present as less active (p<0.001) and more saturated (p=0.035); their Past as more active (p<0.001), more emotionally charged (p<0.001), more structured (p<0.001), and more engaging and meaningful (p=0.003); their Future as more active (p<0.001), more emotionally charged (p=0.003), more saturated (p<0.001), more structured (p<0.001), and more engaging and meaningful (p=0.001). Thus, characteristics of time in patients with AUD significantly differed from that obtained in healthy populations, which is crucial for greater understanding of motivational processes in AUD and development of treatment interventions. The study was supported by RFBR grant (project №16-06-01043).
Modern life's work is a subject to a lot of interruptions and multitasking has become a major competence for lots of different working areas. Therefore research of task switching cost is of great importance which is reflected in the amount of publications. But one topic is not covered enough yet. Therefore a research in order to bring empirical evidence of negative effects of mental fatigue on task-switching was conducted. An undergraduate sample of 55 participants (33 female) with a mean age of 21.9 (SD = 2.5) took part in a letter-digit switching task. The task was either to make judgment about a parity of digits or to decide whether a letter was a vowel or a consonant. The task alternation was randomized. Experimental stimuli consisted of two characters (a letter and a digit) whose location inside a pair was randomized as well. The target character was set with a cue precedent to a pair presentation. Mental fatigue was assessed with questionnaires. Both reaction time and response accuracy were significantly affected with fatigue severity (F(1, 54) = 11.528, p < 0.001 and F(1, 54) = 12.128, p < 0.001 respectively) as well as the switching factor (F(1, 54) = 145.99, p << 0.001 and F(1,54= 12.082, p < 0.001 respectively). Both of factors were worsening the respondent's performance. But only for reaction time did they show significant interaction between each other (F(1, 54) =6.908, p = 0.009) which, surprisingly, increased the reaction time for less fatigued participants. It was shown that fatigue not only causes severe loss in general cognitive performance but also significantly reduces task-switching effects when it comes to reaction time measurements. Considering the general fall off accuracy in fatigued group, this strange interaction pattern can be interpreted that heavily fatigued participants do not analyze the stimuli thoroughly enough, compared to unfatigued ones, which leads to greater error rate in all trials. This shows that mental fatigue has a great negative effect on cognitive control functions.
Hospital clowning is a relatively new practice, when specially trained actors visit patients under prolonged medical treatment or being “in need of joy” because of some stressful life situation. First studies of hospital clowning confirmed its effectiveness: improvement of patients’ adaptation, their mood and well-being, general atmosphere in the ward, and cooperation between patients and medical staff. Among the most important effects – increase of appetite and decrease of preoperative anxiety in children and parents. Clowns’ visits bring not only joy, but also a sense of meaningful life, going beyond the ordinary, overcoming. At the same time, the “healing” power may affect not only patients, but also clowns themselves. The Collective Activity Theory of Y. Engeström et al. provides a model, in frame of which hospital clowning may be regarded as an activity, directed to a shared object at the overlap between the patient’s and the clown’s individual motives, resulting in laugher. How to define a common object of the shared activity between the two persons being in almost the opposite conditions in their lives? The paper presents a pilot study conducted on N=10 hospital clowns from the “Doctor Clown”, the first organization in Russia which provides training in accordance with modern international standards. Methods used were semi-structured interviews, projective drawings of a person and a clown persona. The results of qualitative analysis showed, that hospital clowning usually has a profound personal meaning for clowns, so we regard a special “need to bring joy” in comparison with the “need of joy” in patients. The very activity of hospital clowning influences the clowns not less than the patients, which has never been studied yet. The consequences could be positive (healing effects also for clowns), as well as negative (burning out). To conclude, hospital clowning effectiveness should be regarded from both sides, a clown and a patient. The mechanism of humor and laughter in hospital clowning is to be searched at the overlap between the two needs, two motives, as an outcome of their shared activity. The object of such a shared activity may be defined as connectedness or humanness.
BRIEF NEUROPSYCHOLOGICAL EVALUATION OF COGNITIVE ABILITIES IN PATIENTS AFFECTED BY MULTIPLE SCLEROSIS

Agata Romeo
Valeria Drago
Roberto Risicato
ASP SIRACUSA — O.U. Neurology Augusta Hospital (Siracusa, Italy)

For decades it has been believed that cognitive deficits did not belong to the diagnosis of Multiple Sclerosis (MS) and that they were less important than what the disease could cause like disability to walk, see, incontinence, but cognitive disorders, albeit mild, can interfere in the daily life of a person instilling feelings of uncertainty and concern. Many people, when they are seen by a neurologist, complain of memory problems, and often return home with prescriptions of anxiolytics and/or antidepressants drugs. We want to demonstrate that by using a valid and easy to administer tool, a short monitoring (30 minutes) of cognitive functions can be performed, not a complete assessment, but that still allows a first discrete and reliable cognitive assessment. The sample of 12 women diagnosed with Relapsing-remitting MS (RRMS), aged between 32 and 65 years. Eight out of twelve complained of short-term memory problems and inattention. Four showed obvious changes in mood and anxiety. Each patient has been subjected to: Preliminary meeting with the neurologist, psychological interview, previous and current history of psychopathological issues, administration of tests, return to the patient, sending for any rehabilitation program and/or psychological support. Tests used for the investigations were: BICAMS (Brief International Cognitive Assessment for MS); Language: Phonemic fluencies and semantic fluencies, Rey 15-item Memorization Test; Short-term memory: Digit span forward, Digit span backward; Long-term memory: Babcock Story Recall Test, Raccontino di Anna Pesenti (Novelli e coll., 1986); Attention: Trial Making Test (A-B). Findings: In most cases, the neuropsychological evaluation didn’t show any loss of performance to neuropsychological tests and only the qualitative analysis allowed to highlight the presence of blurred and slight difficulties, not of pathological significance. From the qualitative neuropsychological evaluation, only for 2 patients, the neuropsychological evaluation showed poor performance in one or more cognitive domains. Deficits due to attention, cognitive flexibility, speed of information processing, Visual-Spatial Memory are highlighted. Language, access skills and lexical recovery are preserved. The results are in line with current scientific research on cognitive deficits in patients with MS.
"SELF-PORTRAIT" AND OTHER GRAPHIC TESTS IN PSYCHOLOGICAL DIAGNOSIS OF CHILDREN AND ADOLESCENTS WITH DEVELOPMENTAL DISORDERS

Natalia Zvereva
Aleksey Koval-Zaitsev
Mental Health Research Center, Moscow State University of Psychology and Education (Moscow, Russia)

Mariia Zvereva
Mental Health Research Center (Moscow, Russia)

Tatiana Goriatcheva
RNRMU, Moscow State University of Psychology and Education (Moscow, Russia)

Drawing tests are considered to have a significant diagnostic potential in clinical psychology and used in psychological diagnostics for about a century. In child clinical psychology drawing tests were used more than 50 years (Bekhterev, Gudinaf-Harris, Venger, etc.) These tests may be applied in several aspects: assessment of cognitive, projective, and motor component. Usage of «Drawing Yourself» technique in diagnosis of children and adolescents with impaired development (mental, somatic) is very important. We suppose to investigate connection between duration and beginning of mental or somatic illness and quality of drawing in children and adolescents. Assessment of diagnostic parameters of "Drawing Yourself" technique in children with mental and somatic disorders was carried out. Samples 1 (S1) 48 (10-16 y.o. mean age 14,3) with early beginning of mental disorders before 10 y.o., patients of hospital MHRC. Samples 2(S2) 55 (10-16 y.o. mean age 13,9) patients with beginning of mental disorders after 10 y.o., patients of hospital MHRC. Samples 3(S3) 25 (10-17 y.o. mean age 12,8) patients of somatic outpatient hospital with somatic disorders. Evaluation parameters: Size, location on the paper, type, quality of drawing (rating from 1 to 10), limbs, clothes and features of the drawing. Comparison S1, S2 and S3 showed the difference in type of drawing: the best results were obtained in S3, the worst– in S1. S1 and S2 differ significantly in frequency of scheme as a type of drawing (p≤0,01). The same was obtained in quality of drawing: S1 demonstrated the worst results, S2 and S3 were very similar. The research shows that the drawings of children and adolescents with early beginning of mental disorder (S1) have the worst quality and type of drawings. On the other side patient with later beginning of mental disorder (S2) have similar quality and type of drawings with somatic patient (S3). In the drawings of S3 we find some specific peculiarities concerning there somatic disorder. "Self-portrait" or "Drawing yourself" seems to be a good technic for assessment children and adolescents with different types of disorders.
Differential Item Functioning (DIF) is a technical approach to identify the presence of systematic error in the measurement of latent constructs, when we applied the same item in different populations or groups. DIF has been widely used and studied for decades in educational testing, nevertheless applications in mental health assessment only have receive an increasing interest in the last decade. The purpose of this paper was to analyze the scientific output about DIF in the applied area of mental health, using text mining to identify the main research perspectives in this field, by way of visualization of co-ocurrence networks of keywords extracted from scientific articles. The search was made on the Web of Science database including literature published until 2018. Following a similarity visualization methodology, distance-based maps were constructed using the VosViewer 1.6.9 software. A full counting method and a cluster resolution of 1.00 were defined as parameters for the maps. We analyzed 263 articles, of which 258 were in English, 4 in Spanish and 1 in Chinese. 663 keywords were obtained, of which the 120 most relevant were selected. Ten clusters were identified, which are related to the application of psychometric analysis to assess the quality of tests, use of item banks (epidemiological and quality of life studies), applications of DIF analysis with different methods by a specific variable (gender, aging ), or in assessment of specific constructs (e.g cognitive impairment), cross-cultural analysis and measurement of invariance. The construction of bibliometric maps is an appropriate methodology to identify particular features about item bias research in mental health assessment. The research lines in this area were characterized by, first have a psychometric orientation; Second, empirical research about specific populations by age and diagnosis, and, third, the use of DIF procedures in cross-cultural studies about wellness and quality of life.
Sexting is the exchange of sexually suggestive pictures (i.e. “sexts”) via Internet. Literature distinguished between experimental sexting, which is a new way to explore sexuality, and aggravated sexting, that hides harmful intentions. Among aggravated sexting, previous research pointed out that not-allowed sharing of sexts, that is the sharing sexts of someone else without his/her consents, was related to aggressive behaviors (i.e. bullying, dating violence). The large majority of studies used the Five Factor Model (FFM) to study the personality bases of sexting behaviors. Recently the Six Factor Model of personality, named HEXACO, enlightened to have more predictive power than FFM in several psychological domains. The aim of the present study was to investigate the role of HEXACO personality traits in relation to sexting behaviors among adolescents and young adults. Participants were 674 adolescents and young adults (60.7% girls; n = 409) from 13 to 30 years old. Sexting Behavior Questionnaire-revised and HEXACO Personality Inventory were administered. A set of regression analyses were run. Sending own sexts were positively predicted by age, beta = .15, and extraversion, beta=.09, and negatively by honesty/humility, beta = -.12, and conscientiousness, beta = -.10, R = .22. Sending sexts of other people with their consent was negatively predicted by honesty/humility, beta = -.16, emotionality, beta = -.09, and conscientiousness, beta = -.11, R = .25. Finally, sending sexts of other people without their consent was negatively predicted by honesty/humility, beta = -.17, and conscientiousness, beta = -.12, and males were more likely to engage in it, beta = -.14, R = .32. The present study provided a differential profile of normal personality traits for individual who are more likely to engage in different kind of sexting. However, the distinct feature of the HEXACO personality model, namely the honesty/humility factor, emerged as the most important predictor of each investigated sexting behaviors.
COGNITIVE ENHANCEMENT AND INTELLECTUAL DISABILITY  
PRESENTATION OF A CASE ON FOLLOW-UP

Francesca Comito  
Maurizio Percolla  
Luisa Claudia Maria Cunto  
Maria Grazia Cavallaro  
Neuropsicologia e DSA (Catania, Caltanisetta, Italy)

The Intellectual Disability is a neurodevelopmental disorder, characterized by a significantly under the average intellectual functioning, with serious impairment of the adaptive functioning. It is a complex clinical condition characterized by an interrupted or incomplete psychic development which result in an impairment of cognitive, linguistic, motor and social abilities that show up during the development and contribute to the global intelligence level. Epidemiological studies (Kabra and Gula, 2003) show that in western countries 1-3% of the population has Intellectual Disability (IQ<70), but the percentual grows significantly if we consider a clinical condition with IQ<75 (10% of the population). In the present work, we describe a clinical case of a subject with Borderline Intellectual Functioning, whose IQ improved after cognitive trainings but decreased after a suspension of the specific trainings for 4 years. Objective: showing that the cognitive training can be an effective protection for the Intellectual Disability. We will show the result obtained after the first cycle of cognitive trainings (8 years old); clinical revaluation four years later; results after the second cycle of cognitive trainings (13 years old). The results of this case let the authors conclude that during the development a specific cognitive training can be considered as one of the main way to prevent and protect against the Mild Intellectual Disability.

APPLICABILITY OF A PROTOCOL FOR THE ATHLETE’S ANXIETY MANAGEMENT TO THE PERFORMANCES OF THE SHOW

Monica Monaco  
Graziella Palmina Zitelli  
Ordine degli Psicologi Regione Siciliana (Catania, Italy)

Many people who perform by passion or who work in the entertainment world experience anxiety similar to those described by athletes. Accordingly, the structuring of effective protocols of psychology applied to the show is as a growing need to respond to such difficulties. The psychology applied to sport is a field full of intervention models that can be suitable also for musicians and for other artists or professionals who work in contact with public. The present study aims to explore the usefulness of an anxiety management program, adopted with athletes, to face similar difficulties experienced in the entertainment world. The sample consists of 49 subjects including musicians, presenters, singers and politicians. A test-retest was performed by administering the test S.T.A.I. and a questionnaire on psychological performance in the show. The results show that the protocol drawn from sports psychology is also effective for performances in the show. However, in the entertainment field it seems important to respond to some specific requests (eg improvement of memory, integration of public identity with private ones, etc.), taking care also of specific needs and difficulties experienced in this area.
THE ACTIVITY OF THE MILITARY PRIESTS IN BATTLE CONDITIONS: PROBLEMS AND PERSPECTIVES

Svetlana Solonina
Military University of the Ministry of Defense (Moscow, Russia)

The real practice of military priests requires determining the conditions for improving its effectiveness in the preparation and conduct of military operations. Methodological, theoretical and empirical substantiation of the main characteristics of the activity of military priests is necessary. It is important to define the group ideal of military priests. The methodological basis of our study is the subject-activity theory of S. L. Rubinstein and reflexive-activity approach of E. I. Kuzmina. We used methods: observation, experiment, questioning, conversation, expert evaluation in combination with historical and psychological analysis of documents. The experiment was conducted using the technique "Ideal" (E. I. Kuzmina and Z. V. Kuzmina). This technique, implementing the principle of unity of consciousness and activity in the practice of experimental research, allows in conditions of free choice, activating reflection, to reveal the competent abilities of the individual and collective subject. Each priest (88 people) was asked to write the three most important, in their opinion, qualities for the activities of military priests and arrange them in a hierarchical order.

As a result of taking into account the frequency and ranking of the list of qualities, a group-wide list of ten competitive abilities ranked in order of importance was compiled, reflecting the presentation of the clergy about the ideal number of qualities that should be inherent in military priests. Prior to the pilot study on the technique "Ideal" with the clergy, the group of experts prepared its ideal series of ten qualities ranked in order of importance. Comparison of the group list of priests with the ideal of experts with the calculation of the difference between the ranks showed that they are identical in composition, but there is a difference in the hierarchy of qualities and in the understanding of the content of qualities. Comparison of lists according to the formula of CH. Spearman showed a low identity of the hierarchical series of qualities proposed by experts and clergy. Abilities necessary for the priests to actions in combat — intelligence, vitality, patriotism was in last place in the group-wide list of priests, whereas in the ideal experts of these qualities were in the first place. This means that it is necessary to raise the professional level of priests.
FUNCTIONING OF THE CORE-SETS OF THE INTERNATIONAL CLASSIFICATION OF FUNCTIONING, DISABILITY AND HEALTH (ICF)

Juana Gómez-Benito
Maite Barrios
Georgina Guilera
Rojas Manuel
University of Barcelona (Barcelona, Spain)

World Health Organization established the International Classification of Functioning, Disability and Health (ICF) (WHO, 2001) to determine the functioning and disability of patients in different health conditions in a comprehensive way. The ICF has more than 1400 categories, but in each health condition only categories that better describe the patient’s functioning in that health condition are used. This is called the ICF Core-Sets (ICF-CS). Our task was to show the main characteristics of the studies that try to analyze if the categories of the different ICF Core-Sets are adequate and to evaluate the functionality and disability of patients. We did an analysis of articles that investigate the issue of the proper functioning (adequacy and sufficiency) of ICF Core-Sets in practice to assess the disability and functioning of the patients. The review was conducted on WoS and Scopus databases and spanned from the years of 2007 to 2018. 19 articles were selected that met the established criteria. Some of the results that were found were that 84.21% of the studies investigated the functioning of the Core-Sets using a single country, that most of the studies focus on two health conditions: Osteoarthritis (21.05% of studies) and Low Back Pain (15.79%). Other result was that not all the studies reported the number of centers where they evaluated the functioning of the Core-Sets (only 15 studies), and one study did it in 34 centers and another in 14 centers, while the rest (13) did it in 4 centers or less. We conclude that the studies of the functioning (adequacy and sufficiency) of the ICF-Core-Sets should include different countries to analyze the validity at a cross-cultural level since it was found that most of them were carried out considering only one country, for example, consider at least one country from each of the six WHO global regions. Another conclusion was that it is necessary more hospitals to have a greater diversity in the sample by study, because generally 4 centers or less were used. Finally, in the future, more studies should be conducted to evaluate the ICF-CS of more health conditions, including more mental health conditions.
INTERSECTIONAL APPROACH TO THE SEXUAL AND REPRODUCTIVE EXPERIENCES AND EXPECTATIONS OF CAPE VERDEAN AND PORTUGUESE FAMILIES

Ana Virgolino
Miodraga Stefanovska-Petkovska
Osvaldo Santos
Andreia Silva
Violeta Alarcão
Universidade de Lisboa (Lisbon, Portugal)

Sexual and reproductive health (SRH) constitutes a crucial component of general health and a central feature of human development (UNFPA, 2008). Good SRH is a state of complete physical, mental and social well-being in all matters relating to the reproductive system. As a complex and dynamic construct, SRH is interlinked with several health areas, from fertility to pregnancy, from sexually transmitted infections and sexual dysfunctions to the ability to have a satisfying sex life and capability to decide whether and how often to reproduce. FEMINA (Fertility, Migration and Acculturation) aims to explore intersectional inequities in SRH among Cape Verdean and Portuguese families belonging to different social-cultural groups, and how those inequities impact fertility in Portugal. Main goals: 1) to identify sociocultural determinants of SRH among Cape Verdean and Portuguese men and women of reproductive age; 2) to gain a better understanding of the diversity of the sexual and reproductive experiences and expectations of Cape Verdean and Portuguese men and women of reproductive age, considering the singularities of their migratory, social and family dynamics; 3) to produce recommendations on how policy makers, employers and service providers could better address the reproductive health needs of Portuguese-born and migrants. The study will address these goals using a mixed methods approach, including: a cross-sectional telephone survey with around 600 native and 600 Cape Verdean men and women aged 18-49, residents of the Greater Lisbon Area; a qualitative research through in-depth interviews with a subsample of 30 Cape Verdean and 30 Portuguese men and women; a Delphi technique for finding consensus on good practices for SRH. This proposal general aim is to bring up to discussion supporting practices (from health institutions and practitioners) that would allow more equal treatments of men and women, by supporting a more open attitude towards the cognitions and practices of immigrants and how they can play a role in the receiving culture. The scope of this research underlines the relevance of the knowledge produced by social sciences to understand social phenomena, such as fertility and sexuality, and to uncover efficient pathways to improve systems and practices.
SOCIAL REPRESENTATION OF PERPETRATORS IN ITALIAN SOCIAL WORKERS

Stefania Carnevale
Imma Di Napoli
Marcella Autiero
Fortuna Procentese
University of Naples "Federico II" (Naples, Italy)

