Problematic internet use is common and even may be on rise almost all over the world. To illustrate, recently the ratio of internet addiction among university students is reported to be 3.2% in UK, 3.9% in Italy and 4.2% in European countries and 1.2% in Turkey (e.g., Kuss, Griffiths, & Binder, 2013; Kaess et al., 2014; Kır & Sulak, 2014). Although detrimental effects of Social Media Addiction (SMA) had been focus of a number studies (e.g., Andreassen, Torsheim, Brunborg, & Pallesen, 2012); predictors of SMA haven’t been fully understood yet. The aim of the present research was to reveal effects of motivational tendencies and self-esteem on SMA. Motivational tendencies involved in the study were need for affiliation, need for approval and need for power. Need for approval and need power as well as self-esteem were proposed to be positively; need for affiliation was proposed to be negatively associated with SMA. In addition, moderating role of relationship status in the proposed relationships was investigated. Data was collected from 470 university students from Turkey [161 males, 309 females]. 242 of the participants had been in a romantic relationship at least for one month and 228 of them have not been in romantic relationship on the data collection date. The proposed regression model was tested using Structural Equation Modeling (SEM) and the data provided good fit to the data. The results revealed that the direct paths from need for approval and need for power to SMA were positive and significant; whereas, the direct path from self-esteem to SMA was negative and significant. The path from need for affiliation to SMA was not significant. However, moderated multiple regression analyses showed that interaction effect of relationship status and need for affiliation on SMA was significant in such a way that participants who were high on need for affiliation and who were not currently in a romantic relationship had higher SMA scores than those who were high on need for affiliation and who were currently in a romantic relationship. The results will be discussed regarding the theoretical and practical implications along with suggestions for future studies.
IMPACT OF LOCUS OF CONTROL, SELF-CRITICISM, WORK-LIFE BALANCE ON HAPPINESS OF WORKING PROFESSIONALS IN INDIAN METRO CITY

Venkatesan Murugesan  
Anubha Rohatgi  
Urvashi Sharma  
Indian Institute of Foreign Trade (New Delhi, India)

Personality and Work-Life balance plays a vital role in happiness. Social Learning Theory describes personality as a representation of the interaction of individual with his/her environment. The spill over theory of work-life balance proposes that workers carry the feelings, emotions, attitudes, skills, and behaviours that they experience at work into their family life. Thus the present study is based on aforementioned theories to examine the impact of locus of control (LOC), self-criticism, work-life balance, and burnout on happiness of working professionals in Indian metro city. The main research question of the study is to what extent the aforementioned variables influences happiness of working professionals in Indian metro city and whether do working professionals differ on aforementioned variables with age, gender and type of organization they represent. This study is based on exploratory research that uses ex-post facto research design. A sample of 80 Working Professionals of Indian metro city with an age group of 25 to 55 years were studied using purposive sampling method. The tools used were LOC, The Forms of Self-Criticizing/Attacking & Self-Reassuring Scale, Work-Life Balance, Oldenburg Burnout Inventory, and Oxford Happiness Scale. A positive correlation was found between work-life balance and self-criticism — reassure-self dimension with happiness. LOC, self-criticism — inadequate self and hatred-self dimensions, and Burnout-Disengagement, and Exhaustion dimensions had negative correlation with happiness. The self-criticism-reassure-self dimension and work-life balance had significant and positive predictors of happiness. Age differences were found in LOC, work-life balance, burnout — exhaustion dimension, and happiness. It is evident from the mean differences of 25=35age group have high external LOC and are more exhausted whereas 45=55 age groups have high work life balance and are happier. Professionals of private or public organization exhibited significant differences on LOC, burnout-exhaustion dimension, and happiness. LOC, Self-criticism-reassure-self dimension and work life balance had influenced working professionals’ day to day happiness. This finding would help working professionals to work on their LOC, self-criticizing attitude and work life balance to bring improvement in their happiness.
TECHNOLOGIES OF PSYCHOLOGICAL SUPPORT FOR PROFESSIONAL IDENTITY OF INTELLECTUALLY GIFTED CHILDREN

Irina Bakaeva
Southern Federal University (Rostov-on-Don, Russia)

Outstanding abilities and early achievements of gifted children are not always harmoniously combined. Many gifted adolescents experience difficulties in professional identity, all the possible professions turn out to be exceeding. A project was proposed for psychological support for professional identity of gifted adolescents within additional education. The project involves students in different domains activities, regardless of the profile of training. The research aim is to study peculiarities and to develop technologies of psychological support for professional identity of gifted children. 146 students of the distance education center for gifted children were involved. There were 80 girls, 66 boys aged from 13 to 18. 1. Method "Self-determination of a personality" Minaeva L.M. 2. Method "Map of Interests" Golomshhtok A.E. 3. Questionnaire "Type of Personality" J. Holland. 4. Bibliographic study of personality. Statistical methods used: criteria for the Pearson linear correlation coefficient, Kraskel — Wallace H-test.

1. Professional identity is directly related to the age of students. Significant differences were found according to the criterion "image "I": mental qualities" ($\chi^2 = 11.6$, $\alpha = 0.01$), this figure increases in grades 8 and 10 and decreases in grades 9 and 11; with age, the "image "I": learning and organizational skills" ($\chi^2 = 19.997$, $\alpha = 0.01$), "learning motives: broad cognitive motives" ($\chi^2 = 12.302$, $\alpha = 0.01$) rise to grade 10, and in grade 11 narrow again. 2. Humanitarian students have the most developed values for future work. Among the respondents of the natural science profile, these value orientations are least formed ($\chi^2 = 6.271$, $\alpha = 0.05$). 3. A reverse causality was found between participation in the program of psychological support for professional identity and the criterion "Unformed readiness for professional identity" (Pearson $p = 0.340$, $\alpha = 0.01$). There is a relationship between the age of children and the criteria for personal and professional identity. In specialized groups students of additional education there is a priority of natural scientific knowledge, as the most promoted, and humanitarian field, which may indicate the development of world perception, expanding personal boundaries. A specially organized program of psychological support contributes to the development of readiness for adolescents' professional identity.
HOW AND WHEN ANALYTIC COGNITIVE STYLE IS RELATED TO AND CAUSALLY INFLUENCE POLITICAL IDEOLOGY

Onurcan Yilmaz
Kadir Has University (Istanbul, Turkey)

The relationship between analytic cognitive style (ACS) and political attitudes has been investigated in a series of recent studies conducted in different cultures. Some studies found a negative relationship between ACS and right-wing political orientation, while others failed to find any relationship. However, there is a consistent pattern of negative relationship between ACS and social conservatism in general. We expand on this work by showing that (1) there is a negative relationship between ACS (as measured by standard three items Cognitive Reflection Test, Frederick, 2005) and social conservatism (as measured by binding subscale of moral foundations questionnaire, Graham et al., 2011) in the aggregate analysis of a cross-cultural investigation of 30 politically diverse cultures (N = 7,263), b = -.079, SE = .023, z = -3.481, p < .001, 95% CI [-.123, -.034], (2) this relationship is stronger in WEIRD (Western, educated, industrialized, rich, and democratic) but weaker in non-WEIRD cultures, b = -.211, SE = .084, z = -2.530, p = .011, 95% CI [-.375, -.048], (3) the combined meta-analytic effect was not statistically significant for the relationship between the commonly used single item political orientation question and ACS across cultures, b = -.053, SE = .033, z = -1.619, p = .106, 95% CI [-.116, .011]; and finally (4) ACS causally influences conservative attitudes only when conservatism is measured by contextualized (as represented by the news article), but not stable opinions (as represented by standard questionnaire items). More specifically, we conducted two experiments in Turkey (N = 241), and used a brief ACS training (vs. control condition) to activate analytic thinking, and measured both contextualized, and stable opinions to measure conservatism (Yilmaz & Saribay, 2017). We found that ACS decreases support for the conservative policy in the news article, but no change was observed in the questionnaire items. Our findings offer insight into how and when analytic thinking might be related to and causally influence political attitudes.
MEASUREMENT INVARiance OF THE REACTIVE AND PROACTIVE AGGRESSION QUESTIONNAIRE (RPQ) ACROSS SELF- AND OTHER-REPORT

Xiaohui You
Tuor Liu
Tianjin Normal University (Tianjin, China)

Mengcheng Wang
Guangzhou University (Guangzhou, China)

Nowadays children's delinquency has become a worldwide problem. Reactive and Proactive Aggression Questionnaire (RPQ) is widely used to assess aggression reliably (Koca et al., 2012). However, some researchers have used self-report RPQ to test aggression by others-report (Baker, Raine, and Jacobson, 2008; Fung, Gerstein, Chan, and Hurley, 2013). Obviously, the accuracy of RPQ had not been verified when it is used in others-report way. So, it is necessary to figure out whether the RPQ can be directly used in others-report assessment or not. 485 participants were 1st-6th grade students from a primary school in Guangdong province. Firstly, graded response model (GRM) was ran to do item analysis in Excel, and confirmatory factor analysis (CFA) was conducted to of RA and PA respectively. Secondly, we evaluate measurement invariance using multi-group confirmatory factor analysis (CFA). Both CFA and multi-group CFA were executed in Mplus8.0. Finally, participants’ differences between self-report and other-report were calculated by using raw scores and latent means. Item analysis result shows that item 19 has the lowest discrimination, so this item was deleted in the following analysis. CFA was conducted by using self-report sample and other-report sample respectively. For self-report sample, the model fit indices were TLI=0.933, CFI=0.940, and RMSEA=0.041. For other-report sample, the model fit indices were TLI=0.947, CFI=0.952, RMSEA=0.052. But the configural invariance, which is the first model, was dissatisfactory and did not converge after 10000 iterations. After checking the processing results, item 22 was deleted because of its extreme values of intercept and residual. The multi-group CFA was conducted again and seven models are all acceptable (CFI>0.900, TLI>0.900, RMSEA<0.05). Latent mean invariance of RPQ across two rating ways seems tenable. However, differences camp up on latent mean when other-report group was set as reference group (latent mean=0). Specifically, the difference on reactive aggression was 0.704, while on proactive aggression was 0.406. Therefore, researchers can continue to use different evaluation methods to measure aggression with RPQ in the future.
THE RELATIONSHIP BETWEEN FAMILY CHAOS, ATTACHMENT STYLES, OBSESSIVE COMPULSIVE DISORDER AND DEPRESSION

Fatma Oktay  
Süleyman Demirel University (Isparta, Turkey)  
Sait Uluç  
Hacettepe University (Ankara, Turkey)

Family unpredictability is described as a lack of consistency regarding family behaviors and regulatory systems (Ross & Hill, 2000). It emerges when family members are unwilling and inadequate to discharge their responsibilities, and regulatory systems or mechanisms are ruined. Parents are thought to be the most important actors of this kind of instabilities (Ross & Hill, 2000). The development of the family unpredictability schema is frequently argued in the context of attachment theory and learned helplessness theory. John Bowlby (1969) suggests that early life experiences with primary caregiver have a strong effect on adult personality and behaviors. Studies indicate that family unpredictability is associated with adverse outcomes (Carlton et al., 2006; Obradovic, Bush, Stamperdahl, Adler & Boyce, 2010; Ross & Hill, 2000; Wachs, 2000). The aim of this study is investigating the mediator role of anxious and avoidant attachment styles in the relationship between mother nurturance unpredictability and obsessive compulsive depressive symptoms. In accordance with this aim, only mother nurturance subscale of the Retrospective Family Unpredictability Scale was used. The sample of this study consisted of 174 (110 female, 64 male) students (age range: 18-28) of Hacettepe University. Retrospective Family Unpredictability Scale, Experiences in Close Relationships-Revised, Beck Depression Inventory, Obsessive-Compulsive Inventory-Revised From were used to collect data. Three different path analyses were conducted to show mediation role of attachment styles. Results showed that attachment styles mediated the relationship between mother nurturance unpredictability and obsessive compulsive depressive symptoms ($\chi^2[2, N = 174] = 4.240, CFI = .982, RMSEA = .080 [90% CI: .000-.191]$). It is showed that unpredictable nurturance from mother is associated with avoidant and anxious attachment styles. Moreover, it is found that the relationship between mother nurturance unpredictability and obsessive compulsive depressive symptoms was mediated by attachment styles. Fortunately, family environment is suitable to interventions about enhancing predictable parent behaviors. It is recommended that especially mothers as primary caregivers must educated about the adverse consequences of their unpredictable parenting behaviors.
WHAT ROLE DOES CORTISOL PLAY IN THE EFFECTS OF PSYCHOSOCIAL STRESS ON WORKING MEMORY

Liang Zhang
Chinese Academy of Sciences (Beijing, China)

Exposure to stress has a variety of consequences on human behavior and cognition. Although widely investigated, the impacts of stress on working memory remains inhomogeneous. Individual differences in neuroendocrine responsiveness, e.g., cortisol responses, may be one factor that explains previous inconsistent results. This study assessed the role of cortisol responsiveness in the effects of psychosocial stress on working memory. To examine working memory processes, we analyzed both behavioral performances (ACC, RT, IES) and event-related potentials (ERPs) including N1, P2 and P3. A total of 67 male college students completed a numerical 2-back task after being exposed to the Trier Social Stress Task (TSST) or a control task.

The results showed shorter reaction time, better efficiency together with the larger N1 and P2 amplitudes in high-cortisol-responders, comparing with the low-cortisol-responders and control group, indicating a better working memory performance which is probably due to the enhancements on the orientation and mobilization of attention. Furthermore, correlation analysis revealed a positive association between the cortisol change rate and behavioral as well as ERP indexes among the stressed individuals, suggesting that the increased cortisol may facilitate the working memory under the acute psychosocial stress. These findings provide an insight into the understanding of the relationship between stress and working memory.
EVALUATION OF THE RELATIONSHIP BETWEEN BELIEF IN A JUST WORLD AND THE PERCEPTION OF GOD ON DIFFERENT GENDER IDENTITY AND SEXUAL ORIGINS

Gonca Nebioglu
Suleyman Demirel University (Isparta, Turkey)

The Theory of Belief in A Just World is proposed by Lerner (1965); it is a system of fairness in which the world is fair, good for the good and bad for the bad. More authoritarian and religious people found to have beliefs in a just world in higher amounts. However, Lerner (2010) states that individuals with high religious beliefs may be less likely to "blame the victim", which is one of the dynamics of the Belief in A Just World Theory, because they may think that God will do the right in every way. The concept of God perception is all the references, feelings and thoughts of the individual towards God. In this study, it will be examined how the relationship between the concepts of belief in a just world theory and God perception is explained through gender identity-sexual orientation and justice in Turkey sample. The answers of likert type questions which were prepared related to the six stories created by the researcher were examined with the Moderator Regression Analysis method.

In order to measure belief in a just world beliefs of the participants, Personal and General Belief In A Just World Scale, and God Perception Scale were used to measure god perceptions. As an outcome of this study, it is aimed that the questions indicated below will be answered. -Is there a relationship between the belief in a just world and the perception of God? -Is there a formative role of sexual orientation-gender identity in the relationship between the belief in a personal-general just world and the perception of God? (The belief in personal and general just world will be examined separately). 110 individuals participated in the study. 66 of the participants has identified themselves as heterosexual, 18 as transsexual, 14 as homosexual, 11 as bisexual and 1 as queer. In order to make comparisons according to gender identity and sexual orientation, participants were separated into two clusters as heterosexuals and LGBT individuals.
EFFICACY OF IMAGERY WITH RESCRIPTING IN TREATING GUILT MEMORIES IN OCD: A CASE SERIES EXPERIMENTAL DESIGN, PRELIMINARY RESULTS

Katia Tenore
Barbara Basile
Teresa Cosentino
Brunetto De Sanctis
Francesco Mancini
Scuola di Psicoterapia Cognitiva (Rome, Italy)

It is well-known that guilt plays a significant role in Obsessive Compulsive Disorder (OCD) onset and maintenance (Mancini, 2018). OCD patients often report memories of being criticized and feelings of guilt as a result of the discipline received. Imagery with Re-scripting (IwR), is an emotion-focused technique that binds actual stressful emotions to past memories where similar feelings were activated. This technique is used to change the meaning of emotionally distressing memories, turning aversive mental images into positive ones, achieving a healthier prospective on the event and fulfilling past unmet core needs. IwR has been applied to several psychopathological conditions including Axis I and II diagnoses and has shown promising results (Arntz et al., 2012). It has also been successfully applied to OCD (Veale et al., 2015). The aim of this study is to verify the efficacy of this technique on OCD symptom reduction. At the best of our knowledge, this is the first study addressing the fear of being guilty using imagery techniques, instead of focusing on current symptoms. Until now, sixteen OCD subjects were recruited for the study. After baseline of symptoms monitoring subjects underwent three sessions of IwR, followed by symptoms monitoring and a further monitoring after three months. Measures about obsessive symptomatology, depression and anxiety, and guilt were collected. Preliminary analyses showed that subjects reported a significant decrease in OCD symptoms, (a decrease at the Yale-Brown Obsessive-Compulsive scale from a mean of 26 to 13; clinically significant change RCI= 10.31). Conversely, less differences were detected in levels of depression and anxiety. Although these are preliminary data, our findings suggest that IwR interventions focusing on patients’ blame and reproach early experiences significantly decrease OCD symptomatology, without affecting levels of depression. These data strengthen the role of IwR interventions in reducing psychopathological conditions without a direct intervention on active clinical symptoms (Veale et al., 2015). Our findings also support previous cognitive models on OCD (Mancini, 2016), highlighting the role of guilt-related early life experiences, that seem to be specific to this disorder and to contribute to the historical vulnerability to OCD.
INSTABILITY, ANXIETY AND STRESS: A COMPARISON ACROSS CHINESE, ITALIAN, RUSSIAN AND US COLLEGE STUDENTS

Elisa Delvecchio
Alessandro Germani
Giulia Cenci
Adriana Lis
Claudia Mazzeschi
University of Perugia (Perugia, Italy)

Emerging adulthood is the age of possibilities, as well as the age of instability. It is a critical period characterized by pervasive changes in identity, relationships and life conditions that can create anxiety and stress. Anxiety and stress levels may vary across cultures. Collectivistic cultures are characterized by collective norms, family values, and higher levels of self-control and emotional restraint. However, emerging adulthood is a self-focused age, in which emerging adults have little in the way of social obligations, duties and commitments to others. Therefore, the role of individualism-collectivism may not matter. Although some studies found positive relation between anxiety, stress and collectivistic personality, others found mixed results on the relation between anxiety levels and individualism score of nations. Uncertainty Avoidance (UA) as stated by Hofstede’s, may has to do with the way that a society deals with the idea that the future can never be known. This ambiguity carries anxiety where different cultures have learnt to deal with it in different ways. Uncertainty Avoidance score is the extent to which members of a culture feel threatened by ambiguous or unknown situations and have created beliefs and institutions that try to avoid them. The present study compared anxiety and stress across two individualistic (U.S. and Italy) and two collectivistic (China and Russia) countries, with different levels of UA. About seven-hundred college students (18-21 years old, M=19.13, SD=1.00) coming from China (UA=30), Italy (UA=75), Russia (UA=95) and the U.S. (UA=46) filled in the Depression-Anxiety-Stress Scale. After controlling the effect of age and gender, MANCOVA showed a significant effect of UA on anxiety and stress. Italians and Russians reported higher anxiety and stress compared to US and Chinese people. Also, the Chinese showed lower stress than the Russians. The higher the uncertainty avoidance score of the country, the higher the average score of anxiety and stress showed by emerging adults who live there. The differences were not explained by individualism score. Results suggest that anxiety and stress in emerging adults, may be influenced by the way a society deals with the instability and the uncertainty of future.
RELATIONS BETWEEN FUNCTIONAL AND DYSFUNCTIONAL IMPULSIVITY AND DIMENSIONS OF THE REVISED REINFORCEMENT SENSITIVITY THEORY

Snežana Smederevac
Bojana Dinić
Milan Oljača
University of Novi Sad (Novi Sad, Serbia)

Although impulsivity is most often associated with rapid decision-making, without thinking about the consequences, the differences between functional (FI) and dysfunctional (DI) impulsivity point to the importance of possible explanations of these complex behaviors in the light of other personality dimensions. While functional impulsivity is tendency to act quickly when it is optimal, usually connected to risk behavior, dysfunctional impulsivity refers to acting without forethought and it is related to disinhibited behavior. Revised Reinforcement Sensitivity Theory (rRST), distinguishes the behaviors determined by responding to the signals of rewards (BAS), potential (BIS) and real threat (Fight/Flight/Freeze — FFFS). Since there are important similarities in the Grey's and Dikman's conceptualization of impulsivity, as reactivity to the potential reward, it is expected that both types of impulsivity will be strongly related to BAS. Besides BAS, specific focus in this study was on examining the overlap of FI and DI with measures of BIS and FFFS. On 1314 participants from the general population (49% of males), Dickman Impulsivity Inventory and Reinforcement Sensitivity Theory Questionnaire were applied. Results of a hierarchical multiple regression models, with gender and age in first, and BIS, BAS and FFFS in second steps, have showed that contribution of personality traits was higher in the explanation of FI (27%), than DI (14%). The results clearly showed that low BIS (β = -.31; p < .001), high BAS (β = .24; p < .001) and high Fight (β = .15; p < .001) have contributed significantly FI, whereas high Fight (β = .23; p < .001), high Freeze (β = .24; p < .001), high BAS (β = .19; p < .001) and low Flight (β = -.009; p < .01) have contributed significantly DI. The combined effect of BIS-/BAS+ on FI indicates that lack of emotional excitement and reward reactivity are the basic characteristics of FI, whereas Fight+/Freeze+ indicate that the lack of cognitive and behavioral control are the basic characteristics of DI.
APPROACH-AVOIDANCE IN DEPRESSIVE AND ANXIOUS SYMPTOMS: EVIDENCE FOR DISTINCT MOTIVATIONAL LEVELS

Burak Doğruyol
Altınbaş University (Istanbul, Turkey)

Research devoted to explain anxiety and depression have focused on various cognitive and emotional perspectives. Besides those perspectives, researchers recently focused on the motivational underpinnings as ‘approach’ and ‘avoidance’. Yet, this line of research focus only on approach-avoidance distinction and fails to differentiate those motivations on the motivation hierarchy implying distinct effects of tactics and strategies. Current research aims to investigate the effects of approach-avoidance systems on depressive and anxious symptoms by adopting two distinct levels of motivation. Specifically, promotion and prevention self-regulatory foci were used as strategic level predictors of symptoms and behavioral inhibition and activation systems were used as tactical level predictors. We collected data from 208 (M=21.55, SD=1.56) university undergraduates. In order to measure participants’ self-regulatory foci levels, Portrait Values Questionnaire (Schwartz, Melech, Lehmann, Burgess, Harris, & Owens, 2001) was used as proposed by Kluger, Yaniv, and Kühberger, (2001). Tactical level motivations was measured via Behavioral Inhibition/Activation Scale (Carver & White, 1994), and symptom levels were measured by Hospital Anxiety and Depression Scale (Zigmond & Snaith, 1983). Results of bootstrapped mediation analyses showed that tactical level avoidance motivation fully mediated the effects of strategic level avoidance (i.e., prevention focus) on both depressive (B=-.26, SE=.13) and anxious (B=-1.15, SE=.23) symptoms. Besides, strategic level approach motivation (i.e., promotion focus) directly predicted depressive symptoms (B=-1.29, SE=.38). Overall, results highlight the importance of distinguishing different levels of approach–avoidance systems to go beyond the standard models trying to understand their relation with effects on depressive and anxious symptoms.
THE ASSESSMENT BY DOPPLER ULTRASOUND OF HEMISPHERES INVOLVEMENT IN SPEECH AND VISUAL-PERCEPTUAL INFORMATION PROCESSING

Elena Lysenko  
Pirogov Russian National Research Medical University  
(Moscow, Russia)

Yurii Mikadze  
Lomonosov Moscow State University (Moscow, Russia)  
Pirogov Russian National Research Medical University  
(Moscow, Russia)

(Moscow, Russia)

Saleh Abuzaid  
Burdenko neurosurgery Institute (Moscow, Russia)

Alexander Shakhnovich  
Neurology center of doctor Shakhnovich (Moscow, Russia)

The integrative brain work is determined by unequal contribution of each hemisphere to the provision of different activities. The identifying of functional specialization and the assessment of hemispheres degree involvement in speech and visual-perceptual information processing are demanded in neurosurgical preoperative procedures and rehabilitation practice. A special role in such assessment is played by the simplicity and accessibility and non-invasiveness of the methods used. The method of functional transcranial Doppler ultrasound corresponds to these requirements and now is actively used for identification of hemispheric functional specialization. There are new results of hemispheric dynamic interaction according to increase blood flow velocity in brain arteries during the performance of speech and visual-special cognitive tasks in healthy subjects (57 persons). There was the comparison of the results, which were obtained in healthy subjects and patients with unilateral tumor and cerebrovascular brain lesions (60 patients). There results permit to make a conclusion that different types of activities (speech or visual-perceptual) accompanied by join involvement of two hemispheres, but theirs dominant role are not equal. Also the unequal contribution of each hemisphere depends on lateralization of brain damage and its nosology.
THE RELATIONSHIP BETWEEN EMOTION REGULATION PROFILES, MOTIVATION DISPOSITION, PTSD SYMPTOMS AND PSYCHIATRIC CO-MORBIDITY

Ting Peng
Man cheung Chung
The Chinese University of Hong Kong (Hong Kong, China)

The epidemiological studies found just under 10% of university students met criteria for posttraumatic stress disorder (Elhai et al., 2012; Read et al., 2011). Emotion regulation difficulties have been linked to the development and maintenance of posttraumatic stress symptoms among university students (Miron, Orcutt, & Kumpula, 2014). Ability to use a large number and diverse types of emotion regulation strategies has been associated with reduced traumatic stress (Bonanno et al., 2013). There is evidence suggesting that behavioral inhibition system sensitivity and behavioral activation system sensitivity, which are associated with emotion regulation motives, may contribute to the development of PTSD symptoms. This study investigated how profiles of emotion regulation strategies were associated with posttraumatic stress symptoms and psychiatric co-morbidity, and the moderating effects of behavioral inhibition and activation sensitivity on distress outcomes. Two hundred and four college students were recruited from two universities in China. Five groups of emotion regulation strategies (cognitive reappraisal, expressive suppression, experiential avoidance, brooding and reflective pondering) were generated using latent profile analysis. The PTSD Checklist for DSM-5 was used to assess students’ self-report on traumatic events and symptoms of posttraumatic stress disorders. The 28-item General Health Questionnaire (GHQ-28) was used to detect those with a diagnosable psychiatric disorder. Three latent profiles were identified: (1) Adaptive Regulators, (2) Medium Regulators, and (3) Maladaptive Regulators. Distinct levels of posttraumatic stress symptoms and psychiatric co-morbidity were found among emotion regulation profiles. Behavioral inhibition system sensitivity significantly moderated the impact of emotion regulation profiles on psychiatric co-morbidity. Both behavioral inhibition and activation sensitivity, however, did not moderate the impact of emotion regulation profiles on PTSD symptoms. To conclude, how people use different emotion regulation strategies was related to PTSD symptoms and psychiatric symptoms. Motivation disposition influenced the impact of emotion regulation strategies on psychiatric symptoms.
QUALITY OF LIFE AND PAIN SYNDROME IN PATIENTS WITH SPINE TUMORS BEFORE AND AFTER SURGERY

Ekaterina Usmanova
Moscow International Preschool (Moscow, Russia)

Olga Shchelkova
Saint Petersburg State University (Saint Petersburg, Russia)

Aslan Valiev
Evgeny Sushentsov
N.N. Blokhin Russian Cancer Research Center (Moscow, Russia)

Quality of life (QoL) in oncological patients is studied intensively. Physicians’ attention is fixed not on particular symptoms and disease progression mechanisms, but on a patient as a person with his or her life problems. In clinical and epidemiological researches quality of life more often is considered a measure of medical intervention efficiency. Patients with spine tumors previously had poor prognosis, but modern surgical treatment allows increasing survival of these patients and getting better prognosis. Consequently the issue of QoL in patients with spine tumors becomes especially actual one. The factor significantly decreased QoL is pain syndrome. The aim of the study was to reveal basic parameters of QoL and pain syndrome in patients with spine tumors before and after surgical treatment. Results: Study participants were 35 patients with spine tumors. The methods were: VAS and Watkins scales, «SF- 36 Health Status Survey», Quality of Life Questionnary-Core 30 of European Organization for Research and Treatment Cancer, Spine Oncology Study Group Outcomes Questionnaire. All patients had pain syndrome before treatment. Pain assessment using VAS and Watkins scales before and after treatment revealed pain reduction as a result of surgery. Patients with spine tumors assess their QoL in general after surgery significantly higher than before treatment. As well patients report increasing QoL after surgery on the parameters of neurological status and pain intensity which corresponds to VAS and Watkins scales assessment. Besides the results revealed improving of QoL in patients with spine tumors after treatment on the parameter of emotional functioning. The diagnosis of patients with spine metastases refers to last stages of the disease. So treatment in these patients in most cases initially aimed at palliative care helps not only reduce pain intensity but also increase their QoL and in this way allows patients have emotionally rich life. Nowadays patients with spine tumors undergo effective surgical treatment which increases their survival, significantly improve their QoL and relieve pain. The further research is needed to study psychological factors of QoL in patients with spine tumors in order to make relevant programs of functional, social and psychological rehabilitation for these patients.
The growth of deviations in the children’s population influenced the social status of the school and the specificity of the solved tasks. The scientific request for the study of external factors of deviations is being actualized. The research methodological basis of the study is an ecological approach (J. Gibson) which allows us to consider deviations through the prism of disrupted interactions of the educational environment subsystem elements "subject of the educational process- the sociocultural environment of the school". The sociocultural environment of a school is defined as a set of psychological, pedagogical, socio-economic, geographical, informational conditions of the educational process, allowing the member of the educational process to realize one’s goals taking into account the opportunities presented within the educational system (E.Gilemkhanova). Psychological security of the school is considered as a system-forming characteristic of the effectiveness of the subject and contextual components interaction of the system. It is necessary to determine how the subject level of the educational environment is interconnected with the contextual one in order to study psychological security. Research question: how does the social and economic status of the region affect the subject level of the school’s psychological security? The data on the economic and social status of the regions were obtained from the site of the Federal State Statistics Service. The subject level of the school’s psychological security was studied with the aid of the author’s technique “Pupil Socio-Cultural Security Index”. The study was conducted in 2017 and covered 8 districts of the republic, 36 secondary schools and 32 320 students aged 10 to 16 years. It is established that the level of wages in the region, as well as the level of employment ($F = 37.24; F = 3.2, p <0.05$) have a significant impact on the student’s sociocultural safety index. The cumulative effect of factors is also reliable $F = 10.74; p <0.001$. Thus, the higher the salary and the level of employment in the region are, the higher the risk of the psychological security boundaries violation in school is. The study was carried out with the financial support of the RFBR, project 17-29-02092 of_i_m.
THE LIVED EXPERIENCE OF DIAGNOSTIC SHIFTS IN YOUTH MENTAL HEALTH SETTINGS

Cliodhna O’connor
University College Dublin (Dublin, Ireland)

In the everyday practice of mental healthcare, diagnosis is an important step in indicating prognosis and treatment pathways, explaining symptoms, and facilitating communication between health professionals. However, epidemiological data shows that psychiatric diagnoses have limited temporal continuity, particularly in early life. Over the course of a child’s contact with mental health services, a diagnosis received at one time can transition into a different diagnostic classification or be lost entirely. Diagnostic shifts can have profound implications for young people and their families, given the significance invested in diagnostic labels for making sense of emotional and behavioral difficulties. However, there is currently no evidence-base to inform guidelines for how diagnostic changes should be sensitively managed in clinical practice. A series of narrative interviews were completed with children and parents who have experienced diagnostic shifts and their parents. Interviews explored the narratives through which families made sense of these changes and their psychosocial implications. Interviews were recorded, transcribed and subjected to thematic analysis.