In recent years, the attention for perpetrators treatment programs has increasingly, but in Italy this is a new intervention area (Bozzoli, Merelli & Ruggerini, 2017). The World Report on Violence and Health (WHO, 2014) suggested an ecological approach to the gender and domestic violence to understand the nature of this issue (Chiurazzi, Arcidiacono & Helms, 2015). Violent behavior is analysed on individual, relational, socio-cultural and community levels, considering also the main theoretical approaches (feminist, social, psychological and psychodynamic). The literature analysed the effectiveness of treatment programs (Gondolf, 2004; WHO, 2007; Aldarondo, 2009; Gondolf, 2011), but rarely representations of operators working with violent men. In an ecological perspective, the research aimed at exploring how stakeholders and professional of domestic violence system represented the perpetrators and their motivation to adherence to the intervention programs. Fifty Focalized Narrative Interviews (Arcidiacono, 2016) were collected and analysed by Grounded Theory Method (Corbin, Strauss, 2008). The preliminary analysis highlighted that perpetrator is described as fragile, narcissists (structured power on the maintenance of the oppressed), seducers and manipulators (even with operators), with difficulties in communication and thought (acting-out), often victims of assisted and/or direct violence during childhood, low tolerance and often with other addictions (alcohol, drugs and gambling). In particular, the female workers often appear to be resigned to the assessment of a possible change of the perpetrators, but they propose the fatherhood identity as a motivating factor to create insight into the need for behaviour change, as suggested by the more recent literature fatherhood (Stanley et al., 2012). The research was carried out within the framework of the “Violent dad in child shoes” project funded by the European program Justice 2018, which aimed at building self-assessment of based on exploratory and 4.0 CTS seriousgame.
DEVELOPMENTAL DYSLEXIA AND ADOLESCENCE THE NEUROPSYCHOLOGICAL REHABILITATION OF READING IN ADOLESCENCE A CLINICAL CASE

Maurizio Percolla
Francesca Comito
Marco Maria Leonardi
Luisa Claudia Maria Cunto
Neuropsychologia e DSA (Catania, Caltanissetta, Italy)

Research literature shows how Developmental Dyslexia is a disease that will persist during the life, but it will show different levels of severity depending on personal cognitive characteristic and educational opportunities. However, only few researches investigate the development of this disease during the years (F. Dellai, S.Lapparini, C. Cornoldi, G. Englaro, 2014). The aim of the present study is to show the reading abilities of a girl whose Developmental Dyslexia has been diagnosed when she was 8 years old, and compare the results of the first evaluation with the second one, six years after. At the age of 8, the subject did a first cycle of a sub-lexical Reading Rehabilitation Treatment after which the clinical symptoms were improved (both rapidity and accuracy were in the average). In line with the findings in literature (Tressoldi, Vio 2008), rapidity has been greatly improved after the first cycle of treatment. Objective: Demonstrate the efficacy and efficiency of a Reading Rehabilitation Treatment on a 14 years old subject. Neuropsychological Rehabilitation Treatment based on the Bakker method (Balance Model), organised in 24 sessions (45 minutes each, twice a week). We show the results of the pre and post Treatment and of the follow-up (6 months later).
ETHNOPSISCHOLOGICAL PECULIARITIES OF SOCIAL INTELLIGENCE OF HIGH SCHOOL STUDENTS WITH DIFFERENT TYPE OF PICTURE OF THE WORLD

Mariya Vyshkvyrkina
Southern Federal University (Rostov-on-Don, Russia)

A relatively new, but relevant trend in psychology is the study of social intelligence. Various aspects of the problem of social intelligence are reflected in the works of G. Ayzenk, L.I. Antsiferova, N.V. Bachmanova, M.I. Bobneva, X. Gardner, V.N. Druzhinin, K.A. Kudryavtseva, V.N. Kunitsyna, V.A. Labunskoy, G. Lyman, R. Louhana, E.S. Mikhailova, R. Sternberg, D.V. Ushakova, E.A. Fedorova, N. Frederickson, M.A. Kholodnaya, OB Chesnokova, A.L. Yuzhaninova, et al. At the same time, studies of the ethnopsychological features of social intelligence are practically not presented. In this regard, the goal of our research is to identify the ethnopsychological features of the social intelligence of high school students with different types of world view. Base research: students grades 9-11 at the age of 15-17 years. Of these, 54 Russian-born schoolchildren and 42 are Meskhetian Turks living in the city of Rostov-on-Don. The study used the methods of research of social intelligence Guilford-Sulliven (in adaptation by AS Mikhailova (Aleshina) and the test "Picture of the World" (E.S. Romanova, O.F. Potemkin). Statistical data processing included descriptive statistics, the Mann-Whitney U-test. As a result of the study, it was proved that the senior pupils of both Russian and Turkish nationalities are characterized by the predominance of the landscape picture of the world. At the same time, high school students-Turks are distinguished by a tendency to more often demonstrate a planetary picture of the world, and high school students of Russian nationality a metaphorical picture. It is proved that high school students of both nationalities with a landscape picture of the world characterize a good understanding of the relationship between people's actions and their consequences, orientation in generally accepted norms and rules of behavior, the correct interpretation of both non-verbal and verbal behavior. But Russian high school students better predict the development of the situation, and more accurately predict the consequences of the behavior of the interaction participants. High school students-Turks with a metaphorical picture of the world better anticipate interpersonal events, are well versed in moral and ethical norms and rules, well interpret non-verbal behavior and more accurately predict the dynamics of interpersonal relationships.
MEDIATING EFFECT OF NARCISSISM ON THE RELATIONSHIP BETWEEN EMOTIONAL STABILITY AND GRATITUDE

Agnieszka Malinowska
Wojciech Rodzeń
Roman Szalachowski
Celina Timoszyk-Tomczak
Małgorzata Szcześniak
University of Szczecin (Szczecin, Poland)

A number of researchers suggest that while personality traits are positive predictors of gratitude (without neuroticism), narcissism and arrogance should inhibit gratitude (McCullough et al., 2001). However, this somehow obvious theory has not found a strong support as very few studies have reported the relationship between being narcissistic and grateful (Watkins, 2014). Moreover, in several analyses association between these variables was not statistically significant or it was “trivial” and positive, leading Authors to disconcertedness. Looking at the topic from another perspective, Emmons (2007) observes that, at times, narcissistic people can express gratitude in different ways and for different sorts of things. The aim of this study was to: 1) share more light on the topic through assessment of relationship between dimensions of narcissism and gratitude; 2) focus on the mediating role of narcissism in the relationship between gratitude and emotional stability. The research was conducted on the group of 161 participants who completed IPIP-BFM-20 (personality traits; Topolewska-Siedzik et al., 2014), GQ-6 (gratitude; Kossakowska and Kwiatek, 2014), and NPI (narcissism; Raskin & Hall, 1979). The mean age of the respondents was M=23.82 with SD=8.470 (range=18-60 years). Most were women (80%). The results illustrate a significant correlation between gratitude and: self-admiration/self-absorption (r=0.23**), superiority/arrogance (r=0.18*). Furthermore, it was found that gratitude correlated with: active narcissism (leadership and superiority) (r=0.17*) and independent narcissism (superiority and self-admiration) (r=0.25**). The outcomes obtained by mediation analysis, conducted using a bias-corrected bootstrap, reveal the significant indirect effect only in the case of emotional stability on gratitude through independent narcissism (Indirect = 0.067, SE = 0.303 95% CI[0.009,0.137]). Outcomes of the present study seem to imply that the relationship between emotional stability and gratitude is mediated by the individuals’ independent narcissism. This result shows that besides maladaptive characteristics of narcissism there are also adaptive ones, expressed in capacity to be grateful. Indeed, Emmons (2007) does not deny to narcissistic individuals lack of gratefulness, but he makes evidence that such people differ from non-narcissists by experiencing gratitude for fewer aspects of their lives, being less likely to cite the benevolence of others, and mentioning more material possessions and self-attributes.
ADHERENCE TO PSYCHOLOGICAL TREATMENT

Beatriz Domínguez
BE Psychology Center (Santa Cruz de Tenerife, Spain)

The concept of adherence to treatment has been applied to pharmacology and health recommendations, is also interesting its applicability to psychology; efficacy or therapeutic success is a central concern in the daily professional practice. The oral presentation will try to bring that idea from the practice as therapist. Psychology has developed programs to improve adherence in medication and health recommendations, and help the variables that modulate it, such as prescriber and patient psychosocial variables; the goal is to include those in the psychological treatment to improve efficacy and therapeutic success. During the presentation I will approach how this idea influences the psychological intervention, from the knowledge of the practice of clinical and health psychology; I will explain the importance of: the relationship with the therapist, the expectations of therapy and treatment, constant feedback of the patient’s condition, his / her desire to continue with the techniques implemented or not, his perception of improvement with these techniques and expression Of their needs in session-by-session therapy, the changing environment and, as we are causing a change, changes in patient variables. I will introduce the therapist and adherence as a modulator between the needs / symptoms of the person and the techniques / scientific basis. From the scientific basis therapies are based on therapeutic objectives, needs assessment and symptoms to develop and implement an effective therapy (scientific evidence), since that reality is in perpetual development throughout the therapy, this does not mean that the therapy is established in a continuous way in time, but adapts to the patient’s own change and once the symptoms and the changes that result have been overcome, the person values the need and his desire to continue in therapy, because he needs or not to handle the situation and / or symptoms.
ON PSYCHOLOGY AND PSYCHOSOMATICS

Eva Neu
Michael Michailov

Psycho-somatic as well as somato-psyhic theories respectively summarize high complex interaction of psychic-physiological-social factors of human life giving basis in context of therapy and prophylaxis. During opening-ceremony of ICPM in Kobe Emperor Akihito appointed: "total symptoms of mind and body, seeking ways of holistic care ... it is extremely important for patients ... my hope contributes ... the progress of medical science and people's happiness in the entire world". In this context is demonstrated practical model for integrative psychology. According to epistemology is established psychology by W.Wundt in 20th century as independent fundamental discipline of anthropological sciences related to philosophy&medicine. The interdisciplinary discipline psychosomatics reflects interaction between psychic and physiological phenomena. Psychosomatic practices of occidental/oriental medicine are applied by patients/probands. Evaluation of psychic:"polar-attitude-list"/physiological-parameters is given: heart-rate, blood-pressure, etc. Observations about influence of music, respiratory, yoga-physical therapies on psychic&physiological parameters demonstrate strong positive effects. Items of categories psycho-physiological (relaxed), emotional (tranquil/happy), cognitive (few/ordered thoughts), voluntary (active/spontaneous), social (open/assertive), consciousness (clear/sleepy) are significantly positive changed 25-50%. The 3 therapies have specific psychic effects, e.g. items "relaxed/tranquil" after respiratory- (+45/50%)/music-therapy (+20/5%), also "open" (+25%) are positive, but negative after respiratory-therapy (-20%). Items are stronger changed before then after surgical intervention. Higher effects are observed for investigators&children than of psychology-students. Psychic effects are correlated with positive physiological ones, e.g. heart/respiratory frequency decreased 25-30%, voluntary apnoea prolonged 55% (p<0.05-0.01, n=145). An integrative psychotherapy incl. occidental-oriental (music-/yoga/taichii/Zen, etc.) approaches could be applied for psychosomatic/psychopathological disorders. Combined treatment could be applied by functional cardio-vascular disturbances (arrhythmia, tachycardia, hypertension). Different methods are with preference, e.g. in psychiatry for neurosis (relaxation), for depression&mania: physical training and music therapy (activation/inhibition), for epilepsy: respiratory therapy — hypo-/hypercapnia: inhibitory/excitatory effects on CNS-structures. Systematic research about influence of psychotherapies counteracting disturbances in psychosomatic/psychiatric patients could support UNO-Agenda for better health-education, etc. on global level.
ON PHILOSOPHICAL ANTHROPOLOGY AND PSYCHOLOGY

Michael Michailov
Eva Neu
Ursula Welscher
Int. Council Sci. Develop./Int. Acad. Sci Berlin-Innsbruck-
Muenchen-NewDelhi-Paris-Sofia-Vienna (Muenchen,
Germany)

Christoph Luetge
Techn. University of Muenchen (Muenchen, Germany)

Germain Weber
University of Luxemburg. & Vienna (Vienna, Austria)

Considering the fundamental question of philosophy: “What is the human?” Immanuel Kant created scientific philosophical anthropology. This is essential for a future integrative psychology. New interpretation of psychology related to occidental-oriental philosophy and medicine is necessary, beginning with Aristoteles- Platon- Rhomas Von Aquin — Descartes — Leibniz, etc. as well as Avicenna — Hippocrates — Galenus — Hua T'Ua — Paracelsus. Creation of an integral anthropology (individual-natural-social) including holistic & multidimensional information about human being (spiritual-mental and other upto somatic "spheres") & interaction with nature (geobiobiospheres) & society (family, school, etc.) related to psychology in context of psychosomatic (Th.von UEXKÜLL) & somatopsychic theories (Y.IKEMI) is conditio sine qua non for future education ("Bildung & Erziehung"). Ethical-frames destination acc. to Kant's human obligations to himself (psychologists and personnel), other humans (patients), sub-humans (e.g. reduction of animal experiments), supra-human beings (patients from different cultures: Brahmanism, Buddhism-Shintoism, Christianism-Mosaism, Confucianism-Taoism, Mohammedanism, etc.) related to modern ethical theories (deontology, utilitarism, etc.) are fundamental for future psychology. Psychotherapy and psychopharmacological-surgical-treatment must be in concordance with ethics in psychology and medicine (primum non nocere), e.g. for oncological (radiochemotherapy) or dental patients (infection of teeth, etc.), in context of psychooncology and psychoodontology. Self-control of humans incl. patients by occidental (cognitive therapy, etc.) and oriental practices (Buddhist, Yoga, etc.) could counteract psychopathological and pathophysiological reactions supporting total health (spiritual, mental, social, etc.) of patients. Foundation of an European and an International Academy for Psychology, similar to European Acad. Neurology (EAN-2015-Berlin), by EFPA/IUPsyS/American/European incl. Russian societies, e.g. in Moscow-Kaliningrad or West-Europe could support conception in context of UNO-Agenda for better health-ecology-economy on global level.
A QUALITATIVE ANALYSIS OF PSYCHOLOGICAL CONSULTATIONS FOR NURSES WORKING IN A PALLIATIVE CARE DEPARTMENT

Liu Xinyi
Yu Kawamata
Akiko Kawamoto
Yuka Mizuno
Yutaka Haramaki
Hiroshima University (Higashihiroshima, Japan)

Palliative care encompasses aspects of bodily, social, psychological and spiritual pain. Therefore, palliative care nurses in Japan are often confused and distressed about the adequacy of their communication and care for patients. Clinical psychologists can help the nurses through psychological consultation using professional communication skills. We collected 5 cases of psychological consultations for the nurses working in the palliative care department of a Japanese hospital and analyzed these records as qualitative data. The records are divided into 3 parts: "Nurses' worries", "Feedback and advice from the consultant", and "Lessons and insights from the consultations". The main purpose of this analysis is to specify the role of psychological consultations in helping nurses to solve their problems. We found that nurses had 2 types of worries which were categorized as "Worries about their identity as a nurse" (3 descriptions), and "Worries about communication with patients and families" (10 descriptions). Feedback and advice from the consultant were categorized as "Feedback from sharing a common sense to understand the case" (8 descriptions), "Advice about approaches to communicate better with patients and their families" (8 descriptions), and "Feedback and advice giving to nurses directly" (10 descriptions). The lessons and insights from consultations were categorized as "Knowledge from consultations" (7 descriptions), "Recollections of past behaviors and emotions" (2 descriptions), "Realizations from consultations" (4 descriptions), and "Positive changes after consultations" (5 descriptions). In "Knowledge from consultations", almost all 5 cases mentioned a similar description resembling, "As a nurse, I need to cherish my patients more". For the category of "Positive changes after consultations", some of the nurses mentioned that they felt relieved by consultant’s supportive words. The chief takeaways from our findings are that psychological consultation can provide nurses with both professional perspectives from psychology and support for their emotions. In addition, nurses from this study who were working in the palliative care department tended to worry about their communication with patients the most. Psychological consulting in this manner may further lead them to recognize their responsibility as both a medical provider and a caregiver which is considered especially important for palliative care.
THE EFFECT OF PARALLEL LINES’ ORIENTATION ON THE MAGNITUDE IN THE POGGENDORFF ILLUSION

Sohyun Shin, Jung Woo Hyun, Lee Seungbok
South Korea Cheongju
Chungbuk National University (Cheongju, South Korea)

The Poggendorff illusion is that when the oblique is hid by two parallel lines, the two part of oblique seen looks like do not align each other. There are several theories of the Poggendorff illusion. One of them is that the Poggendorff, Tilt, Ponzo and Zollner illusion are under the same mechanism with the tilted room illusion and rod-and-frame effect what affected by visual context on orientation (Prinzmetal, W., & Beck, D. M., 2001).

In this experiment, effect of parallel lines’ orientation which influence visual context when it is vertical is observed by varying this orientation to examine above theory. The stimuli consist of two parallel lines and obliques. The variable is orientation of parallel lines. The orientations are changed 10° or 20° toward clockwise or counterclockwise from vertical. The oblique is always 45 °. Participants move the oblique lie at left bottom to where looks like most collinear with other oblique lie at right top. The illusion is appeared in all conditions. The difference in condition of interval between parallel lines and oblique do not exist. The magnitude of illusion varied as orientation of parallel lines. When this orientation is toward clockwise, size of illusion is more than twice other two conditions. This result is same with early study which insisted the Poggendorff illusion is large when angle difference of two lines is 15 ° than 40~50 ° (Weintraub and Krantz 1971). The parallel lines’ orientation varied as small degree 10 ° from vertical. Although the different degree is small, when parallel lines are toward clockwise from vertical, the gap of illusion is more than twice. This suggests the condition has specific point that parallel lines are the criterion to judge visual context. If these lines shift from vertical, this criterion impaired and made illusion bigger. This proposes the possibility that the Poggendorff illusion is affected by visual context and have same mechanism with the tilted room illusion and rod-and-frame effect. The reason the magnitude of illusion between other two conditions are similar seems because two effect impaired visual context and orientation difference in lines consisting stimuli cancel out.
THE EFFECT OF EMOTIONAL AROUSAL ON ASSOCIATIVE MEMORY: MEDIATION OF SEMANTIC RELEVANCE AND SPATIAL PROXIMITY BETWEEN ITEMS AND BACKGROUNDS

Weibin Mao
Mou Chengcheng
Wangdongxu
Shandong Normal University (Jinan, China)

A large number of studies have found that emotion arousal could impair the item-background associative memory. Some researchers explained these findings by attention narrowing theory, namely emotional arousal may selectively capture and focus attention to the arousing items, which will enhance the memory of emotion arousal item and impair the associative memory between items and backgrounds. Furthermore, according to the unitization hypothesis, arousal can enhance item-background associative memory when items and backgrounds would be encoded into an integrated unit. Therefore, it is valued to explore how semantic relevance or spatial distance between items and backgrounds will play a role on item-background associative memory. There are 3 experiments to explore how semantic relevance and spatial distance between emotional items and neutral backgrounds would influence the item-background associative memory by using a cued associative recognition paradigm and eye-movement technology. In experiment 1, we conducted a (arousal of items: negative or neutral)×2(semantic relevance : relevant or irrelevant)×2(the distance between item and background: near or far ) within-subject design; in experiment 2, we conducted a (arousal of items: negative or neutral)×2(semantic relevance : relevant or irrelevant)×2(where the item located in the background: central or peripheral ) within-subject design; in experiment 3, we conducted a (arousal of items: negative or neutral)×2(semantic relevance : relevant or irrelevant)×2(spatial consistency: consistent or inconsistent ) within-subject design. The dependent variables in 3 experiments are the accuracy of item memory and item-background associative memory, the rate of fixation number on the area of interests and the distribution ratio of attention to the area of interests. The results showed that (1) semantic relevance and spatial distance would restrict the influence of emotion on the item-background associative memory, and semantic relevance accounts more for this constraint; (2) the unitization of item and background would help to alleviate impairment of arousal on item-background associative memory; (3) Attention is not the only reason to explain effect of emotion arousal on item-background associative memory.
There are sex-specific prevalence rates for several diseases that could be related to how men and women respond to stressors. The impact of sex and the menstrual cycle phase on the autonomic response to psychosocial stress remains controversial. The exposure to a stressful situation elicits the activation of several physiological pathways, including the autonomic nervous system (ANS) which seem to be affected by sex. We explored ANS activity through salivary alpha-amylase, heart rate, and heart rate variability responses to the Trier Social Stress Test (TSST) in healthy young people. The sample was composed of 25 men, 26 women in the luteal phase, and 25 women in the follicular phase, from 18 to 25 years of age. Participants were exposed to the TSST or a control condition. The results indicate that men showed higher sympathetic-vagal activity in the stress condition compared to the two groups of women. These findings support that sex and the menstrual cycle phase moderate ANS reactivity to psychosocial stress.
THE ROLES OF SELF-COMPASSION TO PROMOTE FORGIVENESS WHEN FRIENDS CAUSE TROUBLE

Mika Sakurai
Kokushikan University (Tokyo, Japan)

Japanese college students seem to be in a quandary about how to relate to their Japanese friends during the past two decades. When a Japanese student makes a friend uncomfortable and/or angry, they find it difficult to forgive that friend. As a result, they have tendency to avoid maintaining a relationship with those close friends. The hypothesis of this study is that the development of self-compassion may help students to perceive that it is normal for people to make mistakes, and to promote forgiveness in a way to ease tensions and maintain friendships when suffering from hard feelings in a relationship. The purpose of this study is to explore how self-compassion affects a friend's-forgiveness as well as self-forgiveness. The Japanese version of the Self-Compassionate Reactions Inventory (SCRI-J) and the Japanese Version of the Heartland Forgiveness Scale which consisted of two subscales (Self and Situations, and Others) were utilized to find the relationship between self-compassion and forgiveness of one's self and others. For the purpose of this study, a few questionnaires of SCRI-J and the Japanese version of the Heartland Forgiveness Scale were converted to employ the forgiveness friends instead of the forgiveness others. It is important for college students to focus on relationships with friends instead of with others because they share a large part of their time and energy in their relationships with friends. These two types of self-reporting questionnaires were distributed to 55 college students. Findings showed a positive correlation between self-compassion reactions and Self and Situations Forgiveness, however Friends of the Japanese Version of the Forgiveness Scale were not significantly correlated. Positive implications of this study might be when a college student has learned self-compassion. Such self-compassion might manifest as perceiving and accepting how he/she is, and the ease for the student to forgive himself/herself. However, self-compassion is not enough to forgive friends when college students are suffering from the relationships. Specific interventions may be needed for students to learn why and how to forgive their friends and may be helpful for students to maintain proper relationships with friends.
FEATURES OF INTERACTION THE MAGNOCELLULAR AND PARVOCELLULAR VISUAL PATHWAYS IS A MARKER OF PSYCHICAL STATE

Irina Shoshina
I.P. Pavlov Institute of Physiology Russian Academy of Sciences (Saint-Petersburg, Russia)

The description of the surrounding world in the visual system occurs with the help of a set of channels — neural complexes with certain spatial-frequency characteristics. Magnocellular channels are more sensitive to the low spatial and high temporal frequencies, and they promote rapid information transmission to the neurons, mostly of the dorsal pathway. Because of these properties, the magnocellular neurons are involved in processing of information on the global organization of a stimulus and in analysis of movement of the observed object. The parvocellular system is more sensitive to the high spatial and low temporal frequencies. She provides a slower information transmission to the neurons of primarily ventral pathway. The parvocellular system is responsible for description of color and fine details of the object. The interaction of magnocellular and parvocellular visual systems provides the integrity of perception and adaptive behavior. The study was to examine the functional state of magnocellular and parvocellular visual pathways, features of their interaction in healthy, in subjects with burnout and in patients with schizophrenia. Research hypothesis: visual functions can were as prognostic criteria for a mental state. Burnout was measured with diagnostic method of the emotional burnout (Boyko, 2004). Contrast sensitivity thresholds were measured with the visual contrastometry (in spatial frequencies of 0.4, 3.6 and 17.8 cycles/degree). Patients participating in study were peoples with the first psychotic episode, with chronic schizophrenia and with therapeutic resistance schizophrenia. A post-hoc Games-Howell test revealed that participants with burnout demonstrated increased contrast sensitivity at low spatial frequencies (hyperactivity of the magnocellular system) compared to individuals without burnout and had reduced contrast sensitivity at medium and high spatial frequencies. Patients without long-term treatment and patients with the therapeutic resistance demonstrated hyperactivity of the magnocellular system. Patients with long-term treatment demonstrated hypo activity of the parvocellular system. We can say that the contrast sensitivity at low frequencies increases from left to right in the row healthy, people with burnout, subject witch first-episode of schizophrenia and patient with chronically schizophrenia. Thus, the functional state of magnocellular visual system may be used as a prognostic criteria for a psychical state.
STIMULUS QUALITATIVE BISECTION AS A PROBLEM OF INNER PSYCHOPHYSICS

Ihor Lubashevsky
Ren Namea
University of Aizu (Aizu-Wakamatsu, Japan)

Within the classical bisection task subjects are asked to classify a trial stimulus with respect to its proximity to one of two given stimuli from the same perceptual continuum. It is widely accepted that this bisection is characterized by the geometric mean and a plausible explanation of the effect can be found, at least, in works by Luce, (e.g., Psychometrika, 1961, 26, 151). However a meta-analysis of classification data (Kopec, Brody, Brain and Cognition, 2014, 74, 262; Levy, et. al, Frontiers in Integrative Neuroscience, 2015, 9, 44) reports that the bisection point can exhibit more complex behavior depending on the ratio of referent stimuli and changes from the geometric mean to the arithmetic mean as this ratio increases. In the present work we propose a mathematical theory of stimulus bisection turning to the ideas of inner psychophysics based on Teghtsoonian’s hypotheses and uncertainty of human evaluation of stimulus intensity. Following Lubashevsky (Physics of Mind, Physics of Life Reviews, 2019, also arXiv:1806.11077) a physical stimulus is assumed to cause the emergence of its image in the mental space which is characterized by a certain magnitude representing the stimulus perceived intensity. On one hand, these images are caused by external stimuli and their magnitude bears the information about the intensity of the corresponding stimuli. On the other hand, the individual structure of such images as well as their persistence after emergence is determined only by the properties of mental space on its own. Finally, the mental operations of image comparison and their scaling are defined in a way allowing for the bounded capacity of working memory. Dealing with the introduced measure of the stimulus comparison we demonstrate that the bisection problem is characterized by the geometric mean when the ratio of referent stimulus amplitudes belongs to a certain finite interval. Its lower boundary is determined by Ekman’s law (Weber’s law for inner psychophysics). The upper boundary is determined by the stimulus incommensurability. Outside this interval the bisection is characterized by the arithmetic mean. The results are compared with experimental data.
COGNITIVE STYLE DIFFERENCES IN SIGNAL DETECTION/DISCRIMINATION

Natalia Volkova
Gusev Alexey
Lomonosov Moscow State University (Moscow, Russia)

In order to improve understanding of the processes of signal detection and discrimination we should consider individual differences in observers’ performance, driven by various variables of individual differences. The objective was to study the role of cognitive styles as crucial factors of individual differences that determine the performance of near-threshold and threshold sensory tasks. Our study aimed at testing how five cognitive styles (augmenting-reducing, leveling-sharpening, flexibility-rigidity of cognitive control, equivalence range, and focusing-scanning) affect performance of psychophysical tasks. 112 participants performed a set of cognitive style tests as well as two psychophysical tasks on visual signal detection (‘yes-no’) and loudness discrimination (‘same-different’). The duration of visual pattern presentation and difference between pairs of auditory stimuli were used to provide task’s difficulty level, and therefore the level of perceptual uncertainty. Data analysis showed several effects of cognitive styles on psychophysical tasks performance indices, such as: sensory sensitivity index $A'$, strictness of decision making criterion index YesRate, reaction time and its stability, and response confidence index Conf. Our findings suggest that each style is related to particular benefits and advantages in observer’s overall productivity of solving the task. Furthermore, the contribution of cognitive styles was different in different tasks, depending on task’s type and difficulty level. Our results support current findings, considering cognitive styles as regulators of cognitive activity. Hence, they could be acknowledged as tools, mediating individual strategies, representing different ways of coping with perceptual uncertainty. The study was supported by RFBR, project №18-013-01051.
SELF-REGULATION PROCESS IN LOUDNESS DISCRIMINATION

Svetlana Emelianova
Gusev Alexey
Lomonosov Moscow State University (Moscow, Russia)

The psychological analysis of the process of a sensory task solution points that this process includes various high-level mechanisms of mental regulation of observer’s activity. The purpose of our research is to clarify the role of the mechanisms of personal self-control defining the observer’s strategies used to solve a threshold task of loudness discrimination of two tonal signals. Under the decreasing of the stimulus difference and therefore under increasing the difficulty of loudness discrimination, observers change-over to qualitatively different way of work with signals: distinguish them using the peculiar additional sensory cues (acoustic or/and modal nonspecific) pick up on a signal. These sensory cues were given the name “additional” due to its additional relation to the key parameter of sensory discrimination – the loudness. The psychophysical research of loudness discrimination of tonal signals (method 2AFC) has been carried out. There were two tasks using stimulus differences of 1 and 2 dB in the experiment. Each task included 4 blocks by 100 trials. The additional sensory cues and individual performance strategies were identified in self-reports by content analysis. The influence of self-regulation on RT and sensory sensitivity index $A'$ was found out. The analysis of RT changes while accomplishing of two sensory tasks (2 dB ($F(1,104)=10.931; \ p=0.001$) and 1 dB ($F(1,78)=6.691; \ p=0.011$) has shown the advantage of the Action Oriented observers (OA) and those with a high level of self-organization over the State Oriented observers (OS). In more complicated task (1 dB) the SO-observers showed a certain advantage in sensory sensitivity ($F(1,78)=7.341; \ p=0.008$). It is supposed that OA-observers used more economical strategy of the information processing. They avoid long and comprehensive decision-making. OS-observers attracted more cognitive resources and used additional sensory cues more often. The qualitative analysis of individual ways in signal discrimination was carried out. The obvious relationships between loudness discrimination effectiveness and self-regulation processes characteristics mediating the sensory task performing were revealed. The idea is developed that the variation of stimuli uncertainty leads to appropriate transformation of the functional organ or functional perceiving system relevant to sensory discrimination task demands. Supported by RFBR, project №18-013-01051.
Self-awareness is the ability of an individual to separate the ‘self-entity’ from the ‘other entity’ and oppose the self to the objects of the outside world, become the object of one’s own attention (Gallup et al., 2002). Self-awareness is a key component of consciousness (Leontiev, 1972). The most frequently used method for detecting self-awareness is the mirror self-recognition test first proposed by Gallup (1970). Alternatively, it is proposed to study body-awareness, the ability of animals to take into account the physical parameters of their bodies. We tried to find out how animals take into account the limits of their bodies when solving experimental problems. An experimental box with two compartments was separated by a septum with openings of various sizes. An animal was placed in one compartment and sought to get into another one, where there was either a shelter or bait. To solve the problem, it had to choose a hole large enough to pass through. The independent variables were the size and position of the holes in the wall and the natural or enlarged limits of the body. To enlarge the body limits, we attached foreign objects to the animals. We used small holes, through which an animal could not pass to the goal compartment, medium ones, through which only an animal with natural body could pass, and large ones, through which an animal with the enlarged body could pass. We studied representatives of arthropods, mollusks, amphibians, reptiles, and mammals. The animals representing each species were divided into two groups: for one group only the sizes of the holes varied, for the second group both holes and body sizes varied. A comparative analysis of the experimental results shows significant interspecies differences in body-awareness. Mammals and reptiles produce a generalized rule for choosing certain holes, taking into account both natural and enlarged limits of their bodies. Amphibians are able to take into account only the natural boundaries of the body. Mollusks and arthropods do not form generalized rules either for natural or increased body limits. The study opens a new prospect for research into evolutionary variability of self-awareness.
HOW THE CHEMOSENSITIVITY OF FISH TO NATURAL AMINO ACIDS MAY BE EXPLAINED?

Lyubov Selivanova  
A.N. Severtsov Institute of Ecology and Evolution  
Russian Academy of Sciences (Moscow, Russia)

Irina Skotnikova  
Institute of Psychology Russian Academy of Sciences  
(Moscow, Russia)

Many forms of fish's behavior (food one, antipredatory, migratory, reproductive, social; homing, typical for passing species) are directed by substances dissolved in the surrounding water, which are excreted by water inhabitants. Natural amino acids (AA) are the most important signal substances for majority forms of fish behavior. Therefore, many researchers were engaged in determining fish's sensitivity to AA. However, they did not take into account a concentration of AA in the background water which surrounds fish, and just determined thresholds of AA concentrations, which don’t reflect the fish's differential sensitivity to natural AA. In order to determine the sensitivity of young Russian sturgeon to natural AA, we used an original technique combining the ethological “habituation-discrimination” test and the psychophysical method of constant stimuli, as well as the standard method for AA determining using liquid ion-exchange chromatography (LIOCh). Fishes were tested in groups, without prior training and practically in natural conditions. Results obtained. In case of natural background AA, Stimulus-Reaction functions were determined for certain AA, by which threshold concentrations for discrimination (quality recognition) and detection (sensations without recognition) of AA were determined on the base of a criterion of constancy of a behavioral response sign. Further, differential thresholds (DT) and relative differential thresholds (RDT) for certain AA were calculated, taking into account the AA concentration in natural background water. Correlations were determined between the natural background, from one hand, and parameters of fish's sensitivity to AA, from the other hand, in cases of constant natural and changing artificial backgrounds. Using these data and DT-values, we have found that fish's sensitivity to natural AA is ecologically due when they are recognized, i.e. closely related to AA concentration in natural background water. Thresholds of sensation of natural AA without recognition of their quality are not related to their concentration in the natural background water, but due to their physical-chemical properties, in particular, to molecular weight and structure, on which a sequence of AA output on the chromatogram also depends in case of the LIOCh. In this case, "recognition" occurs not at the holistic, but at the receptor level. Supported by RFBR: №18-013-00148a
A new step is suggested in development of Bayesian model of decision making and confidence in sensory tasks. We have moved to a theoretical analysis of discrimination between three or more sensory or perceptive objects, having two or more attributes from the study of decision making when discriminating two simple single-attributed stimuli. Such a transition becomes possible due to a new decision variable (Shendyapin, 2011) introduced into the Signal Detection Theory: “evidence in favor of signal stimulus” ($\Psi(x)$). It equals to a sum of two logarithms: 1. of a ratio between a priori probabilities of a signal stimulus ($s$) and one of noise stimuli ($n$) and 2. of a likelihood ratio that a vector of sensory effect ($x$) value is due to presentation of the signal stimulus, but not one of noise stimuli:

$$
\Psi_s(x) = \ln\frac{P(s)}{P(n)} + \ln\frac{f(s|x)}{f(n|x)},
$$

where $\ln\frac{P(s)}{P(n)}$ may be called a priori evidence in favor of the signal stimulus choice, $\ln\frac{f(s|x)}{f(n|x)}$ may be called a posteriori evidence in favor of the signal stimulus choice.

Our new model, based on the new decision variable, simplifies the description of decision making in terms of necessary calculations realized by neurons. Since neurons’ responses can approximate the logarithmic operation fairly accurately, and using of logarithms allows to replace multiplication and division operations by simpler summation and subtraction operations, then the new decision-making scheme is more realistic. Due to the evidence approach it is possible to integrate all sensory effects: $x_1, x_2, \ldots, x_n$ into one universal decision variable of evidence. Thus this variable using makes it possible to move from the usual description of decision making in discrimination of perceived objects by individual sensory attribute displayed on individual sensory axis, to describing it on a generalized axis of evidence in favor of stimuli difference, on which sensory differences are integrated from each individual sensory axis. Thus, the evidence variable permits to model decision making at the level of holistic perception, i.e. at the higher level than the elementary sensory effects level, as well as permits both to choose a response and to estimate confidence in it. REPTILES’ BEHAVIOR IN DECISION-MAKING (VISUAL DISCRIMINATION TASKS)

Roman Zhelankin  
Center for biopsychological research of Moscow Psychoanalysis Institute (Moscow, Russia)

Skotnikova Irina  
Institute of Psychology Russian Academy of Sciences (Moscow, Russia)

Own activity and individuality of animals were studied as internal decision-making (DM) mechanisms. In reptiles (slowworm-lizards and grass snakes) significant characteristics of DM were investigated firstly: correctness/erroneousness, time, behavioral reactions (head turns, pointed to orientation, collection of input information, fluctuations in choice) before the DM, and individual patterns of DM.

Choice of one of two ways in a T-maze was observed in colors discrimination (mainly), which is poorly understood in reptiles. Red and green cabins were at the left and right ends of the maze, for which illumination, temperature, visual environment were equal and smell was excluded.

Animals learned to choose a green cabin. It was supported. Then 10 experiments were made in each of 4 lizards and 23 in each of 6 snakes. The significance of differences between the numbers of turns for different types of choice was evaluated by the Mann-Whitney test.

Results. The lizards made 20% errors. Thus, they discriminated between green and red successfully, in distinction of the snakes who made 46% errors.

The snakes discriminated between the shapes of geometric figures (square and circle) better than the color tones (green and red): made less mistakes (43%), and spent less time in the maze. Slow-worm lizards discriminated between sizes of geometric figures (circles) at the threshold level (33% mistakes).

Individual differences in DM patterns were analyzed using indices of time, spent in the maze before choosing, and numbers of erroneous choices. In the lizards 20 experiments were added (circles sizes discrimination and colors + circles sizes one) and two patterns of DM were found: like reflective and impulsive ones, while in the snakes – four patterns in colors discrimination: like reflective, impulsive, slow/inaccurate and fast/accurate ones, similar to the humans’ cognitive styles (Kholodnaya, 2018). Apparently, reflection/impulsivity is one of the basic characteristics of individuality both in humans and animals.

The conceptual representations of the theory of functional systems (Anokhin, 1974) and of the subject-behavioral approach in animals (Skotnikova, Zhelankin, 2018) are confirmed, as well as empirical data about a similarity between some DM mechanisms in animals and humans (Smith, Ratcliff, 2004).