Thematic analysis of the interview data established a range of positive and negative repercussions that diagnostic shifts may have. Clinical implications included the introduction of new treatment options, improved engagement with therapy and disillusionment due to previous missed or mis-diagnoses. Emotional implications included challenges to the self-concept, relief at improved self-understanding, the revision of expectations for the young person’s future, and regret of ‘lost time’ before the ‘correct’ diagnosis was identified. Social implications included the loss/gain of diagnosis-related social identities and evolution of the parent-child relationship. Practical implications included the loss/gain of educational resources and possible change of service-providers. The research contributes to our understanding of how the documented poor reliability of psychiatric diagnosis plays out in real-world clinical practice and in the social and emotional worlds of service-users. Mental health practitioners should be aware of the challenge that diagnostic changes may entail for vulnerable young people, and balance the clinical rationale for diagnostic revisions against their possible emotional and pragmatic costs.
RESPONSIBLE LEADERSHIP STYLES AND CORPORATE SOCIAL RESPONSIBILITY VALUATION. ARE UNIVERSITIES TRAINING THE RESPONSIBLE MANAGERS THAT BUSINESSES AND SOCIETY NEED?

Flor Sánchez
Angélica Sandoval
Fernando Casani
Jesús Rodríguez-Pomed
Julia Sastre
Autonomous University of Madrid (Madrid, Spain)

In this research the relationship between responsible leadership styles and the valuation of different corporate social responsibility (CSR) dimensions is analyzed. A sample of 1833 undergraduate students enrolled in degrees related to business management in six countries were surveyed. First, a factorial analysis allows us to identify two different profiles of the relationships with stakeholders, behaviors and personal achievements the participants expected to realize in the workplace. The relational-integrative responsible leadership (RRL) style reflects a greater predisposition to work with others in a workplace (teamwork, supporting colleagues, subordinates and superiors; integrating disadvantaged people; and so on), and the individualistic-instrumental responsible leadership (IRL) style reflects a drive for personal achievement and limited relationship with others (e.g., a focus on earning money and achieving personal status). Second, the results show that the different responsible leadership styles produce significant differences in the valuation of CSR dimensions. Several regression analyses corroborate the fact that the RRL style is positively associated with CSR oriented towards the welfare and care of internal and external stakeholders, the protection of social and natural environments and ethical issues, while the IRL style is principally and positively associated with maximizing the benefits to shareholders. Both responsible leadership styles are positively associated with the valuation of primary responsibilities to ensure business survival (for instance, by meeting customers’ needs and producing quality products and services). Practical implications for the training of future managers are posed.
According to the systemic transactional model, pregnancy can be characterized as a situation of dyadic stress since it affects both members of the couple. However, the impact of dyadic coping on couples’ quality of life during pregnancy is unexplored. Also, the potential mediating role of marital adjustment on this association remains understudied. Participants were 320 pregnant women and their partners (N = 640) who completed the Dyadic Coping Inventory, the Dyadic Adjustment Scale and the World Health Organization Quality of Life instrument. Data were analysed using the actor-partner interdependence mediation model. Results showed that there was an intrapersonal indirect effect of dyadic coping on quality of life through marital adjustment. Moreover, an interpersonal indirect effect was found with fathers’ dyadic coping being associated with mothers’ quality of life through mothers’ marital adjustment. These findings highlight the importance of assessing dyadic coping strategies of couples during pregnancy and targeting them in the psychological support offered to couples as a way of improving their marital adjustment, and consequently, their quality of life.

Father-fetal attachment is an important contributor to future father-infant relationship and to child outcomes. The aim of this study was to examine factors that can contribute to hinder or facilitate the development of attachment to the fetus. Specifically, we explored the association between fathers’ depressive symptoms and father-fetal attachment and examined the mediating role of dyadic coping in this association. Expectant fathers (N = 302) completed the Hospital Anxiety and Depression Scale, the Dyadic Coping Inventory and the Paternal Antenatal Attachment Scale. A moderated-mediation model was tested. Results indicated that more depressive symptoms were associated directly (95% CI [-1.094, - 0.478]) and indirectly (effect = -0.00, 95% CI [-0.117, 0.106]), through positive dyadic coping (but not through negative dyadic coping), to the father-fetal attachment (R2 = 16%). Moreover, being or not a first-time father moderated this association (index of moderated mediation = .39, 95% CI [.112, .726]). It seems that, for fathers both intrapersonal and interpersonal factors play a role on the development of attachment to the fetus. These findings can contribute to inform psychosocial interventions and research about men’s needs during pregnancy.
CONCEPTUAL METAPHORS IN POETRY INTERPRETATION: A PSYCHOLINGUISTIC APPROACH

Carina Rasse
University of Klagenfurt (Klagenfurt, Austria)

Research in psycholinguistics has shown that conceptual metaphors underlie significant aspects of both linguistic and non-linguistic facets of life (e.g. Lakoff & Johnson 1980; Gibbs 1994, 2017; Kövecses 2010; Jacobs & Kinder 2017). It is currently heavily debated, though, whether metaphor is indeed always understood through the recruitment of conceptual metaphors (e.g. Keysar et. al 2000, Steen 2017). The present study explores whether people access conceptual metaphor during poetry interpretation. The hypothesis was tested in a psycholinguistic experiment. 37 participants, all native speakers of English, were asked to read 14 two-line stanzas of poetry presented to them on a computer screen. For each of the stanzas, they had to rate 8 lexical items according to their relatedness on a scale from 1 (= not related) to 4 (= very much related). The lexical sets consisted of 4 words related to a conceptual metaphor and 4 words that were unrelated. The results have shown that, overall, the mean ratings of all participants across all target items were higher for the mapping-related than for the mapping-unrelated target words ($t(14) = 10.87$, $p < 0.05$). This implies that certain metaphorical expressions in poetry encourage readers to perform conceptual mappings. A close analysis of the ratings of the individual lexical items has revealed that certain items were rated much higher (or lower) than expected. This indicates that associative relatedness does not exclusively depend on conceptual mappings but may also be influenced by factors such as lexical/semantic similarities between the words in the poems and the target words, the participants’ background knowledge or the context in which the metaphors are embedded. The implications of this project will be discussed for psycholinguistic theories of figurative language comprehension in literary narratives.
A SCALE TO MEASURE PARENTING SELF-REGULATION ‘ME AS A PARENT’: THE STUDY OF ADAPTATION TO TURKISH

Özge Sariot Ertürk
Yaşar Kuzucu
Çiğdem Dereboy
Adnan Menderes University (Aydın, Turkey)

This study aims to investigate psychometric properties of the scale ‘Me As a Parent’ in Turkish parents. The scale developed by Hamilton, Matthews and Crawford (2014) to measure parents’ perceptions of their self-regulation as a parent. In the current study, first of all, 16 items, 4 dimensions involved scale was translated in Turkish through the translation back translation procedure. The scale was filled by parents who have child age between 6 months- 12 years. 637 participants were reached via children’s school and the google forms application. In order to test reliability and validity of the scale Exploratory Factor Analysis (EFA) conducted, item total correlation calculated and scores of participants at the upper and the bottom 27% part were compared. After this first wave tests 5 items were taken out of the scale due to the unexpected EFA, item-total correlation values. With the reminder 11 items addition to the same analysis Confirmatory Factor Analysis (CFA) and IRT Graded Response Model (GRM) test were conducted, Cronbach Alpha value was calculated for the scale. Results indicated that, this scale in Turkish has a one factor structure with 4.97 eigenvalue, 45% explained variance. CFA results ($\chi^2 = 66.71$, $Sd = 44$, $\chi^2/Sd =1.51$, $AGFI = .90$, $GFI = .93$, $CFI= .78$, $SRMR = .15$, $RMSEA = .05$) also support this one factor structure. In terms of reliability, item-total correlation scores change between .44-.66. Moreover, when mean scores of participants who are at the upper and the bottom 27% part compared for each item, t values change between 7.29 ($p< .001$) — 10.94 ($p< .001$). Cronbach Alpa score for the scale was calculated as .87. Lastly, the results of IRT GRM showed that all items have acceptable differential item functioning and the scale is better to detect parents who have parenting self-regulation perception at the lower level. As a result, ‘Me As a Parent’ is also reliable and valid scale to measure perception of parenting self-regulation among Turkish parents.
THE INTENTIONAL FORGETTING REQUIRES A MEANS OF DOING SO

Alena Gofman
Lomonosov Moscow State University (Moscow, Russia)

In the present research we first reviewed the main findings relevant to the problem of intentional forgetting with focus on the lack of systematic research isolating a conscious mnemonic goal from other variables thought to affect forgetting. From the perspective of this critique, we assumed that it would be reasonable to examine whether the intention to forget itself decreases the probability to retrieve the to-be forgotten stimulus or the mnemonic goal should be combined with forgetting-evoking means. We reported the empirical study intended to shed light on the independence of interdependence of intention to forget and forgetting-evoking means in recognition tests at a short and a long (two months) delays. 20 Russian — made up language word pairs were exposed to participants (N=71) three times. They then viewed each Russian word from a pair once, with randomized instructions “Forget”, “Remember”, “Repeat”, “Forget by generating associations to the Russian word” or a short cognitive task. Self-reports on the mnemonic strategies were collected. Recognition tests were administered two times — four hours and two months (N=32) later. The probability to succeed by chance was 1 to 3. The main findings consisted of the fact that at two months delay at p<.05 the made-up words in the “Forget” and the “Remember” conditions were recognized the best, the words that were not processed in the context of any conscious mnemonic goals (“Repeat” and “Task”) were recognized worse, and the words in the “Forget by generating associations to the Russian word” condition were recognized the worst. This result brings us to the conclusion that the intention to achieve any goal with mnemonic content itself protects material from forgetting at long time intervals. In contrast, the conjunction of mnemonic goal with congruent means might form a psychological tool that makes possible to keep the initial intention effective.
WHAT IS KNOWN ABOUT THE IMPACT OF NURTURING APPROACHES THROUGH A WHOLE SCHOOL LENS?

Elizabeth Hannah
Elizabeth Lakin
University of Dundee (Dundee, United Kingdom)

Amy Nolan
(Renfrewshire, United Kingdom)

Nurture Groups (NGs) were introduced in the 1970s in the Inner London Education Authority in response to large numbers of vulnerable children starting school with emotional and behavioural needs (Reynolds, MacKay, & Kearney, 2009). They aim to close the gap for children who have not had essential early learning experiences allowing them to operate both socially and emotionally (Doyle, 2003). Despite a range of research on the impact of NGs (Binnie & Allen, 2008; Lyon 2017), less is known about whole school nurture, which involves applying the principles and practices of NGs across the whole school community. This literature review aims to investigate the current state of knowledge regarding the impact of nurturing approaches through a whole school lens. The review adopts a systematic approach employing a seven-stage framework (Petticrew & Roberts, 2006). A total of 146 papers are retrieved from the databases search, of which 61 are duplicate papers. Eighty-five papers are then screened using inclusion and exclusion criteria, resulting in thirteen papers for appraisal and synthesis. Findings from these papers suggest that nurturing approaches can have a positive impact on: pupils’ social, emotional and behavioural needs, pupils’ academic progress, pupils in the mainstream class/school, parents and home life, and the whole school. Additionally, it is suggested that the length of time a nurturing approach is in place has an impact on its effectiveness. NGs operable for more than two years have a greater impact on pupils than those in place for less than two years. Limitations and implications for future research are discussed. Few papers focused primarily on whole school nurture, the majority concerned NGs. More research is therefore needed on whole school nurturing approaches, specifically within in the secondary context. Better quality and more robust research is required in this field. Several papers had methodological weaknesses thereby limiting replication and raising questions regarding data quality and reliability.
SUSTAINABLE QUALITY PERCEPTIONS AND CONSEQUENCES: EMPLOYEE WELLBEING, INTENTION TO LEAVE AND EMPLOYEE PERFORMANCE

Selma Arikan
Bilal Çankır
Istanbul Medeniyet University (Istanbul, Turkey)

Employees’ work related attitudes are affected by their perceptions about their employers and organizations. Employees are generally proud of being the part of successful organizations and being an employee of a successful company is a kind of motivator itself. Sustainable quality perceptions are one of the success criteria that employees take into consideration while they are evaluating their organizations (Çankır and Şahin, 2018). In this study we aimed to find out the role of employees’ sustainable quality perceptions on employees’ intentions to leave and performances. Besides figuring out those associations we also wanted to analyze the mediating role of employee wellbeing in these relations. Our participants consisted of 659 full time employees working in the finance and food sectors in Istanbul. The data were gathered by using survey methodology by using Çankır and Eti’s (2017) 13-item Sustainable Quality Perception Scale, Diener et al.’s (2009) 8-item Wellbeing Scale, Babin and Boles’ (1998) 3 item Intention to Leave Scale, and Kirkman and Rosen’s (1999) 4 item Performance Scale. The data were analyzed by using simple, multiple and hierarchical regression analysis, and Sobel tests. The results showed that sustainable quality perceptions predicted employee wellbeing (R2:.26, F: 229.755, β:.509, p<.01), intention to leave (R2:0.006, F:4.096, β:-0.079, p<.05) and employees’ performances (R2:.14, F:103,650, β:.369, p<.01). The hierarchical regression analysis and Sobel tests also showed that employee wellbeing acted as a partial mediator between sustainable quality perceptions and performance (Sobel:3.697, p<.001), and a full mediator between sustainable quality perceptions and intention to leave (Sobel:3.384, p<.0001). The results once again denoted that quality related efforts of the companies not only have implications on product or service quality and consumer satisfaction, but also on employee wellbeing and related variables as well. Further studies on the antecedents of the sustainable quality perceptions are critical for guiding the organizations, as they also have the potential to point out the possible precursors of employee wellbeing, intention to leave and employee performance.
Family life is frequently described as a context that supports adult moral and provides trust and support for children (Hoffman, Ushpiz & Levy-Shiff, 1988; Larson, 1983; Ryan & Lynch, 1989). Collapsing family routines by various reasons can cause adverse outcomes. Family unpredictability is described as a lack of consistency regarding family behaviors and regulatory systems (Ross & Hill, 2000). The concept of family unpredictability that is based on attachment theory and learned helplessness theory has six major dimensions: financial matters, routine family meals, mother nurturance, father nurturance, mother discipline, father discipline. Financial matters evaluates whether the income was satisfying and counterbalanced family need. Routine family meals is about whether meal times were stable and with the same persons. Nurturance evaluates whether the child could reach mother/father when he/she needed. Discipline is about whether the child took the same reaction when he/she made a mistake. Studies have shown that childhood family unpredictability is associated with adverse outcomes in childhood and adulthood (Carlton et al., 2006; Obradovic, Bush, Stamperdahl, Adler & Boyce, 2010; Patterson, Ross & Hill, 2000; Wachs, 2000). The aim of this study is evaluating the psychological symptoms of people who grew in a chaotic family. The sample of the study consisted of 248 (144 female [50,7%] and 140 male [49,3%]) undergraduates (age range: 18-29) of Hacettepe University. Retrospective Family Unpredictability Scale and Symptom Check List-90 were used to collect data. To analyze the data, structural equation modelling was used. Firstly, measurement model was tested. It yielded acceptable goodness-of-fit indices. Then, structural equation model was tested. It also yielded acceptable goodness-of-fit indices: $\chi^2 (98, N = 284) = 199.373, CFI = .953, RMSEA = .060 (90\% CI: .049-.072)$. Family unpredictability explained 12% of the psychological symptoms variance. In accordance with literature, it is concluded that family unpredictability can increase psychological symptomatology and effect psychological well-being negatively (Carlton et al., 2006; Ross & Hill, 2000). It is possible that unpredictability in family causes emotion of despair, and eventually psychological symptomatology. Intervention programs are needed for families who live in a chaotic family environment.
INTERPERSONAL SENSITIVITY, LONELINESS AND IMPULSIVITY AS PREDICTORS OF SMART PHONE ADDICTION AMONG UNIVERSITY STUDENTS

Merve Malas
Fatih Sultan Mehmet Foundation University (Istanbul, Turkey)

Selma Arıkan
Medeniyet University (Istanbul, Turkey)

Besides their benefits and easiness they brought in our lives, smartphones have the potential to create problems like misuse of the phones, disruption of social relations, and risk of addiction (Gönül 2002, Kwon et al, 2013; Young, 2004). In many ways smartphone addiction is similar to internet addiction, and it contains the characteristics of other technology and behavior addictions (Cha and Seo, 2018). It seems to be a growing problem especially for the adolescents and youngsters. In this study we aimed to understand the role of interpersonal sensitivity, loneliness and impulsivity on smartphone addiction among the university students. We believe that determining the potential antecedents and risks for smartphone addiction might help the families and professional to take some precautions for this problem. With this purpose, we gathered data from 200 university students that continue their undergraduate education at the universities located in Istanbul. Smartphone Addiction Scale (Kwon, 2013) which was adapted to Turkish by Demirci et al. (2014); UCLA Loneliness Scale which was developed by Russell, Peplau and Ferguson (1978) and translated to Turkish by Demir (1989); The Interpersonal Sensitivity Measure (IPSM) of Boyce, and Parker (1989) that was validated for Turkish Culture by Doğan and Sapmaz (2012); UPPS Impulsive Behavior Scale (Whiteside and Lynam, 2001), that was translated to Turkish by Yarıçığ, et al. (2011); and demographic information form were completed by the participants. The multiple regression analysis showed that Interpersonal Sensitivity scores (β: .218, t:3.822 , p<.01), and Impulsivity scores (β: .191, t:2.833, p<.01) significantly predicted Smartphone Addiction Scores of university students (R²: .10, F: 8026, p<.01). We also analyzed the predictiveness of subdimensions of these two variables on Smartphone Addiction. For Interpersonal Sensitivity, Interpersonal Worry and Dependency dimension explained the variance in Smartphone addiction scores (β: .293, t:4308, p<.01) (R²: .09, F: 18, 556, p<.01). For Impulsive Behavior, Sensation Seeking (β: .179, t:3.149, p<.01) and Urgency (β: .591, t:10.378, p<.01) dimensions significantly predicted the smartphone addiction (R²: .469, F: 87.015, p<.01). The results indicated that interpersonally sensitive and impulsive students seemed to be more prone to smartphone addiction; and parents and psychologists dealing with adolescents can consider these variables as potential risk factors for smartphone addiction.
POSTTRAUMATIC STRESS AMONG SYRIAN REFUGEES: THE ROLE OF TRAUMA CENTRALITY, DISTORTED COGNITIONS AND TRAUMA COPING SELF-EFFICACY

Chung Man Cheung
Chinese University of Hong Kong (Hong Kong, China)

Mudar Shakra
Uppsala University (Uppsala, Sweden)

Among Syrian refugees, trauma exposure characteristics following the war are associated with trauma centrality which is also associated with posttraumatic stress disorder (PTSD) and psychiatric co-morbidity. Generalized self-efficacy can mediate the impact of trauma centrality on distress (Chung et al., 2018 2018). These studies, however, have not taken account of distorted cognitive schemas which, according to the self-trauma model (Briere, 1996), can result from the trauma. Also, whilst generalized self-efficacy has been examined, the impact of trauma coping self-efficacy on distress is unknown. The present study aimed to 1) provide further evidence on the link between trauma exposure characteristics, trauma centrality and distress outcomes (PTSD and psychiatric co-morbidity), and 2) examine whether cognitive distortions and trauma coping self-efficacy would mediate the impact of trauma centrality on distress among Syrian refugees. Methods: 475 (F=210, M=265) Syrian refugees with the mean age of 34.06 (SD=11.14) were recruited from a city in Sweden and completed the Harvard Trauma Questionnaire, General Health Questionnaire-28, Centrality of Event Scale, Cognitive Distortion Scales and Trauma Coping Self-Efficacy. Controlling for demographic variables, initial regression analyses established significant associations between trauma exposure characteristics (in particular, direct and indirect experience of horrifying events during the war), trauma centrality, PTSD and psychiatric co-morbidity. These associations, however, became non-significant after inserting distorted cognitions and trauma coping self-efficacy into the model. Trauma coping self-efficacy mediated the impact of cognitive distortions on both distress outcomes. Whilst the subjective experience of war and war-induced changes in life courses, personal beliefs, future expectations, meaning attribution and personal identity can influence psychological distress among refugees, self-schematic changes characterized by self-criticism, a feeling of helplessness or hopelessness, and adopting specific coping strategies for managing the traumatic experience, trauma-related emotions, thoughts, as well as finding meanings and accepting what has happened to them seem to have a much bigger impact on refugees' distress.
HOW RELATEDNESS NEED-SATISFACTION/FRUSTRATION AND MOTIVATION RELATE TO WELL-BEING IN THE DOMAIN OF SOCIAL NETWORK SITES

Yunxiang Chen
Ruoxuan Li
Xiangping Liu
Beijing Normal University (Beijing, China)

Over years, the popularity of social network sites (SNS) has increased rapidly. As one of three basic psychological needs, relatedness need satisfaction (RNS) and frustration (RNF) may trigger different motivations (autonomous vs. controlled) and in turn, affect individuals’ well-being in the context of SNS. Using self-determination theory as a theoretical framework, this study aimed to investigate the hypothesized associations noted above. Participants were 494 freshmen (Mage = 18.810 ± .918, 190 males) randomly recruited from two universities in China. Data were collected through four self-reported questionnaires: RNS and RNF, autonomous and controlled motivation, positive and negative affect in SNS, and general subjective well-being in SNS. Structural equation modeling (SEM) was conducted with Mplus 7.4 to test the main hypothesis; moreover, demographic (i.e., gender and age) and socioeconomic status variables (i.e., parents’ education level and occupation) were controlled in SEM. Demographic variables like gender were found to be associated with the observed scores for general well-being in SNS (β = .086, p = .049), with girls reporting higher than boys. Model fits were adequate in the measurement model, direct effect model, and indirect effect model. The hypothesized model was supported: autonomous and controlled motivation partially mediated the relationship between RNS/RNF and well-being in SNS. Specifically, RNS only significantly predicted positive affect in SNS (β = .402, p = .000), which was only mediated by autonomous motivation (total effect = .075, p = .034; mediation effect = .078, p = .016). In contrast, RNF only significantly predicted negative affect in SNS (β = .567, p = .000), which was only mediated by controlled motivation (total effect = .103, p = .028; mediation effect = .104, p = .027). Building upon the findings of this study, it can be concluded that individuals’ RNS and RNF play pivotal but distinct role in shaping individuals’ motivation and further exert important influence in the level of well-being and ill-being during the SNS usage. Future research should further reveal how we can prevent relatedness need from being frustrated and facilitate its satisfaction in order to better promote individuals’ positive experiences in SNS.
NEED SATISFACTION AND FRUSTRATION PROFILES AND THEIR RELATIONS WITH SNSS OUTCOMES: A PERSON-CENTERED APPROACH

Ruoxuan Li
Yunxiang Chen
Meilin Yao
Hongrui Liu
Beijing Normal University (Beijing, China)

Self-determination theory (SDT) proposes that need satisfaction and frustration are two distinct concepts, both of which exert considerable impacts on individuals’ functioning. To our knowledge, however, limited studies have explored how need satisfaction and frustration are combined with each other and whether their different configurations relate to different levels of well-being and ill-being, especially in social networking sites (SNSs) domain, by using a person-centered approach. This study is designed to explore these issues among Chinese university students. Total of 491 participants (Mage = 18.78, SD = 0.80, 38.30% males) completed self-report questionnaire assessing their offline basic psychological need satisfaction and frustration, life satisfaction, relationship satisfaction, SNSs related well-being (overall satisfaction, flow, positive affect and negative affect), and SNSs addiction. Descriptive statistics was conducted by SPSS 20.0 and latent profile analysis (LPA) was conducted by Mplus 7.4. Four profiles were identified: moderate, satisfied and frustrated, unsatisfied and frustrated, and satisfied and un-frustrated. Results found that satisfied and un-frustrated students demonstrated the most optimal pattern, with higher general and SNSs related well-being and lower SNSs addiction; while unsatisfied and frustrated students seemed to be associated with the most maladaptive pattern, with experiencing lower well-being and showing higher SNSs addiction. As for satisfied and frustrated students, they demonstrated dual characters, i.e., reporting relatively higher SNSs-related well-being (especially flow in SNSs), and showing relatively higher SNSs addiction. The distinct psychological need profiles provide evidence for the differentiation of need satisfaction and frustration, further enriching the extant literatures. Moreover, our results—need satisfied users seems closely linked with demonstrating more positive experience in SNSs, and frustrated users, with more negative experience in SNSs—support social enhancement hypothesis that "richer get richer while poor get poor". Overall, the study contributes a better understanding of the association between individuals’ need profiles (offline) and their general and SNSs related well-being and ill-being.
Entrepreneurship has been recognized as the foundation of economic growth, and benefits the society in many aspects. This study aims to untangle the role of team diversity as a predictor of innovative behavior in entrepreneurial teams. It is expected to extend previous research that examines entrepreneurial team process and effectiveness, and explores how team diversity contributes to team outcomes. To do so, the current study, firstly explore team diversity variables and examine their relationship with innovative behavior. Further, this study examines the possible moderating effects of psychological safety climate. The study adopts a quantitative approach. Participants were 110 employees from 30 entrepreneurial teams. All members within an entrepreneurial team are required to finish 2 questionnaires, which were collected with a time-lagged design. The hypothesized model was tested using two-level structural equation model. The results found support for the diversity-performance link. A certain level of team diversity will have a positive effect on individual innovative behavior, also, psychological safety moderates the relationship between role diversity and innovative behavior. Finally, the implications for practitioners and scholars in the field of entrepreneurship, as well as the limitations will be addressed.
THE INFLUENCE OF POSITIVE PARENTING STYLES ON COPING STYLES OF MIDDLE SCHOOL STUDENTS: MULTIPLE CHAIN MEDIATION OF SOCIAL SUPPORT AND SELF-EFFICACY

Xueming Chen
Xueling Weng
Tour Liu
Tianjin Normal University (Tianjin, China)

Different individuals have different coping styles will lead to completely different consequences when they are facing the same problem. Previous studies had proved that many factors could influence coping style. Positive parenting style is one of the most crucial one. This study focused on exploring the mechanism that how positive parenting styles affected individuals’ coping styles. The present study hypothesized that self-efficacy and social support worked as mediating variables between positive parenting style and coping style. 3784 middle school students took Egna Minnen av Barndoms Uppforstran-own memories of parental rearing practice in childhood (EMBU), Social Support Scale (SSS), General Self-Efficacy Scale (GSES) and Simple Coping Style Scale (SCSS). SPSS 24.0 and Mplus 8.0 were used to process data and construct multiple latent mediated models. The correlation matrix showed that positive parenting style, social support, and self-efficacy had positively relationship with positive coping style respectively, but had no relationship with negative coping style. Multiple latent mediated models results indicated that objective support and support utilization together with self-efficacy played a partial mediated role between positive parenting style and positive coping style, with the mediating effect size of 52.48 % and 51.68 %. While subjective support had an indirectly positive predictive effect on positive coping style, it positively predicted self-efficacy, and self-efficacy furtherly predicted positive coping style, which formed a multiple chain mediated model. The mediated effect accounted for 41.06 % of the total effect. The model results showed that positive parenting style were not the direct predictor of positive coping style, it can indirectly affect positive coping style through the multiple mediation composed of objective support and support utilization together with self-efficacy and through the chain mediation composed of subjective support and self-efficacy.
JOB BURNOUT MEDIATES THE RELATIONSHIP BETWEEN ILLEGITIMATE TASKS AND JOB PERFORMANCE