CATEGORICAL PERCEPTION OF EMOTIONAL EXPRESSIONS: KEY RESULTS

Alexander Zhegallo
Institute of Psychology Russian Academy of Sciences (Moscow, Russia)

Existing studies of the categorical perception of facial expressions give mixed results. Expected maximum of accuracy in ABX discrimination task is ill-conditioned and only partially explained by results of identification task. Additional analysis of the results of research (5 experiments, up to 500 subjects, different stimulus sets) show the following important results. 1. Categories, related to facial expressions are experiential prototypical, according to E. Rosh theory, not categories, defined by feature set. The position of the border between categories varies individually. 2. Perceptual category prototypes show the perceptual magnet effect. In discrimination task it, expressed in preferred choice of the answers, more similar to the prototype. For the pair of images (A, B) in ABX discrimination task this effect may be expressed as Kerr = (N err_B - N err_A) / (N err_A + N err_B). Here N err_A is number of error answers A and N err_B is number of error answers B. Distribution of Kerr on a row of stimulus in discrimination task is approximately slant line (significantly less than 0 on one side of row and significantly greater than 0 on other side). 3. Perceptual category prototypes may differ in perceptual magnet "strength". Relative "strength" of the pair of prototypes may be measured directly in special variant of discrimination task. 4. Discrimination task may be solved, based not only on face on the whole, but on the partial features of face. The way of processing related to analytical / holistic style of perception. 5. Morphing, as procedure of construction of transitional row of stimulus, produce stimulus, equidistant in sense of point-to-point differences between images (Pearson correlation). In the same time discrimination efficiency of stimulus related to generalized differences (global and intermediate wavelet coefficients). 6. Conditions of discrimination task are specially established to reach efficiency slightly exceeding choice level. For different participants the level of difficulty may vary. Generally, we believe, that the perception of facial expressions is important for individually specific communication signals, not universal.
MOTHERHOOD OF WOMEN WITH SCHIZOPHRENIA IN RUSSIA AND PSYCHOLINGUISTIC ANALYSIS OF THEIR AFFECTION TOWARDS CHILD

Olga Rusakovskaya
Marina Novikova-Grund
National Medical Research Center for Psychiatry and Narcology, Moscow State University of Psychology and Education (Moscow, Russia)

Study was aimed at investigation of previously social characteristics and affection towards children of mothers under long-term follow-up observation because of schizophrenia. Taking into account clinical and social characteristics of 42 mothers with schizophrenia and schizophrenic disorders under long-term follow-up observation, essays about their children and motherhood were investigated with psycholinguistic method in comparing with sane mothers’ essays. Basic semantic constructs, key emotions, time perspectives, inner semantic predicates were compared (Novikova-Grund M. V., 2014). In Russia mothers amount to 80% of patients under long-term follow-up observation because of severe mental disorder, who have children 0-18 y.o. Nearly 84% of mothers with severe mental disorders suffer from schizophrenia. In our sample most mothers were good enough in their parenting, but had significant differences in affection towards child. In their essays there were much more concrete expressions about child’s characteristics, more affectively negative expressions, less expressions fall within present, less child-centered and self-centered expressions. Mothers worried about their own disease and child’s sanity. Essays of mothers with schizophrenia contained far less child-centered inner predicates, but the number of women, not used child-centered inner predicates at all, wasn’t different between the groups. According to our previously anticipation, such results can be accounted for disturbances of affection and empathy. From the other side, non-use of child-centered inner predicates can be one of basics personality psycho-semantic characteristics. Nevertheless, we think that psycholinguistic analysis of parents’ essays is a promising opportunity in assessment of parents’ affection towards a child (Rusakovskaya O.A., 2018). Our results can be used to assess the size of mothers suffer from schizophrenia, investigate the success of their motherhood and inhibits the elaboration of preventive services and social support. COLORIZED GOLLIN INCOMPLETE FIGURES TEST

Yuri Shelepin
K. Shelepin
S. Pronin
I.P.Pavlov Institute of Physiology Russian Academy of Sciences (Saint-Petersburg, Russia)

Nigel Foreman
Liliya Korallo
Middlesex University (London, United Kingdom)

Foreman N. and Hemmings R. (1987) developed a computerized version of the Gollin test formed from black and white images of incomplete contour figures, which provides a precise and versatile alternative to the original Gollin card version. This powerful test has been widely used as a measure of Gestalt perception, visual development, long-term memory and as a clinical test for brain dysfunction, to examine amnesic patients, and signal to noise ratio investigation. Digitized drawings of familiar objects were presented via computer, the percentage of the figure on the screen slowly increasing from 0 to 100. Children's performance on the task improved markedly over the age range 2-5 years, and performance improved dramatically over three tests in all participants. Neurophysiological investigations of the mechanisms of incomplete contour figures recognition has been recently publish (Shelepin et al., 2018). But the human’s vision is color vision. Mollon, J. D. and Reffin, J. P. proposed a computer-controlled color vision test (1989). In our work we propose to combine these approaches and have developed the Colorized Gollin Incomplete Figures Test, not only for experimental purposes in clinical psychology but also to have a powerful instrument to measure Gestalt perception from separated but colored figures of different levels of figural completeness. The neurophysiological mechanisms will be discussed. References: Foreman N, Hemmings R. The Gollin incomplete figures test: a flexible, computerized version. Perception. 1987;16(4):543-8. Shelepin K. Behavior and brain activity analyses show that task alternation requires learning, principally similar to acquisition of the tasks proper. Accordingly, switch-related brain activity is task-specific, rather than characteristic of a certain brain area. We have previously shown that anterior and ior cingulate cortex neurons activity after task switch is linked to their involvement in task performance. However, if the task switching is a new experience, we would expect the switch accuracy increase to be accompanied by the dynamics of interplay between the novel switching experience and the earlier formed task experience. Single-neuron activity was recorded with glass electrodes (2.5M KCl; 3-6 MOhm @ 1 kHz) from rabbits’ anterior (AP-4mm; ML±1-2mm; VD+2-6mm) or ior (AP+9mm; ML±1-2mm) cingulate during food-acquisition by pressing a pedal. All cells were categorized as either “specialized” (in relation to a system of a behavioral act) or “unidentified”. Spike frequencies in the first, the second, and a median of frequencies in trials 3-6 after transition between two tasks on symmetric sides of experimental chamber were calculated for each neuron. These and other measures were compared between neurons recorded during the first and the second week of task switching. The differences of activity changes after task transition between the specialized and unidentified neurons were more evident during the second week of recording, than during the first week. Namely, spike frequency in unidentified neurons was lower in the first trial after transition in ior cingulate (Mann-Whitney U, p<0.05), and tended to be lower in trials 3-6 in anterior cingulate. The contrast between two weeks of recording in terms of trial-wise activity changes in specialized and unidentified neurons presumably reveals dynamics of relations between novel experience of switching and earlier task-performance experience. These relations would further allow for faster transition between the alternated tasks. Supported by Russian Foundation for Basic Research, grant 17-06-00653.
PERSONAL PREDICTORS OF INFORMATION DISTORTION

Mikhail Maryin
Moscow State Psychology and Pedagogical University (Moscow, Russia)

Vyacheslav Tsvetkov
Efimkina Nadezhda
Moscow University of the Ministry of Internal Affairs of the Russian Federation of V.Ya. Kikotya (Moscow, Russia)

The digital world nowadays allows a quick access to any amount of information from different sources. Not only the speed of communication increases, but also the opportunities with the proper use of new technologies. Employees in high-risk professions also work with large amounts of information flows, and the extent to which they are able to perceive, evaluate and communicate information orally or in writing may influence the effective implementation of the assigned tasks. In our research we have studied personal predictors of distortion of service-based information in high-risk professions. At the first stage of the research, questionnaires were used for existing employees, which included questions aimed at establishing the presence of cases of distortion of service-based information in their activity; conditions and causes of this fact; questions of studying the impact of socio-psychological characteristics of employees, their needs, as well as managerial competencies of supervisors on the distortion of service-based information. At the second stage, with the help of the expert-sociometric program “Monitoring”, 262 employees were evaluated, for each of which we obtained the indicators characterizing them in relation to distortion of service-based information, actions to ensure the reliability of service-based information, as well as personal attitudes and readiness to comply with the requirements of norms and rules of service behavior. Taking into consideration the results obtained, persons prone to distortion of service-based information can be described as people seeking to avoid anxiety and fear by replacing the solution of subjectively complex tasks with simpler ones and, in so doing, converging to an early level of adaptive response. These employees tend to avoid actions that require a lot of tension, tend to solve their tasks with "someone else's hands", in case of omissions at work to designate the situation as a collective irresponsibility. The members of this group are oriented towards social approval and expect direct remuneration and satisfaction of personal needs.
Political ideology is defined as a set of individual attitudes about how the state should be governed. The purpose of this study is to develop a scale of political ideology that can reach a wide range of political beliefs held by every individual in society. The construction of items is done through Focus Group Discussion (FGD) with expert and folk, question sort (q-sort) measurement, content validation, and intensive literature study. We used exploratory factor analysis (EFA) and confirmatory factor analysis (CFA) to testing scale and carried out on 5077 respondent – national representative sample. We obtained a three-dimensional fit model that shows the degree of series of individual attitudes towards the role of the government; (1) Social dimension (conservative vs. liberal) — the extent to which the state needs to be involved in regulating the norms and morals of society; (2) Religious dimensions (fundamentalist vs. secular) the extent of individual beliefs about the separation or integration of religion in political practice; (3) Economic dimension (socialism vs capitalism) — the scope of the role of the government in regulating wage standards, social classes, subsidies, salaries, and economic competition. The instruments were also validated and observed to have strong inter-correlations with other constructs (RWA, SDO, free market fairness, need for cognitive closure, dogmatism, secular-belief, single-item liberal vs. conservatism). The political ideology scale with this context-specific was expected to explain political orientation more precisely based on individual socio-religious diversity in Indonesian social-political activities.
Militant Extremist Mindset (MEM) refers to a set of beliefs, feelings, thoughts, and motivations that tend to mobilize under facilitating conditions and may lead to violent behavior (Stankov, Saucier, & Knežević, 2010). Ingredients of this mindset are, to some extent, present in all human beings. Not for specific population only, such as terrorists or political criminals. There are at least three ingredients of MEM; nastiness – pro-violence, grudge – vile world belief, and excuse – utopianism (Stankov, Knežević, Saucier, Radović, & Milovanović, 2018). One of these ingredients (grudge) is hypothesized to be more likely to change and intervene due to its partially situational nature, compared to other factors, specifically through media exposure. Drawing from cultivation theory (Gerbner, 1974) and Stankov et al., (2018) argument, we propose that grudge, but not nastiness and excuse, will systematically decrease because of exposure of positive valence of media.

Positive valence media may change how individuals perceive the world and may lead to attitude change. In three days straight, we expose participants in our experiment with news by manipulating the content valences (good news vs bad news). In good news condition, participants exposed to news about a decrease in corruption, poverty, and crime indexes. In bad news condition, participants exposed to news about an increase of corruption, poverty, and crime indexes. We showed that dangerous world belief and competitive world belief are associated with some ingredients of extremist mindsets. Decreases of grudge due to treatment were consistent with declines of dangerous world belief, but not competitive world belief. From these results, we primarily discuss the usefulness and strength of simply repeated media intervention, to reduce extremist mindsets in general population.
A RELATIONSHIP BETWEEN NIGHTTIME SMARTPHONE USE AND SLEEP PROBLEMS AMONG UNIVERSITY STUDENTS IN JAPAN: A PRELIMINARY QUESTIONNAIRE SURVEY

Toshihiko Sato
Nagano University (Ueda, Japan)

Using smartphones or other electronic devices at night might have some adverse effects on subsequent sleep processes and might cause some sleep problems and insomnia symptoms, not only because lights emitted from liquid-crystal displays of these devices can stimulate the brain, but also because some kinds of negative or positive emotion might be aroused by the contents they are viewing on the display. To clarify a relationship between nighttime smartphone use and sleep difficulties, we asked undergraduate students who attended lecture courses related to psychology in a university in Nagano prefecture, Japan, to respond to a questionnaire consisting of items on time duration spent on internet browsing and use of electric devices including smartphones, personal computers, and home video game consoles after 6 pm at night, and nighttime sleep difficulties including sleep latency, wake after sleep onset, morning mood, nightmare, daytime sleepiness, and experience of being treated for insomnia. This study has been approved by the research ethics committee of Nagano University, and the survey was conducted in January 2018. Data from 90 participants were analyzed by using IBM SPSS software, version 24. In the statistical analyses, the significance level was set at 0.05. In the results, the average time spent on a smartphone in the night was 2.3 hours, and internet browsing was 2.1 hours. Next, the participants were divided into two groups: 1) those who use a smartphone for 3 hours or more in the night, and 2) those who use it less than 3 hours. We compared scores on various kinds of sleep difficulties between these two groups by performing a one-way analysis of variance, and found that the group using smartphones for three hours or more showed a significantly higher score on the number of wake after sleep onset, indicating that the students who spent three hours or more on smartphone use tended to wake more frequently during nighttime sleep than their classmates. The present results strongly suggest that nighttime smartphone use might disturb subsequent sleep processes, especially sleep maintenance, in the night.
EXPLORING THE RELATION BETWEEN BURNOUT AND CONFORMITY: POSSIBLE EFFECTS OF PSYCHOLOGICAL REACTANCE AND COGNITIVE DISSONANCE

Reyhan Bilgiç
Middle East Technical University (Ankara, Turkey)

This study investigates the relationship between conformity tendencies of employees and their burnout levels. Burnout is the situation of high level exhaustion, and also an indicator of negative well-being in workplaces. Conformity is a personality feature defined as being prone to act and think accordingly to observed social norms and immediate social groups across different situations and positions. Previous research indicates that there is no significant relation between conformity and burnout level. However, the current study aims to investigate whether there are possible moderators and mediators which may determine the strength of the correlation between burnout and conformity levels. The study suggests that cognitive dissonance, defined as the anxious state of individuals that is caused by the conditions in which their actions and behaviours are not in line with their aspirations and attitudes, can be a possible moderator; and cognitive reactance, defined as a motivational state in which individuals attempt to restore their threatened freedom when they perceive threats to their behavioural freedom, can be a possible mediator in this relation. In this wise, it is hypothesized that there is a positive correlation between the conformity and burnout levels of employees through a mediating effect of high cognitive reactance, when their values and opinions do not match with their workplace, leading to cognitive dissonance. We test this hypothesis in a multisource correlational study in which relevant questionnaires measuring conformity, psychological reactance, cognitive dissonance and burnout, will be collected from 200 employees working in various workplaces. Following the completion of data collection, a regression analysis will be conducted. Results are expected to reveal that the relationship between conformity and burnout is not significant without a moderator and mediator effect. However, when the effects of cognitive dissonance and cognitive reactance are taken into consideration, the relationship is expected to be found meaningful. The current study contributes to previous research with a cognitive burnout model which has not been discussed or proposed before, and with practical implications in terms of selecting and training employees according to their conformity and reactance levels in order to prevent burnout.
FACE INVERSION EFFECT IN BINOCULAR RIVALRY

Jeong Yeonhwa
WooHyun Jung
Chungbuk National University (Cheongju, South Korea)

In situation that different stimuli seen by each eye, we experience binocular rivalry that the stimulus are competed. Upright face is clearly perceived more long time than another scene on binocular rivalry. According to research in past, the face has much information about that person and is easily recognized. However inverted faces gave less information and are recognized hard even if we know that was the face. This phenomenon is known by face inversion effect (FIE). This research was conducted to know that how to face inversion influence on binocular rivalry. Participants had seen monitor through mirror stereoscope. Before each session, participants had adjusted cross lines in order that to perceive only one cross line. After adjust session, picture of human face is presented in one side of cross line and picture of house is presented in other side for a minute. If times went passes about half of session, position of house stimuli was changed the site of face and vice versa. Participants put the one key respond to stimuli when clearly seen picture of face or house. The clearly perceived time of the upright face is larger than of house stimuli. The clearly perceived time of inverted faces is shorter than the upright faces. When picture of inverted face was presented, dominant time of inverted face is similar to dominant time of house even if they know that stimuli is the face. This suggests the possibility that the specific part of brain which process face influences on perception in the binocular rivalry.

THE EFFECT OF NARRATIVE THERAPY BASED GROUP COUNSELING PROGRAM OF ADOLESCENTS’ RESILIENCE

Busra Yazici
Maltepe University (Istanbul, Turkey)

The goal of this research is to examine the effects of Narrative Therapy based Psychological Counselling Program on Adolescents’ Psychological Resilience Levels. The application of the research took place; in 2017-2018 academic year, on 9th, 10th and 11th grade students who study at Davutpaşa Anadolu High School in Fatih district of Istanbul. The research group consists of 16 people in total with 6 female and 10 male students. Throughout the research; the Adolescent Psychological Resilience Scale has been used to measure participants’ levels of psychological resilience. The research which has been conducted by experimental method; is composed of 2 study groups; the experimental group which the Narrative Therapy based Psychological Resilience Program is applied to and the untreated control group. In result of the research; the adolescents who were in the experimental group which the Psychological Counselling Program was applied with the Narrative Therapy based group, were observed to have a significant amount of increase in their scores on the Adolescent Psychological Resilience Scale compared to the control group. In the following evaluation, it has been identified that the changes which occurred in the levels of psychologic resilience of the participants are long-term.
THE EFFECTS OF NARRATIVE THERAPY BASED PSYCHOLOGICAL COUNSELLING PROGRAM ON ADOLESCENTS’ WILLPOWER AND ANXIETY LEVELS

Merve Koca
Hasan Kalyoncu University (İstanbul, Turkey)

This research was aimed to examine the effect of Psychological Counselling Program on Adolescents’ willpower and anxiety levels with the Narrative Therapy based Group. The application of the research took place; in 2017-2018 academic year, on students between 15-17 years of age who study at Ebu Hureyre Religious School for Girls in Kağıthane district of Istanbul. The study, has been determined with simple random sampling method and executed with 16 people who were all female students. Throughout the research; personal information forms of all participants, Self-regulation Scale to measure the participants’ willpower levels and State-Trait Anxiety Scale to measure their anxiety levels have been used. This research which utilized experimental pattern is composed of 2 study groups, the experimental group with the Narrative Therapy based Group which was exposed to Psychological Counselling Program and the untreated control group. In result of the research; it was observed that the adolescents in the experimental group who were exposed to the Psychological Counselling Program with the Narrative Therapy based Group, showed a significant decrease in their scores on the State-Trait Anxiety Scale compared to the control group. After the application of the program no substantive difference of volition skills has been detected between the experimental and the control groups.
PERSONALITY TRAITS AND DEPRESSION: EFFECTS ON ANXIETY IN MEXICAN MOTHERS

Mirna Garcia-Mendez
Sofia Rivera-Aragon
Pedro Wolfgang Velasco-Matus
Rozzana Sanchez-Aragon
Maria del Pilar Mendez-Sanchez
National Autonomous University of Mexico (Mexico City, Mexico)

Most of the research is focused on two-parent families, their relationships, their alliances, and their effects of personal and group wellbeing. On the other hand, single-parent families are usually associated with children’s academic failure or poor academic performance, lower income and risk of higher levels of stress, anxiety, and depression due to lack of social and psychological support. Anxiety can play a key role in negative emotions due to its relationship with high levels of Neuroticism and low levels of Conscientiousness and Extraversion. Literature also suggests that depression is a predictor of anxiety, which is why when a family member suffers anxiety and/or depression, the overall family dynamic and its functioning are affected, which in turn can lead to a higher prevalence of health issues. The purpose of this research was to establish the effects of personality traits and depression on trait-state anxiety in Mexican mothers. A total of 836 mothers from Mexico City (from single-parent and two-parent families) were part of this research. The results of regression analysis show the effects of all five factors of personality and depression on trait-state anxiety, in both types of mothers. It is worth noting that the most relevant effects are those from Neuroticism and depression on trait-state anxiety, in both single and two-parent mothers, leading to higher levels of anxiety in both cases. The effects of depression on trait-state anxiety are linked to a higher risk of comorbidity of anxiety disorders and higher levels of depression. These results show that Neuroticism and depression have negative, undesirable effects on trait-state anxiety since both increase the anxiety levels. On the other hand, moderate negative effects can be observed from Extraversion, Openness and Agreeableness, and they’re considered an element that can moderate and buffer the negative outcomes of trait-state anxiety of Mexican mothers (Project PAPIIT IN306616).
OLDER TEENS’ RATIO OF THE MANIFESTATIONS OF INTELLIGENCE PRODUCIVITY AND FEATURES OF THE MORAL AND ETHICAL SPHERE

Yana Sipovskaya
Institute of Psychology Russian Academy of Sciences (Moscow, Russia); Moscow State University of Psychology and Education

The problem of personal’s moral development in adolescence is particularly acute in the context of studying the productivity of intellectual activity, that is, intellectual competence. The hierarchical structure of sensory semantic abilities [3] of different types of modality: tactile, taste, auditory, olfactory and visual sensations — is considered in the article from the perspective of the development principle [2]. The study involved 90 older adolescents (average age 15 years). Methodological base of the research was “Interpretation (essay)” on one of A. I. Podolsky’s and O. A. Karabanova’s [quoted in 1] moral dilemmas — methodical technique for evaluating the peculiarities of moral choice and level of intellectual competence. The results of the study prove that none of the manifestations of intellectual competence correlates with the peculiarities of research participants’ moral choice. Such data can be explained by the immaturity of these constructs, when they are only at the stage of formation and are not represented in their integrity in the individual mental experience of the individual. The obtained results are pioneering, both in view of the narrative approach to the measurement of intellectual competence, and data on the undetectable links between the manifestations of intellectual competence and the peculiarities of the moral choice of research participants. The data provided in the article enrich our knowledge of the manifestations of intellectual competence in older adolescence and inspire us to expand the methods of studying both the competence itself and its components, as well as potential factors influencing this construct. Of particular importance is the study of the manifestations of intellectual competence in other age periods, to determine the dynamics of the revealed patterns.