Beata Basinska
Gdansk University of Technology (Gdańsk, Poland)

Ewa Gruszczyńska
SWPS University of Social Sciences and Humanities (Warsaw, Poland)

Wilmar Schaufeli
Utrecht University (Utrecht, Netherlands)

The Job Demands-Resources theory (Bakker & Demerouti, 2014) assumes that health impairment process due to chronic job demands may drain personal resources and therefore lead to individual (health problems) and organizational costs (reducing job performance). The aim of the study was to examine an indirect role of job burnout in the relationship between job demands and performance. Job burnout was described as primary symptoms (exhaustion, mental distance, loss of cognitive and emotional control) and secondary symptoms (psychological distress and psychosomatic complaints). The results of previous studies demonstrated that organizational demands to be more taxing than professional demands. In particular, job performance, both, in-role and extra-role, may be affected by work overload and illegitimate tasks (red tape). The group of 293 white-collar workers took part in a survey. The following assessment methods were used: the Job Demands-Resources Questionnaire (Schaufeli, 2015) and the Burnout Assessment Tool (Desart, Schaufeli, De Witte, 2017). In a cross-sectional design, model with parallel mediators, i.e. symptoms of job burnout, was tested using the PROCESS macro version 3.1 (Hayes, 2018). The white-collar workers most often reported symptoms of exhaustion and psychological distress. Work overload and red tape correlated significantly with primary and secondary burnout symptoms (small to medium effect sizes), with the only exception for relationship between work overload and loss of cognitive control. After controlling of work overload, the relationship between red tape and in-role performance was partially mediated via mental distance and loss of cognitive control (total indirect effect = -.09 95% CI [-.14; -.05]), whereas the relationship between red tape and extra-role performance was fully mediated via loss of cognitive control only (total indirect effect = -.07 95%CI [-.13; -.04]). The new method of burnout measurement allows to examine how primary symptoms of job burnout magnify health impairment process between job demands and performance. Illegitimate tasks increase psychological costs of work (loss of cognitive control and mental distance) and thereby are associated with worse job performance. Funded by the National Science Centre, Poland, grant no. UMO-2017/26/M/HS6/00451
THE INFLUENCE OF SOCIAL COMPARISON ON COLLEGE STUDENTS' SUBJECTIVE WELL-BEING IN SOCIAL NETWORKS

Yuan Jiang
Chen Chen
Beijing Sport University (Beijing, China)

Subjective Well-being is the evaluation of people’s satisfaction with their own life. Social comparison is the comparison of one’s own views and abilities with others. In order to study the influence of social comparison of different directions and categories on college students’ subjective well-being in the use of social networks, 176 college students were selected, between the ages of 18 and 22, half of men and women, with the method of experiment and questionnaire, to investigate the influence of social comparison direction and category on the subjective well-being of college students in the use of social networks. The results of social studies show that: (1) There is no significant difference between implicit and explicit social comparison categories on the subjective well-being of college students; (2) There are significant differences between the upward and downward social comparative direction on the subjective well-being of college students; (3) The interaction of social comparison direction and category has a significant effect on the subjective well-being of college students; (4) The influence of downlink implicit social comparison, uplink explicit social comparison, uplink implicit social comparison and downlink explicit social comparison on college students’ subjective well-being is from low to high. The study recommends that: In the use of social networks, the downward social comparison of college students can effectively enhance subjective well-being, and the explicit social comparison is more obvious than the implicit social comparison.
The purpose of the research is to study the psychological problems of adolescents in different socio-economic conditions. Social stressors are acting in the adolescence together with normative, age-related crisis; therefore, adolescents become the part of society that is strongly dependent from changes in socio-economic conditions. The research is based on L.Vygotsky's cultural-historical theory, the works of S.Rubinstein, A.Leontiev, and W. Bronfenbrenner’s theory of ecological systems. The ‘Problem Questionnaire’ by I. Seiffge-Krenke was used in the study conducted from 1993 to 2015. More than 4500 teenagers from Germany, Russia, Vietnam, China, West Africa took part in it. The use of the same tool opened opportunities for comparative analysis of the adolescent’s psychological problems in cultures with different conditions of socialization. The results of cross-cultural research reflect the differentiated influence of socio-economic factors, represented on macro, meso, and microenvironment level. Comparative analysis of the problematic experiences of adolescents living in different cultures during the period of socio-economic crisis and recovery shows that some age-related psychological characteristics remain constant regardless of sociocultural conditions and others are affected by them. The first ones are relations with parents and peer relations. The second are the attitude to the future, to leisure time and to themselves. The influence of the society strongly appears in the situations of social upheaval or the fall of economy. However, traditional for the society forms of relationships also have a significant impact to micro-social groups. Psychological services for adolescents are developing around the world. One of their tasks is to solve the psychological problems of adolescents in communication, learning and self-assessment. The educational programs for parents and teachers, psychological support to adolescents, designed according the socio-economic conditions of their development and individual characteristics are very important. During twenty years of work of L.Regush’s scientific school was created a new questionnaire “Psychological problems of adolescents”, which was standardized on Russian sample of adolescents aged 13–16 years. Its main scales were changed according to the most relevant areas of Russian adolescents’ problem experience: school, future, parents, peers, self-attitude, leisure, health, society.
Data obtained in empirical Psychological studies are always analyzed with statistical tests. Many of these statistical tests (e.g., t-test) assume that a distribution of the data has a normal distribution. Many scientists consider this assumption satisfied because of the central limit theorem. This theorem says that variables always form a normal distribution when these variables are sums or averages computed from a specific number of other variables that are randomly sampled from an arbitrary distribution. Consider some experiment testing human participants. Some dependent variable is measured multiple times and an average of the measured variables is computed for each participant. Note that these averaged variables were collected from multiple participants that do not form a normal distribution because a condition of the central limit theorem has not been satisfied. Randomness of the dependent variable within the individual participants and the randomness of the averaged dependent variable across the participants are taken from completely different mechanisms. The central limit theorem can be applied only when these two types of random variables have identical distributions. We tested how this violation of this condition affects the results of a t-test in computer simulations using the Monte-Carlo method. The frequency of rejecting the Null hypothesis was measured under a condition in which the Null hypothesis had actually been satisfied. Two sets of random variables were sampled from a single, non-normal distribution and they were compared by using an unpaired t-test. The significance level of the t-test was 5%. The non-normal distribution was generated by combining two Gaussian functions with identical width and height but with different positions. We controlled the number of the samples from the distribution and distance between the Gaussian functions as independent variables. The session was repeated one million times for each condition. The results of these simulations showed that the null hypothesis was rejected more frequently than 5% with the non-normal distribution (e.g. 5.7% when the sample size was 4 and the distance was twice that of the full-width-at-half-maximum of the Gaussian functions). Clearly, the type-1 error in empirical studies was potentially more frequent than many people must have thought.
PREDICTORS OF SOCIAL PARTICIPATION AND WELL-BEING IN HOMELESS CLIENTS: A STRUCTURAL EQUATION MODEL

Miranda Rutenfrans-Stupar  
Tilburg University (Tilburg, Netherlands), SMO Breda e.o. (Breda, Netherlands)

Tine Van Regenmortel  
Catholic University of Leuven (Leuven, Belgium), Tilburg University (Tilburg, Netherlands)

René Schalk  
Tilburg University (Tilburg, Netherlands)

A contemporary approach to support the homeless is usually to offer them housing, but this alone is not sufficient to improve their social participation and well-being. For example, the evaluation of the Housing First Europe project showed positive results in ending homelessness, but it also showed negative side effects such as loneliness and social isolation (Busch-Geersema, 2013). Research also showed that social participation enhances well-being and happiness (Eurostat, 2010). Consequently, it is necessary to examine which factors enhance social participation and well-being. In the present study we examined care-related and demographic predictors of well-being among 225 homeless clients of a Dutch organization providing shelter services and ambulatory care (shelter facility). The role of social participation as a mediator was considered. In this study we used the following care-related predictors: (1) participation in various group activities in the shelter facility, and (2) client’s experiences with care, such as their satisfaction with the social worker and the shelter facility. Additionally, age and education level were included as demographic predictors. Results from Structural Equation Modeling showed that the client’s experiences with care and education level were predictors of well-being with a mediating role of social participation, and that participation in activities at the shelter facility was a direct predictor of well-being ($\chi^2/df = 1.668$, CFI = .961, RMSEA = .055). However, age was not significantly related to social participation or well-being. These findings indicate the importance of social participation. Moreover, we suggest that interventions for the homeless should be based on a combination of individual and group approaches. Special attention should be given to the client-worker relationship and to client satisfaction. Unfortunately, some Dutch (mental) health care institutions have been implementing cost-cutting measures recently, and have stopped offering activity programs to clients. However, we believe that group-based interventions can actually help to save costs, especially when parts of the individual programs are substituted by group work. Clearly, more research regarding the cost-effectiveness of activity-based programs would be helpful.
GROWTH THROUGH PARTICIPATION: A LONGITUDINAL STUDY OF A PARTICIPATION-BASED INTERVENTION FOR (FORMERLY) HOMELESS CLIENTS

Miranda Rutenfrans-Stupar
Tilburg University (Tilburg, Netherlands), SMO Breda e.o. (Breda, Netherlands)

René Schalk
Tilburg University (Tilburg, Netherlands)

Tine Van Regenmortel
Catholic University of Leuven (Leuven, Belgium), Tilburg University (Tilburg, Netherlands)

The current longitudinal study examined a participation-based intervention for homeless and formerly homeless clients, Growth Through Participation (GTP), developed by a Dutch organization providing shelter services and ambulatory care. GTP is based on a combination of group and individual approaches, whereby clients are enabled to learn to identify their strengths and talents, to develop social skills through interaction with each other, and to learn to once more lead a structured life (SMO Breda, 2014). GTP is based on principles of a strength-based approach (Rapp & Goscha, 2012; Wolf, 2016) and also includes organizational aspects (e.g., leadership styles, organizational culture, and work engagement). GTP aims to enhance social participation and quality of life among (formerly) homeless clients. The present study was conducted among 172 (formerly) homeless clients and comprised three measurement time points. It examined whether (1) quality of life increased during the GTP intervention; (2) social participation (e.g., labor/recreation), self-esteem, clients’ experiences with care (i.e., satisfaction with the services received and with the client-worker relationship), and psychological distress improved during GTP; (3) clients exhibiting psychological distress benefit more from GTP than others. Results from Latent Growth Modeling showed that quality of life (M(T1) = 59.70, m = .92, p = .04) and the amount of time clients spent on labor activities (M(T1) = 5.83, m = .72, p = .02) increased significantly, but the amount of time clients spent on recreational activities (M(T1) = 16.60, m = -2.53, p = .03) decreased over time. Clients with psychological distress experienced increased quality of life (m = 2.56, p < .001) and self-esteem (m = 1.09; p < .001), and reduced psychological distress (m = -.15; p <.001). Other variables did not significantly change during GTP. Although not all hypotheses were (fully) confirmed, it can be concluded that GTP seems to be a potentially promising intervention. Hence, it is in line with government policy in the Netherlands and various other Western countries, because it enhances an important aspect of social participation (i.e., labor) and quality of life. It is recommendable to conduct a multisite RCT to determine the efficacy of GTP.
HOW IS PARTICIPATION RELATED TO WELL-BEING OF HOMELESS PEOPLE? AN EXPLORATIVE QUALITATIVE STUDY IN A DUTCH SHELTER FACILITY

Miranda Rutenfrans-Stupar
Tilburg University (Tilburg, Netherlands), SMO Breda e.o. (Tilburg, Netherlands)

Tine Van Regenmortel
Catholic University of Leuven (Leuven, Belgium), Tilburg University (Tilburg, Netherlands)

René Schalk

Bo Van Der Plas

Rick Den Haan
SMO Breda e.o. (Breda, Netherlands)

Social participation, defined as ‘a person’s involvement in activities that provides interaction with others in society’ (Levasseur et al., 2010), is a high priority issue for the Dutch government and the European Union, because it enhances well-being and brings happiness (Eurostat, 2010; Wallace & Pichler, 2009). For the large majority of homeless people, participation is not self-evident because they are often socially isolated (Van Straaten et al., 2016). The current research is conducted within a Dutch homeless shelter facility that offers educational, recreational, and labor activities to clients in an environment which is designed to feel safe (an enabling niche). The main aim of these activities is to facilitate social participation. We conducted two qualitative studies consisting of 16 semi-structured interviews, to explore clients’ experiences with participation in activities in relation to their well-being. Data analysis consisted of transcribing data, followed by structuring the participants’ answers in a meta-matrix (Miles & Huberman, 1994) and using color codes to distinguish relevant quotes associated with the different themes. By using this method, we were able to explore the answers from each individual participant in detail and we were able to perform systematic comparisons between participants. Findings showed that clients experienced that participation had led to an improvement of physical, social, and mental well-being. In general, clients reported that due to participation in activities they have strengthened their social support network, improved their (mental and physical) health, self-esteem and personal growth. We concluded that in order to facilitate lasting positive outcomes of participation in practice, it is necessary to focus on group cohesion, and on the social worker’s behavior and attitude. Finally, we recommended to conduct future research on participation in activities in society as a whole (i.e., one step further than participation in activities in a shelter facility) and the steps that are necessary to accomplish social participation.
THE MECHANISM OF GENDER-EMOTION STEREOTYPES: BASED ON DUAL-PROCESSING THEORY

Ping Fang
Yan Ma
Capital Normal University (Beijing, China)

Wen Long Zhu
Beijing Normal University (Beijing, China)

Yuan Jiang
Beijing Sport University (Beijing, China)

Stereotype is one of the core issues in social and psychological fields because of its significant impact on information processing in social cognition. The internal mechanism of stereotypes, however, is still uncertain. The stereotypical response tendency is commonly considered as an automatic consequence of cognitive processing. Recent research, however, has found that gender-emotion stereotypes may have a bottom-up processing pathway, in addition to the well-known top-down processing one. The present study try to further confirm this dual-processing mechanism of gender-emotion stereotypes. In present study, we measured the gender-emotion stereotypes of 57 undergraduates by face recall task, and used revised process-dissociation procedure analysis to estimate the independent contribution of automatic and controlled processing to gender-emotion stereotypes. Materials for face perception were created by FaceGen Modeller 3.5. For trials asking to recall the emotional expression, no matter if emotional expressions of distractors are congruent or incongruent with the targets, the error rates of male faces with fearful expression were significantly higher than female faces with fearful expression and male faces with angry expression (ps < .001), and the error rates of female faces with angry expression were significantly higher than male faces with angry expression and female faces with fearful expression (ps < .01), indicating that participants tend to misperceive the fearful face of a male as angry and the angry face of a female as fearful. However, there was no significant difference in the comparison among all face types above in the trials of recalling gender (ps > .27). After parsing responses into automatic and controlled components of stereotypical perception tendency of emotional expressions by revised process-dissociation procedure analysis, the one sample t-test with Saut and Scon were both significantly greater than zero, indicating that stereotype may include not only an automatic processing, but also an independent contribution from the controlled processing pathway. The revised process-dissociation procedure analysis confirmed that both automatic and controlled processing have their own independent effects on gender-emotion stereotypes.
Infertility stands as a stressful life event affecting many individuals, especially women (Domar et al., 2000). These individuals have limited access to professional psychological help (Read et al., 2014) and they have increasingly been choosing internet to obtain information and get social and psychological support (Greil & McQuillan, 2004; Satir & Kavlak, 2017). The current study aims to develop and test the effectiveness of an online intervention program in meaning making of infertility. The intervention program was developed based on Wong’s Meaning Centered Therapy principles (2010). An 8-weeks online group intervention program focusing on improving the positive meaning making of infertility was held through an instant messaging program. It was implemented by a clinical psychologist to 27 women diagnosed with primary infertility. Their results on Presence of and Searching for Meaning, Post-Traumatic Growth, Stress Appraisal Measure (measuring Threat, Challenge, Controllable by Self, Controllable by Others, and Uncontrollable by Anyone in a specific stressful event) as well as depression, anxiety, hopelessness, positive and negative affect and finally infertility self-efficacy were compared with the results of 24 infertility diagnosed women in the waiting list-control group. In the pre-test post-test control group study, as expected, the online intervention was found to be effective in increasing presence of meaning and the tendency to evaluate infertility as a challenge, controllable by self and controllable by others in infertile women. Moreover, the online intervention was effective in increasing infertility self-efficacy. The current study presented promising results in terms of using internet in providing psychological support. To the best of our knowledge, this is the first study in the literature aiming to develop and the effectiveness of an online intervention in meaning making of infertility. The whole intervention or some parts of it can be adapted to and then implemented with different kinds of stressful health conditions.
COPING BEHAVIOR AS A TOOL FOR SELF-RELIANCE OF SECURITY UNDER STRESS: A GENDER ASPECT

Olesia Bubnovskaia
Far Eastern Federal University (Vladivostok, Russia)

The field of study is education with many transformations and risks. The aim is to reveal the differences of students’ coping behavior under stress. Methods are Copying Test (R.S. Lazarus); Social Readjustment Rating Scale (T.H. Holmes, R.H. Pahe); Module «Personality» of Career guide (A.G. Shmelyov); SPSS program: correlation and comparative analysis. The respondents are first-year students, 18-19 years old, 198 females and 81 males (School of Arts and Humanities, FEFU). A quarter of students is characterized by low level of psychophysical well-being and health problems, more than half — neurotic development, a fifth — low resistance to frustration. Optimism about their own health prevails over the care of them. Level of males’ neuro-physical health and well-being is higher. They are less anxious and neurotic. Females are more vulnerable, characterized by tendency to despair and to fall ill. They have higher stress load, psychosomatic problems and defense reactions. Top 5 of copings includes «Planning Solutions», «Finding Social Support», «Self-control», «Taking Responsibility» and «Positive Revaluation». Constructive coping is more common in students with low stress load. The correlation analysis revealed a direct relation between the level of stress load and the choice of non-constructive coping strategies (p<0.01). In the case of taking into account the stress level, statistically significant gender differences were established for copings: «Finding Social Support» (p<0.01) and «Planning Solutions» (p<0.05) under low stress load, «Escape-Avoidance» under threshold stress load (p<0.05); for personality traits: «Emotional stability» at all levels of stress load, «Proactive attitude» under low and high stress load, «Consent» under high stress load (p<0.05). Males are more active and emotionally stable. A comparative analysis revealed statistically significant differences in the choice of non-constructive coping strategies under threshold stress load (p<0.05). A first year student with non-constructive one is characterized by emotional instability, low level of self-control, communication problems, closure, distancing, disorganization, anxiety. This study proves the significance to develop the students’ competence to constructively cope with life difficulties. In case of stress load increase, the influence of gender and psychological personality traits on the choice of coping strategies decreases and the probability for students to choose non-constructive coping strategies increases.
CROSS-CULTURAL TESTING OF A MODEL OF INTERGROUP ANXIETY, EMOTION REGULATION, NATIONALISM, AND ETHNIC OUTGROUP AGGRESSION

Snezana Stupar-Rutenfrans
Petrouschka Verdouw
Jedidja Van Boven
University College Roosevelt (Middelburg, Netherlands)

In the current study we focus on the psychological mechanisms behind ethnic outgroup aggression in mainstream groups living in 10 countries. We proposed and tested a new model in which emotion regulation, nationalistic attitudes, and national identification all mediate the link between the intergroup anxiety, susceptibility to persuasion, and contact with ethnic outgroups on the one hand and ethnic outgroup aggression on the other. The current project is scientifically relevant as it is the first to assess a refined cross-cultural framework on the anxiety-nationalism-aggression relationship. The data set was collected using an online panel among 2,482 mainstream students living and studying in cities in the Netherlands, Serbia, Aruba, Albania, Montenegro, Russia, Turkey, Kosovo, Greece and Croatia. All constructs were assessed by measures that employed Likert-scale format (e.g., Intercultural Anxiety Scale; Susceptibility Questionnaire; National Identification Scale, Emotion Regulation Questionnaire, adapted scale on ethnic outgroup aggression), where back-to translation was applied. Multigroup path analysis supported a model in which in all mainstream groups’ emotion regulation, nationalistic attitudes and national identification mediate the relation between intergroup anxiety, susceptibility to persuasion, and contact with ethnic outgroups as antecedents, and ethnic outgroup aggression as outcome ($\chi^2 = 1028.071, p < .001; \chi^2/df = 1.955, CFI = .938, RMSEA = .02$). High intergroup anxiety toward ethnic outgroups and susceptibility were associated with low ethnic outgroup aggression, but only when emotion regulation was taken into account. More contact with ethnic outgroups was associated with more nationalistic attitudes and national identification. While nationalistic attitudes are further positively related to ethnic outgroup aggression, national identification is negatively related to the same type of aggression. Additionally, results from MANOVA showed that ethnic groups significantly differ in all assessed constructs. We concluded that intergroup anxiety, susceptibility to persuasion, contact with ethnic outgroups, emotion regulation, nationalistic attitudes and national identification are all important for the understanding of ethnic outgroup aggression in ethnically diverse societies. Future research might benefit from including Cross-Cultural Competence and Intercultural Adjustment to this model considering their important role in social attitudes formation, especially during intercultural contact.
Implcit Conception of Self-Change in Everyday Consciousness

Natalia Grishina
Marina Avanesyan
Svetlana Kostromina
Saint Petersburg State University (Saint Petersburg, Russia)

Self-schemas, salient identities, implicit theory of personality are considered as significant factors of human activity regulation and effectiveness of difficult situations' overcoming in various spheres of life [Markus, Nurius, 1988; Dweck, 1999, 2008; Lee, Jamieson, 2018]. The aim of this study is to identify which implicit concepts of human variability exist in ordinary consciousness of people and how they are related to personal readiness for changing. a semi-structured interview. Sample: N=62 (25 men, 37 women), average age is 35.3 years (SD =11.2, min — 21, max — 72). Implicit conception of changeability is characterized by a consistency of ideas about a possibility of fundamental changes in life ("start from scratch") and an opportunity of own changes (r=.29, p<0.05). The answers regarding a possibility of fundamental changes ("Is it possible to start life from scratch?") were distributed as follows: (1) recognition of possibility for changing (55%); (2) inability for fundamental changes, because a person can not forget his/her past, escape of environment and responsibilities towards his/her relatives (21.7%); (3) need for suitable circumstances (10%) (resources) or certain personal characteristics (10%). The more a person recognizes the opportunity to start his/her life from scratch, the greater the number of self-change situations in his/her life (reading literature, attending special classes, trainings) (r=.25, p<0.05). With age, a conviction about the possibility to start own life from scratch decreases (r=.30, p<0.05), a volume of statements related to personal obligations, primarily to family, children, etc. increases (r=.25, p<0.05). It turned out that men compared to women more often tend to believe that some people are able to change radically their lives, to start from scratch, and some people are not (r=.29, p<0.05). In the second study (N=30, 20 women, 10 men, average age 41.7), along with an interview, a projective test was used to explain the changes taking place in people's life. The results of both studies have shown that the process of personal change is described by respondents as reactive process, as a forced response to circumstances, and not as a proactive changing of themselves. The study was supported by Russian Foundation for Humanities, project 18-013-00703/18
ROLE OF THE SIGNIFICANT OTHER IN THE EXPERIENCE OF POST-TRAUMATIC STRESS DISORDER

María Ortúñño
Cidália Duarte
University of Porto (Porto, Portugal)

Cassiano Santos
Clinic of Psychiatry and Mental Health (Porto, Portugal), Centro Hospitalar Universitário de São João (Porto, Portugal)

PTSD is described as an intense emotional response caused by the exposure to an event that is potentially threatening to the life or health of the person or to a person close to them. Relatives, family members and significant others that live day by day with a person diagnosed with PTSD have the risk to develop Secondary Traumatic Stress Disorder, emphasized by their emotional and physical connection. This research focuses on a deep understanding of the experiences of secondary victims oriented to family, friends or significant others; knowledge their perception as well as the consequences that the traumatic event exerts in their lives. So, have a better understanding of the role of the significant others in their new reality as individual, family and social life. In a mix, voluntary and anonymous participation of significant others that are over 20 years old, semi-structured interviews were recorded by audio and, subsequently were applied with a sociodemographic questionnaire the Portuguese version of BSI, WHOQOL–Bref, IES-R and, SORTS. Through this mixed methodology, the data information is analyzed with the SPSS statistics program. The data analysis is configured by a scheme of inter-linked factors for the understanding and recognition of the role of significant others in the coexistence with the PTSD. The design is projected for data collection until June 2019. Up to now, indicators of physical and mental health problems are evidenced, with a higher percentage of emotional distress and depression versus the acquisition of self-awareness about personal competences and deprivations. The literature indicates that a person can manifest symptoms of this disorder immediately or after several years the traumatic event occurred. By analyzing the data obtained, it has been seen that the elapsed time is an important factor in the manifestation of symptoms with a proportional relation to age, social support, occupation and gender. Dealing with a new reality involving internal and external factors emphasizes the importance, interest and necessity of this research. The participation obtained underlines the value that a significant others represents, as well as the needs and responsibilities that arise within their new context of life.
FORMATION OF THE IMAGE “I AM A SUCCESSFUL PERFORMER” IN THE STRUCTURE OF THE SELF-CONCEPT OF A MUSICIAN IN THE PROCESS OF LEARNING

Marina Yumaeva
(Saratov, Russia)

The problem of the formation of the psychological readiness of a musician for performing activities is one of the most important topics in education. The purpose of the research: the identification and study of the components of the self-concept and the implementation of correctional and developmental psychological counseling aimed at forming the image «I am a successful performer». The respondents are students of the Saratov Regional College of Arts in the amount of 60 people. The hypothesis — the formation of the image "I am a successful performer" is due to the ability of the performers to adequately experience disturbing situations through targeted social and psychological learning. The technologies of cognitive-behavioral therapy (according to A. Beck and D. Beck), systematic desensitization (according to D. Volpe), the theory of experiencing F. Ye. Vasilyuk. To diagnose the dynamics of personal changes in the course of a targeted correctional and developmental program, the following methods were used: modification of the test of incomplete sentences (D. Saks and S. Levi), the alarm scale of A. Beck, test C.D. Spielberger — Yu.L. Hanina (personal and situational anxiety), content analysis of the essay “I’m on the scene”. The use of techniques of cognitive-behavioral therapy and systematic desensitization contributed to the formation of the ability to control one's own anxiety, reduced the level of anxiety of students on the stage and to achieve greater productivity of performing activities. The result of testing on a scale assessing the level of situational and personal anxiety (Ch.D. Spielberger, Yu.L. Khanin): personal (before the experiment): 63 points, (after) — 46 points; situational (before the experiment): 65 points, (after) — 37 points. The implemented psychological correctional program contributed to the formation of the image "I am a successful performer" in the I-concept and allowed us to ensure the stability and sustainability of the musician’s behavior in a concert performance. The developed psycho-correctional program allowed: to develop the skill of analyzing cognitive distortions, to transform the image of "I am a performer" in the direction of increasing self-esteem and self-esteem, to form an experience of a positive experience of the situation "I am on stage".
DIGITAL MEDIA AND YOUTH’S MENTAL HEALTH

Elena Savina
James Madison University (Harrisonburg, USA)

The proliferation of digital media significantly changed the socio-cultural context of youth’s development and the ways young people learn, communicate, and interact with others. This presentation will synthesize research on the impact of digital media on youth’s mental health. Excessive digital media use can interfere with important, formative relationships with family and peers. Parental withdrawal and unresponsiveness due to Smartphone use might have negative consequences for infants’ social-emotional development (Myruski et al., 2016). The overuse of screen media negatively affect youth’s social-emotional skills, including empathy (Hansel, 2012). Social comparison through social media is associated with body image problems and depressive symptoms (Meier & Gray, 2013; Manago et al., 2008). Overuse of digital media alters the motivational system by creating a perceived need to be constantly connected with others. The resulting fear of missing out is associated with stress (Balta et al., 2018; Morin-Major et al., 2016). The overuse of social networking might disrupt sleep which heightens risks for depression and externalizing problems in adolescents (Vernon et al., 2016). Digital media also alter reward system and might lead to Internet addition and consequent depression, substance use, aggressive behavior, and diminished cognitive control (Wang et al., 2015; Rial et al., 2018). Youths with Autism Spectrum Disorder and ADHD are at a greater risk to develop compulsive digital media use than their typically developing peers (MacMullin et al., 2016; Weiss et al., 2011). Early exposure to screen media is associated with subsequent attentional problems (Christakis, 2009). Watching fast-paced media content has a negative impact in children’s executive functioning (Lillard & Peterson, 2011). Digital media multitasking can also compromise executive functioning by overtaxing mental resources (Baumgartner et al., 2014; Courage et al., 2015). Digital media multitasking is also associated with depression and anxiety, possibly disrupting attentional control involved in affect regulation (Becker et al., 2013). The presentation will offer recommendations on how to integrate research on the impact of digital media in mental health practice with parents and youths.
THE ROLE OF PEER SUPPORT IN PRESSURED CLASS CLIMATE: FOCUSING ON THE MEDIATION OF ACADEMIC HATRED IN JD-R MODEL

Minyoung Lee
KyeongJoo Lee
Sang Min Lee
Korea University (Seoul, South Korea)

Job Demands-Resources (JD-R) model is recognized as one of the leading job stress model. JD-R proposes two processes: 1) Health impairment process: high job demands lead to strain and health impairment. 2) Motivational Process: high resources lead to increase motivation and higher productivity. Currently, this model has been applied to the school context and proves the importance of academic demands and resources related to students’ achievement and their mental health. Based on JD-R, we were focusing on the effects of interpersonal resources (i.e., peer support; PS) to academic burnout (AB) and academic engagement (AE) at pressured classroom climate caused by teacher’s academic demands. Also, we set academic hatred (AH), which is an academic emotion among Korean students, as a mediator in the relations between PS and AB/AE. Hypothesis1 (H1): PS is related positively to AE and negatively to AB. Hypothesis2 (H2): PS is negatively related to AH. Hypothesis3 (H3): AH mediates the relationship between PS and AB/AE. To test our hypotheses, we performed Multi-Group Mediation Analysis by Amos 18.0. Data was collected from 3rd-year students in 8 high school, including 43 classes, in South Korea (N=1,015, response rate 94.2%, female 57.3%) before one-month the College Scholastic Ability Test. Results are as follows. H1 was supported in HP (high level of pressured class climate group; $\beta = -.17^{***}$ at AB, $\beta = .17^{**}$ at AE), however, in LP (Low level of pressured class climate group), the effects of PS on only AE was significant ($\beta = .18^{***}$, not significant on AB). Next, H2 was supported in only HP ($\beta = -.20^{***}$) because the effect of PS on AH was not significant in LP. Finally, H3 was supported in only HP. Concretely, AH partially mediates the relations between PS and AB (indirect effect= -.095, 95% CI [-.16, -.05]), and AE (indirect effect= .127, 95% CI [.06, .21]). This study has implication which could provide an answer to the question ‘why people are able to stay enthusiastic even in a work environment where work-demand is high’.
BURNOUT, ANXIETY AND DEPRESSION IN MEDICAL PROFESSIONALS

Youri Ianakiev
Donka Keskinova
Plovdiv University (Plovdiv, Bulgaria)

Tanya Deneva
Medical University, University Hospital “St. George”
(Plovdiv, Bulgaria)

Medical profession is a stress factor for the development of burnout, symptoms of anxiety and depression as a result of 24-hour work, delayed work-life balance gratification and challenges associated with patient care. This study aimed to verify the rates of burnout, anxiety, and depression presented by health professionals working 24-hour shifts under emergency conditions. Forty-five medical professionals — physicians, biologists, chemists and laboratory technicians from the University Hospital St. George (Plovdiv, Bulgaria) were compared to 45 individuals in a control group working outside medicine. Burnout was measured using the Maslach Burnout Inventory (MBI). Anxiety and depression were measured using the State-Trait Anxiety Inventory (STAI) and Zung Self-Rating Depression Scale (SDS). Saliva cortisol by chemiluminescence enzyme immunoassay and glycosylated hemoglobin (HbA1C) (Beckman Coulter systems) were also studied as stress-related biomarkers. Data analysis was performed with IBM SPSS Statistics 25.0. The level of burnout in the subscale of emotional exhaustion was high in 96.6% of medical professionals. In the subscale of personal accomplishment, 39% had high scores. In terms of the depersonalization subscale, all of the participants showed a low level. Regarding the STAI, 22.2% and 68.9% of medical specialists showed positive score (≥40) for S-anxiety and T-anxiety scale, respectively. 11.1% indicated greater anxiety (score ≥ 55) for T-anxiety. In relation to the depression scale, 31.1% had mildly depressive states and 8.9% had moderately depressive states. Participants with a high level of emotional exhaustion presented higher results for saliva cortisol and HbA1C compared to the control group. A significant positive correlation existed between the two dimensions — emotional exhaustion and depression (r=0.683, p<0.01). In conclusion, our study verifies that there are some psychological aspects related to stress in the medical profession and may indeed be relevant for further research in order to improve individual health and decrease negative aspects of professional stress.
GENDER-RELATED PATTERNS OF PSYCHIATRIC DISORDER CLUSTERING AMONG BARIATRIC SURGERY CANDIDATES: A LATENT CLASS ANALYSIS

Leorides Duarte-Guerra
Marco Aurelio Santo
Francisco Lotufo-Neto
Bruno Coelho
Yuan-Pang Wang

University of São Paulo (São Paulo, Brazil)

Obesity and mental disorders have become major challenges to medicine. The panorama suggests that psychiatric disorders can be persistent and co-occurring, and indicates the possibility of subgroups psychopathological between patients seeking to bariatric surgery. Objective: 1) to investigate the persistence and co-occurrence, of psychiatric disorders; 2) identify clinically distinct psychopathological subgroups among patients candidates for bariatric surgery. This is a cross-sectional observational study in patients with obesity level III, awaiting bariatric surgery at the Hospital das Clínicas de São Paulo. The subjects were submitted to semi-structured interview for psychiatric diagnosis: SCID (Structured Clinical Interview for DSM-IV Axis I Diagnosis). The sample size was 393 patients (79.1% women); age mean 43 years, mean of BMI 47.8 kg/m². The persistence of disorders was defined by prevalence ratio (PR): one month-to-lifetime (1M/LT). The co-occurrence of psychiatric disorders was investigated by the tetracoric correlation analysis. The psychopathological profiles were detected by latent class analysis, differentiated by gender. Logistic regression analysis showed the influence of socio-demographic factors. Most of the sample presented 2 or more co-occurrence lifetime psychiatric disorders. Anxiety disorders were the most persistent conditions and were significantly correlated with bipolar, depressive and eating disorders. The best-fitting solution of latent class analysis, for both genders, was 3-class psychopathological. Women: (1) "oligosymptomatic" (42%) low probability of psychiatric disorders; (2) "bipolar/comorbidities" (33%); (3) "anxiety/depression" (25%). Men, (1) "bipolar/comorbidities" (47%); (2) "oligosymptomatic" (40%); (3) "anxiety/depression" (13%). For both genders, the likelihood of eating disorders was higher in both "bipolar" and "anxiety/depression" classes. Substance use disorders was prominent among "bipolar" men. In comparison with "oligosymptomatic" class, the likelihood of higher BMI was observed among "bipolar" men and poorer work attainment among men with "anxiety/depression". Psychiatric disorders are frequent and enduring conditions among patients looking for bariatric surgery. Comorbid anxiety, mood, and eating disorders are remarkable features in treatment-seeking patients with obesity. Three comorbidity profiles were detected in pre-surgical period, in patients with severe obesity. The class of "bipolar disorders" most likely presented comorbidity with eating and substance use disorder. This natural clustering of psychiatric disorders among bariatric patients suggests gender-related therapeutic approaches.
BEYOND CLINICAL DESCRIPTIONS, EXPERIMENTAL DATA SUPPORTED 
PREERVED MEMORY CONTROL FOR TRAUMA-RELATED INFORMATION 
IN PTSD

Andrei-Cristian Tudorache  
David Clarys  
University of Poitiers (Poitiers, France)  
Wissam El-Hage  
University of Tours (Tours, France)

Intrusive traumatic recollections suggest an inability in Posttraumatic Stress Disorder (PTSD) to control and notably to inhibit trauma memories. Supported by inhibitory deficits found on experimental settings in PTSD, memory functioning and memory biases in the disorder were usually explained through inhibitory and control deficits in the processing of trauma-related information. The two experimental studies presented here were designed for investigating inhibitory deficits accounts of memory biases for trauma-related information in PTSD. The first study compared 34 patients diagnosed with PTSD to 37 un-traumatised controls. The second study compared 32 participants presenting high levels of Posttraumatic Stress Symptoms (PTSS) at the PCL-5 (i.e. > 40) to 32 participants presenting low levels of PTSS (i.e. < 20). Through directed forgetting and negative priming procedures, the two studies investigated respectively controlled and automatic abilities to inhibit memorisation of Positive, Neutral, Negative and Trauma-related words. Repeated-measures ANOVAs were performed on the proportions of correctly recollected words by type of word and encoding conditions. Considering PTSD symptoms, we expected participants presenting high PTSS to be unable to inhibit their memory functioning for trauma-related stimuli. However, on both studies, while these participants recollected more trauma-related words compared to other valences and control participants, contrary to expectations, memory inhibitory abilities were specifically preserved for trauma-related words while they vanished for other information. In conclusion, rather than the expected inhibitory deficits, our results suggest that PTSS are associated with a preserved cognitive functioning and notably preserved memory inhibition abilities for trauma-related material at the expenses of other information. Considering the inability in PTSD to inhibit traumatic intrusive memories, these results appeared quite counterintuitive. Questioning links between clinical views and experimental data in PTSD, these findings additionally shed some new lights on theories of resources reallocation in PTSD.
DIFFERENT FORMS OF CIVIC ENGAGEMENT AMONG EMERGING ADULTS IN RELATION TO IDENTITY COMMITMENT AND EXPLORATION

Petek Akman Özdemir
Beykoz University (Istanbul, Turkey)

Civic engagement involves diversity of civic attitudes and behaviors such as voting and volunteering. In few empirical studies, each form of civic engagement has been examined separately in relation to identity formation. As identity formation is considered as a central developmental task of emerging adulthood, it is important to understand how young people in this developmental period explore their identities and search for ways of participating in the society. So, the aim of this study is to examine how identity exploration and commitment of emerging adults in ideological and interpersonal areas relate to political, unconventional political and community-oriented forms of civic engagement and socio-demographic variables. The sample consisted of 583 university students (49.2% female, 50.8% male) between the ages of 18 and 23 (Mage = 19.29, SD = 1.26) living in Istanbul. The Ego Identity Process Questionnaire (EIPQ) and scales measuring political voice, engagement in electoral politics, unconventional politics and community issues were administered individually. A series of hierarchical regression analyses were performed after controlling for gender, age, parental educational level and size of hometown to examine the relations between identity processes and civic engagement. Hierarchical regressions revealed that ideological exploration positively predicted involvement in community issues, unconventional political engagement and expressing political voice. Higher ideological commitment contributed to stronger engagement in electoral politics. Interpersonal exploration and commitment were not found to be related to civic engagement. Maternal educational level positively predicted political voice and unconventional politics. Women and students from relatively small hometowns were found to be more likely to engage in community issues. The results indicated that ideological exploration was the main identity process in emerging adulthood contributing to most of civic activities. Yet, engagement in electoral politics required stronger commitment. Overall, the findings suggest that identity processes associated with civic engagement vary by the form of civic engagement. The study highlights the link between identity and various forms of civic engagement. Practical and theoretical implications of findings are discussed in terms of identity theories and socio-cultural factors.
PERCEPTION OF LEADER’S FIGURES, POLITICAL TRUST AND CONFLICTS OF DECISION-MAKING TO PARTICIPATE IN GENERAL ELECTION

Andik Matulessy
Lailatul Badriyah
Tatik Meiyuntariningsih
Universitas 17 Agustus 1945 Surabaya (Surabaya, Indonesia)

In 2019, Indonesia will undergo a new phase in the practice of democracy to plan the election of presidents and vice presidents, legislative members and regional representatives council. The purpose of this study was to find out the relationship between perceptions of political leader’s figures and political trust with decision-making conflicts to participate of beginners voters in the Indonesian General Election. The results of this study found that: there was a significant positive correlation between perceptions of political leader figures with conflict of decision-making to participate in the General Election (Rho = 0.499, p <0.05); there is no significant correlation between political trust and participation decision-making conflicts to participate in the General Election (Rho = 0.023, p> 0.05).

THE JOB INSECURITY SCALES: A PSYCHOMETRIC EVALUATION OF RUSSIAN VERSIONS

Anna Smirnova
Saratov State University (Saratov, Russia)

The aim of this study was to compare the definition the job insecurity given by different authors and validate the Job Insecurity Scales (JIS) developed by (1) J. Hellgren, M. Sverke, K. A. Isaksson, (2) H. De Witte. Job insecurity (JI) has been identified as one of the most important phenomena of contemporary environment. Dynamic changes in contemporary society make JI researches relevant. Different definitions of job insecurity and three approach of the JI analysis are exists: the first define JI as a job stressor as a perceived threat of job loss, the second approach has identify qualitative and quantitative components of JI (Ashford; Greenhalgh & Rosenblatt; Hellgren, Sverke, Isaksson; Roskies & Louis Guerin). The third has identified cognitive and affective components of JI (Ashford; Borg & Elizur; De Witte). The powerless to overcomes the threatened job situation is also analyzed (Ashford, Greenhalgh & Rosenblatt; Kinnunen). The Job Insecurity Scales (JIS) developed by (1) J. Hellgren, M. Sverke, K. A. Isaksson was validate. The empirical sample of the study is industrial employees (N=588). The Confirmatory Factor Analysis (CFA) was used to test tests the invariance of the JIS structure. The result of factor analysis has improved the two factors model existence. Cronbach Alpha = 0.726 for qualitative component of JI and 0.569 for quantitative component of JI/ Take after J. Pienaar; H. De Witte, J. Hellgren, M. Sverke we administered a short version of the measure of job insecurity originally devised by H. De Witte (2000)/ The structure of the scale was evaluated based on the fit indices outlined above (χ2/df = 6,189, CFI 0,933, GFI (ACFI)=0,946 (0,898), TLI=0,901). Cronbach Alpha = 0,478 (AJI), 0,720 (CJI). Thus the Job Insecurity Scales can be considered as valid and reliable instruments to measure job insecurity and can be used for Russian sample and its comparisons with another countries.
THE NEW THEORETICAL MODEL OF JOB INSECURITY

Anna Smirnova
Saratov State University (Saratov, Russia)

The purpose of this article is a methodological analysis of perceived job insecurity (JI). The theoretical model devoted by author are discussed. JI is define as a process of experience and at the same time as a result of this experience caused by a combination of perception of job situation as the threatening of job loss (of its characteristics) as well as evaluating own personal resources as insufficient to overcome this situation. Analyzed the psychological content and structure of JI determination of the phenomenon, its consequences for the employee, organization and other social groups are discussed. The personal and group resources of overcoming and the possibility of preventing the employee from the experiencing of JI are found out. The JI considered as a collective experience. It is noted that collective memory affects the experience of JI. This research assessed the causes, consequences and moderators of job insecurity using several measurement instruments: The Career Satisfaction Scale (Greenhaus, Parasuraman, &Wormley), Organizational Justice (Colquitt) and Roch&Shanock), Perceived Stress Scale (Cohen, & Williamson ), Oldenburg Burnout Inventory (Demerouti, Mostert, & Bakker), Self-perceived Employability Scale (Rothwell & Arnold),Perceived Organizational Support Scale (Eisenberger, Huntington, Hutchinson, and Sowa), Pay Satisfaction Questionnaire (Heneman& Schwab), UWES (Schaufeli, & Bakker), Minnesota Satisfaction Questionnaire (short-form), Work-Family Conflict Scale (Netemeyer, Boles, & McMurrian), Work-related Behavior and Experience Patterns (AVEM) Scale (Schaarschmidt), Career Anchors (Shain), Job insecurity Scale (Hellgren,Sverke, &Isaksson, De Witte). The possibilities of application of eye tracking technology in job insecurity perception is discussed. Statistical methods: Pearson product-moment correlation coefficient, statistical analysis of variance (f-test), confirmatory factor analysis, structural equation modeling. The relationship between job insecurity and variables mentioned above were found out. The theoretical model of job insecurity were created. More results will be presented in the during the oral presentation.
ATTRIBUTES FOR EFFECTIVE LEADERSHIP: A COMPARATIVE EVALUATION OF MANAGERS AND SUBORDINATES IN A MULTINATIONAL ORGANIZATION

Guido Demicheli
Universidad de Valparaíso (Valparaíso, Chile)

Bibiana Ceratti
(Valparaíso, Chile)

Leadership has been a widely studied field in the organizational arena. For decades, researchers have formulated theories and models that repeatedly show its complexity and diversity of expressions. Based on a general model of observable behaviors, in 2009, Google created the Project Oxygen (Garvin, Wagonfield & Kind, 2013) that compiled and coded data from multiple information sources to build an instrument of eight behaviors associated with effective leadership in the company. Google’s model has shown important coincidences with several of the central dimensions included in other theoretical models on leadership developed in recent years (i.e. Hall, 2014, Dokuyucu, 2016). The present study used this instrument in a bidirectional manner. It asked managers to which degree they believe they perform these behaviors towards their subordinates. And it questioned subordinates about the degree their managers present such behaviors. Both groups were also asked how frequently they believe they perform and receive these behaviors, respectively. The general objective was to establish possible differences or similarities in managers and subordinates’ beliefs in relation to the eight habits of effective leadership of Google’s model. A second objective was to establish possible differences among the four continental groups analyzed. The study was carried out with 76 Euromonitor International’s employees, a global strategic market research company. Four groups, constituted by managers and subordinates, were divided into continental groups: America, Asia & Oceania, Middle East, Africa & India and Europe (N = 76). Score comparisons were conducted by average of managers and subordinates in each of the questionnaire’s items, using “intensity” and “frequency” scales. Among the studied behaviors, the ones that showed the highest manager-subordinate score difference in terms of intensity were “does not micromanage”, “focuses on priority results/deliverables” and “communicate clear goals for the team”. While in terms of frequency, “gives actionable feedback” and “has meaningful discussions about career development” presented the highest differences. Beyond managers and subordinate differences in each continent, it was possible to observe interesting inter-continent regularities that allow to raise hypothesis whose explanations might be (in some dimensions) related to geographical-cultural aspects and (in others) with the company’s characteristics as a global organization.
INCLUSIVENESS OF WOMEN WITH CHILDCARE COMMITMENTS IN DIFFERENT HUMAN RESOURCE MANAGEMENT SYSTEMS

Aleksandra Bordunos
Sofia Kosheleva
Saint-Petersburg state university (Saint-Petersburg, Russia)

Current review explores HR initiatives that foster inclusiveness of women with the childcare commitments, accounting for their fit for High-Involvement Work System, High-Commitment Work System and High-Performance Work System. The review combines two streams of research: the Gender Inclusiveness and the Strategic Human Resource Management. Each work system (WS) grounds on a certain system of values and beliefs specific for the time of a WS’ lock-in on the own path-dependence track. The lock-in of a WS happens when the solution fits the institutional environment, organizational and employees’ identity, HR philosophy. The review shows similarity of values of High-Performance Work System and female identity affected by the liberal feminism. Most initiatives here are controlled by the government, ensuring equal personhood and providing institutional support for the fulfilment of the childcare commitments. High-Commitment Work System shares similar values with the postfeminist and neoliberal assertion that women should be competitive, taking personal responsibility for being successful both in a profession and as a mother (1). The research also points out at the lack of discourse analysis of the female identities in High-Involvement Work Systems. Striving to cover the revealed gap, it analyzes findings of the researches of the female entrepreneurs, providing possible HR solutions, which could potentially fit High-Involvement Work System too. Through the analysis, the paper concludes by describing the whole research of Inclusiveness of women with childcare commitments in different work systems. Findings provide guidance both for future research and empirical application by firms and individuals. Rottenberg, C. 2014: The rise of neoliberal feminism. Cultural Studies, 28(3): 418-433
VERBAL CHARACTERISTICS OF DECEPTION IN INTERPRETER PRESENT INTERVIEWS

Mariya Khaleeva
Juliana Granskaya
Alla Shaboltas
Saint-Petersburg State University (Saint-Petersburg, Russia)

Aldert Vrij
University of Portsmouth (Portsmouth, United Kingdom)

Nowadays many investigative interviews require the presence of an interpreter due to the fact that interviewer and interviewee do not speak the same language. The aim of our experimental research is to study the verbal characteristics of deception in interpreter-based interviews, as well as to assess the effectiveness of the Model Statement tool, a method to increase the amount of details reported during an interview. Earlier studies showed that liars report less information than truth tellers and that both liars and truth tellers report less information in Interpreter present interviews than in interviews carried out in their own native language. Use of a Model Statement (a short example of a detailed answer about a topic unrelated to the topic of investigation) encourages interviewees to report more details. This research is a part of an international project conducted in the UK, USA, South Korea and Russia lead by Professor A. Vrij (University of Portsmouth, UK). Russian collaborator is St.Petersburg State University. We report the Russian data collected in St.Petersburg in 2015-2016. 80 participants (half were truth tellers and half were liars) took part in our study (67 female, 13 male, average age 20.8) who were interviewed with or without an interpreter about an alleged city trip. Also half of the participants from both groups listened to a 3 minutes Modal Statement at the beginning of the interview. All interviews were audio and video recorded. Results demonstrated that liars reported fewer details than truth tellers in all interview conditions. Liars also reported fewer complications and more self-handicapping strategies, particularly in the Interpreter absent condition. Participants reported less information with than without an interpreter in the Model Statement absent condition, but there was no such effect in the Model Statement present condition.
Maternal Self-Efficacy (MSE) is defined as beliefs about one’s ability to be successful in the maternal role. Studies showed MSE was negatively related to maternal depression, the perception of infant temperament, and mother-infant interactions. The literature provided a domain-specific measure of MSE, Perceived Maternal Self-Efficacy (PMP S-E) tool. The purpose of the study was to conduct adaptation study of Turkish version of PMP S-E. Three different samples of the first-time mothers of full-term healthy infants were reached out. The mothers in the first sample (N = 289) filled out Turkish PMP S-E online for construct validity and internal consistency analyses. The mothers in the second sample (N = 50) filled out PMP S-E, CES-Depression, State-Trait Anxiety Inventory, Early Close Relationships-II, Infant Behavior Questionnaire (IBQ)-SF online for criterion and predictive validity analyses. The mothers in the third sample (N = 57) filled out PMP S-E twice, post-partum pre-test at their home and 4-month post-test at the lab. Confirmatory Factor Analysis (CFA), zero-order correlation and simple regression analyses were run. The results of CFA supported four-factor structure of PMP S-E (N = 289, $\chi^2$/df = 3.23, GFI = .84, CFI = .93; RMSEA = .09). The sub-scales were Care Taking Procedures (CTP), Evoking Behaviors (EB), Reading Behaviors (RB), and Situational Beliefs (SB). Internal consistency for PMP S-E, CTP, EB, RB and SB total were .97, .86, .92, .91, and .91 respectively. The results of criterion validity indicated the negative correlation between maternal avoidant attachment and PMP S-E, CTP, EB, RB and SB total. The RB and SB total were negatively related with state-trait anxiety. PMP S-E, CTP, EB total were positively related to effortful control of IBQ. Predictive validity findings demonstrated that PMP S-E total was predictive of maternal life satisfaction ($\beta = .35$, $R^2 = .12$, $p < .05$). The test-retest reliability was .56*** for PMP S-E total, .57*** for CTP, .55*** for EB, .42** for RB, and .35** for SB. Findings provided support for reliability and validity of Turkish PMP S-E.
WHEN POWER IS GRABBED AND WHEN POWER IS GRANTED: CHILDREN’S ALLOCATION OF RESOURCES IN SOCIAL POWER SITUATIONS

Cheng Nanhua
Zhu Liqi
An Jing
Chinese Academy of Science (Beijing, China)

In social interaction, there are usually two ways of gaining social power: the dominance-based strategy (the power is grabbed actively by the powerholder) and the prestige-based strategy (the power is granted passively by group members). Understanding and distinguishing different ways of obtaining power is very important in children’s social interaction with others. This study examined the resource allocation favoring of children aged 4-8 in two social power acquisition situations and these children’s attitudes toward the two ways of obtaining power. In Study 1, with the increase of age, the resource allocation of children aged 4-8 years (N = 213) in both two power situations gradually shifts from favoring the powerholder to no favor (in the prestige-based situation) or favoring the subordinates (in the dominant-based situation). And, children aged 6-8 but not 4-5 were more likely favoring the powerholders in the prestige-based situation than that in the dominance-based situation. Additionally, in Study 2, when power does not produce existing inequality, children aged 7-8 (N =48) favored the powerholders in the prestige-based situation, while not showed favoring in the dominant-based situation. Thus, children’s attitudes towards the two ways of obtaining power are gradually differentiated, and the distribution of children’s resources in the power situations is influenced by the way of obtaining power and children’s fairness development.
MATERNAL TRAUMA AND POST-PARTUM WELL-BEING: THE PATH FROM ATTACHMENT TO ALEXITHYMIA

Yasemin Kahya  
Social Sciences University of Ankara (Ankara, Turkey)

Sait Uluç  
Hacettepe University (Ankara, Turkey)

Maternal trauma can adversely influence maternal post-partum well-being, increasing the likelihood of post-partum depression, anxiety, and low maternal self-efficacy. Literature showed that childhood trauma was a developmental risk factor for dysfunctional interpersonal relationships and emotion regulation. Grounding this, the purpose of this research was to inquire whether maternal trauma initiates a path from insecure attachment and alexithymia to post-partum depression, anxiety, and low maternal self-efficacy. Post-partum mothers (N = 62, Xage = 29.27) with healthy singleton infants participated in the research. They filled out Childhood Trauma Questionnaire, Perceived Maternal Parenting Self-Efficacy Tool, CES-Depression, State-Trait Anxiety Inventory, Early Close Relationships-II at home. Serial multiple mediation analyses were run with PROCESS macro. Maternal trauma would be related to anxious attachment (avoidant attachment), which would be associated with alexithymia and successively with post-partum depression (Model 1 & 2), or post-partum anxiety (Model 3 & 4), or maternal self-efficacy (Model 5 & 6). Results of Model 1 (R2 = .27, p < .001) supported serial mediation of anxious attachment and alexithymia from maternal trauma to post-partum depression (B = .04, CI [.00, .12]). Model 2 (R2 = .24, p < .001) showed the significant mediator role of alexithymia on the relationship between maternal trauma and post-partum depression (B = .15, CI [.01, .39]). Model 3 (R2 = .55, p < .001) indicated serial mediation that maternal trauma was associated with anxious attachment that was related to alexithymia, and in turn to post-partum anxiety (B = .05, CI [.00, .13]). Model 4 (R2 = .55, p < .001) demonstrated the significant mediator role of alexithymia on the relationship between maternal trauma and post-partum anxiety (B = .17, CI [.02, .39]). In Model 5 and 6, the direct effect of maternal trauma was significant on post-partum maternal self-efficacy (B = -.60; B = -.58, p < .01). Findings implied that early maternal trauma with associated developmental problems may constitute vulnerability for post-partum depression and anxiety. Anxiously attached mothers with alexithymic features are more prone to post-partum depression and anxiety. In post-partum well-being prevention and interventions, developmental factors need to be addressed.
RETHINKING INTERGENERATIONAL TRANSMISSION OF ATTACHMENT: MATERNAL REFLECTIVE FUNCTIONING AND ITS IMPLICATIONS IN MICROANALYSIS OF MOTHER-INFANT INTERACTION

Yasemin Kahya
Social Sciences University of Ankara (Ankara, Turkey)

Pioneer work indicated the gap in intergenerational transmission of attachment, specifically global maternal sensitivity construct did not fully account for the link between maternal and infant attachment (van IJzendoorn, 1995). Scholars state that intergenerational transmission of attachment can be explained by maternal reflective functioning (MRF), maternal capacity to understand her own mind and the infant mind, and provide the infant a sense of his mind (Fonagy, Steele, Steele, Higgit, & Target, 1994; Slade, 2005). The current review aims to inform this link by examining the mother-infant interaction (MII) (Beebe, Cohen, & Lachmann, 2016). Articles linking MRF and attachment or MII were reviewed (N = 23). The literature review approach was narrative. Dyadic systems theory and microanalysis of MII were presented to further explain the way microanalysis of MII might inform the translation of MRF into non-verbal behaviors. MRF is an empirically supported mechanism to link maternal and infant attachment with various approaches. This common finding implies the intergenerational transmission of affect regulation capacity. MRF as an evolving construct may be particularly important during early infancy. Microanalysis research at 4 months indicated patterns of maternal affective responses predictive of attachment at 12 months, specifically disorganized attachment. Building blocks of MRF can be observed in the microanalysis of maternal affective responses in MII as these interactions predict infant attachment. There is a need of research combining MRF and the microanalysis of MII to go beyond global maternal sensitivity measures to explain procedurally encoded behaviors of attachment relationship.
The research aim is impact of artLogo methods on life-meaning orientations and responsibility of contemporary adolescents. The theoretical framework is Logotherapy of Viktor Frankl, life meaning studies by V.E.Chudnovsky, D.A.Leontiev, publications on art therapy by N.Rogers, A.I.Kopytin. The study design is experimental. 421 adolescents (aged 13-16) participated in the study. The experimental group consisted of 201 people, control group — 220 people. The research methodology included "Life-Meaning Orientations test" by D.A.Leontiev, Viability test by S.Muddy, "System of Life Meanings" technique by V.Y.Kotlyakov, questionnaire “Responsible behaviour” by L.I.Dementiy, express-diagnostics of responsibility. The results were processed by qualitative and quantitative methods, using methods of statistical analysis (Mann-Whitney U test, Spearman correlation coefficient). Personal life meaning is formed in adolescence, this period is sensitive for responsibility formation — a quality, enabling a person to take consequences of his actions and control activity according to social, moral and legal regulations. The study revealed levels of life meaningfulness, responsibility and viability. Connection between life-meaning orientations and responsibility was detected: general life meaning is connected with responsibility through "attitude to difficulties", "emotional attitude to important tasks", "fulfilment or rejection to fulfil one's intentions"; purposes in life are connected with "attitude to difficulties", "fulfilment or rejection to fulfil one's intentions". "Locus of control — Self" correlates with "attitude to difficulties", "fulfilment or rejection to fulfil one's intentions" and "emotional attitude to important tasks". Educational experiment included artLogo method, integrating art therapy and Logotherapy. Combining personal creative potential and life meaning component helps adolescents to explore their own personality, answer existential questions: attitude to life, values priority, responsibility for choice, life meaning. After the educational experiment level of life meaningfulness became higher. Attitude to difficulties, promises, consequences of actions became more conscientious. Level of "responsibility" and "situational responsibility" increased. Participation in the experiment raised responsibility and life meaningfulness. The study shows that artLogo is a promising method for forming responsibility and life meaning conception of adolescents. The program helps every participant to obtain a constructive self-study way and ability to make responsible choices, enables harmonious development and personality formation.
THE ORGANIZATION OF EDUCATION IN HOSPITAL AS A PART OF PSYCHOLOGICAL ASSISTANCE AND SUPPORT DURING THE STAGES OF TREATMENT