References
In K12 Teacher training in China, many psychological theories are introduced and often puzzled the teacher by how to use them. Teachers often complained about they are in need of practicable tools and simple theory. This research puts forward the “Energy Discharge Tunnel” theory and its preliminary application in education. The EDT theory based on the hypothesis that human psychology is a system of energy discharge tunnels and it is designed to make the hypothesis so simple that it is easy to apply and to comply with other theories well. The research used the mixed research method to testify this theory. We designed a series of toolkit for teachers in K12 schools to apply and verify this theory and also to influence the students to check its effect. This toolkit includes key emotional event interviews, coding tools, action contracts’, etc. The data and other materials were analyzed using quantitative and qualitative analysis softwares. Results indicated that the teachers satisfaction degree of the EDT Toolkit is significantly higher than other similar tools. There was statistically significant correlation between positive changes of the student cases and the quality of application of action contracts. Teachers using the EDT toolkit was a significant predictor for teacher’s motivation to make achievements in research of their teaching. These findings show that the EDT theory and its toolkit preliminary got its practical values through the effect from the students changes and the positive behaviors and attitudes of the teacher.
ON PSYCHOLOGY IN CONTEXT OF GLOBALIZATION

Eva Neu
Michael Ch. Michailov
Peter Birkenbihl
Institution of Umweltmedizin (Muenchen, Germany)

Manfred Holler
University of Hamburg (Hamburg, Germany)

Dieter G. Weiss
University of Rostock (Rostock, Germany)

Enormous global problems are essentially related to education-ecology-economy-medicine, etc. Psychology is of essential importance for total human health (spiritual-mental-emotional-social-somatic). Globalization needs renewal of psychology by philosophy (scientific-theory/ethics/etc.), also by new organzatory models. Enlargement of Executive Committee of IUPsyS/EFPA/national organizations by a. election of permanent 3-honorary (meritocratic & triumvirate principles: moral support, continuity), 3-presidents, 3-general secretaries, etc.; interdisciplinary commission to EFPA/IUPsyS incl. scientists from psychology/philosophy/physiology, etc.; scientific-political commission — incl. representatives of international societies: psychology/IUPsyS, philosophy/FISP/IAB, physiology/IUPS, medicine/CIOMS, etc.; d. Election of permanent (seniors: continuity) & fixed-term members (flexibility) to the Executive Committee: (sub-)continental representatives from important countries (Afro-/West-Asia; America; Australia/Asia-China-India-Japan, etc.; Europe: Austria/France/Germany/Russia/Spain/Italy, etc.). Implication of interdisciplinary topics to congress programmes for psychology: philosophy, medicine, theoogy (Brahmanism-Yoga/Buddhism incl. Zen-Shintoism/Christianism-Mosaism/Confucianism-Taoism/Mohammedanism-Sufism, etc.) Organization of common interdisciplinary congresses. Creation of an International Academy for Psychology with continental/national-branches by network, also of institutes to International Universities (proposal by British Nobel Laureate B. Russell/G. Mensching): intern. UNO-employees, e.g. intern. professors, possibility for whole life work, etc. Realization of proposals by IUPsyS/EFPA/European, etc. societies could be model for scientific&organizational renewal supporting UNO-Agenda for better health on global level.
There are several authors that have discussed the importance and impact of parenting on educational outcomes of children and psychological issues, such as, stress, depression and emotional problems (Mackenbach et al., 2014). Nevertheless, little has been said about indirect processes. The purpose of this study was threefold, (a) to explore whether parental involvement mediates the relation between perceived stress and negative affect in elementary school children (5th and 6th grade), (b) to analyse the impact of cognitive vulnerability on their perceived stress and behavioral problems, (c) to analyze whether parental involvement mediates the association of cognitive vulnerability and negative affect. Information was gathered on 748 Peruvian children from the normal population (319 girls and 329 boys). Teacher of each classroom reported the level of educational involvement of the parents by filling out a short questionnaire for each student, children filled out two measures of negative affect and cognitive vulnerability. Hierarchical multiple regression analyses were conducted to investigate independent and interaction effects. Results showed a mediation effect of Involvement over Perceived Stress and Negative Affect ($\beta_{\text{dis}} = .38, p = .001$). Likewise, a mediation effect of Involvement was found over cognitive vulnerability and stress ($\beta_{\text{dis}} = .27, p <.001$; and $\beta_{\text{inv\_eng}} = .28, p = .001$). Additionally, we found independent effects of Cognitive Vulnerability in the five subscales of Perceived stress ($\beta_{\text{pri}} = .10, p = <.05$; $\beta_{\text{sec}} = .19, p = <.001$; $\beta_{\text{dis}} = .29, p = <.001$, $\beta_{\text{inv\_eng}} = .30, p = <.001$; $\beta_{\text{inv\_dis}} = .29, p = <.001$) and in Emotional problems ($\beta = .15, p = <.01$), Negative affect ($\beta_{\text{neg}} = .25, p = <.001$) and positive affect ($\beta_{\text{pos}} = -.08, p = <.05$). It can be concluded from this study that despite the detrimental consequences of perceived stress, it can be said that parental involvement intervenes in the stress and negative affect relationship. Likewise, parental involvement acts upon the association between cognitive vulnerability and perceived stress. Additionally, cognitive vulnerability predicts perceived stress, positive and negative affect and emotional problems in children of 5th and 6th grade.
THE APPLICATION OF PSYCHOLOGICAL KNOWLEDGE IN THE APPROACH TO EPILEPSY

Natalia Tokareva
National Research Mordovia State University N.P. Ogarev (Saransk, Russia)

E.Zheleznova
V. Serbsky Federal Medical Research Centre for Psychiatry and Narcology (Moscow, Russia)

The aim of this work was to study the psychological component in the interdisciplinary approach to epilepsy. The study included 317 patients aged 18 to 55 years, with various forms of epilepsy, in the structure of the disease which was dominated by simple, complex partial attacks, with a duration of the disease up to 30 years. The verification of the diagnosis in the examined patients was carried out on the basis of the results of clinical and neurological, psychopathological, pathopsychological, electroencephalographic examination and the computed tomography of the brain. The study used the psychodiagnostic technique "personal profile of the crisis." The statistical data processing was carried out using the program Statistica 10.0. The complex clinical and psychological study of patients with epilepsy allowed to justify the selection of 3 variants of mental changes. Clinico-psychopathologically, in the first variant (38% of patients), the predominant are cerebrospinal disorders combined with psychopathic and cognitive disorders: a moderate decrease in mnemonic-intellectual functions, violations of emotional response (Me=7, Q1=4, Q3=11). Clinico-psychopathologically in option II (35% of patients) dominated by cerebral disorders, a slight decrease in mnemonic-intellectual functions, changes in behavior and activity: absorption problem (Me=4, Q1=2, Q3=8), the presence of functional problems: disorders of the gastrointestinal tract, dysfunction of the autonomic system, cardiac disorders, sleep problems (Me=6, Q1=3, Q3=10). Clinico-psychopathologically III variant of mental changes (27% of patients) corresponded mainly to disorders of the secondary neurotic level in the form of affective lability, normative parameters of the cognitive sphere, depressive tendencies (Me=2, Q1=1, Q3=7). The studied parameters reflect the adaptation of the patient’s personality, which is manifested in the form of restructuring of functional structures and systems of the individual under the influence of the disease. Thus, in the clinic of epilepsy psychological component becomes an important component of the treatment and diagnostic process, serve as a criterion for the dynamics of the patient’s condition during treatment, psychocorrection and psychotherapy, in the implementation of different types of examinations.
Gender Differences in Subjective Experience of Mental States in Children with Deficient Development

Lira Artishcheva
Kazan Federal University (Kazan, Russia)

The purpose of this research is to study gender differences in subjective experience of mental states of children with deficient development. We studied six mental states: joy, anger, calm, indifference, fatigue, sadness. To determine the structural components of subjective experience of mental states of children (7-10 year old boys (9 people) and girls (8 people)) and teenagers (13-14 year old boys (10 people) and girls (9 people)) we used methods of self-report and content analysis of respondent’s texts. The subjects retrospectively and prospectively described their mental states in the way they wanted. We singled out the basic semantic units and calculated their frequency in the respondents’ texts. We have compared gender characteristics in each nosological and age groups. Subjective experience of the states of joy, anger, calmness in boys is represented by the same characteristics (evaluative and comparative, description of actions, emotional and sensual sphere), the experience of girls is more diverse in its content. 7-10 year old girls reveal the experience of joy through the description of the causes of this state and through emotional and sensory experiences; the experience of anger is expressed through value judgments, and the experience of calm is expressed through the description of actions and causes of the state. The subjective experience of joy in teenage girls contains emotions, feelings and expressive reactions. Anger is represented by evaluative and comparative characteristics, actions, and conditions of the state development, and the experience of calm is filled with emotions, feelings, and comparative characteristics. The subjective experience of indifference, sadness has a similar content in adolescents and is revealed through evaluative and comparative characteristics and descriptions of actions. The experience of fatigue in teenage boys is presented through revealing the causes, situations, and conditions of the state development. When it comes to teenage girls, their past experience of fatigue contains a description of actions. They also tend not to describe the future.

The study was carried out with the support of the Russian Foundation for Basic Research in the framework of the research project No. 18-013-01012 “Subjective experience of mental states in the situation of life prediction”.
SELF-FORGIVENESS IN FIBROMYALGIA PATIENTS AND HIS RELATIONSHIP TO ACCEPTANCE, CATASTROPHISM AND COPING

Miguel A. Vallejo
Laura Vallejo-Slocker
National Distance Education University (Madrid, Spain)

Javier Rivera
University General Hospital "Gregorio Marañón” (Madrid, Spain)

The aim of this study is to explore the relationship of self-forgiveness with fibromyalgia (FM). We studied the impact and severity of FM, acceptance, catastrophism, self-efficacy and coping. We evaluated 228 female FM patients. They completed the Mauger Self-forgiveness scale (FS), FSQ, FIQ, ICAF, CPAQ, PCS and SF-36. A descriptive, correlational, factorial and a decision-tree analysis was conducted to identify the relationship between FS and clinical and psychological variables. A high self-forgiveness is related to high active coping ($r=.41$) and acceptation ($r=.38$) and a low self-forgiveness is related to emotional negative factors and catastrophism ($r= -.56$). Two factors were obtained. One physical and other emotional. FS is in emotional factor with emotional negative, catastrophism and a deficit of active coping. A decision-tree analysis with FS as dependent variable showed a first node with ICAF Emotional scores and a second level with CPAQ and PCS scores as predictors. FS is useful to understand the FM patient situation. An important lack of FS indicate a problem with the health aspects related to this syndrome. This influence is related at first to emotional factors. Acceptation could be require a low negative emotional status. People with high FS were likely to increase acceptation. It is the positive component of acceptation in FS. This do not indicate an interest to maintain his problematic behaviors. Nevertheless, the lack of FS was related to an increase of distress and catastrophism.
LEARNING STYLES DETERMINE DIFFERENT IMMIGRANT STUDENTS’ RESULTS IN TESTING SETTINGS: RELATIONSHIP BETWEEN NATIONALITY OF CHILDREN AND THE STIMULI OF TASKS

Sandra Figueiredo  
UAL and Center for Psychology Research (Lisbon, Portugal)

Tânia Brando  
O. Nunes  
Universidade Autónoma de Lisboa Luís de Camões (Lisbon, Portugal)

The main goal is to explore how different stimuli affect the performance variability of Portuguese second language (L2) learners, which minorities and in what degree of importance. Literature presents little examination on the learning styles and sensorial preferences of immigrants during decoding of different tasks in testing contexts. Methods: In this cross-sectional study non-native children (between 2nd and 12th grades) were divided into six groups determined by country of origin and examined on different stimuli — visual and auditory — associated with four tasks that measure cognitive and linguistic specific abilities. First, the multivariate analysis confirmed that the children’s nationality significantly explained achievement variability regarding picture recognition and auditory discrimination. The Manova allowed to compare means and standard deviation error of performance in all tasks. $\eta^2$ values indicated that there were moderate to larger effects (in accordance with current practice, Cohen, 1988) for the nationality as a factor that explains the variance of performance along the four tasks by comparing the six groups of students. The statistical differences were significant in all children’ groups in the auditory discrimination and visual decoding tasks: (p > .05) auditory text recall a) (partial $\eta^2 = 0.285$) and b) (partial $\eta^2 = 0.179$), picture naming (partial $\eta^2 = 0.117$), picture phonemic recognition (partial $\eta^2 = 0.219$) and dichotic hearing (words transfer) (partial $\eta^2 = 0.108$). Second, the confirmatory factorial analysis showed that nationality acts as a mediating factor ($\chi^2 = 208.72$, with df = 36 (p = .000); CFI: 1.0; RMSEA = .21) in models where, simultaneously, other factors emerge with lower predictive value for the children’s performance in the same tasks. Results indicate that tasks’ stimuli can effectively assess and differentiate specific young minority groups in order to understand their actual level of preparation and their needs for further learning. The listening input, on the one hand, should be established as the main differentiator for all groups at the time of school entry, but, on the other hand, it should be avoided in Asian groups and Eastern European new students during the first stages of L2 learning in European contexts with romance languages as the target learning.
INTELLIGENCE AFFECTED BY SLEEP HABITS: THE CHRONOTYPE OF PORTUGUESE SCHOOL-AGED CHILDREN, PERFORMANCE AND SCHOOL SCHEDULES

Sandra Figueiredo  
UAL and Center for Psychology Research (Lisbon, Portugal)

J. Hipólito  
C. Tomás  
Universidade Autónoma de Lisboa Luís de Camões (Lisbon, Portugal)

Children academic success is highly determined by biological factors such as the different chronotypes. Literature does not contribute yet to understand completely how the chronotype affects the cognitive achievement in school-aged children and considering the cognitive predisposition or decline (desynchrony effect) in different schedules of schools. Firstly, we administered the Portuguese version of Children’s Chronotype Questionnaire (CCTQ, Couto, Gomes, Azevedo et al., 2013) to examine three major sleep behaviours: duration of sleep time (midsleep point), morningness and eveningness (2), and chronotype (3). This specific study focused the chronotype measure in order to understand the different diurnal types of children. Morningness, intermediate and eveningness types were all considered for this study, reporting no sleep disorders and aged between 7 and 11 years old. Secondly, two subscales (coding and symbols) of Wechsler Intelligence Scale for Children (WISC-III) were administered in two periods of schooldays during two weeks: morning and afternoon periods. The Portuguese version of the intelligence scale test was used (Simões, Seabra-Santos, Albuquerque et al., 2003). The Mann-Whitney U test demonstrated the impact of sleep habits differences concerning specifically how the morningness and eveningness (p< .05) explained the variation of children’s performance in the morning schedule for the subscale of coding subtest. The morning types were the best performers. For the other subscale — symbols search — the scores were not statistically significant between groups (considering age, gender and grades). Collected data suggest desynchrony effect for the evening types among school-aged children. Children with sleep and awake late schedules (determined by eveningness) may be at risk in school regarding testing of academic and cognitive performance. The test scores might be biased concerning their real skills for specific academic subareas because the tests or activities are administered in schedules that may not match with cognitive optimization period of children. Schools and professionals should examine which timetables are more appropriate for morning and evening types to ascertain the competencies evaluation.
IMPRESSION MANAGEMENT MECHANISM FOR ADVICE TAKING

Xiufang Du
Qiaona Jia
Shun Wu
Jingxia Wu
Shandong Normal University (Jinan, China)

Advice taking is an important part of the decision-making area. Previous studies mainly concerned with why advice discounting occur. From the view of information processing, researchers have suggested a variety of theories to explain the mechanism of advice discounting, such as anchoring and adjustment, egocentric bias and information asymmetry theory. While advice taking is also an interpersonal interaction process. This suggests that decision makers may also consider what kind of social evaluation and impression will make to others when they decide taking advice or not. In this study, two experiments were designed to investigate the impression management mechanism of advice taking. Experiments 1 explored how the degree of advice taking influenced the evaluation from others and meta-perception (judging how others see them). Half of the participants were asked to evaluate the warmth and ability of decision makers who took other’s advice high or low. The other half were asked to judge how others evaluated their warmth and ability when their advice taking degree was high or low. The result showed that that the decision-makers with high degree advice taking were evaluated warmer, and those with low adoption rate were evaluated with higher ability, and there was no significant difference between other people’s evaluation and meta-perception. In other words, the decision-makers realize that others evaluate their warmth or ability according to the degree of advice taking. So it is possible for the decision-maker to impress others by taking advice strategically. Using JAS paradigm and a single factor design, experiment 2 attempted to test this hypothesis, and the independent variable was expected impression (warmth, ability), the dependent variable was WOA (weight of advice). The results showed that when participant expected to get a warm impression, they projected a higher degree of advice taking; when they expected to shape the ability impression, the participants projected a lower degree of advice taking. Therefore, it can be considered that the degree of advice taking is related to impression management.

FLIGHT CREWS TRAINING AS PROFFI THROUGH GENERATIVE GAMES

Alexander Zakharov
Rossiya Airlines, Leading Instructor (Moscow, Russia)

Vitaliy Tretyakov
Saint Petersburg State University (St.-Peterburg, Russia)

One of the competence developing methods widely used to form safe behavior is and recommended by the international aviation community is generative games that have proven themselves in the energy industry as a tool to increase personnel reliability and are successfully held in Russia, the CIS countries, France, Germany, and the USA. In aviation, the generative games are used to increase readiness for actions in an extreme situation due to accelerated building and further maintenance of the image of a professional, including the image of professional flight activity, which leads to increase in reliability of the activity. An important element of the generative scenario in a crew is to add experience and put it into practice, i.e. to strengthen it. At the same time, different crews creating the participants’ experience resort to
different scenarios, which can finally lead to absolutely unlike results including those that concern flight safety. In the course of a game situation, pilots can see the interaction process, on the one hand, and they are engaged into it, on the other hand. Everyone resorts to their own scenario and can see what their actions lead to in the end of the game. The project “Using game techniques in the training of aviation personnel” has showed that the use of generative games has a good learning effect. The game “SAFA Inspection” was used during the special ground (joint) training of pilots and flight attendants. The “Limitations” and the “Pilot Career” card games were used during /before the conversion for Airbus 320 or Boeing-737. The game “Flight” was held as part of the Recurrent CRM Training. A version of board game has currently developed – the “Commander of the Aviation Squadron”, which will serve as an introduction to the specifics of pilots career. In the future, we plan that it will form the basis of a professional game for flight crews. Simulator training also includes generative scenarios. The instructor takes the situation to the plane of success by reinforcing the pilots “safe behavior” skill.

**ACTIVITY APPROACH IN THE SYSTEMOGENETIC PARADIGM TO THE PSYCHOLOGICAL CONSULTANCY IN EDUCATION: THE THEORY AND THE PRACTICE**

Galina Suvorova
Moscow Pedagogical State University (Moscow, Russia)

The complex of issues about the activity way in the systemogenetic paradigm as an innovative stage in the development of a systematic approach to the psychological consultancy in education was raised by Suvorova (2015). The activity of the psychologist links the subjects of education: student, parents and teachers. In education, experts are increasingly turning to the theory of systemogenesis of activity (Shadrikov, 1982-2017) and to his model FPSA (Functional Psychological System of Activity) which is a universal model to analyze all activities.

The “the world of inner life” is justified as a subject that should be studied by psychology by Shadrikov (2006). Hence «the world of inner life» is set as a matter of dialogue between individuals involved into psychological consultancy (child, parents, teachers and psychologist) in education (Suvorova, 2006).

The child from the moment of his birth learns: to walk, to talk, to play, to communicate, to read, to write, or in other words, he is engaged in educational activities. The goal of it is learning.

According to Shadrikov, learning is the developing of FPSA. The key issues of the activity approach to psychological consultancy in education are illustrated by two author’s models. Psychological counseling is considered as a joint activity of a psychologist and a consultee, which is organized by a psychologist and aims to study the behavior and activities of a consultee in order to form various mechanisms of his self-regulation. At the same time, cognitive actions are considered as educational, which are the basis for the development and operational mechanisms of abilities and operational mechanisms of learning. The content of the cognition tasks organizes mental processes for student into the FPSA. Meanwhile the intellectual task, solved by cognitive actions of different levels of integration, is considered as a means of abilities and intelligence development (Suvorova, 2012).

Psychologists-consultants professional competence and experience of their independent professional activity is practiced in triads: consulted-consultant-expert.
FROM PSYCHO-ANALYSIS TO CULTURE-ANALYSIS: A CULTURALLY SENSITIVE REVISION OF PSYCHOLOGY

Marwan Dwairy
Oranim Academic College (Nazareth, Israel)

Applying psycho-analysis that reveals unconscious, typically forbidden contents, with clients from collective cultures may lead to confrontations with the family and the social environment. In these confrontations typically the client is the weakest and therefore the looser. This lecture re-examines the application of psychodynamic approach in collective cultures and suggests culture-analysis as an alternative and/or to pave the road for psycho-analysis. Culture-analysis is based on the fact that each cultural value system includes many opposites and contradictions. In culture-analysis therapist identifies subtle contradictions within the belief system of the client and employ cultural aspects that may facilitate change. Similarly to how a psychoanalyst analyses the psychological domain and brings conflicting aspects to the consciousness (e.g. aggression and guilt) in order to mobilize change, a culturanalyst analyses the client’s belief system and brings contradicting aspects to the consciousness in order to mobilize revision in attitudes and behavior. Unlike the unconscious drives which are revealed through psychoanalysis, these intra-culture conflicts are not supposed to be threatening because all aspects revealed are culturally and morally legitimizied. This process can be described in humanistic terms too. In much the same way that a Rogerian therapist establishes an unconditional positive regard and empathy to facilitate the coming forward of the real authentic self, a culturanalyst establishes positive regard and empathy to the culture and facilitates the coming forward of more and more aspects of the culture that were denied and that may be employed to effect change. Alternatively, one can understand this process in terms of generating cognitive dissonance within the client’s belief system that necessitates change. Regardless of the theoretical explanation, in order to conduct a “within-culture therapy,” therapists need to be open and incorporate several aspects of the culture in the therapy in order to create a new dynamic within the client’s culture. Beside empathy, a thorough inquiry into the client’s culture in order to identify the cultural aspects that may be employed in therapy is needed. Some examples of within-culture therapy will be presented.

PSYCHOLOGICAL HARASSMENT PRACTICES EXERCISED BY SUPERIORS IN THE WORKPLACE: PERSPECTIVES OF EMPLOYEES

Daniel Blondin
François Courcy
Université de Montréal et Université de Sherbrooke (Mont-Saint-Hilaire, Canada)

Mélanie Couture
Centre-Ouest de l’île de Montréal (Côte-Saint-Luc, Canada)

This article describes psychological harassment practices exercised by superiors in the workplace, as experienced by employees who, ultimately, were able to have those practices cease. Individual interviews were conducted with nine unionized and non-unionized employees having been subjected to this type of stressful situation. From these interviews, it emerges that harassment practices utilized by immediate superiors are part of a social process aiming to discredit the employee by exercising direct control over the person and manipulating the work environment in order to subjugate him or her. Keywords: psychological harassment, workplace resilience, conflict resolution
SPECIFIC FEATURES OF ETHNIC IDENTITY IN THE REGIONS WITH DIFFERENT DEGREE OF ETHNIC DIVERSITY

Olga Zotova
Lyudmila Tarasova
Elena Syutkina
Olga Solodukhina
University for Humanities (Yekaterinburg, Russia)

Sustainability of ethnic groups poses the problem of the search for principles of their formation and existence, make-up of ethnic group portraits, identification of their psychological and socio-cultural characteristics. However, it was difficult to provide groups’ portrait without taking into account specific features of their group members. It is within this context that the study into specificity of ethnic identity is associated with the examination of particular subjects as well as factors and regularities of their ethnic self-identification. The study involved the sample from the Sverdlovsk region (N=100) and the republic of Bashkortostan (N=100). The Sverdlovsk region is characterized by average degree of ethnic diversity (diversity index is 0.263540), Bashkortostan has a high index of ethnic diversity (0.730376). The samples were ordered according to gender, age, education and income. The following methods were exploited in the survey: The Twenty Statement Test by M.Kuhn&T.McPartland; G.U. Soldatova&S.V.Ryzhova "Ethic Identity Types" questionnaire; assessment of positivity and uncertain identity by A.N. Tatarko and N.M.Lebedeva. The results showed a modest magnitude of differences. Still, they are statistically significant. The respondents from Bashkortostan are characterized by more intensive and sustainable ethnic identity; they are more likely to identify themselves as representatives of a particular ethnic group. Unlike them the respondents from the Sverdlovsk region exhibit weak accentuation of ethnic status; they more often define themselves as a Russian, a "Yekaterinburger",etc. The respondents from Bashkortostan are oriented to preservation of their ethnic belonging; express more ethno-egoism while 19% of the Sverdlovsk sample would agree to change their ethnic belonging if they had the opportunity. The respondents from diverse ethnic regions are more selective, intolerant to other nationals. This peculiarity is accentuated when it comes to including another national in one’s inner circle. The revealed differences are statistically significant at p<0.05 level. Specific features characterizing the assessment of psychological security of these regions given by the respondents from these territories were indicated. In addition, moderate correlation between the respondents’ estimates of their own psychological security and the pronouncement of their ethno-consolidating attitudes in inter-ethnic interaction was found. The article was supported with a grant from the Russian Science Foundation (project Nº18-18-00112).
TRANSFORMATION OF ETHNIC IDENTITY RESULTING FROM BEING INVOLVED IN POLY-ETHNIC INTERACTION

Olga Zotova
Elena Perelygina
Aleksandr Dontsov
University for Humanities (Yekaterinburg, Russia)

The study into ethnic identity should be addressed both in theoretical and practical fields. The importance of theoretical generalizations, concepts and conclusions is determined by the possibility of their application for modeling social processes. Theory is realized in models, elements and relationships of which are associated with socium by specific correspondence parameters: between the way of socium organization and the way with the help of which the model describes the socium; between the tools used in the process of modeling and conceptual apparatus of the theoretical model; between the socium and theory. Taking into account the complexity of identity formation its modeling is aimed at fixing the actual state of the problem, revealing focal points, defining key tendencies and risk factors, finding optimal solutions for existing social challenges. The study of this phenomenon involves not only the analysis of its essential manifestations and typological features, its transformation under certain historic and socio-cultural conditions but also issues associated with identity development, formation and transformation. A series of narrative interviews with people from post-Soviet republics was conducted. This method was used with a view of identifying greater phenomenology of identity transformation in the course of poly-ethnic interaction than with the use of quantitative standardized forms. The sample consisted of males and females aged from 21 to 45. The analysis of 38 narratives allowed for revealing Personality Identity Transformation Profile in the course of poly-ethnic interaction. This profile is defined by the ratio of changes according to the following criteria: image of a man; gender relationships; work and power; relationship between “the collective- the individual”; attitudes towards time; attitudes towards the sacred; attitudes to violations of cultural norms. Each criterion specifies a semantic field in which the respondent places two cultures. As a result, it is possible to define at what point of continuum he finds himself, what culture is closer to him, and the presence/absence of marginal position. A set of the considered criteria acts as a system of social formats and interrelations demonstrating meaning-based, functional and evaluative statuses and social dynamic of ethnic identity. The article was supported with a grant from the Russian Science Foundation (project № 18-18-00112).
STUDY OF LEARNED HELPLESSNESS OF MIGRANTS FROM CENTRAL ASIA AT DIFFERENT STAGES OF ADAPTATION

Iana Sizova
Irina Ponomareva
Chelyabinsk State University (Chelyabinsk, Russia)

The global context of modern society is characterized by a violation of the integrity of the humanitarian world. This violation is manifested first of all in mass migrations of the population. Once in another ethno-cultural and linguistic environment, one category of migrants effectively orientates in a new situation, shows independence, optimism, and the other category of migrants experiencing psychological difficulties, shows passivity, helplessness, indifference, easily falls into depression.

Pessimistic expectations, uncontrollable repeated stressful events associated with moving to another country, are an obstacle to social and psychological adaptation and the cause of the state of learned helplessness. For a more holistic and deep understanding of the complexities in the system of adaptation of migrants, a study of learned helplessness as a characteristic of the individual, complicating the processes of adaptation and integration of migrants in the host community was conducted.

The psychodiagnosis of the learned helplessness was carried out on young people from among migrants of Central Asia at various stages of adaptation (150 people) by means of a technique of diagnostics of the learned helplessness. We consider young people as the most receptive to everything new, the most active and mobile, but still subject to the negative impact of the age category as the base of the study. The sample of subjects was divided into subgroups depending on the stage of adaptation: the stage of preadaptation, the stage of adaptation during displacement, primary and secondary adaptation.

As a result of the study, it was found that the state of learned helplessness is significantly more often diagnosed at the stages of adaptation during displacement and primary adaptation. The obtained data are explained by the fact that it is at these stages that the stress of acculturation begins, and the most active inclusion in the new social environment occurs. The data obtained allows to create a theoretical basis for solving applied problems of socio-psychological support of adaptation and integration of migrants, as well as a prerequisite for the study of cultural and ethnic determinants of personal helplessness of young people in Russia and young people from among migrants in Central Asia. The reported study was funded by RFBR according to the research project № 19-013-00949.
THE NEGATIVE EFFECT OF SOME INFORMATION PRESENTATION IN MASS MEDIA FROM THE POINT OF VIEW OF PSYCHOLOGY STUDENTS

Valeriy Rybchinskiy
Southern Federal University (Rostov-on-Don, Russia)

One of the everlasting themes for discussions and scientific research is an influence of mass media on person’s psychology and behavior. Watching TV shows, reading notes in newspapers and magazines a psychologist involuntarily asks a question: «For whom this stuff was created? There is an impression that correspondents, journalists, TV presenters and editors of mass media were never interested in and do not understand elementary concepts of social psychology». In our pilot research (74 respondents, students-pyschologist, most women 20-21 years old were interviewed) we tried to get to know the attitude of young people to all what is said and shown concerning the case of killing students and teachers in Kerch Polytechnic College (and similar cases in Russia and other countries). Many students agreed that covering of these events on TV often looked like a direct and detailed «instruction about what to do», as the «plan of action» to persons with unbalanced psychics. Some respondents agreed that there is a kind of contradiction between the enthusiasm of commentators who described this event as a sensation and the fact that all correspondents, journalists, TV presenters, etc. «like parrots», unanimously used for the person who committed such a terrible crime a neutral name «shooter» instead of words like «a criminal», «a murderer», «crazy killer» etc. Most respondents agreed that it is necessary to control a dissemination of such information because it can have harmful effect on people; some students even compared it with the mass distribution of extremist materials (which is strictly prohibited in Russia by the article 20.29 of the Administrative Code). In their opinion, this is not a ban on freedom of speech; it is a need to adhere to the common sense, and psychological knowledge. Getting acquainted with materials of Congresses, Forums and Scientific conferences of psychologists (under the auspices of the Russian Psychological Society), we unfortunately came to conclusion that until now there is no suggestions as to how to educate mass media specialist in social psychology with the aim to improve their work and to reduce potential risk for society in covering some important events.

THE MANDALA AS A TECHNIQUE OF MINDFULNESS IN PALLIATIVE CARE

Daniela Respini
Cristina Lucia
Associazione Mareluce Onlus (Siracusa, Italy)

According to literature, pain is one of the most common experience in cancer patients, specially in terminal cancer patients. Mindfulness can help patient to relieve pain and other similar symptoms present at the end of life. Mindfulness, in this context, involves bringing attention to an individual’s present moment experiences, including thoughts, feelings, and physical sensations, with openness, curiosity, and acceptance A home care program for a terminal cancer patient. The patient was assessed with Minnesota Multiphasic Inventory (MMPI-2), Cognitive Behavioural Assessment (CBA), a Italian Questionnaire of Pain (QUID) was weekly measured. The Oncological medical care was a pain relieving drug. The techniques used were coloring mandala listening soft music, breathing exercise, and counselling. A semi-structured questionnaire aimed at identifying mood status. Fve weeks later the perception of pain from lancinating and persistent changed to intermittent and bothersome, the patient
improved his self control and the level of humour. A better quality of life with an increment in the quality of relationships was observed. The posology for pain managment was reduced. The mood status changed from nervous to calm. The technique of coloring mandala helped the patient to discover his interiority, decreased the tension for pain and created a relaxed environment.

Mindfulness techniques do not resolve the problem of cancer patients, however help the patient to considered himself in the totality of his dimensions: mind, spirit and body according to an holistic approach. The mandala can be considerate as an instrument that helps the patient to concentrate on him self, with the aim to get back his normal internal equilibrium.

RELATIONSHIP BETWEEN THE PROFESSIONAL SUCCESS OF COACHES WITH THE INDICATORS OF THEIR LIFE SATISFACTION

Zurida Sagova
Sergey Leonov
Lomonosov Moscow State University (Moscow, Russia)

With the growing popularity and development of sports, interest in effective coaches is growing. Along with the professionalism of the coach is extremely important its individual characteristics and the ability to be an example for the athlete in their beliefs and attitude to life, as all this can have a direct impact on the development and effectiveness of the athlete. The aim of the study was to study the connection of professional success of coaches with indicators of their life satisfaction. To select the criterion of professional success of coaches, we analyzed the literature and information obtained during the interview with respondents. In the present work, the components of this criterion are the maximum level of performance of athletes brought up by coaches — as an objective indicator of the professional success of coaches, and self-assessment of the success of respondents — as a subjective indicator. Checking the degree of consistency of the two indicators of success of the coaches showed their moderate and reliable correlation. In order to study the life satisfaction of coaches used the technique of B.L. Neugarten (in the adaptation of N.V. Panina). The sample consisted of 59 coaches from different sports and various levels of professional success, leading professional activities at the bases of the Moscow Department of Sports and Tourism. The average age of the respondents was 42 years (m = 40, f = 19). The respondents were divided into groups of professional success based on the level of achievements of their athletes. Analysis of the results revealed a nonlinear relationship of the studied parameters. The established nature of the relationship allows us to conclude that the indicators of life satisfaction of coaches are not always due to the growth of professional success. The results can be taken into account when planning and conducting psychological work with coaches to improve the efficiency of their activities, in drawing up recommendations on their individual professional development. The results of the study raised new questions about the professional success of the coaches and made it possible to outline new priority areas for further research.
THE ROLE OF ETHNIC IDENTITY IN THE PERCEPTION OF TIME REALITY
(ON THE EXAMPLE OF INDIGENOUS PEOPLES OF THE NORTH-EAST OF RUSSIA)

Albina Buchek
Belgorod National Research University (Belgorod, Russia)

The perception of time is recognized as an objective condition for the life of the individual, at the same time it is a product of her mental activity. The decisive role in shaping the attitude of the individual to time belongs not to biological but to social determinants. The study of the category of time in the context of ethnic characteristics of the individual is of particular importance, since time is a cultural and historical phenomenon. The aim of the study was to study the temporal characteristics of the individual in the context of her ethnicity. We attempted correlation of meaningfulness of life (the scale of the test of life-meaningful orientations in the adaptation of D. A. Leontiev) and components of time perspective (scale methodology temporal perspective of the individual by F. Zimbardo in adaptation A. Sircova, etc.). To study the semantic space of the notion "time" the 21-scale semantic differential of T. S. Baranova was used. The study involved representatives of indigenous peoples of the North-East of Russia (Kamchatka region) aged 16 to 59 years: paleoasiates (Itelmen, Koryaks, Chukchi) and peoples of the Tunguska-Manchurian group (evens) — a total of 96 people (43 men, 53 women). The ethnic specificity in the perception of time associated with the meaning of life, with the definition of fatalism, predetermination of the present, which is expressed in the attitude of the individual to the past experience and the formation of the image of the possible future. A characteristic feature of the perception of the world in the mental space of indigenous peoples is a sense of unity with the outside world, the experience of the integrity and syncretism of the world and itself as an integral part of it. The perception of time is a violation of the balance in the subjective ratio of the past, present and future in the structure of time characteristics, fixation on the past (both positive and negative), a sense of fragmentary life in the present, insufficient expression of aspirations in the future, which acts as an obstacle to the meaningfulness of life, complicates the realization of their capabilities.
THE DYNAMICS OF PERSON’S LIFE-MEANING ORIENTATIONS IN ADULTHOOD

Tatyana Sakharova
Moscow Pedagogical State University (Moscow, Russia)

The report will present the results of an empirical study of the dynamics of the meaningful life orientations of the individual during the period of maturity. Meaningful life orientations are a dynamic formation, having qualitative differences at different age stages. The example of an empirical study of respondents aged from 30 to 60 years will show the influence of such factors as gender, professional activity, material well-being, religiosity on the overall level of meaningfulness of life.

FEATURES OF EXPERIENCING LONELINESS IN OLD AGE

Elena Umanskaya
Moscow Pedagogical State University (Moscow, Russia)

The article discusses the phenomenon of loneliness, as an experience in the period of advanced age. The author attempted to highlight the psychological characteristics of experiencing loneliness in old age, depending on various social factors.

LEARNING IN THE “THIRD AGE” AS A WAY OF COGNITIVE AGING PREVENTION

Elena Belovol
Moscow Pedagogical State University (Moscow, Russia)

Influence of standard regular education of elderly adults (aged 55+) on psychological well being and cognitive aging is studied. The hypothesis that education can slow-down the process of cognitive aging has been verified. By the example of longitudinal study, the dynamics of worry domains, their content as well as cognitive functioning improvement have been studied.
DYNAMICS OF VALUES OF GENERATIONS

Margarita Postnikova
Northern (Arctic) Federal University named after M.V. Lomonosov, Arkhangelsk, Russia

Anastasia Miklyaeva
Herzen State Pedagogical University (St. Petersburg, Russia)

The article presents the result of researching the values of generations living in different regions of Russian North. The aim of the research is to identify changes in the values of generations over the past decade. The study involved 804 people (354 men and 450 women) living in Archangelsk and Arkhangelsk region, St. Petersburg and Leningrad region, aged 16-83 years. There were two stages of research: the first stage was conducted in 2009, the second — in 2018. The theoretical and methodological basis of the study was a sociological approach to generation, as well as socio-psychological interpretation of the generation as a large social group. We have tested hypothesis: are there any differences in values of generations and how they have changed since 2009. The results cover answers to three research questions: 1) How do values of different generations change depending on heterogeneity of socio-cultural conditions? 2) Are there any differences in values between generations? 3) Have there been changes in the values of generations in Russian society? We used a questionnaire of values, developed by S. Schwartz (Schwartz S.,1992), adapted to the

Russian sample (Karandashev, 2004). Theoretically this technique is based on two concepts: 1) the existence of terminal and instrumental values (M. Rokich), 2) the concept of the motivational goal of value orientations and universality of basic human values (S. Schwartz). We used the univariate analysis of variance (ANOVA) for the comparison of generations according to the values of the individual. For detalization of the difference in the generations according to the values of the individual we used the methods of multiple comparison of average within the framework of ANOVA: the method of contrasts and the method of paired comparison of averages Post Hoc. We also applied unilateral analysis of variance Kruskal Wallace’s to compare results by region and samples of 2009 and 2018. The results show: 1) values are a good indicator for monitoring the processes of social and individual change resulting from historical, social and personal events; 2) generations statistically significantly differ on each of 10 values of the personality.

Work was supported by the Russian Foundation for Humanities project № 18-013-00910.
AN EXPLORATORY METHODOLOGICAL APPROACH TO THE STUDY OF THE SAY-DO-REPORT CORRESPONDENCE IN CLINICAL PRACTICE

Miguel Núñez De Prado Gordillo
Carolina Trujillo
Isabel Ávila-Herrero
María Xesús Froxán-Parga
Universidad Autónoma de Madrid (Madrid, Spain)
Concepción Serrador-Diez
Universidad de Guadalajara (Mexico City, Mexico)

Therapists commonly want to enhance the degree of consistency between what clients say that they will do, what they effectively do and what they report having done afterwards; this depiction of the clinical practice closely resembles what in experimental settings is known as the Say-Do-Report correspondence (SDRc). However, research on the SDRc in applied, natural and ecological settings is still scarce. Therefore, our main objective was to establish an experimental setting and task which could enable us to assess the SDRc in a more ecological setting (i.e., the clinical context). In addition, we wanted to assess, in an exploratory way, whether therapy could affect the SDRc. We individually analyzed the evolution of the SDRc across therapy in four cases. Two of them attended psychological treatment, while the other two did not. SDRc was evaluated both before and after therapy focusing on three target behaviors: “eating”, “drinking” and “performing an activity”, with six possible options within each category. Self-reports were employed to assess the “say” and “report” phases. To assess the “do” phase, a systematic observation of target behaviors was conducted. The experimental task proved to be appropriate to evaluate the SDRc. Regarding the effect of therapy on SDRc, our initial evidence has been inconclusive. Firstly, our experimental task has proven to be an effective way to evaluate SDRc in a more ecological setting. Specifically, we have been able to measure SDRc in the clinical context, although we believe that this kind of experimental task could easily be applied in other natural settings. Secondly, our initial results on the effect of therapy over the SDRc have proven to be inconclusive. However, research on rule-governed behavior and on the verbal interaction patterns that occur throughout therapy give us reasons to believe that one of the key processes underlying successful clinical outcome is the systematic reinforcement of the SDRc. Future research on this area should overcome some obvious methodological limitations (e.g., small study sample) of this pilot study in order to better appreciate the possible effects of therapy on the SDRc.
The reading the mind in the eyes test: psychometric properties in a Peruvian population

Jonathan Adrián Zegarra Valdivia
B. N. Chino Peru Arequipa
Universidad Nacional de San Agustín de Arequipa (Arequipa, Peru)

Theory of mind (ToM) is a core cognitive process of social cognition, with huge importance in neuroscience research and neuropsychiatric disorders. Regarding its relevance, a well-extended method to assess advanced ToM in adults is the Reading the Mind in the Eyes Test. The aim of this study was to explore its psychometric properties in the Peruvian population, accuracy percent for each item among different countries versions of the RMET; and test-retest reliability after one-year follow-up. 288 participants from 17 to 55 years old were recruited among first-year students from a technologic institute and general population of Arequipa City. 55 participants were followed-up for a year and completed the same psychological assessment. The RMET display good validity and consistency in the Cronbach Alpha’s approach, as well as test-retest reliability after one-year follow-up. Bland-Altman test and Intraclass coefficient correlation display score-stability. No differences were found between the kind of education or socioeconomic status. Regarding gender, females score better than men confirming previous results. The RMET has been widely used to measure theory of mind and have good psychometric properties in Peruvian Population. These results may improve clinical practice and further studies in clinical and nonclinical samples.
A PRIMARY STUDY OF THE THEORETICAL BASIS AND METHOD OF POSITIVE RUMINATION TRAINING

Hongfei Yang
Zhejiang University (Hangzhou, China)

The positive rumination training was developed on the basis of reviewing previous studies. Its theoretical bases rooted in positive psychology and cognitive therapy. The key technique is to train clients to think with the guideline of positive items of the Positive and Negative Rumination Scale. The company techniques are: listening counseling recording, concreteness and abstraction, Subjectification and objectification, problem-solving, and acceptance and tolerance. The positive rumination training includes seven steps: Introducing the rules, understanding the issues, introducing the principles, setting goals, key technique training, company technique training, and end stage. Its effectiveness has been proved in psychological counseling for college students and mental health class for high school students.