Ekaterina Zorina
Southern Federal University (Rostov-na-Donu, Russia)

In recent years creation of educational classes in hospitals for in-patients where children undergo a long-term treatment, became a possible reality thanks to development of the networked educational commonwealth “Uchim&Znayem” and efforts of the psychological and pedagogical community in regions. Children got an opportunity not to interrupt their education and to study in the most comfortable hospital conditions. In the Rostov region the first hospital division of school was opened in 2018 on the basis of the Regional children’s clinical hospital. The educational class was equipped, regional normative legal acts were elaborated to settle the process of education for children and teenagers aged from 6 and a half up to 18, the psychological and pedagogical collective working in the oncohematological department was completed and the model of psychological and pedagogical maintenance was built. An Individualized Educational Program is written for each student enrolled in the structural division of the hospital school, the most possible academic load is coordinated with doctors. We often have to meet various difficulties with the organization of educational process. Having analyzed their reasons and nature, we succeeded to systematize them in groups. During the hospital period of education teachers conduct lessons internally in a chamber or in a specially equipped classroom. When a child comes back home, he falls under a constant contact due to Skype technologies, educational process is being led remotely. Another important direction is the research of cognitive functions and the organization of correction of revealed deficiencies. Today we have a program of psychological and pedagogical maintenance for the children who undergo a long-term treatment. Thus, the emergence and existence of a full-fledged educational space make possible not only formation of the informative and training content for the children undergoing a long-term treatment, but they also provide psychological and pedagogical maintenance, allow to improve cognitive functions, fulfill the shortage of socialization, create conditions that are extremely close to a usual life.
RELATIONSHIP BETWEEN PERSONAL VALUES AND LIFE-MEANING ORIENTATIONS

Tatyana Popova
Russian Academy of Education (Moscow, Russia)

Roman Borisov
Russian Academy of Education External (Moscow, Russia)

The study aim is to explore relationship between personal values and life-meaning orientations in adulthood, determine characteristics of this relashionship in groups of people with low and high life meaningfulness. The theoretical framework is works devoted to life meaning by V.Frankl, D.A.Leontiev, V.E.Chudnovsky, K.V.Karpinsky, and others. The study design is cross-cultural. Ascertaining experiment was used during the study. 435 people (281 women and 154 men) from different Russian cities participated in the study. The methodology included ,Value Survey” by M.Rockeach; ”Life-Meaning Orientations test” by D.A.Leontiev (LMO); ”System of Life Meanings” technique by V.Y.Kotlyakov. Spearman rank correlation was used for statistical data analysis. The data analysis showed the following peculiarities in groups of people with low and high life meaningfulness. Mild negative correlation was revealed between hedonistic life meaning orientation and subscales of LMO test: “Process” (r=-0,37) and “Result” (r=0,33). General life meaning index correlates with meanings related to pleasure (r=0,3). The scale ”Purpose”, characterizing ability to set goals in life, correlates with the values ”Freedom” (r=0,35) and ”Pleasures” (r=0,34). Connection of value “Love” with life-meaning orientations in the 1st group differs from that in the 2nd one. In case of low life meaningfulness there is a positive correlation between “Love” and subscale ”Purposes”, while in case of high meaningfulness — between ”Love” and ”Result” (r=0,35). The group with high life meaningfulness is characterized by connection between the value “Happiness of others” and subscales of LMO “Process” (r=0,3) and ”Locus of control — Self” (r=0,37). Considering the mild connections detected, it is assumed that hedonistic values and meanings, pursuit of pleasure without considering other people’s interests, focusing on one’s own needs and absence of purposes beyond one’s self lead to low life meaningfulness, absence of its ontological importance awareness. Focus on other people, altruistic life orientation, transcending one’s own interests are the factors related to experiencing life fullness, awareness of its meaning. The results received correspond to V.Frankl’s conception about straightforward striving for happiness and pleasure. These things can only be achieved as side-effect, while implementing meaningful objectives and tasks that life sets for a person.
SUITABILITY OF BEHAVIORIST PERSPECTIVES TO STUDY COPING WITH INTIMATE PARTNER VIOLENCE

Nermin Taşkale
Istanbul University (Istanbul, Turkey)

Recent research to explain causes of intimate partner violence (IPV) states that situational variables like fear and alcohol use are strongly correlated with the occurrence of IPV compared to background variables like age, income, and education. These findings, which underline the importance of the “hot moments” of IPV, support behavioristic event-based perspectives to violence. Another research line focusing on the aftermath of IPV presents that as the degree of victimization increases so does the coping efforts. However, there are plenty of measurement options for coping. One of them is the Intimate Partner Violence Strategies Index (IPVSI; with domains of Formal Networks, Legal, Security Planning, Informal Networks, Resistance and Placating) which asks for whether victims (women) use the listed coping strategies and how helpful they find them. Therefore, two scores may be computed for the scale: event-based total score of the number of coping strategies used and the cognition-based total score of how helpful they are perceived. This study aims to understand which computation method will elicit scores that are comparably more related to IPV scores. Participants were 301 married IPV victim women who enrolled in a larger study. They filled out a demographics form, the Revised Conflict Tactics Scale (CTS2) and the IPVSI. Results revealed that the chronicity total score of CTS2 (r(299) = .63, p < .01) was slightly more related with the IPVSI scores compared to the frequency total score (r(299) = .54, p < .01). The relationship between CTS2 chronicity total scores and IPVSI domain scores were in the positive direction for event-based scores and in the negative direction for cognition-based scores (except for Resistance). All of the relationships between CTS2 chronicity total scores and event-based IPVSI domain scores reached significance (correlation coefficients between r(299) = .57, p < .01 for Resistance and r(299) = .41, p < .01 for Security Planning). As for the cognition-based scores, only two of them (Formal Networks; r(299) = -.16, p < .01 and Informal Networks; r(299) = -.12, p < .05) reached significance. The results support the suitability of event-based, hence behavioral, perspectives to investigate coping with IPV.
DIFFERENCES BETWEEN WOMEN’S REPORTS OF THEIR OWN AND PARTNER’S EXPLANATIONS FOR VIOLENCE

Nermin Taşkale
Istanbul University (Istanbul, Turkey)

There is abundant research investigating why intimate partner violence (IPV) occurs. These explanations have been grouped under four levels: ontogenic (variables related with developmental history), microsystem (characteristics of the violence setting), exosystem (formal and informal social structures) and macrosystem (general culture). This study aims to survey and compare IPV victim women’s (own) and partner’s (perceived) explanations for IPV. Women who have been living in a shelter (N = 78) and with a partner (N = 79) participated in the study (total N = 157). They were presented with a checklist about causes of violence. It included items from ontogenic (furiousness, alcohol-drug use, stress, and psychological problems), microsystem (refuse to have sex, and children), exosystem (economic reasons, immediate environment, relatives, and displacement of his anger towards me), and macrosystem levels (right of a man and disobedience of woman). Participants filled out the checklist from their own and partner’s perspective with a response set fixed to “Yes-No”. Results of Chi-Square analyses revealed that all items were signed as “Yes” more when the women were reporting from their own perspective compared to their partners’ except for disobedience of women which had a reverse pattern (furiousness: $\chi^2(1) = 45.473, p < .001, V = .54$; alcohol-drug use: $\chi^2(1) = 98.782, p < .001, V = .80$; stress: $\chi^2(1) = 68.641, p < .001, V = .66$; and psychological problems: $\chi^2(1) = 48.058, p < .001, V = .55$), microsystem (refusing to have sex: $\chi^2(1) = 101.850, p < .001, V = .81$; and children: $\chi^2(1) = 75.196, p < .001, V = .69$), exosystem (economic reasons: $\chi^2(1) = 44.013, p < .001, V = .53$; immediate environment: $\chi^2(1) = 44.734, p < .001, V = .53$; relatives: $\chi^2(1) = 58.337, p < .001, V = .61$; and displacement of his anger towards me: $\chi^2(1) = 35.888, p < .001, V = .48$), and macrosystem levels (right of a man: $\chi^2(1) = 84.037, p < .001, V = .73$; and disobedience of woman: $\chi^2(1) = 39.809, p < .001, V = .50$). IPV victims feel a discrepancy between their own and partners’ explanations for IPV.
Source monitoring (SM), the ability to remember where, when, how, from whom, and through which modalities and means the information is acquired, develops during the preschool years (e.g. Gopnik & Graf, 1988; Lindsay, Johnson, & Kwon, 1991). Recent research examining the possible relationship between this development and executive function presented mixed findings because of the differences in the studied type of source monitoring and the studied component of executive function (e.g. Kanakogi, Moriguchi, Fu, Lee, & Itakura, 2012; Melinder, Endestad, & Magnussen, 2006). The aim of the present study was to provide a comprehensive account of this relationship in terms of 3 SM types: a) external SM referring to distinguishing between sources that are outside the individual and publicly perceived such as two people, b) internal SM referring to differentiating between sources that are originated from the inside of the individual like saying and thinking, and c) reality monitoring referring to distinguishing between internally and externally generated sources such as the person him/herself versus another person; and 2 components of executive function, namely inhibition and shifting. Thirty 3-year-old (M=44.27, SD=2.86) and 30 5-year-old Turkish-speaking monolingual children (M=65.23, SD=3.36) participated in the Stickerbook SM task assessing reality, external and internal SM, the Day-Night Stroop Task assessing inhibitory control, the Dimensional Change Card Sorting (DCCS) Task assessing cognitive shifting, and Peabody Picture and Word Matching Task measuring linguistic abilities. Separate hierarchical regression analyses for each SM type with the number of correctly identified sources as the criterion; age and Peabody score as the predictors in the first step included through the enter procedure; and the Day/Night Stroop task score and the DCCS performance as the predictors in the second step through the enter procedure were conducted. They demonstrated that reality monitoring performance was predicted by the Peabody score (F(4,55)=17.66, p=.000, R2=.56), internal SM performance was predicted by age (F(4,55)=11.70, p=.000, R2=.68) and external SM performance was predicted marginally significantly by DCCS performance (F(4,55)=12.65, p=.000, R2=.48). These results indicated that the development in different SM abilities is related to different developmental and cognitive changes.
THE FORMATION AND DIFFUSION OF PUBLIC STEREOTYPE OF DRUG ADDICTS: A STUDY USING SERIAL OF REPRODUCTION PARADIGM

Jiaqian Chen
Ruochen Li
Jifan Zhou
Meng Zhang
Zhejiang University (Hangzhou, China)

The public generally holds a negative stereotype for drug addicts. Previous studies have shown that mainstream social prejudice caused by this negative stereotype may be an important reason for the difficulty of drug addicts returning to normal life after rehabilitation and leading to high rate of relapse. Therefore, understanding the psychological mechanism underlying the formation and diffusion of the negative public stereotype of drug addicts has theoretical and practical significance. Majority of previous researches on stereotypes used methods of self-reports or implicit tests, which is difficult to reflect the development of stereotype in the dynamic interpersonal communication process. Based on this, we deployed a serial of reproduction paradigm to simulate the formation of stereotypes in interpersonal communication, and intended to explore the formation and diffusion of negative stereotypes of drug addicts in a more ecological context. In the experiment, 79 participants studied the randomly generated three groups of 18 hypothetical characters and each character with 6 trait words to be memorized (drug addicts, light criminals, ordinary people). After confirming the identity of the character was correctly memorized, participants were asked to select the six trait words out of 48 candidate words for each character. The combination of the words and characters selected by the first participant became memory materials for the next participants. Every 7 participants consisted one reproduction chain, 11 chains in total. We hypothesized that in each generation of reproduction, participants used biased information to replace the contents they were uncertain of. In the end of the chains, bias of impression was accumulated and amplified, reflecting the profound stereotype. Compared with the other two groups, characters who were labeled as drug addicts were selected with significantly more negative drug addict stereotypical words as the chains developed. The results indicated that public’s negative stereotype of drug addicts may be due to the cumulative accumulation of unfamiliar content substitutions and modifications by individuals during the process of interpersonal communication, which ultimately leads to polarized negative stereotypes at the public level. Therefore, disseminating objective information of drug addicts to the public may reduce negative stereotype of the drug addicts in society.
DIFFERENT COGNITIVE REAPPRAISAL TACTICS AND THEIR LINK TO WELL-BEING AND PERSONALITY

Corinna Maria Perchtold  
Elisabeth, M. Weiss  
Christian Rominger  
Andreas Fink  
Ilona Papousek  
University of Graz (Graz, Austria)

Cognitive reappraisal is generally considered a highly effective emotion regulation strategy in dealing with adverse events. Yet, multiple different tactics can be applied in cognitive re-interpretations of critical situations, some of which potentially more adaptive than others. In three studies, we tested individuals’ inventiveness in generating multiple different reappraisals for anger- and anxiety eliciting situations to investigate preferences in using cognitive reappraisal tactics and their link to well-being and personality traits. In the RIT, reappraisal ideas may be categorized in broader reappraisal categories (e.g., positive re-interpretations) as well as in over 15 specific reappraisal tactics within these categories. In study 1 (n = 80), anger-related reappraisal ideas imputable to the broad category of positive re-interpretations were significantly linked to less chronic stress and depressive experiences in daily life, whereas no such link emerged for de-emphasizing reappraisals. In Study 2 (n = 95), scrutinizing different reappraisal tactics, we demonstrated that in anxiety-reappraisal, two tactics from the positive re-interpretation category showed a remarkably different pattern of associations: While the tactic of ‘finding general positive aspects’ was associated with less depression, negative affectivity and antagonism, the tactic of ‘generating worst-case comparisons’ was linked to more depression, negative affectivity, and detachment. Study 3 (n = 101) showed that individuals most frequently implemented the tactics of ‘planning alternative actions’ and ‘trivializing the problem’ in both anger- and anxiety-reappraisal. However, in anxiety-compared to anger-reappraisal, ‘general positive aspects’ and ‘alternative explanations’ were implemented to a greater degree, while the tactics of ‘interpreting the situation as a learning experience’ and ‘turning a disadvantage to an advantage’ were more frequently implemented in anger-compared to anxiety-reappraisal. Altogether, these results corroborate that cognitive reappraisal ideas are highly diverse and may not be equally adaptive, which suggests implications for psychotherapeutic interventions aimed at increasing reappraisal use in the daily life of patients.
DOES DIGIT SUPERIORITY INDISPENSABLE IN TERMS OF VERBAL SHORT TERM MEMORY SPAN?

Dilara Doğan
Şengül Erdoğan
Banu Cangöz
Hacettepe University(Ankara, Turkey)

Short-term memory (STM) span is defined as the longest sequence of items that can be recall in the correct order after a single presentation of different types of verbal material and measured by digit span task. Research suggest that item integrity used in STM span studies has an advantage for linguistically familiar digits. This study aimed to investigate the effect of stimuli types (digit, word, color) on verbal STM and to test digit span superiority effect in terms of verbal STM by series of experiments using verbal materials. In order to measure STM capacity, memory span task was used including digit, word and color span lists and stimuli for the lists were prepared by researchers. This study consisted of three different experiments. Two of them were performed by 64 undergraduates (digit name and word for Experiment I; digit name, word and color name for Experiment II) and last one will be predicted to perform by 30 undergraduates (digit name, digit, color name and color). The t test for dependent groups and repeated measures one-way ANOVA were used for analyzing Experiment I and Experiment II, respectively. Results of Experiment I and II revealed that there was a significant difference between digit name and word in terms of span size and total span (Experiment I, span size (t(32) = 2.81, p <.05) and total span (t(32) = 6.17, p < .001); Experiment II, total span (F(2, 60) = 54.71, p < .001 η2p = 0.65) and span size (F(2, 60) = 36.04, p < .001 η2p = 0.55). Also, in Experiment II, post hoc analysis indicated that, there was a significant difference between digit name and word (p < .001) and digit name and color name (p < .001) in terms of total span; digit name and word (p <.001), and digit name and color name (p < .001) in terms of span size. Results supported that verbal STM has an advantage for digits over words and color names. Besides, digit span superiority in verbal STM has shown one more time with this study. Experiment III has still continued.
THE ROLE OF PSYCHOLOGICAL CAPITAL ON EMPLOYEE VOICE

Unika Prihatsanti
Universitas Airlangga; Universitas Diponegoro, Indonesia

Seger Handoyo
Rahkman Ardi
Universitas Airlangga (Surabaya, Indonesia)

Puji Tania Indonesia
Universitas Atmajaya (Jakarta, Indonesia)

Organizations need to adjust to the dynamic changes that occur in the business environment, to be more innovative and have quick responses to changing situations. Psychological capital (psycap) affects the impact of work behavior. Positive Organizational Behavior perspective can provide an explanation of how individual resources have an impact on work behavior. This study aims to examine the relationship between psycap and employee voice. PsyCap is a positive psychological state that characterized by having confidence (self-efficacy) to take action and make the effort needed to solve challenging tasks; have positive attributes (optimism) about success in the present and future; persevering in achieving goals (hope); and when faced with problems and misery can survive and rise to achieve success (resiliency). Employee voice is voluntary and open communication from relevant employees in the organization intended to influence the work context, such as policies, practices and work procedures. This study involved 182 participants from various companies. Questionnaires were circulated via an instant messaging application, several social media platforms and paper-based. Participants filled out psychological capital questionnaires (24 items, $\alpha=0.86$), and employee voice scale (10 items, $\alpha=0.86$). Based on a simple regression analysis, it is proven that psychological capital is significantly related to employee voice ($r=0.385, p=0.000$) Employees can choose to speak up when they are motivated by a pro-social motive that is to bring constructive changes to themselves and the organization. Personal resources, namely psychological capital that interacts simultaneously produces different manifestations. By acquiring these resources, individuals are ready to meet the demands of work and achieve their work goals, by providing a voice. The limitations of the study were carried out by cross-sectional and self-report, which resulted in common method bias in this study. Thus, the next researcher needs to conduct research with the other characteristics of respondents and varied data sources.
STUDY OF METAPHORICAL IMAGES IN NARRATION OF SICILIAN FIBROMYALGIC PATIENTS

Agata Romeo
Marilina Schembari
ASP SIRACUSA (Siracusa, Italy)

Patients affected by Fibromyalgia, often develop feelings of frustration, perceive themselves as "not believed" or "invisible". The aim of our survey is to compare metaphorical images that describe the pathology, recorded in the context of psychological clinical interviews carried out during an enrollment phase and at the end of a multidisciplinary care path. The sample is made up of 25 Sicilian women aged 30 to 70, with upper secondary education degree. We proceeded with a semi-structured interview (describing symptoms, pain experience and quality of life) subsequently reviewed and the contents transcribed faithful. To the question "describe how is the pain" emerge images of "a clinging dog that doesn't let go, a toxic form, something that tears the flesh off...". Fibromyalgia is perceived as a persecutory agent that attacks, invades and sometimes becomes "a life partner". These images refer to a sense of aggression and strength. Woman feels helpless, highly vulnerable, unable to control what's happening to her. The pathology is assimilated and integrated in the perception of a new "Self", generating perceptions such as: "I feel mutilated", "I'm caged in Fibromyalgia", "It's like I got beaten", "as if I had been caught in a car accident". The body is like a "hole that has drained the soul". Women attend a psycho-educational path with a doctor, a psychologist and physiotherapists in 10 weekly meetings. It consists of an information phase, the study of daily habits, postural education, ergonomics, respiratory education, autogenic training. In the end, women improve their self-esteem by showing a renewed self-awareness. Narrations undergo a metamorphosis and images of light and energy emerge, lightness like that of Mrs. Celestina who says "I learned to prune the trees gently, like a dancer that moves between the branches". After giving meaning to the disease, it follows the search for consistency in the condition of chronic ill. Narratives show that adequate psychological support with the help of a psycho-educational line of care, generate changes at several levels, improving intimate, relational functioning and also one's sense of identity.
TURKISH MOTHERS’ SHARENTING PRACTICES ON INSTAGRAM

Hale Ogel-Balaban
Bahcesehir University (Istanbul, Turkey)

Sebnem Altan
Isik University (Istanbul, Turkey)

Nowadays, parents are sharing their lives with their children and their children's lives on social media. As a result of this activity, sharenting defined as "the practice of a parent to regularly use the social media to communicate a lot of detailed information about their child" (Sharenting, n.d.) occurred as a new concept. The aim of the present study was to examine Turkish mothers’ sharenting practices on Instagram, and whether they are related to mothers’ social support, anxiety level, child-rearing practices and self-perception of parental role. 438 mothers (Mage=34.29, SD=5.81) completed the demographic information form, the use of social media form, the Child-rearing Questionnaire (Yağmurlu & Sanson, 2009), the Self-Perception of Parental Role Questionnaire (MacPhee et al., 1986; Güler & Yetim, 2008), the Trait Anxiety subscale of the State-Trait Anxiety Inventory (Spielberger et al., 1983; Öner & Le Compte, 1983), and the Multidimensional Scale of Perceived Social Support (Zimet et al., 1988; Eker, Arkar, & Yaldız, 2001). The results indicated that 83% of the mothers had an account on Instagram. "staying connected to friends", "sharing moments” and "having fun” were the most frequently reported reasons of Instagram use among these mothers. 83% of them reported sharing their children’s photo on Instagram. The frequency of this sharenting practice was found to be correlated positively with the frequency of using Instagram (r=.25, p=.000), the frequency of sharing on Instagram (r=.80; p=.000), the level of support (r=.17, p=.003), and the parental warmth (r=.17, p=.004); and negatively with age (r= -.27, p=.000) and parental obedience (r=-.10, p=.06 (marginally)). Regression analysis demonstrated the predictive effect of the frequency of sharing on Instagram (F(9, 240)=50.67, p=.000, R2=.66). Furthermore, sharing children’s photo was not found to be related to self-perception of parental role. These findings suggested that although Instagram is widely used among Turkish mothers and they frequently use it for sharpening practices, it is not related to their parenting roles contrary to the argument that sharenting provides emotional and informational support to parents and contribute to their parental confidence. This implication will be discussed in light of other possible predictors and outcomes of Instagram use in Turkish culture.
PERSONALITY TRAITS AND CREATIVITY AS PREDICTORS OF SECOND LANGUAGE ACQUISITION IN LINGUISTICS STUDENTS

Irina Novikova
Nadezhda Berisha
Alexey Novikov
Dmitriy Shlyakhta
Peoples’ Friendship University of Russia (Moscow, Russia)

Second (foreign) language (SL / FL) proficiency is one of the important competencies of a modern person, which is necessary for both his professional and personal fulfillment. The problem of psychological factors of second language acquisition (SLA) is relevant to modern science in spite of the large number of studies. The purpose of this study is to consider and compare the personality traits and the creativity as predictors of the success in SLA in linguistics students. The sample includes 128 (82% — female) first- and second-year university students in the Linguistics Department of RUDN University, all students learn English as their major SL. The creativity was measured with the Abbreviated Torrance Test for Adults (ATTA©). The ATTA© includes one verbal creativity activity and two non-verbal creativity activities. We used indicators for each activity separately, total indicators of fluency, originality, elaboration, flexibility, and the total creativity index (CI). The FFM personality traits (neuroticism, extraversion, openness to experience, agreeableness, and conscientiousness) were measured with the Russian NEO Five-Factor Inventory adaptation by S. Biryukov and M. Bodunov. To assess SLA we used the traditional academic achievement indicator (the average value of the semester final grades of English) as well as English teachers’ assessment of SLA in their students by authors’ expert scale (10 SLA indicators and total score). The descriptive statistics methods, coefficients Cronbach’ α and McDonald’s ω, Spearman rank correlation analysis and the multiple regression analysis were used for processing the data. Statistical processing was carried out in the R software environment for statistical computing and graphics, version 3.3.2. Findings of our research showed that creativity indicators have a stronger but contradictory impact on SLA assessments than personality traits: (1) fluency and especially non-verbal creativity are significant and positive predictors of most SLA experts’ assessments; (2) originality is significant and negative predictor for most of these assessments, and verbal creativity is significant and negative predictor of the Final grades in English; (3) among personality traits, only conscientiousness has significant and positive impact on several SLA indicators, including total score according to experts’ scale.
ANTECEDENTS OF WORK-FAMILY CONFLICT AMONG EMPLOYED MOTHERS: THE ROLES OF SOCIAL SUPPORT AND PARENTING DAILY HASSLES

Gozde Babaoglu
Sibel Kazak Berument
Middle East Technical University (Ankara, Turkey)

Work-Family Conflict (WFC) is a role-based conflict experienced by worker related to the interference between work and family life (Greenhaus, & Beutell, 1985). Previous studies have highlighted the importance of demographic factors, and social support on employee’s WFC (Page, Deuling, Mazzola & Rospenda, 2018; Tanaka & Lowry, 2013). The primary aim of this study is to examine antecedents of working mothers’ work interference with family (WIF) and family interference with work (FIW). Different from other studies, this study examined multiple aspects of antecedents, including child behavioral self-regulation skills, and temperament as child related factors.

Participants of this study were 109 mother-child dyads (M mother age = 33.79, S.D. = 3.96; M child age = 49.13 months, S.D. = 7.23). Mothers filled in Work-Family Conflict Scale (Netemeyer, Boles & McMurrian, 1996), Family Support Inventory for Workers (King, Mattimore, King & Adams, 1995), Parenting Daily Hassles Scale (Cnic & Greenberg, 1990), Child Rearing Questionnaire (Paterson & Sanson, 1999), Children’s Behavior Questionnaire (Rothbart, Ahadi, Hershey & Fisher, 2001), and The Childhood Executive Functioning Inventory (Thorell & Nyberg, 2008). Children were administered peg-tapping task (Diamond & Taylor, 1996) at their preschools. Two hierarchical multiple regression analysis was conducted to predict mothers’ WIF and FIW. Mothers’ parenting daily hassles (PDH) positively predicted both WIF and FIW. Mothers’ full-time employment pattern and children’s higher amounts of weekly non-maternal childcare positively and marginally predicted mothers’ WIF. In terms of social support, while extended family support on childcare was negatively related to mothers’ WIF, presence of spousal support also negatively predicted FIW. None of the child related factors and organizational support predicted mothers’ WIF and FIW. A simple slope analysis was conducted to examine significant interaction terms. Based on the interaction slope, in the presence of higher amounts of extended family support on childcare, mothers, who had lower levels of PDH showed less FIW compared to mothers, who had higher levels of PDH. Results suggest that spousal support buffered the negative impacts of stressors on work-family interference. However, extended family support on childcare was not expectedly found. Findings will be discussed in the light of literature.
DEVELOPMENT OF CHILD DEPRESSIVE SYMPTOMS SCALE

Elif Erol
Ömer Faruk Şimşek
Arel Üniversitesi(Istanbul, Turkey)

Neslihan Zabcı
Maltepe Üniversitesi(Istanbul, Turkey)

Although there are numerous means of measuring to detect developmental difficulties in children's clinics, measures of behavior, symptoms, pathology are very limited. Existing measurement tools are generally adaptation. As the tests adapted from different cultures have difficulties in terms of language and cultural codes, it is worth every country to have its own culturally appropriate measurement tool. The detection of the child's behavior and symptom through a valid and reliable measurement may be an useful instrument in the treatment. In this context, the purpose of this study is to develop a measurement tool adapted in accordance with the psychoanalytic theory. During the development phase of the scale, along with the content validity, construct validity and criterion validity, normal and psychiatric group comparison, internal consistency, item analysis and test-retest reliability studies were performed. To test whether the sample size is sufficient for factor analysis, KMO and Bartlett tests have been examined. In order to test the validity and reliability of the scale; Pearson Correlation Analysis was performed to determine interrelationships between factors, Cronbach’s Alpha and Split-Half Test Correlation to test the reliability of the subscales of scale, Independent t Test to determine the distinctiveness of sub-dimension and total scores, the correlation analysis with Conners’ Parent Rating Scale Short Form (CPRS-48) to test construct validity, Pearson Correlation Analysis to test-retest reliability, and Mann Whitney U to make the psychiatric group comparisons. As a result of all these analyzes, it has been determined that the scale meets the conditions of high reliability and validity. The implementation was done through interviews with 1626 children who are 37-80 month-old in 60 kindergartens throughout Istanbul. As a result of the research, it is verified that the scale has an 8-dimensional structure according to the explanatory and confirmatory factor analyzes. These factors are named as Maladjustment to the Objective Reality, Aggression, Social Adaptation, Loss-Separation Anxiety, Early (Archaic) Anxieties, Impulsivity and Hyperactivity, Deterioration in Cognitive Processes (Attention and Learning Ability) and Somatization.
PSYCHOSEMANTIC STUDYING OF THE PROFESSIONAL EXPERIENCE STRUCTURE