COGNITIVE PERFORMANCE IN OLD PERUVIANS: EPIDEMIOLOGICAL APPROACH

Jonathan Adrián Zegarra Valdivia
B.N. Chino Peru Arequipa
Universidad Nacional de San Agustín de Arequipa
(Arequipa, Peru)

Dementia has an increased rating in elderly people in low-income countries. Estimations of the prevalence of dementias worldwide envision an unfavorable outlook, especially in developing countries; since factors such as education, socioeconomic status and health that play an important role in the development of Alzheimer's disease and other dementias. Perhaps, not well epidemiological studies have been performed with tests that present adequate levels of reliability or cut-off point. In this study, we want to complete two different but complementary objectives. First of all, we analyzed the sensibility and specificity of the ACE-R test vs MMSE in the Peruvian population, to obtain recommended cut-off scores for dementia. Then, we analyze in a sample of 1500 patients (mean age between 60 — 90 years old) the prevalence of dementia through the ACE-R test. We combined an instrumental and epidemiological study. 342 participants complete the first experiment and in 1500 the second one. Ranges between 60 to 90 years old were obtained to display the prevalence of cognitive impairment and dementia. The most suitable cut points for our population were selected through the ROC curves and the Youden index. The percentage of global mild cognitive deterioration and dementia were higher than previously reported in Peru.
THE EFFECTS OF DEPRESSIVE SYMPTOMS ON ACADEMIC ACHIEVEMENT AND ADJUSTMENT TO COLLEGE

Ivanka Zivcic-Becirevic
Sanja Smojver-Ažić
Tamara Martinac Dorčić
University of Rijeka (Rijeka, Croatia)

The prevalence of depression among university students is pretty high with increase in recent years (Eisenberg et al., 2017). Student mental health problems are strong negative predictors of academic outcomes (Khubchandani et al., 2016). The main goal of this prospective study is to test the effects of depression on student academic success and adjustment. The representative sample of 492 undergraduate students (60% females) from various study programmes completed Student Adaptation to College Questionnaire (SACQ, Baker & Siryk, 1999) and Beck Depression Inventory (BDI-II, Beck, Steer & Brown, 2011) and are followed during three academic years. Academic achievement was measured by cumulative grade point average (GPA), number of academic credit points (ECTS) and student efficacy status after 3 years (finishing undergraduate study on time, repeating a year, dropped-out). The results showed that 23% of all the freshmen have increased level of depressive symptoms (26% of students who stayed at home and 17% of those who changed residence). The level of depressive symptoms was not correlated with GPA, but it was negatively correlated with the number of ECTS achieved at the 3rd year, indicating poor efficiency of depressed students. The students who dropped-out from college do not differ from those who stayed in their initial level of depression, but they have increased level of depressive symptoms on the second year. A significantly higher percentage of students with a high level of depression dropped out from college or repeated a year, comparing to those with a low level of depressive symptoms. The students with more depressive symptoms also had worse academic, emotional and social adjustment at the beginning and during their study. We can conclude that students with a higher level of depressive symptoms are more prone to poor academic efficiency and higher drop-out, as well as low adjustment to college. It is important to early detect students with increased level of depressive symptoms and help them cope and facilitate their successful study. Key words: depression, university students, academic achievement, adjustment to college.
CONSTRUCTION AND EFFECT EVALUATION OF ENGINEERING IMAGINATIVE TEACHING MODEL

Lin Yaonan  
Fu Jen Catholic University (Taipei, Taiwan)

Fa-Chung Chiu  
Chinese Culture University (Taipei, Taiwan)

Hsueh-Chih Chen  
Yu-Lin Chang  
National Taiwan Normal University (Taipei, Taiwan)

Chi-Ling Kao  
HungKuo Delin University of Technology (Taipei, Taiwan)

The purpose of this study is to develop an engineering imagination teaching model and to design a curriculum and test the effectiveness of the course. In this study, college students were assigned to the engineering imagination group and the control group in the pre- and post-tests. The experimental procedures of this study are as follows: (1) In the pretest, both conditions received the technological imagination disposition scale and the Imaginative Thinking Tests; (2) The participants in the imaginative group attended a 30-hour imaginative curriculum, and the participants in the control group attended a 30-hour psychology-related curriculum. In the post-test, both groups received the technological imagination disposition scale and the Imaginative Thinking Tests. The results are as follows: (1) Comparing with the control group, the imagination group showed improved effect on creative imagination, qualia representation, beyond reality, practical evaluation, positive emotion, and value indicators of the technological imagination disposition scale; (2) Participants in the imaginative condition showed improvement in fluency, beyond reality, and flexibility indicators; however, there was no significant improvement in the vividness indicator. Additionally, qualitative analysis revealed that the participants in the imaginative group obtained the concept of creative thinking; their thinking mode and the attitude of life changed; they acquired imaginative thinking skills. In summary, the engineering imagination curriculum developed in this study is effective and can be applied to the practice of engineering imaginative thinking curriculum.
SERIOUS GAMES HAVE BECOME A POPULAR TOOL FOR TRANSFERRING KNOWLEDGE AND SUPPORTING CHANGE IN BEHAVIOUR, PERCEPTION, OR COGNITION, BUT THERE IS STILL RELATIVELY LITTLE RESEARCH ABOUT THEIR EFFECTIVENESS. IN THE ECONFIDENCE PROJECT (HORIZON 2020), A SERIOUS GAME FOCUSED ON IMPROVING HELPING BEHAVIOUR OF BYSTANDERS IN BULLYING SITUATIONS HAS BEEN DEVELOPED. THE AIM OF THE STUDY WAS TO TEST THE EFFECTIVENESS OF THE GAME IN BEHAVIOURAL CHANGE OF BYSTANDERS BY USING MULTI-METHOD APPROACH. PILOT APPLICATION OF THE GAME WAS CARRIED IN 10 EUROPEAN SCHOOLS IN SPAIN, MALTA, ENGLAND AND IRELAND. STUDENTS (N=345) BETWEEN 12 AND 14 YEARS OF AGE PARTICIPATED IN AN EXPERIMENTAL STUDY. BEFORE AND AFTER PLAYING THE GAME, STUDENTS IN ALL GROUPS (EXPERIMENTAL AND CONTROL) COMPLETED AN ON-LINE QUESTIONNAIRE ABOUT THEIR EXPERIENCE AND BEHAVIOUR IN BULLYING SITUATIONS, APPROPRIATE REACTIONS IN BULLYING SITUATIONS AS WELL AS THEIR BEHAVIOUR IN EVERYDAY SOCIAL SITUATIONS. FOR THE EXPERIMENTAL GROUP PLAYERS’ REACTIONS DURING GAME-PLAY WERE RECORDED. PLAYING GAME HAD NO EFFECT ON KNOWLEDGE ABOUT APPROPRIATE REACTIONS IN BULLYING SITUATIONS, BECAUSE STUDENTS SHOWED VERY GOOD INITIAL KNOWLEDGE. IN-GAME DATA SHOWED THAT ALMOST ONE THIRD OF PLAYERS DID NOT PARTICIPATE IN BYSTANDER ROLE. MOST OF THE STUDENTS WHO PARTICIPATED IN BYSTANDER ROLE CHOSE APPROPRIATE REACTION IN ALL GAME SITUATIONS. FOR THE REST OF STUDENTS, IT TOOK ONLY ONE IN-GAME TRY TO MAKE ALL CORRECT CHOICES. ACCORDING TO SELF-ASSESSMENTS, STUDENTS WHO PARTICIPATED IN THE BYSTANDER ROLE REPORTED ABOUT MORE ASSERTIVE BEHAVIOUR IN EVERYDAY SITUATIONS IN PRE-TEST THAN STUDENTS WHO DID NOT PARTICIPATE IN THAT ROLE. THIS FINDING SHOWED THAT STUDENTS’ INITIAL SOCIAL BEHAVIOUR DETERMINES THEIR PLAYING ACTIVITIES. THE RESULTS INDICATE THAT MULTI-METHOD APPROACH COULD GIVE IMPORTANT INSIGHT IN INTERPLAY BETWEEN INDIVIDUAL CHARACTERISTICS AND IN-GAME BEHAVIOUR THAT COULD AFFECT GAME OUTCOMES.
FEATURES THE INTERRELATIONS BETWEEN SATISFACTION AND CONCERN WITH OWN APPEARANCE AND SUBJECTIVE ESTIMATION OF ECONOMIC STATUS

Vera Labunskaya
Southern Federal University (Rostov-on-Don, Russia)

This study is aimed to scrutinize the interrelation between satisfaction and concern with own appearance and subjective estimation of economic status that is considered as one of main predictors of life satisfaction. Recent research analyzes predominantly the role of real economic status on different aspects of human life including satisfaction and concern with own appearance (Harris & Carr, 2001; Sadeghi – Bazargani et al., 2017; Amil & Bozgeyikli, 2015; Czyz, et al., 2016; Chang et al., 2014). In contrast to mentioned studies our investigation is focused on subjective-comparative approach to economic status evaluation. According to this approach the participants have to identify themselves either with the group “rather poor than rich” or with the group “rather rich than poor”. According to our definition of appearance and the concept of satisfaction and concern with own appearance (Labunskaya & Shkurko, 2017; Labunskaya & Drozdova, 2017; Kapitanova & Labunskaya, 2016) we consider satisfaction and concern with own appearance as independent phenomena. We hypothesize that satisfaction and concern with own appearance in youth vary as a factor of subjective evaluation of economic status. The participants were 41 males and 82 females aged from 20 to 35 (M=27.6); 62% of subjects estimated their economic status as “rather poor than rich” and 38% of participants identified themselves with the group “rather rich than poor”. The questionnaires “Attitudes towards Own Appearance: Satisfaction and Concern” (Kapitanova & Labunskaya, 2016) and “Subjective Evaluation of Economic Status” were administered. Participants who estimate their economic status as “rather rich than poor” have higher satisfaction with appearance in comparison with participants in the group “rather poor than rich”. Representatives of both groups do not differ significantly in concern with own appearance. Subjective evaluation of economic status has stronger impact on satisfaction with own appearance in comparison to concern with own appearance. Acknowledgements This study is conducted in the frameworks of the research project №17 18 01260 supported by Russian Science Foundation.
PSYCHOLOGICAL AND STRATIFICATION FACTORS OF ESTIMATION OF A PERSON’S PERCEIVED AGE

Tatyana Shkurko
Southern Federal University (Rostov-on-Don, Russia)

Explosion of interest to the analysis of the factors of a person’s perceived age is observed in the modern science. Researchers studied genetic, ecological, and medical-and-esthetic factors effecting the perceived age of a person. At the same time, the effect of gender-and-age related, social-and-demographic, and psychological factors, to which our study is dedicated, is studied insufficiently. Hypotheses of the study: 1) the perceived age estimation can be conditioned by the gender-and-age related and social-and-demographic characteristics of perception subject and object; 2) estimations of a person’s perceived age may differ depending on the type of representation of such a person (full-height or portrait photo) to a perception subject; 3) parameters of a perception object’s attitude to his/her appearance may condition his/her perceived age estimations. Methods of the study used were: 1) procedure «Photo-video presentation of appearance» (Shkurko, 2018); 2) method «Person’s estimate-and-content interpretation of his/her own appearance and its correspondence with gender-and-age related constructs» (Labunskaya, 2017); 3) social-and-demographic questionnaire. Sample group of the study: 20 persons (10 men and 10 women from 18 to 58 years old) were selected as perception objects («models»); 60 persons (47 women and 13 men from 14 to 77 years old) were selected as perception subjects. 80 persons in total participated in the study. It has been shown that the following factors effect the estimation of a person’s perceived age: 1) age of a perception object; 2) age of the perception subject; 3) person’s esthetic assessment of his/her own appearance. The following factors do not effect the estimation of a person’s perceived age: 1) type of presentation of a perception object (full-height or portrait photo); 2) gender of a perception object; 3) gender of a perception subject; 4) marital status and level of material prosperity of a perception subject. Conclusions: The contribution of different types of a perception subject’s age (chronological, psychological, perceived age self-estimation) to the precision of his/her estimation of another person’s age has been described. Factors effecting / not effecting the estimation of another person’s perceived age have been systematized.

This study is conducted in the frameworks of research project № 17-18-01260 supported by Russian Science Foundation.
DYNAMICS OF SELF-ASSESSMENT OF HUMAN APPEARANCE AT DIFFERENT STAGES OF LIFE

Tatyana Shkurko
Irina Drozdova
Gennady Serikov
Southern Federal University (Rostov-on-Don, Russia)

The concept of the dynamic nature of the system of a person’s relations (Myasishchev, 1995) and the social-psychological approach to appearance, its assessments and self-assessments (Labunskaya, Drozdova, 2017) served as the methodological preconditions of the study. The goal of the study was studying the age-related dynamics of a person’s assessment of the components of his/her appearance and its integral characteristics. Methods of the study used: 1) V. Schutz Interpersonal Relations Questionnaire; 2) method «Person’s estimate-and-content interpretation of his/her own appearance and its correspondence with gender-and-age related constructs» by V. A. Labunskaya; 3) social-and-demographic questionnaire. 103 persons (57 women and 46 men) at the age from 14 to 60 years were selected as the study empiric object. The participants of the study were divided into 3 subgroups in accordance with their life stage. The first subgroup consisted of 30 persons at the age from 13 to 18 years (adolescent persons); the second subgroup consisted of 43 persons at the age from 19 to 34 years (young persons); the third subgroup consisted of 30 persons at the age from 35 to 60 years (adult persons). The age-related dynamics of a person’s assessment of the components of his/her appearance and its integral characteristics was revealed using Kruskal-Wallis test. «Positive progressive» age-related dynamics (significant increase of indices with age) of: 1) a person’s assessment of his/her own expressive behavior; 2) the assessments of the correspondence of appearance with gender and gender role; 3) the assessment of the appearance attractiveness for an opposite-sex partner; 4) the assessment of the appearance sexuality was detected. In addition, «negative progressive» age-related dynamics (significant decrease of indices with age) of the assessments of the appearance age-related attractiveness was detected. The carried out gender analysis showed that the detected dynamics is typical, first of all, for women. The carried out study allowed defining the age-related dynamics of a person’s assessment of the components of his/her appearance and its integral characteristics (appearance sexuality, appearance attractiveness for other people) showing that the lowest assessments of their own appearance are typical for adolescent and young persons in comparison with adult persons.

This study is conducted in the frameworks of research project № 17-18-01260 supported by Russian Science Foundation.
“EVALUATION OF THE “SAFE TOUCHES” IN GREECE: A SCHOOL-BASED PRIMARY PREVENTION PROGRAM OF CHILD SEXUAL ABUSE”

Galani A.
Karaviti M.
Kollonata C.
Nega C.
Apergi F-T.
The American College of Greece-Deree

Background: Child sexual abuse (CSA) has received great attention the last years due to its epidemiological proportions and negative consequences, behaviorally and psychologically. In Greece, 1 in 5 children report at least one incidence of sexual abuse before adulthood. Efforts to halt CSA and prevent the associated consequences have focused on primary prevention programs. Three studies evaluated the effectiveness of the Safe Touches program which is the first comprehensive school-based program to be implemented in Greece. Children’s knowledge gain was evaluated before and after participation in the program, as well as in a 12-month follow-up. Finally, teachers’ knowledge on CSA was evaluated following a complementary training workshop.

Method: Study 1: 195 kindergartens and elementary (Grades 1-3) public-school children participated in a 50-minute interactive workshop. Knowledge gain was evaluated post participation. Children were recruited from randomly selected areas of Attica and Crete. Differences in the program’s effectiveness between urban and rural areas were also examined. Study 2: investigated knowledge retention after 12-month interval. Seventy-seven children (Grades 3-4) were recruited from a private school in a middle-class suburb of Attica. Children’s knowledge was evaluated by the Greek version of Children’s Knowledge of Abuse Questionnaire (CKAQ-RIII). Study 3: 237 elementary school teachers participated in a two-hour training workshop on recognizing and reporting CSA. The Greek version of Teachers’ Knowledge of Sexual Abuse Questionnaire (TKSAQ) was utilized to measure teacher’s knowledge before and after the implementation of the program.

Results: Children participating in the Safe Touches program showed significant knowledge gains on the concept of CSA and the use of personal safety skills (p<.001). Knowledge was maintained at the 12-month interval (p<.001). Overall scores of children from the rural areas were significantly lower than the scores of children from urban areas (p<.001). Lastly, teachers’ knowledge on CSA increased after intervention (p<.001).

Conclusion: The present studies provide evidence regarding the effectiveness of Safe Touches program and highlight the importance for the existence of a pre-service education for teachers. Safe Touches requires only one session and is culturally adaptable. Future research should identify the core themes of the program that were better retained and evaluate children’s behavioral intentions on CSA-scenarios.
Kindness expressed in daily, business and educational settings is a topical issue. Several researchers consider educators’ kindness towards students as key to educational success (Loreman, 2011), while teacher’s “internal warmth” helps creating productive learning atmosphere, which would allow students to express their interest freely (Vygotsky, 1995). This type of behaviour is related to pedagogical culture defined as an integrative characteristic of personality that requires advanced professional and pedagogical values and communication skills, personality-oriented approach in knowledge and social norms transfer (Minzhanov and Erstynbaeva, 2016). Considering the above definition and theories used to describe kindness (Caldwell, 2017), it is possible to define pedagogical kindness as adult’s moral quality reflected in beliefs, attitudes, intentions, and behaviour, which would affect nurture, educative activities, perceived as good by the recipients and observers and leading to a positive educational effect.

In this case the following questions raise: How is kindness expressed at psychological states and behaviour? How is kindness reflected in pedagogical culture, and in all its’ components?

Is it possible to conceptualize a continuum with pedagogical kindness - pedagogical evil (aggression, etc.) as its’ poles? Kashdan and Biswas-Diener (2014) believed that such a continuum is non-existent. Or is it possible to consider kindness as a complex phenomenon as opposition to separate characteristics, e.g. selfishness as opposition to altruism (Sober and Wilson, 1999), ignorance (Hornor, 2014) as opposition to sensitivity and attentiveness? What is the minimal and optimal level of kindness, which is represented in teachers’ pedagogical activity? Is it possible to create an assessment tool for pedagogical kindness? Are there cross-culturally universal components of pedagogical kindness? Are there unique characteristics of pedagogical kindness? Are there relations between individual psychological and demographical characteristics and kindness characteristics?
THE DEVELOPMENT OF VECTOR CODING OF THE IMAGINATIVE INFORMATION IN THE BRAIN

George Losik  
United Institute of Informatics Problems of National Academy of Sciences of Belarus, Belarus

Aleksandr Vartanov  
Moscow State University, Russia

Purpose. To use the vector psychophysiology approach in this research.

The hypothesis: The nature of topological coding of scale signals in the brain is suggested. For the vector encoding the morphological constancy of those neural ensembles that memorize the topology of the shape of the object is principal. This signal is the trace of the subject’s movement trajectory. The registration signal cannot be linear metrical parameters of the signal, but it must be presented as a topological figure by vector coding.