Despite the importance of the experience as the result of the task-oriented activity that has a big "predictive" potential, the question of the experience elements, its structure, characteristics and mechanisms of “accumulation” remains open. We addressed to the studying of the professional experience within the scope of the psychosemantic world model by E. Artemieva, Y. Strelkov and V. Serkin (1, 1991). The main aim of the study was a choice of a professionally valuable object that would allow us to detach the steady structure of the semantic appraisals. 110 physicians of two professional groups — medical workers of maternity hospitals and hospices — took part in the study. We supposed, that medical workers with different length of service would variously describe the main object of their work, which is specified in our study with the words “Man” and “Patient”. The respondents were offered to fill in two forms “Integral job satisfaction” [2], “Professional burnout” [3] and two psychosemantic methods — “Unfinished sentences” with the following content-analysis of the author’s endings, 14-scale modification by E. Artemieva of the semantic differential by Ch. Osgood. Statistic elaboration was carried out with the pack SPSS, version 17. The paradoxical feature of the results achieved consists in the fact, that the labor object may be the source of both psychological problems of the personnel and joy and inspiration. This partly confirms the choice productiveness of the “patient’s” semantic characteristics as the key “divider” between fortunate and unfortunate medical workers, regarding the burnout. The data achieved allow emphasizing the following semantic characteristics of the medical workers’ labor object, which reflect the specificity of the professional experience content: “emotional tone of the estimation”, “the semantic coincidence contingent of the description of different labor objects “types”, “abstraction/specificity of the descriptions”. These data would be helpful for distinction of the medical workers, who need psychological help. References: Artemieva E., Strelkov Y., Serkin V. (1991) The describing of the subjective experience structure // Thinking. Communication. Experience, 99-108. Batarshev A. (2005) Psychodiagnostic in management. Maslach K., Jackson S. (1981) The measurement of experienced burnout// Journal of Occupational Behavior, 2, 99-113.
INTERRELATION BETWEEN SOCIAL DOMINANCE ORIENTATION AND ATTITUDE TOWARD HOMOSEXUALS IN RUSSIA

Zabir Shaekhov
Lomonosov Moscow State University (Moscow, Russia)

The goal of the research is determination of bisexuals’ and heterosexuals’ attitude toward homosexuals in a Russian sample. In the beginning, the respondents were asked to answer the questions of the questionnaire: age, sex and sexual orientation. 45 respondents took part in the research. Of them 20 men, 25 women; 20 bisexuals, 25 heterosexuals aged 18-55 years old. The questionnaire «Measurement of prejudices against people with homosexual orientation» by Guleevich et al. was used to reveal attitude toward homosexuals. The method «Social dominance orientation» (SDO) by F.Pratto and J. Sidanius adapted by E. Agadullina was used to reveal social dominance orientation. In the course of the research it was discovered that there are no significant differences between female and male sexes in prejudices against homosexuals and SDO. However, significant differences were found in prejudices against homosexuals depending on sexual orientation. Subscales threat to: morality (p≤.020), culture (p≤.000), public (p≤.000), individual (p≤.001), as well as strategies of behaviour: treatment (p≤.013) and discrimination (p≤.017) are higher in heterosexuals than in bisexuals, but SDO didn’t reveal significant differences. In the course of the research we divided the respondents into high and low levels of SDO for revealing differences in their attitude to homosexuals. However, we did not obtain reliable differences depending on SDO level. Interrelations between attitude to homosexuals and SDO were not discovered. The obtained data can be explained by negative attitude to homosexuals in the Russian society, as well as by heterosexuals’ possible perception of homosexuality as a threat to traditional norms. Also reasoning from the results of the research we can say that negative attitudes to homosexuals do not show themselves depending on maintaining group hierarchy in society, i.e. maintaining division into different social strata, but show themselves only depending on sexual orientation. In further studies it is necessary to consider other social and cultural factors, which can influence formation of negative attitude to homosexuals in heterosexuals.
APPLYING STATISTICAL PROCESS CONTROL CHARTS IN THE ANALYSES OF SEQUENCES OF TRIALS IN ILLUSION OF CONTROL EXPERIMENTAL TASKS

Reinaldo Augusto Gomes Simoes
Universidade Federal do Rio Grande do Sul (Porto Alegre, Brazil)

People often perceive more control than they actually have and notice covariation where none exists: illusion of control (IOC) is such tendency to overestimate the probability of personal success in chance-based situations. Studies indicated that the scenario valence and the probability of the outcome (p(O)) affect the magnitude of IOC. Statistical process control (SPC) charts, normally applied in manufacturing and business processes, provide analysis of trial-by-trial variation statistics (mean and SD), with 8 simultaneous tests that indicate change points (“special causes”) by different criteria. The current two studies aimed to analyze trial-to-trial reaction times (RT) using SPC during IOC tasks under different valences and p(O)s. In the first study, 81 undergraduate students tried to control a lamp bulb programmed in E-Prime. They were randomly assigned to one of two scenarios (productive or preventive valence) and two p(O)s (.20 or .80) of lights on in one block of 50 trials. Judgments were self-assessed in a bidimensional scale. Similarly in the second study, a traffic light was presented to other 81 participants who tried to produce the green light (n = 40) or to prevent the red light (n = 41), through four blocks of 50 trials under all of four p(O)s in random order (.10, .30, .70, and .90). SPC charts provided the analyses of sequential data. The results in both studies showed that participants declared to have some control under higher probabilities of success in both valences. SPC charts indicated that there is a fast decrease of RT in the beginning of the first block, when participants adapt themselves to task. When judgment was null, the charts indicated a decreasing of RT mean, and change points towards smaller variation; while in the presence of illusion, the RT was longer, with larger and stable variation. Muscular responses may possibly be indicators of cognitive changes if there is illusion, otherwise it seems that participants got into an automatic pattern of behavior. SPC charts may be useful to model data patterns of mean and SD, and to detect change points in sequences of trials during experimental tasks, more precisely than in block statistics.
IMMIGRANT STATUS AND STUDENT’S CIVIC LEARNING IN THE RUSSIAN FEDERATION: ARE IMMIGRANT STUDENTS DISADVANTAGED?

Kerry Kennedy
Jinxin Zhu
Margarita Pavlova
The Education University of Hong Kong (Hong Kong, China)

This is a presentation for the Education Stream. The purpose of this study was to evaluate the effect of immigrant student status on civic achievement in the Russian Federation. Three research questions were addressed: Is student immigrant status associated with civic knowledge? (2) Are there mediating effects that help explain the relationship between immigrant status and civic knowledge? (3) What are the school level effects of variables discussed in RQ 1 and 2? The study used secondary data from the International Civics and Citizenship Education Study conducted in 2016. Student surveys were administered to 7289 students in 382 schools using a two stage stratified sampling design. Using an Opportunity-Propensity (O-P) framework the following measures were included: Civic Knowledge, SES, language used at home, school civic learning, civic participation at school, perceived open classroom climate, perceived student-teacher relationship, and perceived importance of conventional citizenship. A two-level path analysis was conducted with the student at the first level and the school at the second level with Mplus 8.0. Within schools, students’ immigrant status did not have a significant effect on their civic knowledge ($\beta=-.04$). The largest effect was SES ($\beta=-.23, p>0.001$) with a smaller effect related to language used at home ($\beta = .10, p<0.001$). Immigrant status did have a very small but significant effect on civic learning at school ($\beta=.04, p<0.01$). Similar results were found at the school level indicating that schools with high average levels of immigrant students were not adversely affected in their civic knowledge scores ($\beta=-.02$) but schools with concentrations of high SES students did well demonstrating high school-averaged civic knowledge scores ($\beta=-.02, p<0.001$). There were no insignificant indirect effects in the model. Student immigrant status in most European countries is seen as a disadvantage when it comes to civic learning. But this is not the case in the Russian Federation as shown here. Explanations advanced for these results include immigrant students’ positive attitudes to learning, support provided by their parents, their facility in the Russian language, the limited effects of SES, and limited experience of racism.
Clinical psychology as a profession has been growing in Indonesia since the last decade after declaration of several government regulations and laws (e.g., Law No. 36 of 2014) which include clinical psychologist as one of the health professionals. Since then, from 2500 clinical psychologists registered in Indonesian Clinical Psychologist Association (ICPA) more than 1500 are conducting their clinical practices in hospitals, clinics, and privates. Unfortunately, professional psychology master programs in Indonesia, the only formal education for professional psychology, do not state specifically that their graduates are clinical psychologists. Students in this program can choose their interest in clinical psychology and get 560-640 hours’ practicum and internship in addition to 11 courses (equivalent with 30 academic credits) of psychological science, methods, and practices, including thesis, before enter an exit exam to be a psychologist. In order to evaluate knowledge and skills in clinical psychology, as well as to identify related factors with their clinical practice experiences, we conducted qualitative survey among 300 clinical psychologists in several areas in Indonesia. Interview protocol and intensive briefing were provided to the experts who were categorized as senior psychologists by ICPA. Results suggest, from 5 defined levels of clinical psychologist in Indonesia, only 20% of them categorized in the middle level, less than 10% categorized in the higher (4th and 5th) levels, and almost 70% categorized in the lower (1st and 2nd) levels. These level discrepancies might relate with lack of the curricula management in the professional psychology master program, less practical experiences as well as infrequent training and continuing education programs. In the short term, ICPA should provide more intensive competency assessment along with conducting several training and workshop to increase clinical psychology professional competency in the field. In mid and long terms, ICPA together with Indonesian Psychological Association and the universities that provide professional psychology master program should discuss possibilities of curricula modification and develop a special master or even doctoral program for professional clinical psychology.
LATENT CLASS ANALYSIS OF SOLITUDE BEHAVIOR AND ITS EFFECTS ON NOMOPHOBIA

Xurong Lu
Jie Liu
Tour Liu
Tianjin Normal University (Tianjin, China)

With the development of technology, mobile phones have brought great convenience to our daily life. Nowadays, the nomophobia is a very common phenomenon among college students. However, the causes of nomophobia remain unclear. The main purpose of this research was to explore the effect of solitude behavior on nomophobia and the differences of various types of solitude behaviors in nomophobia. The Chinese version of Nomophobia Questionnaire and the Solitude Behavior Scale were used to investigate college students. Data analysis was fulfilled in Mplus8.0 and SPSS24.0. Latent class analysis, ANOVA and t test were employed to classify solitude behavior and explore the relationship between different solitude class and nomophobia. The 6-class model is the best model to fit the data (BIC=60086.486). The six classes were named respectively typical low solitude, tendency to low solitude, typical moderate solitude, tendency to moderate solitude, typical high solitude and tendency to high solitude. According to the results of ANOVA, significant differences among 6 classes were found in the total score of nomophobia (F=44.17, p=0.000). And there was no significant difference in the total score of nomophobia between the class 6 and class 2, class 2 and class 5, class 5 and class 1, class 1 and class 4 respectively. By t test, the significant difference between the class 6 and class 2 people was found in losing connectedness (t=2.05, p=2.05), and the same difference also occurred in class 1 and class 4 (t=5.12, p=5.12). The significant differences between class 2 and class 5 people was found in not being able to access information (t=2.62, p=0.009) and not being able to communicate (t=3.37, p=3.37). However, there were no significant differences in four dimensions between class 1 and class 5 people. The solitude behaviors of college students could be roughly divided into six classes. For the nomophobia, the scores of positive solitude were the lowest. Participants who are social avoidance and loneliness are more likely to develop nomophobia. Eccentricity had significant impacts on the scores of losing connectedness. Social avoidance and loneliness had significant impacts on the scores of loss of communication and information.
Feedback is a crucial element of any task performance across organizational settings. Any feedback has a purpose of aiding the recipient to improve on his/her performance. The findings from the literature concerning the impact of negative feedback on task performance are puzzling. One strand of literature suggests that it has a positive impact (Podskoff & Farh, 1989) on task performance whereas another suggests a negative association (Green, Gino & Staats, 2017). Extending this line of research explaining the inconsistency, the current study focuses on the receiver end of the feedback flow and proposes mindfulness as a construct that helps explain the inconsistency. In simple English, mindfulness is present-centered attention and awareness (Gunaratana, 1996). Negative feedback is an external stimulus that generates negative affect in individual (Weiss & Cropanzano, 1996). Negative affect in an individual is bad for task performance (Kaplan et al., 2009), and thus it is supposed negative affect mediates the relationship between negative feedback and task performance. A mindful person has the characteristics of being objective, non-judgmental and non-self-evaluative towards the present moment experiences and events. Mindfulness helps emotion regulation, especially in undesirable situations. Thus, mindfulness is proposed as a moderator in the relationship. The hypotheses will be tested using experimental method, with a sample of working executives. The experimental group will be provided a 3-day audio-visual based mindfulness training (Zeiden et al., 2011) followed by the task performance and negative feedback. A one-way ANOVA analysis will show a difference between the experimenter and a control group and it is expected that the difference comes out as significant. The significance of the results imply that mindfulness leads to decrease in the negative impact of negative feedback on task performance. Many organizations are now including mindfulness in their employees work life. This paper proposes mindfulness as a tool to tackle the bad side of negative feedback. Promoting mindfulness not only in academics might also prove beneficial as negative feedback is common in student's life. References

WHOM DO YOU FOLLOW ON SNS AND HOW DO YOU FEEL ABOUT IT? THE EMOTIONS FELT AFTER SOCIAL COMPARISONS ON SNS

Ceyda Taşçıoğlu
Leman Pınar Tosun
Bursa Uludağ University (Bursa, Turkey)

The aim of the study was to examine the activities people engaged in social networking sites (SNS) and social comparisons they made in specific domains (physical appearance, social life/popularity, financial situation, happiness and achievement) with others (the close ones, acquaintances and celebrities) in SNSs. Moreover, the emotions felt after those comparisons were investigated within the framework of Smith’s (2000) Theory of Social Comparison-based Emotions. For these purposes, data was collected from 227 university students (186 female, 41 male) each of whom attended in individual research sessions. In each session, participants were given a 7-minute free time to spend in their SNSs (Facebook or Instagram), then were asked to answer questions about social comparisons they did during that time. First, the activities they did during the session were examined. Findings revealed that during the sessions, participants spent more time to examine the posts sent by others than either to examine their own profiles or to make changes in their profiles. Second, participants’ frequencies of doing upward, lateral and downward social comparisons were compared. Participants mostly reported that they did lateral comparisons with their close ones; mostly did upward comparisons with their acquaintances, and almost always did upward comparisons with the celebrities. Next, the emotions they felt after those comparisons were asked. Inspiration, admiration, optimism and envy were more likely to be felt after upward comparisons. On the contrary, pride and sympathy were more likely to be felt after downward comparisons. Finally, whether comparisons made with the close ones, acquaintances or celebrities affect the type of emotions felt after comparisons was tested. One of the expectations was that the level of upward and downward assimilative emotions would increase when participants make upward and downward comparisons with their close ones. A second expectation was that the level of upward and downward contrastive emotions would increase when participants make upward and downward comparisons with their acquaintances and celebrities. The results were tested in five different comparison domains, and supported both expectations only in some of the domains. The results were compared to the existing literature and discussed within the scope of Social Comparison Theory.
CAN CARTOONS WHICH DEPICT CHARACTERS WITH AUTISM SPECTRUM DISORDER (ASD) IMPROVE ATTITUDES TOWARDS PEERS WITH ASD?

Carla Engel
Sheppard Elizabeth
University of Nottingham (Nottingham, United Kingdom)

Identifying effective means for improving relations between typically developing peers and those with Autism Spectrum Disorder (ASD) has become increasingly important. Research has highlighted the immense impact that peers have on social interaction for individuals with ASD. Educational television programmes have previously been used as a vehicle for encouraging inclusivity and cross-group friendship. The indirect (extended) contact hypothesis (Wright et al., 1997) was utilised as a theoretical framework to explore the efficacy of educational television programmes in promoting peer acceptance and positive engagement with individuals with ASD. The present study explored two research questions: (1) How much do children learn from educational television programmes? (2) Can they generalise what they learn to their everyday lives? The study assessed the efficacy of two cartoons which depict characters with ASD in improving conative (behavioural) attitudes towards peers with ASD in two separate studies. Cartoon 1 showed cross-group friendship and gave explanatory information while cartoon 2, relayed explanatory information only. This study employed a within-groups design. Forty-six children participated in Study 1 (4-7 years), and 47 children participated in study 2 (8-11 years). Conative attitudes were measured via Likert Scale questionnaire. Knowledge of ASD was assessed by asking participants what they knew about ASD and coding the number of correct responses. These were measured before and after the cartoon interventions. Analysis of Variance was used to analyse the change in Conative Attitudes. T-tests were used to analyse significant changes in knowledge post intervention. In Study 1, knowledge significantly increased (p < .001) after watching the cartoon. Level of knowledge was also correlated with age, a desire to play with peer with ASD and a desire to have them in class. Overall attitudes to ASD improved significantly after watching the cartoon, in line with the hypothesis. In Study 2, knowledge increased significantly after watching the cartoon (p < .001), but there was no overall improvement in attitudes. However, knowledge was shown to correlate with some but not all conative attitude measures. The findings suggest that cartoons can improve attitudes to ASD but this may depend on how information is presented.
ABUSIVE SUPERVISION AND EMPLOYEE’S EFFECTIVENESS: THE MODERATIONS OF YIN-YANG THINKING AND BELIEF OF LOYALTY TO SUPERVISOR

Li-Fang Chou  
National Cheng Kung University (Kaohsiung, Taiwan)  
Ying-Ting Pao  
Yu-Sheng Hung  
National Cheng Kung University (Tainan, Taiwan)  
Chun-Jung Tseng  
SITA (Kaohsiung, Taiwan)

Abusive supervision is a common phenomenon in the workplace. There are numerous studies of abusive supervisor within Chinese organizations, but most of them were conducted with Western theories and viewpoints and quite a few of them adopted cultural viewpoint and interaction norm to understand the impact of abusive supervision (Hu & Cheng, 2014; 2014; Ng, Chen, & Aryee, 2012). This study examined the relationship between abusive supervision and employee’s effectiveness (subordinate’s emotional exhaustion and job performance). Furthermore, we hypothesized that subordinates’ Yin-Yang thinking (a kind of Chinese Dialectical thinking) could mitigate the harm of abusive supervision, but the advantage would be reversed if subordinates had high belief of loyalty to their supervisor. Using a two-wave survey, we analyzed data from 264 dyadic supervisor-subordinate of 6 private enterprises in northern Chinese. Results showed that (1) abusive supervision is positively related to emotional exhaustion, but negatively related to job performance; (2) there is a significant three-way interaction of Yin-Yang thinking and belief of loyalty to supervisor on the relationships between abusive supervision and employee’s effectiveness. Abusive supervision had the strongest harm on employee effectiveness when subordinate with high Yin-Yang thinking and high belief of supervisor loyalty. Nevertheless, abusive supervision didn’t have significant negative impact on employee effectiveness when subordinate with high Yin-Yang thinking and low belief of supervisor loyalty. Finally, the contributions and limitations of this study were discussed and the recommendations for academic and practical applications were also provided.
SOCIAL SUPPORT AND CYBERBULLYING: THE MEDIATING ROLE OF INTERNET ADDICTION AND THE MODERATING ROLE OF STRESS

Xiaoyuan Chu
Yuan Li
Beijing University of Posts and Telecommunications (Beijing, China)

Bullying has been a severe problem in today’s society and it can be in many different forms. With the rapid development and pervasive use of Internet technology, cyberbullying appears to be gaining in popularity. It can be defined as repeatedly harassing someone via any device used to electronically communicate with the intention to harm, embarrass, or damage the other individual. A growing body of research has documented that social support is negatively associated with cyberbullying. However, little is known about the mediating and moderating mechanisms underlying this relation. Based on theory of compensatory Internet use and stress-buffering model, the present study examined whether Internet addiction mediated the relationship between social support and cyberbullying, and whether this mediating process was moderated by stress. Our theoretical model was tested using data collected from 1152 Chinese university students (M age = 20.22 years, SD = 1.52). Participants completed a battery of anonymous self-report questionnaires which include social support appraisal scale, stress scale for college students, internet addiction test, cyberbullying scale as well as demographic information (gender, age, grade, family economic status, and parents’ education levels). After controlling for demographic variables, social support was negatively associated with cyberbullying. Mediation analysis indicated that Internet addiction partially mediated the association between social support and cyberbullying. Tests of moderated mediation further revealed that the mediated path was stronger for university students with lower stress. And stress played different roles in the two paths of the mediating model. To be specific, for individuals under lower stress, the effect of social support on Internet addiction was stronger while the effect of Internet addiction on cyberbullying was significant but weaker. Results highlighted the significance of identifying the mechanisms that moderate the mediated paths between social support and cyberbullying of young adults, based on which, suggestions for reducing cyberbullying among young adults were proposed.
WHAT DO AUTHORITARIAN AND AUTHORITATIVE LEADERSHIP MEAN TO JOB PERFORMANCE? MEDIATIONS OF JOB STRESS AND MODERATIONS OF BENEVOLENT LEADERSHIP

Li-Fang Chou  
National Taiwan Normal University (Kaohsiung, Taiwan)

Wei-Chieh Lai  
Taiwan National Taiwan Normal University (Tainan, Taiwan)

Ming-Yen Lee  
Taiwan National Taiwan Normal University (Taoyuan, Taiwan)

Yu-Han Tseng  
Taiwan National Taiwan Normal University (Taipei, Taiwan)

The authoritarian leadership rooted in Chinese culture has always been an important and distinct leadership phenomenon in Chinese organizations. Because the negative connotations associated with the term ‘paternalism’ in the West, authoritarian was viewed a kind of negative leadership. Nevertheless, with the trend of globalization, the functions and positive effectiveness of authoritarian leadership were found in empirical researches. According to cultural source and nature of leadership, this study divided authoritarian leadership into two categories; dominance-focused authoritarian leadership and discipline-focused authoritative leadership. Research purposes of this study were: (1) to clarify the different influences of authoritarian / authoritative leadership on job performance through the challenge/hindrance job stress separately; (2) to understand moderators of benevolent leadership for authoritarian/authoritative leadership. By using survey method, 193 dyadic supervisor-subordinate data from southern Chinese private organizations were collected. The results of hierarchical regression and Bootstraps analysis showed that: (1) the dominance-focused authoritarian leadership only triggered the subordinates' hindrance stress and, in turn, harm subordinate's job performance; (2) the discipline-focused authoritative leadership only induced the challenge stress and further promoted subordinate's job performance; and (3) the benevolent leadership of the supervisor would weaken the positive influence of dominance-focused authoritarian leadership on hindrance job stress and strengthen the positive influence of discipline-focused authoritative leadership on challenge job stress. Finally, based on the results of this study, we discussed the research contributions, research limitations, and future research directions.
A CROSS-CULTURAL, MIXED METHODS STUDY ON RESILIENCE, NATIONAL IDENTITY, AND BELIEF IN A JUST WORLD

Larisa Buhin Krenek  
Touro College Berlin (Berlin, Germany)

Melissa Morgan-Consoli  
Alyssa Hufana  
Emily Unzueta  
Danny Meza  
University of California (Santa Barbara, USA)

Resilience is the ability to return to baseline functioning after an adverse event (Rutter, 2012). Understanding resilience across cultures in the face of socio-political transition is crucial in the current climate of global instability. Belief in a Just World (Jiang et al., 2016) and National Identity (Aitchenson et al., 2017) have been linked to people’s ability to adapt but have not been investigated explicitly in regard to resilience and economic or political adversity. Qualitative, Thematic Analysis of 14 interviews and multiple regression analyses of college students’ survey data (NUS Latinx=103, NCroatia=257) constituted a mixed methods design. Resilience was measured using the Connor-Davidson Resilience Scale (Connor & Davidson, 2003). The Personal Belief in A Just World Scale (Dalbert, 1999) assessed participants’ beliefs about events in their own lives being just (BJW), and National identity (pride, nationalism, devotion, and cosmopolitanism) was measured using the National Identity Scale (Čorkalo & Kamenov, 1999). Our triangulated results illuminate the complex relationship between BJW, NI and resilience. Family support was instrumental to resilience for both U.S. Latina/o and Croatian students, as were religious faith and community support. Latinx students did not mention NI during interviews and Croatian students minimized its role. Participants in both locations negated the idea that the world was just, but spoke of a religious sense of justice (Croatia) and making sense of adversity by working toward justice (Latino/a participants). Quantitative analyses produced a different image: national identity ($\beta=0.25$, $p=0.015$) explained 9% of the variance in resilience in the Latino participants ($R^2=0.09$, $F (2, 98) = 4.54$, $p=0.013$). Three predictors were statistically significant in the Croatian sample, accounting for 14% of the variance in resilience ($F (5,297) = 9.57$, $R^2 = 0.139$, $p=0.000$): National pride ($\beta=0.32$, $p=0.001$), Cosmopolitanism ($\beta= -0.26$, $p=0.000$), and BJW ($\beta= -0.15$, $p=0.007$). Despite participants’ outward minimization of its relevance during interviews, quantitative study findings corroborate ethnic identity research in finding national identity an important aspect of adaptive human functioning. Findings also further contribute to the view that believing in an unjust world may actually contribute to higher resilience.
Paternalistic leadership is the only leadership theory developed by non-Western society and organizations (Hernandez, Eberly, Avolio, & Johnson, 2011) and has been claimed to be one of the most prevalent and vivid leadership styles in Asia. It includes three different kinds of leadership: Authoritative leadership, benevolent leadership, and Moral leadership. In addition to the conception level, the level of organizational structure has also been valued by leadership researchers, which including direct leadership and indirect leadership. The former refers to the leadership behavior of the direct supervisor that demonstrates an action-oriented influence on subordinates while the latter means the leadership behavior which has an impact on subordinates below two levels and wields an image-oriented influence. By using cascade model (Larsson, Sjöberg, Vrbanjac, & Björkman, 2005), this study took soldiers from Taiwan Army as the subject, including "battalion commander" — "middle level leader" — "soldier", to explore how battalion commander’s paternalistic leadership affect soldier's identification with battalion commander. Participants included were 355 middle leaders and 1019 soldiers from 120 battalions of Taiwan Army. Using survey method and Hierarchical Linear Modeling, the results showed that (1) there is a positive correlation between direct paternalistic leadership (battalion commander’s authoritative, benevolent, and moral leadership rated by middle leader) and indirect paternalistic leadership (battalion commander’s authoritative, benevolent, and moral leadership rated by soldier). (2) Indirect paternalistic leadership has positive influences significantly on soldier’s identification with battalion commander, in which benevolent leadership has the strongest effect, then moral leadership, and authoritative leadership the weakest. (3) According to cross-level bootstraps analysis, the cascade model of cross-level effects of battalion commander’s paternalistic leadership on soldier’s identification with battalion commander are supportive. Finally, based on the results of this study, we discussed the research contributions, research limitations, and future research directions.
PROBLEMATIC ISSUES OF PROVIDING PSYCHOLOGICAL HELP TO LGBT PEOPLE IN RUSSIA

Maria Sabunaeva  
Russian LGBT Network (Saint Petersburg, Russia)

Olga Razmakhova  
"Psychology for Human Rights" (Saint Petersburg, Russia)

Socio-political situation in Russia has a great influence on mental state of LGBT people. Statistical data shows (n=120) a high level of fear among LGBT people towards turning to psychological and psychotherapeutic help by specialists outside LGBT organizations due to the risk of facing homophobia, biphobia and transphobia. The law prohibiting the "advocacy of non-traditional sexual relationships", as well as information concerning prosecution and murders of homosexuals in Chechnya and refusal of initiation of critical cases against hate crimes, — all these issues have a tremendous effect on LGBT people (which is confirmed by high levels of anxiety, depressive states, suicidal behaviors: St.-Petersburg, Moscow n=80; other Russian regions n=40; Spielberger-Khanin Anxiety Scale, Beck Anxiety Inventory, Beck Depression Inventory). The most significant factors which were distinguished by complex research (statistical data is going to be presented within the project proposal): 1. Homophobia and transphobia of specialists, psychologists who are not qualified to work with LGBT clients. It can be a conscious personal attitude of specialists or can be caused by lack of information. The students are often forbidden to conduct research on sexual orientation and gender identity. Clients who have encountered discrimination by specialists don’t have a practical possibility to file a complaint towards these psychologists. One of the problems in Russia is the absence of laws which would ensure ethical aspects of psychological help. 2. Insecurity and exposure of organizations and groups of specialists who provide educational services in the sphere of working with LGBT people. In 2018 in Moscow the 5th Annual Family Conference LGBT "Family and Partnership Values. Ethics and Politics" had to be cancelled due to incoming threats and refusal of the venue owners to host the event. In 2017 two participants of that conference were attacked after leaving the building. 3. Difficulties and lack of possibilities to include LGBT-related topics into official public educational programs. Impossibility and difficulties of defending theses and high-quality scientific papers on LGBT topics in psychology. As a result, secondary traumatization of LGBT clients by specialists occurs, which we consider to be a crucial yet invisible problem of professional community.
Visuospatial and spatial working memory (WM) of elderly with mild cognitive impairment (MCI) responses to cognitive training in different ways but the phenomenon is not well studied. This study aimed to investigate the differential effects of imagery-based Chinese calligraphic handwriting (IBCCH) program on neuroplastic changes related to visuospatial and spatial WM functions of a group of elderly with MCI as reflected by P2a and N200 event-related potential components, respectively. Sixteen elderly with MCI (mean age = 63.2 years) joined in a 4-week IBCCH program, in which they were trained to write Chinese calligraphy with ink brushes with visuospatial and spatial imagery. They were asked to continue practicing Chinese calligraphy writing for 3 months after the program completion. At the beginning, upon program completion and 3 months after the program, each participant was asked to go through a number of neuropsychological tests, including Digit Backward Tests and Color Trail Test. This was followed by participating in three cognitive tasks with position-specific Chinese radicals and abstract shapes: (1) visuospatial 2-back and (2) spatial 2-back and (3) visual detection tasks. The electroencephalogram was concurrently recorded. Repeated measures ANOVA showed significant improvement in WM capacity, indicated by more positive P2 amplitude at central site upon program completion (T2) compared with baseline while performing visuospatial and spatial 2-back task with radicals (p<0.02 & p<0.01, respectively). Furthermore, significant improvement in WM maintenance, indicated by more negative at Fz & Cz sites at 3 months follow-up compared with earlier time points while performing visuospatial & spatial 2-back task with radicals (p<0.01 & p<0.05). In addition, improvement in WM capacity as indicated by more positive P2 amplitude at frontal site upon program completion compared with baseline while performing visuospatial 2-back task with shapes (p<0.01), suggesting calligraphy training could be generalized to other types of non-contextual stimuli. The findings suggested that, despite the cognitive decline, neuroplastic changes related to visuospatial & spatial working memory could be mediated differentially in elderly with MCI after a period of imagery-based cognitive training.
BEHAVIORAL AND ERP PRIMING EFFECTS AFTER INCIDENTAL LEARNING DURING IMPLICIT AND EXPLICIT RETRIEVAL: A NOVEL PERSPECTIVE ON EYEWITNESS TESTIMONY

Evgeniya Matvienko
Werner Sommer
Humboldt-Universität zu Berlin (Berlin, Germany)

In eyewitness situations there is typically no intention to remember the witnessed event or person. Therefore, retrieval processes after incidental encoding are of special interest. The present experiments explored the utility of priming effects on the behavioral and neural level to assess memory traces after incidental encoding as a function of retrieval intention (implicit vs. explicit retrieval). In two experiments, 20 students each took part. In the incidental learning phase, participants saw pictures of male and female faces and briefly named some distinctive features of each face. No mention of memory testing was made. In the retrieval phases, the familiarized faces were intermixed with new male and female faces, arranged in a prime-target paradigm. Experiment 1 required a gender decision on each target face (implicit task), whereas Experiment 2 required a familiarity decision (explicit task). Priming effects were measured on the behavioral level and with event-related brain potentials (ERPs), recorded from 64 scalp electrodes. On the behavioral level, priming effects were enhanced for familiarized than for novel faces (but more so during explicit than implicit testing), indicating the presence of memory traces from incidental learning. ERPs indicated an enhanced priming effect for familiarized faces only rather late in the epoch. In contrast, during explicit testing, enhanced priming effects were found in the N250r and in the N400 components. Importantly, the same enhanced ERP priming effects were seen in misses as compared to false alarms. The present results indicate that differential behavioral priming effects (stronger for familiarized than novel faces) in implicit tasks may serve as indicators of incidentally acquired face familiarity, potentially allowing for concealed memory testing. Even more interestingly, ERPs revealed traces from incidental encoding of faces in both implicit and explicit tests. During explicit testing this was the case even when participants were unaware that faces were familiar or novel, that is, for misses vs. false alarms. These findings offer a new handle on dissociating overt and covert signs of memory in eyewitness testimony.
THE MEDIATOR ROLE OF DRIVING AND RIDING AVOIDANCE IN THE RELATIONSHIP BETWEEN TRAFFIC LOCUS OF CONTROL AND DRIVER BEHAVIORS

Ozgun Ozkan
Bahar Oz
Middle East Technical University (Ankara, Turkey)

Road traffic accidents are a serious worldwide public health problem. Variables which are derived from individual differences such as driver behaviors and driving skills are related to risky behaviors and accidents on the road. Although human error is the greatest contributor factor, accidents generally arise from the interaction between vehicle, driver and the environment. Locus of control can be defined as a personality attribute that contains two dimensions as external and internal locus of control. In traffic situations, externals attribute greater responsibility to external factors and they take less responsibility in determining the possibility of an accident. Besides, internals attribute greater responsibility to themselves and they are more likely to involve accidents than externals. Additionally, driving-related anxiety leads to driving and riding avoidance that is negatively correlated with deliberate violations. It is stated that individuals who assigned the responsibility to other drivers are tend to report greater level of driving and riding avoidance than people who attribute more responsibility to themselves. Therefore, avoidance might have influence in the relationship between traffic locus of control and driver behavior. In the present study, determining the mediator role of driving and riding avoidance on the relationship between traffic locus of control and driver behavior was aimed. A total of 291 drivers (153 male and 138 female) drivers participated in the study. Participants were asked to fill out the Driver Behaviour Questionnaire, Multidimensional Traffic Locus of Control Scale and Driving and Riding Avoidance Scale. A simple mediation analysis was conducted by using the PROCESS macro for SPSS (Hayes, 2013). It is revealed that avoidance was negatively mediated the relationship between external traffic locus of control and aggressive violations which refers to driving aggressively or expressing hostility to other road users. Besides, avoidance was also a positively significant mediator between external locus of control and unintended behaviors as lapses and errors. The findings of the study showed the effect of driving and riding avoidance on the relationship between driver attribution and behavior. Since these variables are crucial in road safety, enlightening the previously mentioned relationship may be helpful for developing driver training programs.
THE USE OF PSYCHOLOGICAL AND PSYCHO-PHYSIOLOGICAL ASSESSMENT METHODS IN PERSONNEL MANAGEMENT

Amangossov A.A.
University Turan-Astana

Mambetalina A.S.
Kashhinbai B.B.
ENU L. Gumilyov

The use of psychological and psycho-physiological assessment methods in personnel management is very important in labor organizations. The significance of the research is enhanced and emphasized by the requirements of the modern consumer to the quality of the services provided. The railway industry is a strategically significant object of Kazakhstan.

Considering the fact that the Company employs one percent of the country’s population, there is an urgent need to apply modern psychological and psycho-physiological methods of personnel assessment.

The methodological basis of the theoretical and practical research of our research was the works of foreign authors and our publications, as well as the rules for accepting and transferring to some positions of the Company, the rules of psychophysiological testing and other rules of the National Company Kazakhstan Temir Zholy JSC.

The object of study is the railway personnel.

Hypothesis: we assume that the introduction of a psychological testing system to determine compliance with the positions of workers directly related to the safety of train traffic on the “Human Factor” and the further use of psychophysiological methods in the management of railway transport personnel will contribute to high-quality and transparent staff selection will reduce the risk of emergency situations arising due to human factors.

After passing the test, workers in 48 posts responsible for safety at EPDC-MK, AIC issues a report on the results of testing.

The introduction of this method in the Center, used to start at the station “Astana”, led to the nullification of emergencies due to the human factor at the specified station. Its use in the management of railway personnel contributes to high-quality and transparent selection of personnel for vacant positions and, as we see, reduces the risk of emergency situations arising due to the human factor.
THE RELATIONSHIP BETWEEN TIME PERSPECTIVE AND DRIVING AVOIDANCE

Ozgun Ozkan
Bahar Oz
Middle East Technical University (Ankara, Turkey)

Human error is the most important factor in accidents. Driver performance and behavior are the main components of human behavior on the road. Besides, it is revealed that driving-related anxiety leads to driving and riding avoidance which is negatively correlated with deliberate violations. This kind of behavior can be observed in traffic which stemmed from various situations such as unpleasant driving conditions or vehicular traffic in general. On the other hand, time perspective is found to be related to different negative behavior outcomes in traffic. For instance, present-oriented people tend to exhibit unplanned and risky behaviors such as traffic violations while future-oriented people are less likely to show risky driver behaviors. The present study was conducted with 291 drivers between the ages of 19 to 58 in order to determine the relationship between time perspective and avoidance behavior. The participants were asked to fill out a demographic information form, Zimbardo Time Perspective Inventory and Driving and Riding Avoidance Scale. Age, gender and total mileage was controlled. The Linear regression analysis revealed that time perspective of the drivers is related to avoidance behavior. Namely, traffic avoidance is positively related to future time orientation while being negatively related to present time orientation. The results revealed that time perspective is significantly related to avoidance on traffic that shape a driver’s risk taking behavior on the road. In the present study, the relationship between time perspective and driving and riding avoidance behavior was studied for the first time in the literature and this study has a potential to contribute to the literature by investigating the importance of driving and riding avoidance within the frame of time perspective. Since our perceptions about time influence our actions, the results of the study might be used to understand human behavior for accident prevention.
EVALUATION OF PSYCHOLOGY STUDENTS’ PROFESSIONAL COMPETENCIES MATURITY LEVEL

Tatyana Khudyakova
Voronezh State Pedagogical University (Voronezh, Russia)

Modern education paradigm assumes emergence of new requirements to students’ professional training. One of the main research trends in the context of students’ professional formation studies is the search for tools to evaluate their professional competencies maturity level. This aspect is particularly topical during evaluation of psychology students' professional competencies due to complexity and multi-competency of their future professional activity, lack of clear criteria of its effectiveness and unavailability of work results for direct measurement. A. Margolis and I. Konovalova point out that absence of common criteria to evaluate work of educational psychologist is one of the main reasons for inadequate expectations about effectiveness of his professional activity and imposed requirements. In order to build an effective evaluation model, it’s important to consider the specifics of educational psychologist professional activity. Today contents of worker’s occupation, primary requirements for their competency level as well as criteria to evaluate labor performance are fixed in professional standards. There’re different approaches to evaluate specialist’s work. E. Sabelnikova and N. Khmeleva note the necessity to evaluate training results and consider American project CLA to be one of the best examples, because it implies testing of specialist’s universal skills, not related to professional focus of training. A. Minurova and O.' Leonova talk about necessity to develop and apply domestic model of professional exam, which should become the main method for evaluation of pedagogical workers professional competencies. We’ve conducted the research on Voronezh State Pedagogical University students’ professional competencies, using case method and method of expert evaluation. 200 students participated. Case method allowed us to identify students’ ability to establish an algorithm for solving professional tasks. Teachers and practicing psychologist from educational institutions acted as experts. Based on diagnostics results two groups of students were formed, depending on their professional competencies level — basic and advanced. As the next step, difference in degrees of several parameters intensity was studied, which allowed to outline determinants that define successful professional formation of students with different educational profiles.
HOPE AND CREATIVE SELF-EFFICACY AS SEQUENTIAL MEDIATORS IN THE RELATIONSHIP BETWEEN SOCIAL-ECONOMIC STATUS AND CREATIVITY

Yinyinzi Yang
Weiguo Pang
East China Normal University (Shanghai, China)

Creative ideation, the cognitive ability to generate many creative ideas, is considered as the critical part in everyday creativity, eminent creativity and one facet of creativity. As with other facets of creativity, there are some specific aspects concerned with effective creative ideation. It is influenced by certain cognitive attributes, personality traits, knowledge, thinking style and environment. Many researches have revealed that family environment as a pivotal part of individual’s life has direct effect on creative idea generation. Family social-economic status (SES), including different aspects of family, can reflect the family environment. Low SES means less resources which could limit creative development. Study showed that the students who live in low-income family always with less hope compared to the students in high-income family. According to some researches, hope as a positive personal trait can influence creativity and as a positive motional state also can plus self-efficacy. Creative self-efficacy (CSE), the belief that people can be creative in doing tasks, is an essential element to influence our creative performance. This study aimed to examine how Family environment predict individual’s creativity through the mediating role of hope and creative self-efficacy. Participants were 619 undergraduate students (females=371) from three universities in China. Data were collected using the SES Scale, the Adults Hope Scale, the Creative Self-efficacy Scale and the Runco Ideational Behavior Scale. Correlational results indicated that SES was significantly and positively associated with creative ideation, hope and creative self-efficacy. Importantly, the path analyses indicated the sequential mediating role of hope and CSE in the link between SES and creative ideation. These findings suggest that hope and CSE underlie the effect of SES on individuals’ creative ideation. From the results of this study, it is possible to say that poverty environment will not limit creativity when we have hope.
EFFECTS OF NICOTINE ABSTINENCE ON PROSPECTIVE MEMORY

Gün Pakyürek
Ceren Özerbil
Ecem Karaosmanoğlu
Kerem Gülçek
Melda Hatice Alımlı Can
Adnan Menderes University (Aydın, Turkey)

The main purpose of this study is to examine how smoking abstinence affect performance on prospective memory (PM). Secondary aims are to examine how abstinence affect performance on attention and to make an adaptation of Virtual Week (VW) (Rendell and Henry, 2009), which is considered as a PM task, to our country's culture, and to test its functioning on young smoking sample. For this purpose, VW was applied to a total of 50 young participants, including abstinent (25) and non-abstinent smokers (25). Participants were assigned randomly an abstinent (25), non-abstinent (25) conditions. VW consists of a training day and 3 virtual days which has totally 30 PM tasks. At the end of each virtual day, the Recognition Test (RT) was applied and participants RM performance were controlled. In addition, Stroop Test was given and the relationship between attention and smoking abstinence was also examined. 2 (Abstinence: Abstinent- Non-Abstinent) X 2 (Task Regularity: Regular- Irregular) X 2 (Task Type: Event Based-Time Based) mixed ANOVA design repeated at last two factors was applied. Abstinence were manipulated with between groups and task regularity and task type were manipulated with within subject. RT which was applied after VW, time check task which was a real-time task, and the completion duration of VW were analyzed separately. For this analysis, t-Test was carried out. According to the analyzes performed, abstinsents' correct response performance on PM was significantly lower than the non-abstinsents. However, there was no difference between abstinsents and non-abstinsents in terms of Stroop Task performance, RT performance and completing time of VW. Abstinsents' performance were lower than non-abstinsents’ on time check tasks. The results demonstrated that, abstinence had a negative effect on correct PM response performance. In addition, findings of task regularity and task type were supported the Multiprocess Theory of PM and Preparatory Attentional and Memory Processes -PAM- Theory. It has shown that Turkish version of VW in young smoker adults is a reliable measurement tool for evaluating the PM performance.
STRUCTURE OF PERSONAL MATURITY OF ELDERLY PEOPLE

Elena Soldatova
Saint Petersburg State University (Saint-Petersburg, Russia)

Irina Zavialova
South Ural State University (Chelyabinsk, Russia)

Achievement of personal maturity in the elderly is manifested in the personality integration. If an elderly person wants to be modern, then he needs to lead an active lifestyle and use new technologies. An elderly person receives a new experience, but does not analyze his life, and therefore does not implement development tasks and does not achieve the personality integration. From this point of view, it is important to determine the social expectations concerning the period of "old age" and to reveal the essential psychological characteristics in order to achieve the integration of the personality. The study included two stages. At the first stage, experts made a content analysis of 82 aphorisms on the problems of aging and old age in order to determine these social expectations regarding old age. At the second stage, appropriate research methods were chosen, and an integration model was developed using structural equation modeling. The sample consisted of 306 participants. The represented in the culture characteristics of the elderly are positive emotional background, self-acceptance, internality, reflection of life's journey, contemplative life position, acceptance of mortality. In the model of personality integration of elderly person there are significant relationships between personal maturity and self-acceptance (r = 0.19; p < 0.001), personal maturity and acceptance of others (r = 0.24, p < 0.001), personal maturity and emotional comfort (r = 0.2, p < 0.001), personal maturity and internality (r = 0.19; p < 0.001), personal maturity and ego-identity achievement (r = 0.92; p < 0.001). The model is consistent: likelihood criterion $\chi^2 = 9.260$ (p < 0.026); CFI = 0.986; AGFI = 0.930; RMSEA = 0.08 (90% confidence interval from 0.025 to 0.146); PCLOSE = 0.145. Studies show that the characteristics of social expectations concerning the period of "old age" correspond to the development tasks of this age period. The personality components specific to the late adulthood in the structure of ego-integration are self-acceptance, acceptance of others, emotional comfort, internality. The ego-identity achievement is essential to the personality integration structure.
ASSOCIATIONS BETWEEN SOCIAL IDENTITY AND SCHOOL SATISFACTION: A STUDY OF NORWEGIAN HIGH SCHOOL STUDENTS

Inge-Erland Simonsen
Torbjorn Rundmo
Norwegian University of Science and Technology (Trondheim, Norway)

School satisfaction is considered a key indicator of education quality in addition to academic achievement and coping, as well as an important factor to prevent student dropout from school. The primary aim of this study was to investigate how high school students’ self-efficacy, school identification, and teachers’ classroom management are associated with school satisfaction. The study included controls for gender, education programme and parental education level. A self-report questionnaire was administered to high-school students at three upper secondary schools in Norway. The sample comprises 794 first year students. The survey was conducted at the end of the autumn term in 2015, 2016 and 2017. The response rate was 100 per cent. Previously validated measurement instruments to measure social identity, self-efficacy and school satisfaction were used. To examine differences in social identity, self-efficacy and school satisfaction due to type of study and demographics, MANOVA/ MANCOVA was used. SEM and hierarchical logistic multiple regression analysis was used to investigate prediction models of school satisfaction. School identification was found to be more important for the students’ school satisfaction than perceived self-efficacy. Moreover, according to these results, teachers’ social identity leadership could play a role in school satisfaction indirectly by teachers’ influence on the students’ school identification. The current study underscores the importance of school identification. Finally, the findings imply that the teachers’ role in social identity leadership is imperative. The implication of these findings for classroom management is discussed.

SOCIAL TRUST AND ATTITUDES TOWARD THE INTRODUCTION OF ARTIFICIAL INTELLIGENCE INTO EVERYDAY LIFE

Timofei Nestik
Russian Academy of Sciences (Moscow, Russia)

Antecedents of human confidence in AI and robots are analyzed. The results of a series of empirical studies (N = 526, N = 129, N = 293) are presented, that were devoted to the socio-psychological predictors of Russian adults’ attitudes toward the introduction of AI systems into everyday life. Different psychological types of AI technologies (“cyborgization technologies” and “smart city technologies”) are identified, which are influenced by different psychological factors. It is shown that the perceived threats of AI are associated not so much with the reliability and predictability of the technology as with its use by the state and other people. At the same time, fears that artificial intelligence will get out of control and subjugate people are more typical for those who are ready to use AI technologies, believes in its rapid development and benefit to society. It is shown that the estimation of the technologies of specialized AI and their possible influence on society directly depends on the person’s level of social trust. It was found that the willingness to interact with the general AI as a partner that has consciousness and emotions requires a combination of techno-optimism with social optimism, with confidence in social institutions and other people. Support for the using of AI to improve the effectiveness of social institutions was not associated with prosocial and collectivist attitudes, but with an emphasis on personal success and a low value of safety. Perspectives of further research are proposed.
SUBJECTIVE PERCEPTION OF DANGER AND COPING STRATEGIES AMONG MILITARY PERSONNEL IN DIFFERENT CONDITIONS OF PROFESSIONAL ACTIVITY

Natalya Ulyanova  
Southern Federal University Senior (Rostov-na-Donu, Russia)

Lida Pravdina  
Southern Federal University (Rostov-na-Donu, Russia)

The authors thank the military psychologists who assisted in the preparation of the study. The goal is to study the influence of the conditions of activity of military personnel onto their subjective perception of the dangers of service and coping strategies. Theoretical foundations: a systematic approach, the concept of personal adaptation resources. Methods. Respondents: 359 men (18 — 54 years old) — military men of different statuses and types of troops. Techniques: IES-R (Horowitz, Wilner et. Al); “Coping Inventory for Stressful Situations” (Norman S. Endler, James D. A. Parker); “Strategic Approach to Coping Scale” (Stevan E. Hobfoll). Statistical processing was carried out using descriptive analysis methods, linear regression analysis, the Kruskal-Wallis Test and the Mann — Whitney U-test. Results. The lowest levels of subjective perception of service-associated risks show recruits and the highest — cadets and officers (U= 3772.5; p ≤ 0.01). Constructive coping strategies are significantly more often used by ordinary conscripts and contract soldiers than by cadets and officers (U= 3784.5; p ≤ 0.01). There are differences between military personnel assigned by the type of troops and deployment: conscripts of the airfield unit estimate the stress level higher than those serving in other military branches (U= 579.5; p ≤ 0.01). Soldiers of railway troops demonstrate a level of stress higher than the aircraftmen do (U= 530.0; p ≤ 0.01). The most significant predictor of formation of a traumatic reaction to the conditions of military service for all groups of respondents is the use of emotionally-oriented coping. Coping strategies preferred by military personnel form patterns that are negatively or positively associated with their perception level of danger. These patterns are different for recruits, contract soldiers, cadets, and officers. For example, for ordinary contract soldiers, problem-oriented coping strengthens indicators of a subjective threat. The strategy, usually regarded as constructive, reinforces the trauma here. Thus, soldiers should be trained in patterns of coping behavior, effective for the specific conditions of service. For each military unit it is important to identify specific patterns of coping behavior, which will allow to neutralize the traumatic effect of extreme conditions in professional activity.
Worker in both developing and developed countries are suffered from psychosocial risks at their workplaces, and those risks have significant consequences for employees' physical and mental problems as well as work related problems, such as decreasing productivity, quality of life, and motivation. Unfortunately, psychosocial factors are often overlooked by companies, mostly in developing countries, including in Indonesia whereas the incidences of work related psychosocial factors, such as high job demands, abandonment, and stressful working conditions have been happening. Hence, better attention on the work-related psychosocial factors in Indonesian companies, both private and state owned, may have a significant impact on employees' welfare, engagement, and even performance. The Copenhagen Psychosocial Questionnaire (COPSOQ) and the 24 items Aon Hewitt Questionnaire of Employee Engagement were administered to 1500 participants from a largest Indonesian state owned company which specialty in electricity power and distribution. Both questionnaires were also administered to 1300 participants from a large private branded shoe manufacture company in Indonesia. Participant performance rates from performance management data as well as various demographic characteristics (e.g., job levels, genders, educational levels) were also collected. Exploratory factor analysis and internal consistency of the scales confirmed the validity of the both questionnaires in Indonesian version. Our logistic regression analysis confirmed that a wide range of significant psychosocial factors at work were different between two companies. Multiple regression analyses suggested that those psychosocial factors predict employee engagement and performance in both companies in different ways and mechanism. These findings were also associated with participants’ demographic characteristics. The mechanism of the associations between those different aspects of psychosocial factors with employee engagement and performance are discussed using seven models of psychosocial risk factors at work (Kompier, 2003) and other relevant theories. We recommend improvements in the psychosocial work environment with adjustment to relevant demographic characteristics may be helpful to increase employee engagement and performance in state owned and private companies.
COGNITIVE PROFILE AND EMOTIONAL REGULATION CHARACTERISTICS IN PATIENTS WITH ALCOHOL USE DISORDER

Anna Trusova  
Anton Gvozdetsky  
Saint-Petersburg State University (Saint-Petersburg, Russia)  
Svetlana Klimanova  
Anna Berezina  
V. M. Bekhterev National Research Medical Center for Psychiatry and Neurology (Saint-Petersburg, Russia)

Alcohol dependence is a challenging disorder, both to prevent and to treat. Impaired emotion regulation is a core issue underlying Alcohol Use Disorders (AUD) that often persist during remission and is associated with relapse. One of the most difficult aspects in assisting individuals with AUD in their recovery process is fostering the development of compensatory cognitive strategies, which support emotion and behavioral self-regulation and, thus, allow to maintain sobriety. The purpose of this study is to investigate the interrelation between cognitive functioning and emotion regulation in patients with AUD. 113 patients with the diagnosis of alcohol dependence based on ICD-10 criteria (83 men, 73,45%) were recruited. The average age of participants is 41.91±8.22 years old, average duration of alcohol dependence is 10.83±7.5 years (M±SD). The following self-report methods were used: Emotion Regulation Questionnaire, Cognitive Emotion Regulation Questionnaire, Difficulties in Emotion Regulation Scale, Anxiety and Depression Scale. In addition, the participant’s cognitive functioning was assessed with BAC-A, CPT-IP, Stroop-test, and Working Memory Test. Data were analyzed using Mann-Whitney criterion and Spearman ratio. Two-factor model of cognitive control including response inhibition and working memory was confirmed by the principal component method (p <0.001). Participants were assigned into two groups – high-level (n=51, HL) and low-level (n=62, LL) of cognitive control. The groups didn’t differ significantly on the measures of anxiety and depression. Patients from LL group received significantly higher scores on emotional suppression (p=0,012), positive reappraisal (p=0,006), Putting into perspective (p=0,013), and catastrophizing (p=0,027). In patients from LL group, the level of anxiety and depression positively correlated with the tendency to employ strategies of rumination (p=0,021, p=0,007) and catastrophizing (p<0,001, p=0,001). In patients from HL group, the level of anxiety negatively correlated with the emotional reappraisal (p=0,004) and the level of depression and positively correlated with difficulties maintaining goal-directed behaviors (p=0,028). The difference in characteristic of emotion regulation between high-level and low-level cognitive control patients with AUD has important clinical implications for understanding of the role of emotion regulation and cognitive processes in patients with AUD and development of effective treatment methods. The study was funded by RFBR (№16-06-01043).
A THEORETICAL MODELING FOR THE ANALYSIS OF ORGANIZATIONAL TRAUMA: A MIXED-METHODS STUDY

Idil Işık
Esin Çetin Özbudak
Istanbul Bilgi University (Istanbul, Turkey)

This study aims to develop a model to investigate the events with long-lasting negative psychological consequences that overwhelm the capacity of people in organizational settings. These events are entitled as “potentially traumatic events” (PTEs) and recently took work/organizational psychologists’ attention to develop methodologies for defining, explaining, and controlling them. The present study is a three phases study for the in-depth conceptualization and measurement of organizational trauma. Firstly, we conducted a comprehensive literature review to develop a typology of PTEs. The search of databases for the term “organizational trauma” (from 1995 to 2016) revealed 81 articles. The inductive qualitative content analysis brought three PTEs: “events resulting from organizational processes”; “adverse experiences in trauma-prone occupations/sectors”, and “catastrophic events caused by economic/social/environmental conditions”. It was compelling to observe that empirical studies were a few and the case study analysis was prominent. Therefore, as the next step, we aimed to test if the empirical research will help us to identify PTEs akin to the emerging typology. In the qualitative phase, we organized focus groups (employees from the logistics center of a textile company; n=21; 48% females; Mean_age =31; SD=6.5). Thirty-six diverse traumatic events emerged as input to Traumatic Organizational Events Scale (TOES) to measure risk perception. TOES was designed to evaluate both the probability of event and possibility to prevent it. Lastly, TOES was administered to white-collar employees via convenience sampling (N=145; females=47.5%; mean age=34.5, SD=7.6; managers=46.8%). We included Organizational Resilience Scale as well to test TOES’ construct validity. Multi-Dimensional Scaling detected seven segments (accidents, violence, reputation, theft, psycho-social, financial, organizational change, uncontrollable-external events) and two dimensions (“individual-level impact”; “organizational-level impact”). Perceived risk of traumatic events had a significant negative correlation with resilience (r=-0.361, p=.00). The managers and non-managers’ perception of risk differed for events with organizational-level (t=2.34, p=.021; Cohen’s d=0.38) and individual-level impact (t=2.79, p=.06, Cohen’s d=0.47). Managers tend to perceive risk lower than non-managers do. We will discuss these findings with its potential contribution to theoretical conceptualization of organizational trauma as a rather current research area.
TESTING THE HYPOTHESIS OF “RETROGENESIS” BETWEEN TYPICALLY DEVELOPING YOUNG CHILDREN AND MENTALLY HEALTHY OLDER ADULTS

Georgia Papantoniou
Magda Dinou
Effie Katsadima
Eugenia Savvidou
University of Ioannina (Ioannina, Greece)
Despina Moraitou
Aristotle University of Thessaloniki (Thessaloniki, Greece)

Retrogenesis has been defined as the process by which degenerative mechanisms reverse the order of acquisition in normal development. Since the retrogenic models suggest that comparisons of cognitive abilities should be made between the developing children and the cognitively normal older adults or preclinical AD patients, the administration of the same screening instruments to the two groups should be available. The aim of this study was the comparison of cognitive abilities, between typically developing young children and mentally healthy older adults, by exploring possible differentiations in the latent structure of four neuropsychological tests across the age subgroups of the sample: 42 kindergarten students (61-75 months), 56 elementary students (74-98 months), 118 new-old adults (61-79 years), and 27 old-old adults (80-88 years). The tests administered for measuring cognitive abilities: (a) subtests, of the ATHINA Test, tapping cognitive ability (verbal and visuo-spatial ability), phonological memory, and neuropsychological maturation, (b) the Children’s Category Test (CCT-1) tapping nonverbal learning and memory, concept formation, and problem-solving abilities, (c) the Educational Coloured Progressive Matrices (CPM), nonverbal screening measure of general ability, and (d) the Mini-Mental State Examination (MMSE), which assesses the cognitive status. In specific, the present study attempted to investigate the latent structure qualitative changes in each of the aforementioned neuropsychological tests, from age to age, using Confirmatory Factor Analyses (CFA) and testing a conventional two-factor model and/or a unidimensional model of them. CFA fully verified the one-factor structure of [R] Educational CPM: for the group of first- to second-grade elementary school students, and for the group of new-old adults. The comparison of the CFA Models indicates a similar structure in CCT-1 for first- to second-grade elementary school students, new-old adults, and kindergarten students. The comparison of the CFA Models indicates a similar pattern of structure in AT for first- to second-grade elementary school students, and old-old adults. Regarding the new-old adults group, CFA indicated that individual variability across MMSE measured variables can be modeled by a two-factor model. The patterns of two-factor and one-factor MMSE structure were not verified for the groups of kindergarten students, elementary school students, and old-old adults.
INTERACTION STYLES OF “CHILD-GUARDIAN” RELATIONSHIPS IN KINSHIP CARE AND GUARDIAN FAMILIES

Anastasia Miklyaeva
Elena Volkova
Elena Korjova
Svetlana Bezgodova
Herzen State Pedagogical University of Russia (Saint-Petersburg, Russia)

Guardianship and kinship care are common forms of child custody in Russia. Although both forms of custody allow putting child in family, circumstances for building “child-guardian” relationships vary considerably. We suggested that factors of the child’s emotional wellbeing differ in kinship care from guardian families. To test this hypothesis, we interviewed pairs of school-age children and their guardians in kinship care families (with grandmothers as guardians, n=56) and in guardian families (n=103). Control group consisted of 42 families of birthparents with children. Interview was designed to include variables from «Parental Attitude Research Instrument» (for adults) and «Tool for family relations» (for children) as well as scales from «Family APGAR». Factor analysis suggested five parameters of educational styles (“positive interest in child’s life”, “authoritarian socialization”, “ignoring conflicts”, “excessing infantilizing care”, “forcing child development”) and three characteristics of adult’s behavior assessed by children (“positive interest in my life”, “excessive control”, “unpredictable reactions”).