Methods. The used analysis of azimuth corner of topologically to represent big-scale signal. After registration the signal of route track there is a recognition of cognitive motive in the path of route track. Linear process become as a chain of motives, a chain of cognitive gestures. It is a chain of sequences and a relay circuit of commanding neurons according to E. Sokolov.

Results. We have carried out experiments on “circular perception “map” registration of a three-dimension object in a virtual reality environment. The extent of dissimilarity between one route and the other can be understood as the extent of the extremely anthropological closeness of two individual’s actions in their practical activity in a psychological meaning: motivational, goal-setting, individuality-oriented.

Discussion. It can be assumed model: circular rotation routes of an object, executed by hand, are copied and preserved in the brain in the form of neural-routes topological shape. These routes follow the topology of external routes. Reference points are formed in the sections of these routes, where the route makes a topologically sharp, steep bend. In some reference points the brain adds to them “a picture” kind of a natural external scene that the viewer could have seen in reality. Besides the pictures, semantic landmarks, meaningful milestones and emotional affects, experienced by the observer, are added to the route at these reference points. This information is being joined on the route as well, that could be felt directly on these reference points.
Background: Previous studies found inconsistent results regarding psychological wellbeing correlates of sexting. Some authors underlined the relationship between sexting, depression and anxiety (Dake et al., 2012; Van Ouytsel et al., 2014), while others found no link between sexting and psychological distress (Hudson, 2011; Temple et al., 2014). Therefore, this study aims to investigate, whether involvement in sexting precedes psychological symptoms or whether these symptoms precede involvement in sexting behavior. Methods: Eighteen-month longitudinal study with baseline measurements taken in June 2016 and follow-up measurements in October 2017. The study included 359 adolescents aged 11 to 15 years, who participated by filling out a self-administrated questionnaires on both occasions of data collection. Sexting was assessed with Sexting Behaviors Scale (Dir, 2012). Negative emotional states (depression, anxiety and tension/stress) were measured with Depression, anxiety, stress scale (Lovibond i Lovibond, 1995). Findings: The baseline measurement of the psychological difficulties and the follow-up measurement of the sexting outcomes were used for logistic regression analyses. The participants engaged in sexting at the baseline measurement were excluded from these analyses. Anxiety symptoms were significantly associated with the sexting. In second analysis, the predicted probability of psychological difficulties at follow-up is estimated using sexting variables from the survey at baseline. In these analyses sexting (sexters vs.nonsexters) variables at the baseline measurement were used as a predictor variables, while psychological difficulties at the follow up were defined as a criterion variables constructed as a categorical dummy variables: none and with psychological difficulties. Participants with psychological difficulties at the baseline measurement were excluded from these analyses to avoid a potential error on conclusion of relationship between sexting and psychological difficulties. Logistic analysis revealed that pupils who engaged in sexting have greater odds of depressive symptoms compared to those who are not engaged in sexting. Discussion: The results show that adolescent involved in sexting behaviour had a significantly higher risk for psychological difficulties like depressive symptoms compared with adolescent who are not involved in sexting behavior. At the same time, anxiety symptoms at the beginning of the year represent a risk factor for involvement in sexting eighteen months later.
TEACHERS’ INFLUENCE AND CROSS-CULTURAL DIFFERENCES ON PUPILS’ ATTITUDES TOWARDS MIGRANTS: A FIELD-STUDY IN ITALY AND RUSSIA

Lucia Bombieri
National Research Institute Higher School of Economics (Moscow, Russia)

In this study, we examined whether different styles of teachers’ instructions (pro-social vs. behavioural) affect the attitudes and beliefs of pre-adolescents towards peers from a migrant background. Moreover, we consider possible influences due to cultural characteristics and perception of threat. The research has been conducted in two countries: in Italy (N = 93) and in Russia (N = 134) among students in their last year of primary school (M age = 11.27). Children’s opinions were measured both on individual and group levels. Results confirm that pro-social instructions enhance positive traits towards the individual while increasing favourable characteristics and hindering the negative ones in the ingroup and outgroup’s projections. We discuss the implications of these results with regard to teachers’ impact in modelling social skills. Cultural differences are also evident in the rating of positive and negative traits of the ingroup between the two samples.

SELF-EFFICACY, ACHIEVEMENTS AND SPATIAL ABILITY AMONG ADOLESCENTS

Anna Fominykh
FGBNU “Psychological Institute of Russian Academy of Education”

Dmitry Kornienko
Perm State University (Perm, Russia)

Self-efficacy concept was developed within the framework of socio-cognitive approach A. Bandura (1977). The main objective of the study is to examine the role of general self-efficacy as a mediator between academic achievements. The main goal of this study was to study the relationship of self-efficacy, the connection of different types of self-efficacy with academic achievements and individual differences.

The relationship between self-efficacy and academic achievements was studied in a sample (N=154, 69% – females 31% – males) aged 15-18 (M=16.4, SD=.68) Measures: 1) the general self-efficacy scale (Sherrer, Maddux, 1982) adapted by the authors of this study; 2) Matrix Reasoning subtest (Wechsler Adult Intelligence Scale-IV). This subtest allows to explore visual, non-verbal reasoning skills and perceptual organization skills 3) academic performance was assessed by the results of the unified state exam.

We found that self-efficacy is to some extent due to the successes in the field of mathematical ability. Our results show that the level of assessment of one’s own abilities is associated with successful solution of mathematical problems. Males have higher self-efficacy than females. Spatial intelligence index reveals connections only with achievements in mathematics.

The results help to deepen the view of self-efficacy as a psychological phenomenon, as well as to clarify some features of individual differences in success. The results of this study can be used by psychologists to improve the effectiveness of training programs.
Personality traits and personal values are examined as important predictors of a multitude of outcome in various areas such as occupational psychology, educational psychology, social psychology and others. This study examines relationships between personal values and personality traits in two generations of Russians: generation of parents and generation of their adult children. Sample included parents (N = 292, mean age – 48.49; SD – 6.85) with children over 18 years of age, and their children (N=146, mean age – 22.42; SD – 3.99, 52% female). We used Russian version of Schwartz’s Portrait Values Questionnaire to estimate values and Russian version of Big Five Inventory to assess personality traits. Parents demonstrated greater preference for Security, Conformity, Tradition and Universalism, while their adult children showed greater preference for Self-direction, Achievement, Power, Stimulation and Hedonism. In general, a similar pattern of correlations between Big Five personality factors and personal values was found for two generations. The exception was the Self-Transcendence values: a greater number of links were found with parental personality traits. In both groups Agreeableness correlated positively with Self-Transcendence and negatively with Openness to Change and Self-Enhancement. Extraversion correlated positively with Openness to Change and negatively with Conservatism values. Openness to Experience correlated positively with Self-Enhancement values. Neuroticism demonstrated negative links with Openness to Change and Self-Transcendence values. Conscientiousness correlated positively with Conservatism values in both groups.

Personality traits usually viewed by researches as antecedent to values (Olver, Mooradian, 2003). Such traits as Openness to experience and Agreeableness relate systematically to values, but the relations between Extraversion and Neuroticism and values are weaker (Olver, Mooradian, 2003; Parks-Leduc et al., 2014). Different results were found out for Conscientiousness: in some studies it was shown that this trait has significant relations with values (Roccas et al., 2002), but in some studies these results not found any support (Parks-Leduc et al., 2014). The aim of our study was to determinate interrelations between values and personality traits on Russian sample. Total number of participants were 438; age ranged from 18 to 69 years (mean age 39, st.dev. = 13.6), 50.7% were females, 49.3% males. We used following methods: 1) Portrait Values Questionnaire; 2) Russian version of BFI and 3) Tolerance for Ambiguity Scale. To analyze interactions between personality traits and values
linear regression analysis was conducted. The model for Conservation value explained 30.8% of variance. It was found out that the most strong predictors were Conscientiousness (+) and Extraversion (–), there was no any significant relations with Neuroticism. For the Openness to change value the model explain 31% of dispersion; Big Five personality traits and Tolerance for Ambiguity were significant predictors for this value, but the strongest one was Openness to experience. The regression model for Self-Enhancement explains 14.5% of variance, only Extraversion (+), Openness to experience (+) and Agreeableness (–) became significant predictors for Self-Enhancement. The explanation of dispersion for the last regression model was only 11.3%, there were significant relations between Self-Transcendence value and Neuroticism (–), Extraversion (–), Agreeableness (+) and Conscientiousness (+). The results of our research partially confirm conclusions of previous studies: Openness to experience, Agreeableness and Conscientiousness demonstrate significant relations with values. But we also found out strong relations between values and such trait as Extraversion.

THE RELATIONSHIP BETWEEN STUDENTS’ LEARNING STYLES AND THOSE PRESENT IN VARIOUS EDUCATIONAL INSTITUTIONS

Špela Brezovar; Velko S. Rus
University of Ljubljana (Ljubljana, Slovenia)

Background: Learning style is a complex combination of one’s cognitive, motivational and emotional functioning. It is a preferred way of using abilities in a learning context. Although individuals differ in their learning styles, one can adapt his/her learning process to become more efficient, once his/her style preferences and tendencies are identified. The aim of the study is therefore to examine the relationship between student’s perceptions of their own learning styles on one side and those which are present in different learning institutions on the other.

Method: The purposive sample included 107 students (64 male and 43 female), aged from 19 to 30, with a mean age of 23.4 years (SD = 2.39). Participants filled-out Kolb’s Learning Style Inventory (LSI); including some open questions to get deeper insight into the phenomenon.

Findings: The results showed that the learning styles of students differ statistically significantly from those which they perceive as present in their learning institutions. Significant differences were found in the following modes: concrete experience ($\chi^2 (2) = 36.85, p < .01$), abstract conceptualisation ($\chi^2 (2) = 15.19, p < .01$) and active experimentation ($\chi^2 (2) = 11.89, p < .01$). Female students were more likely to prefer the concrete experience learning than male ($t (105) = -2.70, p < .01$). Male students were more likely to prefer the abstract conceptualisation learning than female ($t (105) = 2.26, p = .03$).

Discussion: The results will be reviewed from the importance of identifying and understanding one’s optimal way of learning which can have strong impact on students’ academic achievements. Findings of the study can help teachers to considerate their and their student’s diverse learning styles. By providing various learning methods, activities and techniques, teachers can not only considerate their student’s learning styles but also encourage them to develop new ones.
PHENOMENA OF THE “NON-SELF CONCEPTION” AND EXPERIENCE OF A CATASTROPHE IN EUROPEAN ARTISTIC PRACTICES (ON THE PRINCIPLES OF PSYCHOLOGY OF ART)

Grigoriy R. Konson
Doctor of Art History, Professor, Head of Department of Humanities and Social Science, the Institute of Contemporary Art, Chief Researcher, GISTR Film & Television School

The talk is devoted to phenomena that appeared in the connection with catastrophic tendencies in the life of society. The fear of these tendencies became a universal trend and is defined as a megatendency of civilizational functioning of society. For this reason, analysis of the marked phenomenon in life and art became an emphatic need for knowledge.

In this megatendency we shall be interested by the issue of catastrophism of personality – such behavior of a human being who has transgressed the laws of morality and senses fear of inevitable retribution. This fear may appear in different ways: it may be concretized in visions, which for a person may become an obtrusive form of neurosis, hallucinatory phenomena, an obsession in the form of infernal images. It may seem that they have appeared from the outside, but in reality – similarly to motion of the human spirit according to Georg Wilhelm Friedrich Hegel, they are set apart from the self-identity of the individual into another type of existence, and then his consciousness begins to live in two worlds – a real one, which is his own, and an unreal, alien one, which, nonetheless, also belongs to him.

Moreover, such an individual exists in different perceptions of being not isolatedly, but in virtual communication. His “Self” periodically converses with his partner “Non-Self.” The peculiar element here is the individual’s existence in the state of depersonalization in which the appearance of the double and the concept of duplicity occurs, in the latter contains its invariant foundation and the unexpected shifts in juxtaposition: “Self” – “Non-Self.” This binary archetype of personality in cultural society is determined by the conflict of ethical-religious essences, where the creative personality, mastering the sphere of “Non-Self,” elevates it to the level of a full-fledged philosophical-culurological psychology. For this reason the hypothesis of our research will be the presence in artistic practices of the “Self-Conception” (or “Consciousness of Self” – William James) and the phenomenon which is of “alien logic” [conception of Andrey Smirnov] to it, defined by us as the “Non-Self-Conception,” which has manifested separately or conjointly in the catastrophic reflection of the authors of art works.
DEVELOPMENT OF DIGITAL EDUCATION:
THE METHODOLOGICAL CHALLENGES

Egorov S.Yu., Kovalev A.I., Shilko R.S.,
Zinchenko Yu.P.
M.V. Lomonosov Moscow State University, Dept. of Psychology

"Analogous" traditional forms of the educational landscape (textbooks, traditional classroom system) undergo drastic transformations in the XXI century stimulated by widely developing digital-teaching approaches and media. A considerable number of currently developed educational digital systems formed new ways of instantly accessing teaching resources. Higher speeds, larger volumes and variety of types of information obtained by the subject of learning via novel digital educational media impose new requirements and challenges toward cognitive processes. Numerous studies of efficiency and other aspects of digital learning nonetheless did not elaborate generalized requirements to effectiveness of digital learning as a system within activity-system approach with the reference to the requirements of integrity and efficiency of educational process and variability of individual differences of the subject of training under conditions of growing opportunities and variety of novel digital technologies. Despite obvious severe impact of the digital educational environment no former vigorous studies has been performed. The goal of our study is creating and further implementing the generalized model of digital education and the electronic educational environment on the basis of the activity-system approach expanded by the authors of this project.

This work was supported by the Russian Foundation for Basic Research (grant № 18-29-22049/18).

ETHNOPSYCHOLOGICAL MARKERS IN EUROPEAN ABC-BOOKS:
EVOLUTION OF THE IMAGE OF A NON-EUROPEAN

Olga Fedotova
Don State Technical University (Rostov-on-Don, Russia)

In this research dynamics of representation of an image of representatives of non-European civilizations in the ABC-books published in the European countries during the period since 1850 till present is analyzed. Empirical array are materials of electronic archive http://goobiweb.bbf.dipf.de and 20 modern editions of ABC-books from the European countries. On the example of the introduction of the letter “I” in teaching reading, accompanied by the didactic illustrations (drawings) depicting the image of Indians, it has been established that while maintaining the attributes of an original culture in the form of a suit and weapons in the image of an Indian, the discourse of brutality is lost. American natives, represented in the middle of the 19th century through the prism of the “natural state” of an adult male and soldier, appear in modern editions in the form of benevolently-minded children playing Indian. A certain share of comic giving of images of Indians is connected with a current trend in manifestation of elements of carnival culture and the postmodern idea of a deconstruction. Dynamic development of education systems and culture acutely asks about preservation of its forms and the thoughtful relation to ways of its representation in the educational books acquainting school students with a non-European civilization.
DYNAMICS OF MASTERING THE MEANS OF COMMUNICATION IN CHILDREN WITH DELAYED SPEECH DEVELOPMENT

Skuratovskaya Marina
Klimkina Elena
Don State Technical University (Rostov-on-Don, Russia)

This study analyzes the cyclical, spiral nature of mastering means of communication by the children of early age, where in each subsequent cycle the motives and forms of communication with others become more complicated, which leads to the development of internal mechanisms of speech and mastery of more complex means of communication (expressive-mimic, subject-effective and speech). Cycles associated with internal development, the accumulation of linguistic means, the emerging internal mechanisms of speech, are replaced by periods of external deployment, improvement of oral, expressive speech. Empirical data – materials of the study of speech development of young children with delayed speech development, have been conducted over 7 years. For children of the 3rd year of life with delayed speech development is characteristic a violation of the interrelated development of dynamic (motivational-need sphere) and structural components of speech (communicative-cognitive verbal and non-verbal means of communication), as well as sensory functions. The most important condition for overcoming the delay in mastering expressive-mimic, subject-effective and speech means of communication is the emotional interaction of the child with close adults, contributing to the development of children’s imitation, as the basis for mastering verbal and non-verbal means of communication.

Key words: young children, delayed speech development, verbal and nonverbal means of communication, early help, emotional interaction with a close adult, children’s imitation.

BALINT GROUPS IN PROFESSIONAL AND PERSONAL DEVELOPMENT OF HELPING PROFESSIONALS

Avagimian Anzhela
(Moscow, Russia)

In modern reality, the growing number of helping professionals and the pressure put on them increases the necessity to develop and apply methods of preventing professional burnout, as well as promote their professional and personal development. The report focuses on the results of the practical study of the professional burnout prevention methods held at 2016-2018 in No 1 Psychiatric Clinical Hospital (PCH) after N.A. Alekseev. The study involved over 200 professionals - psychiatrists, medical psychologists, department heads, nurses and senior nurses who participated in the Balint groups. A Balint group is a classical method of training research work used in prevention of burnout in helping professionals. A battery of techniques was used to determine the degree of professional burnout. The main parameters of professional burnout, formed in psychiatric medical personnel are described, as well as the parameter’s dependence on the age and work experience of employees. The study substantiates the effectiveness of the method for preventing crises in the professional and personal development of the PCH personnel.
EYE MOVEMENTS PATTERNS DURING FACIAL EXPRESSION RECOGNITION IN MALE AND FEMALE OBSERVERS

Jahan Gani-Zada
Elizaveta Luniakova
Malysheva Natalia
Lomonosov Moscow State University (Moscow, Russia)

Recent research is devoted to study the effect of the sex of the observer on facial expression recognition and eye movement pattern. We proposed that women are better experts in facial expression recognition because they are more likely to use feature-based processing than men. We also expected to reveal this difference in the eye movements’ strategies.

We used Photos of 2 male and 2 female models from WSEFEP (Olszanowski et al., 2015 doi: 10.3389/fpsyg.2014.01516) for stimuli. Every model displayed six basic facial expressions (anger, fear, surprise, sadness, happy, disgust) and neutrality. The images of one male and one female models were morphed with neutral images of the same person to obtain weak expressions. Each image was presented in upright, inverted and Thatcherized conditions. A subject was presented with a stimulus for 600 ms and then he had to choose the correct emotion for depicted expression by mouse click. The study involved 53 subjects (28 F, average age of 20.2 years). We analyzed response accuracy and eye-tracking pattern.

Results did not show any significant differences in the accuracy of facial expression recognition between male and female participants for any of the types of stimuli. There were no significant differences in accuracy decrements caused by inversion and by Thatcherization between male and female participants; therefore, there were no differences in holistic and feature-based processing between men and women. At the same time two gender groups showed some differences in patterns of eye movements. Women fixated both eyes more frequently compared to men, independently of conditions of presentation. Male subjects (M) looked more at the nose area. In distorted stimuli, differences between genders remain only in the area of the right eye. Hence, we can conclude that differences in the strategies of eye movements do not reflect differences in the perceptual mechanisms used.

PARENTAL AND TEACHER MEDIATION OF ADOLESCENTS’ INTERNET ACTIVITY

Galina U. Soldatova, Svetlana V. Chigarkova
Lomonosov Moscow State University (Moscow, Russia)

The research is devoted to the study of the characteristics of teacher mediation of adolescents’ Internet activity as one of the aspects of their digital socialization. The study examined the following main strategies: restrictive mediation (the establishment of rules that limit and regulate online time, the place of use, activities), active mediation of Internet use (engaging in activities such as talking about the Internet content that children encounter or explain how to do something in Internet), active mediation of Internet safety (offering safe ways of Internet use and strategies for coping with online risks).

The sample included 1553 adolescents 12-17 years old and 1219 parents from 8 Federal districts of the Russian Federation. The questionnaire contained blocks of questions devoted to various aspects of digital socialization, including teacher and parental mediation of Internet use.

One of the most common strategies for both teachers and parents is restrictive mediation. If teachers make more use of the prohibition of access to the Internet and establishment of rules for its use at school, then parents more prohibit adolescents from sharing personal data on social networks. Among the strategies of active mediation of use, the encouragement of learning and developmental activity in the network stands out, meanwhile to a greater extent on the part of parents and less on the part of teachers. The most common strategy of active safety mediation was information on safe use of the Internet; more than half of adolescents experienced it from parents and a third from teachers. The rarer teacher strategies turned out to be preventive communication about coping with online risks and direct support after actual encounter with them. Every second adolescent experienced these parental strategies.

Thus, compared with parents, teachers still have a not so wide set of mediation strategies for using the Internet, primarily relying on prohibitions. At the same time, the level of digital competence of teachers is higher than that of parents that can predict greater effectiveness of teacher active strategies.