Positive interest in child’s life rated significantly lower in all custody families compared to control group. Kinship care families had higher rates of excessing infantilizing care than in guardian families and control group. But, positive interest in child’s life was scored significantly higher by children from custody families. Interaction between children and adults in custody families is more controversial by nature than in native families. For control group, emotional wellbeing of the child is not surprisingly determined by mother’s reflective positive interest in child’s life, while mothers also associate their wellbeing with such positive interest. Guardian families show the same trend; however it is hard for the child to predict expressions of guardian’s interest. For kinship care families, child’s emotional wellbeing is connected to grandmother’s reflective positive interest in child’s life, lack of excessive control and ability to ignore conflicts. Practical implications of this study will require “identifying targets” for psychological support in guardian and kinship care families. The study is supported by RFBR, project № 18-013-00085.
EXAMINING BORDERLINE PERSONALITY BELIEFS IN TERMS OF SHAME, GUILT AND COMPASSION

Ekin Doga Kozak
Istanbul Kultur University (Istanbul, Turkey)

Julide Ceren Yildirim
Kocaeli University (Kocaeli, Turkey)

Shame and guilt as self-conscious emotions are defined to occur as a result of evaluation of one’s own self. The intensity and frequency of these emotions can be related to develop and/or maintain personality disorders. On the other hand, self-compassion which is defined as evaluation of one’s own self without judgement can be a protective factor against psychological problems. The aim of this study is to investigate the relationship between self-conscious emotions (shame and guilt) and borderline personality beliefs (BPB) and the role of self-compassion and fear of compassion on this relationship. Data collection was carried out via online questionnaires from 208 volunteer participants from Turkey with an age range between 18 and 56 (M = 26.84, SD = 6.96). Participants were given Demographic Information Form, Guilt and Shame Scale, Borderline Subscale of Personality Belief Scale, Self-Compassion Scale, Fear of Self-Compassion Subscale of Fears of Compassion Scale and Marlowe-Crowne Social Desirability Scale. According to the results, shame was positively while guilt was negatively correlated with borderline personality beliefs. Shame and guilt had a high positive correlation with each other but at the same time their direction of correlation with borderline personality beliefs was opposite. By creating four different categories with high and low ends of shame and guilt scores, their relationship with borderline personality beliefs were reexamined. The results indicated that shame-free guilt category had the lowest borderline personality belief scores. Hierarchical regression analyses were applied in order to discover the predictors of BPB. Shame and guilt explained 17% of the variance of BPB in the first step. In the second step, self-compassion and fear of compassion raised the explained variance to 46%. Mediational effects of self-compassion and fear of compassion were tested via Process Macro. It was found that borderline personality beliefs were mediated by self-compassion and fear of compassion. As results suggest, in treatment interventions of borderline personality beliefs, it is important to cultivate self-compassion and to decrease fear of compassion. The implications of this study would be beneficial for a better understanding of borderline personality.
THE RELATIONSHIPS AMONG HUMOR, HUMOR STYLES, WELL-BEING AND INTERPERSONAL RELATIONSHIP OF COLLEGE STUDENTS

Pei-Zhen Xia
Zuway-r Hong
Wen Cheng
National Sun Yat-Sen University (Kaohsiung, Taiwan)

Humor was considered a positive psychological trait that can help people improve their interpersonal relationship (Kuiper & Olinger, 1998). People who are more humorous have better social interactions (Fitts, Sebby, & Zlokovich, 2009), life satisfaction (Dyck & Holtzman, 2013), as well as a higher self-esteem (Zhao, Kong, & Wang, 2012). However, humor is a complicated trait and could hurt others if individuals do not conduct it appropriately. Thus, Martin, Puhlik-Doris, Larsen, Gray & Weir (2003) showed that there are “good” and “bad” humor which separated in four different styles of humor: affiliative, self-enhancing, aggressive and self-defeating. The previous studies indicated that humor is positively related to psychological health and well-being (Dyck & Holtzman, 2013). Besides, people who have better interpersonal relationships also have better well-being. The previous studies also showed that interpersonal relationships moderated the relationship between well-being and forgiveness (Tse & Yip, 2009) or gratitude (Lin & Yeh, 2014). However, there were few studies examined the relationship among humor, humor styles, interpersonal relationships, and well-being. The purpose of this study was to investigate the relationship among humor, humor styles, interpersonal relationships, and well-being.

The current study included 205 students. There were 88 male students (42.9%) and 117 female students (57.1%) with mean age 20.4 years old. This study adopted four instruments: Adolescent Cognitive Competence of Interpersonal Relationship Scale (Liou, 1992), the Oxford Happiness Questionnaire (Hills & Argile, 2002), Multidimensional Sense of Humor Scale (Chen & Chen, 2005) and Humor Styles Questionnaire (Martin, Puhlik-Doris, Larsen, Gray & Weir, 2003). Hierarchical regression and multiple moderation regression were conducted. The results revealed that well-being (p = .015), affiliative humor (p < .001), self-enhancing humor (p < .001), and self-defeating humor (p < .001) significantly predict sense of humor. Interpersonal relationship significantly moderated the relationship between well-being and humor (p = .031). Well-being positively related to sense of humor has been shown in this study. Aggressive humor did not predict sense of humor. One of the possible explanations include that aggressive humor hurts others, and therefore individuals who use aggressive humor may not be considered as the sense of humor in social contexts.
POWER DISTANCE IN THE MATHEMATICS CLASSES: HOW DOES IT AFFECT COMMUNICATION AND ACADEMIC PERFORMANCE?

Selma Arikan
İstanbul Medeniyet Üniversitesi (İstanbul, Turkey)

Müjgan Erkol
Okan Üniversitesi (İstanbul, Turkey)

Turkish culture is known to be a high power distance culture and this situation shapes the communication styles and interactions among the parties with different social statuses (Bodur and Kabasakal, 2002). High power distance culture of Turkey also affects the interactions inside the classrooms and this situation has the potential to influence communication, students’ motivation and academic performance. One of the problems in Turkish education system is the low motivation and performance of the students in mathematic courses. From this point of view we designed a study to understand the effects of power distance on teachers’ communication skills and students’ performances for math classes. Besides we wanted to control the interaction of teachers’ power distance and communication skills with mathematics self-efficacy of students as it was previously found that mathematics self-efficacy could be one of the indicators for performance of mathematics (Bandura, 1997; Pajares and Miller, 1995). The data were gathered from the 8-grade students of nine state schools situated in Çankaya, Ankara. 795 students filled our surveys consisting 13-item power distance scale, Karagöz ve Kosterioğlu’s (2008) 25-item teachers’ communication skills scale, and Usher and Pajares’ (2009) 24 –item Sources of Self Efficacy in Mathematics Scale. Students were also asked to write their first and second term math grades. We used the data of 449 students as there were no missing items in their surveys. The data were analyzed by Multiple and Hierarchical Regression analyses. The moderated regression analysis (Aiken and West, 1991) and Sobel tests were also used to analyze the data. The results showed that power distance predicted teachers’ communication skills. Moreover power distance and teachers’ communication skills were found to be explaining the variance in maths grades. Although no interaction effect of self-efficacy in mathematics was found among these relations, self-efficacy was found to be a predictor for mathematics performance. The results showed that high power distance of the teachers is one of the factors hindering the effective communication in classrooms and this situation indirectly predisposes lower performances in maths exams. Our results once again showed the importance of students’ self-efficacy in mathematics.
THE IMPACT OF FACEBOOK AND INSTAGRAM EXPOSITION ON BODY IMAGE PERCEPTION IN MEXICO

Melissa Garcia-Meraz
Celeste Alvarado-Zuñiga
National Autonomous University of Mexico (Mexico, Mexico)

It has been found that the exhibition of beauty ideals on Facebook, Instagram and other social networks (for example, publishing or viewing other photographs) of idealized bodies of women contributes to social comparison and body dissatisfaction (Fardouly, Diedrichs, Vartanian, & Halliwell, 2015). The shared images of “perfect” female bodies through Facebook and other websites can also be a significant predictor of negative mood and greater social comparison with other women (Fardouly et al., 2015). In the same way, the longer active Facebook, the greater the negative state of mind (Sagioglou & Greitemeyer, 2014). For this reason, and with the aim of identifying dissatisfaction with the body figure before and after exposure to different groups, a group of 80 university undergraduate students aged between 18 and 25, was asked to participate. The anthropometric measurements of the participants in the arms, neck, head, trunk and legs were taken to enter them in the Body Image Assessment Software (BIAS) of the University of Barcelona and Body Perception of UNAM. The software allowed participants to visualize their body shape and indicate dissatisfaction satisfaction with their body before and after exposure to social networks (Instagram and Facebook), web Page (Fashion page) and home design (control group), three ways ANOVA mix model was tested: gender, condition group and time pre-post exposition (2 × 4 × 2). The results showed that there is greater disagreement with the body and body figure after exposure. The software gives two data, the first related to the perceived body image, that is, how the participants think they look, the second, related to how they would like to look. The results are shown in percentage terms, showing that, after exposure, women want to be thinner or wider. These results are discussed in terms of gender stereotypes, the beauty standards assigned and demanded of women and how this impacts the perception and idealization of beauty.
STRATEGIES FOR MATERNAL BEHAVIOR IN JOINT ACTIVITIES WITH A YOUNG CHILD

Elena Gorlova
Russian State University for the Humanities (Moscow, Russia)

Particular significance of the social environment is emphasized in L. Vygotsky’s theory: starting from the very birth, every child enters a unique system of relations which is called social situation (context) of development and defines child personality development. The impact of various contextual aspects is associated with the child’s own experiences. Adults’ competence, especially at early stages of ontogenesis, is determined by their capability to sensitively perceive intentions of their child, to respond to them and support the child’s initiatives in his dialogue with the adults. It should be noted that mother-child dialogical contacts take a leading role in the theory of attachment, initially elaborated by J. Bowlby and extended by M. Ainsworth. The result of mother-child interaction is formation of a strong affective bond, a sustainable emotional support, which also provides the child with resources to safely explore the outside world and to be successful. Common to both approaches is the fact that they both emphasize the invaluabale role of a close adult bringing the child into the world. In this research, we consider the phenomenon of mother-child interaction from both sides: from the side of a child, we look upon the child’s experiences towards his mother’s attitude expressed in attachment behavior; from the side of the mother, we look into characteristics of the behavior performed by the mother towards her child in course of joint activity. The study involved 32 children aged 1.7 to 3 years, and their mother aged 23 to 40 years. Quality of maternal relationship towards the child and maternal behavior within a context of joint activity were studied by means of observation. The vast majority of the children showing more manifestations of one pattern also perform behavioral tendencies specific to the other two types of attachment. Strategies of maternal behavior within the context of joint activity differed depending on what group of attachment behavior the child belonged to. It should be noted that in all of the three groups, the predominant way the mothers reacted to their children’s actions, was making pauses, but the value of those were different for “secure”, “avoidant” and “ambivalent” children.
SELF-CONCEPT AS FACTOR OF SUBJECTIVE WELLBEING OF GIFTED ADOLESCENTS

Svetlana Bezgodova
Anastasia Miklyaeva
Elena Volkova
Irina Volkova
Herzen State Pedagogical University (Saint Petersburg, Russia)

Studies of psychological well-being of gifted adolescents stay fragmented, and the underlying factors remain contradictory. World Health Organization considers gifted children to be at certain risk, as personal development of the gifted child stands out from age norms. Talent might disturb subjective wellbeing, especially when the talent provokes social stigma. We revealed a range of factors which could influence on psychological wellbeing of the gifted child. The goal of our study was to assess such factors, including self-concept, self-efficacy, agency, characteristics of life perspective and attitudes regarding their life. Study methods included document analysis and expert evaluation (for characteristics of adolescent’s talent and its perception by social environment) and questionnaire survey (for adolescent’s attitudes to his/her own talent, self-concept, self-efficacy, agency and attitudes to his/her life). Study sample consisted of adolescents of 13-17 ages participating at short- or long-term education programs for gifted children, and control group of 13-17 old normal adolescents. The results present the model subjective wellbeing and self-efficacy, self-concept, agency, life perspective and attitudes to person’s own life, mediated by adolescent’s attitudes to his/her talent, achievement in the field connected to his/her gift and specifics of this field. The set of tools developed in this study might be useful for population studies, monitoring, the results might contribute to effective programs for subjective wellbeing and mental health of adolescents.

The study was supported by RFBR project No. 19-013-00729.
FOCUSING ON OTHERS: FROM SOCIAL COMPARISON TO SELF-PRESENTATION

Sila Demir  
Final International University (Antalya, Turkey)

Turker Ozkan  
Middle East Technical University (Ankara, Turkey)

Basar Demir  
Akdeniz University (Antalya, Turkey)

Self-presentation is manipulating the image of oneself when interacting with other individuals. The self-presentation motivation might be associated with specific individual differences. In the current study, social comparison tendency is tested as a predictor of self-presentation. Social comparison refers to individuals’ tendency to use others as an anchor to evaluate themselves. Festinger (1954) suggested that if people perceive a discrepancy between themselves and their comparison target they would either change themselves or the comparison target, or stop the comparison. In addition to these, in the current study, self-presentation is offered as another outlet for the tension created by this self-other discrepancy. That is, if people attend to the information about others to evaluate themselves, they might be more likely to focus on the image they present to others. As social networking site (SNS) use become an ordinary part of daily life, the link between social comparison and self-presentation emerges as an important area to investigate. Furthermore, the role of personality in this association was aimed to explore. To investigate this relationship, the data collected from 558 university students were analysed. The participants completed the self-presentation tactics scale, Iowa-Netherlands Social Comparison Orientation measure, social comparison frequency scale, HEXACO-PI-R, and demographics. The linear regression analyses supported the prediction that social comparison tendency and frequency would be highly associated with self-presentation ($\beta = .49$, $\beta = .39$, $ps < .001$, respectively). However, the moderation analyses conducted using the PROCESS macro of Hayes (2012) revealed that personality does not have a moderator role in the association between social comparison and self-presentation. The results indicate that social comparison might be an antecedent of self-presentation. Moreover, the fact that the personality traits did not moderate the association between these two constructs suggests that their association is impervious to the personality traits. The authenticity of the individuals might explain this strong association between these two constructs. As people are more authentic, they would be less focused on external information for self-evaluation and less willing to monitor the information they present to others than highly self-conscious individuals. The implications for SNS experiences and future directions will be discussed.
It has been documented that university students with a past trauma experience can develop posttraumatic stress disorder (PTSD) along with psychiatric co-morbidity (e.g., Boyraz et al., 2015, 2016). According to emotional processing theory (Foa & Kozak, 1986), they can also develop a distorted self-schema (Briere, 2000) which mediated the impact of PTSD on psychiatric co-morbidity among Chinese university students (Fang & Chung, 2019). These studies, however, have not taken account of mentalizing capacity (Fonagy & Target, 2006) which can collapse as a result of a trauma and affect distress (Allen et al., 2012). Past trauma can also affect students’ ability to regulate their effort to persist at academic tasks and complete study goals (e.g., Pintrich, 1991, 2004). However, whether trauma can affect self-efficacy in meeting academic demands remains to be investigated. Focusing on a group of Chinese university students, this study examined 1) the association between PTSD from past trauma, psychiatric co-morbidity and self-efficacy in academic performance, and 2) whether cognitive distortions and reflective function would mediate the impact of PTSD on psychiatric co-morbidity and self-efficacy. 845 (F=534, M=311, mean age=18.52, SD=1.63) first year undergraduate students were recruited from a university in Hong Kong. They completed the Posttraumatic Stress Diagnostic Scale for DSM-5, General Health Questionnaire-28, Cognitive Distortion Scales, Reflective Function Questionnaire and the self-efficacy part of the Motivated Strategies for Learning Questionnaire. PTSD, cognitive distortions, and reflective function predicted psychiatric co-morbidity. Both cognitive distortions and reflective function mediated the impact of PTSD on psychiatric co-morbidity. However, PTSD did not predict self-efficacy in academic performance but distorted cognitions and reflective function did. PTSD from past trauma can influence students’ mental health through negative views of themselves and their future, as well as restricted ability to perceive and interpret one’s own behaviours and those of others as emanating from intentional mental states (e.g., needs, desires). These negative self-perception and restricted ability, as opposed to PTSD, also influenced students’ confidence in meeting academic demands.
MENTORSHIP is considered the most effective way for giftedness realization (E.P. Torrance, 1984; B. Bloom, 1985). According to H. Zuckerman (1983) half the Nobel laureates she studied had had another laureate as a mentor. Mentorship is widely used in the world gifted education (Australia, Germany, Turkey, UK, US). At present mentoring is coming back into educational system of Russia (eg, Resource Centre "Mentori"). This movement is quite natural due to officially accepted “inclusive approach” in our schools. Because of its introduction, teachers are busy with their daily obligations and cannot meet needs of all categories of students. They are not always able to discover students’ interests, gifts nor provide the time and energy to develop them. In addition, teachers are not trained properly to adapt instruction to various levels of students’ development. Under such conditions highly able students may not realize their potential at school because of: too simple learning materials; emotional problems; mismatch of their thinking, learning styles and instructional styles. Mentoring can help the gifted and potentially gifted to overcome limitations of unchallenging environment. Taking into account the fact that the highly able are as varied as any other children, the purpose of our study was to find psychological factors essential for efficient mentorship programs. Method used: case study due to expressed individuality of the gifted. Aims for mentors were to encourage the gifted: to think independently and at a higher-level; to develop originality, initiative and self-direction. Results will be presented in detailed discussion of three cases to illustrate advantages and difficulties of mentorships for the gifted with different psychological characteristics: openness to the new, speed of information processing, stereotypes, learning styles. The gifted were from normal (not specialized) schools and enjoy only minimal individualization. When whole-class mixed-ability teaching is in practice, mentoring is necessary for all the gifted: potentially gifted from culturally disadvantaged homes, for those who are under incorrect gender expectations. Moreover, high achievers need mentors to develop a creative approach to their projects and to get rid of the pressure to be always perfect in their academic work.
THE PSYCHOLOGICAL WELL-BEING OF THE TEACHER IN CONNECTION WITH THE EDUCATIONAL AND ECONOMIC RATING OF THE SCHOOL

Rezeda Khusainova
Kazan Federal University (Kazan, Russia)

The effectiveness of the educational space that "sets the system of social relations" (A.A. Popov) depends on both by the characteristics of the environment itself and by the characteristics of the subject included in this environment. The quality of interaction largely depends on the teacher, and not only on his professional activity and competence, but also on his psychological well-being. As a part of our study, we consider the educational environment of the school at the regional level while studying the relationship of economic and educational factors with indicators of the psychological well-being of the teacher.

The theoretical basis was the research made by N. Bredburn describing psychological well-being through a subjective feeling of satisfaction/dissatisfaction with life. Taking into account the fact that psychological well-being is "a purely subjective phenomenon" (T.D. Shevelenkova, P.P. Fesenko), it is manifested in satisfaction with oneself and life in general and connected with the notion "quality of life" (T. B. Johnson), the following methods were selected: 1) a questionnaire of behavior and experiences associated with the work of AVEM; 2) a questionnaire WAQA-100. Two groups of municipal districts were allocated according to the criteria "maximum" expressed value upon the parameters "educational school rating" and "economic school rating". There were studied two schools in each of the selected districts, 124 teachers in total. Teachers of both groups are characterized by high satisfaction with life and a sense of social support. The teachers from schools with a high educational rating have more connections. The desire for their professional growth is accompanied by a decrease in the number of personal relationships, restraint in emotions; significant energy costs increase fatigue, reduce sexual activity, the opportunity for rest; and only a growth of the distance to work increases vitality, self-esteem, gives a feeling of peace, happiness. The teachers from schools with a high economic rating have system-forming indicators BE, PS (striving for perfection), with their values increase there have been improved the working capacity, learning ability, and activity.

1 The study was carried out with the financial support of the Russian Foundation for Basic Research, project 17-29-02092 ofi_m.
Mapping out values in different cultures and across cultures to understand differences and commonalities among individuals and (cross) cultural groups is a long history in psychology. Values from different research traditions are defined and measured solely as “desirable end states” (“approach”) most of the time. For example, values are defined and measured as “desirable end states” in Schwartz’ value theory and value surveys. However, different psychological concepts which have been theoretically and empirically demonstrated to relate to values generally conceptualized as two distinct mechanisms which generally labelled as “approach” vs “avoidance” (e.g., approach vs avoidance motivation, goals and regulatory focus). More importantly, cross-cultural studies have demonstrated that the approach and avoidance tendencies are also culture-bounded and affect how to assess cultural differences. For example, Schwartz and Bardi (2001) stated that, “people typically view values as desirable and values generally range from somewhat to very important”. Focusing on “positive” value generally creates “limited” variances across individual and culture which might lead some methodical “biases” to discover latent structure of values within and across cultures. Therefore, current study is conducted to discover whether cultural value structure might be changed according to desired values vs undesired values are used. Also, the study used a value pool based which reflect both desired and undesired values on previous indigenous quantitative studies to reflect emic approach to investigate value structure. 100 graduate students were asked to classify 150 “desired” and 120 “undesirable” values according to similarity (content, meaning, etc.). Then, frequently used MDS approach with ALSCAL method used to map out values structures for desired and undesired values separately. Even though classification based on desired values showed some culture-specific structural patterns, most of dimensions resemble the universal individual-level value structures (e.g., Schwartz’ value dimension). For example, “tradition”, “conformity” and “security” value types were emerged and closely located at two-dimensional space. However, classification of “undesired values” was showed distinct patterns of structure which could not conceptualized as opposite direction of positive value orientation. The findings were discussed how adding “undesired” values into value survey to test value taxonomies and discover emic aspects of value dimension.
INTERNATIONALIZING UNDERGRADUATE PSYCHOLOGY- LESSONS FROM EIGHT YEARS OF TEACHING IN EUROPE

Larisa Buhin Krenek
Touro College Berlin (Berlin, Germany)

The author will address opportunities and challenges for teaching psychology in international environments drawing on her own 8-year-long experience of teaching in two US institutions in two different European countries. The first institution is in Croatia and psychology is part of general education. Graduates receive both Croatian and US diplomas. The second institution is in Germany and graduates choose either a German or a US diploma. Among the challenges are differing expectations for competencies at bachelor-level study of psychology. European countries generally grant the title of psychologist at the completion of undergraduate study whereas in the US this step is inadequate for meaningful professional activity. However, the European curriculum is often more demanding than a typical US undergraduate program. This is a possible advantage for US students who wish to continue their graduate studies in the US. Consequently, one of the first challenges for programs aiming for dual-accreditation without the additional costs of running two parallel programs is curriculum design. This requires culture-specific knowledge of educational requirements and regulations and occasionally involves conflicting pedagogical and assessment expectations. Increased diversity of students in the classroom is a major advantage of teaching internationally. At a unique, religiously affiliated college in Germany, between seven and 10 different nations may be represented in a typical undergraduate psychology course. Additionally, the student body includes a significant number of military veterans who were stationed in Germany and wish to continue living there. In Croatia, this diversity means that students whose countries were engaged in the wars of former Yugoslavia in the early 90s now sit in the same classroom. Finally, the author will critically discuss the problem of US-based textbooks and the overrepresentation of White, North American-based psychological knowledge. Geopolitically relevant instruction materials, extreme student diversity, and opportunities for innovative research either designed by or involving undergraduate students require a high level of multicultural competency on behalf of instructors, but also offer possibilities for increased formal and informal positive contacts across cultural groups.
Students with Specific Learning Disability (SLD) may be vulnerable to discriminations and marginalization by virtue of being labeled as a student with disability. Thus it becomes important to know whether an inclusive educational setting, which is viewed as one of the media to bring about inclusion in the society at large, can provide some shield against it by nurturing better peer relationships. Therefore, the current study looked into peer relationships among students with and without SLD and compared them on the dimensions of total number of friends, total number of friends in school, total number of friends outside school and quality of friendship. There were three groups of participants [students with SLD studying in Special Schools (n= 72), students with SLD (n= 75) and students without SLD studying in Inclusive Schools (n= 75)] from two educational settings: Inclusive Schools and Special Schools. For the dimensions of number of friends, the participants were asked to mention the names of their friends, their age and the school that they went to. Friendship quality was measured using Friendship Quality Questionnaire-Revised. Non parametric (Kruskal Wallis Test) and parametric (MANOVA) statistical tests were used for the analysis of data. The results revealed that compared to the other groups, students with SLD studying in Special Schools had the highest number of total friends, friends in school and also friends outside school, whereas, students with SLD studying in Inclusive Schools had the lowest number of total friends and friends in school. For friendship quality, there was significant difference among the three groups on the conflict and betrayal dimension, where students with SLD studying in Special Schools scored the least, while students with SLD studying in Inclusive Schools scored the highest. The homogeneity (in terms of academic difficulties) among the students in a special school and the sense of shared characteristics may have led to them having greater number of friends. The results also reflect the probability that students with SLD studying in Inclusive Schools are not as well accepted as would have been expected in an inclusive set up.
COMMUNITY BASED TOURISM FOR SMALL ISLANDS SUSTAINABLE DEVELOPMENT

Graziella Zitelli  
Order of psychologists (Catania, Italy)

Giovanni Ruggeri  
OTIE (Palermo, Italy)

The increase of frequency of travels modified the sensibleness of the travelers that looks for more authenticity and a real experience with local communities. People living in small contexts as islands, are becoming part of the travel motivation and the hosting community is more related with the travel experience. In this way the relations between hosts and guest are part of a new concept of tourism presented in literature as relational tourism (Calderon, Ruggieri, 2011). This paradigm has a relevant attention for human relationships rather than travel industry services. It is a tourism of encounter (Grolleau, 1988) and sharing (Richards, 2013), where the tourist participates in the way of life of the local community (Okazaki, 2008). In this paper we describe the changes of tourist demand and its impact, later to go into the business and local challenges that relational tourism faces to improve, and the efforts for island companies to follow these trends. The study highlights some implications for future studies on islands tourism and the consideration for the local community to reply to these new challenges. The possible answer is to emphasize the relational dynamics promoting a dynamic clustering of cooperation among local and tourist communities. (Wearing & McDonald, 2002; Prats & Guia, 2005; Haugland et al., 2011; Mancini et al. 2012).
EXPLORING NATURALISTIC CONCEPTIONS ABOUT MORALITY OF CHILDREN IN TURKEY

Büşra Aktaş
29 Mayıs University Teaching (Istanbul, Turkey)

Sercan Balim
Sevim Cesur
İstanbul University (Istanbul, Turkey)

Mehmet Karasu
Van Yüzüncü Yıl University (Istanbul, Turkey)

Bahar Aykac
Düzce University (Istanbul, Turkey)

Many studies in the area of moral psychology are predominated by theory-based research including WEIRD samples (Western, Educated, Intellectual, Rich and Democratic; see Henrich, Heine, & Norenzayan, 2010). However, we need to have more qualitative research that enable us to elaborate both underlying culture-specific factors which can affect moral reasoning and emotionality in developmental period for comprehending the deeds of developmental pattern of moral conceptualization. Thus, the purpose of this study is to explore naturalistic conceptions of morality in children with addressing cultural factors. Since Turkey has a relatively honour and collectivistic culture, there can be different underlying factors which can affect moral conceptualizations in daily life. To understand both how morality is conceptualized in children and how Turkish culture might contribute this conceptualization distinctly from Western cultural background, we used semi-structured interviews which made us capable to have deeper knowledge about their daily narratives for morality. The study was conducted with 150 children (7-15 years) living in different cities in Turkey. Content analysis was applied to analyze the interview transcriptions (Klaus, 2004). The main conceptions of morality are as follows: Harm avoidance, care, sharing, respect, honesty, property, conform to (traditional) rules, cleanliness, tidiness and kindness. Results also demonstrate that most of the naturalistic conceptions about morality of children are relationally constructed among close friendships and family members. Results will be discussed within the framework of universal theories of morality such as Kohlberg's Moral Development Theory, Moral Foundations Theory, and relational-contextual theories of morality such as Shweder’s Three Ethics of Morality and Relational Models Theory.
Decision making is the process which determines all the spheres of a human life. Today this process is the subject matter of many branches of science and is quite profoundly studied. Nevertheless, the development of information technologies, including Internet-technologies, introduces new areas for the research of the process. The purpose of the research is to study psychological features of persons taking a decision to buy online. The theoretical grounds of the study are based on the works by Burnett P., Busemeyer J.R., Caruso D.R., Chumakova M.A., Ford S., Gardner H., Grigolava V.V., Gurova L.L., Hofstede G., Kahneman D., Karpov A.V., Kornilov S.A., Kornilova T.V., Krasavtseva Y.V., Lee M.D., Mann L., Mayer J.D., Morgenstern O., Neumann J., Radford M., Salovey P., Tversky A., Zhuravlev, A.L., etc. The empirical part of the study includes such methods as questioning (a specially developed questionnaire), testing (Melbourne decision making questionnaire; Personal factors of decision-making; A new questionnaire of tolerance-intolerance to uncertainty, etc.) and statistical data processing. The sample consists of two groups. The basic group includes 45 people who have to buy online and at the same time have states of anxiety, fear, uncertainty, etc. The control group includes 36 people who feel pleasure and satisfaction buying online. The main results show that the respondents of the basic group have a less pronounced tendency to rationality and disposition to risk-taking; statistically-proved higher rates of defensive avoidance and hypervigilance, and lower levels of interpersonal intolerance to uncertainty and intuitive ability. Discussing the findings it is possible to conclude that people who have to buy online and experience anxiety, fear, uncertainty and other negative emotional states are inclined to postpone decision-making and try to avoid responsibility for their decisions. They exaggerate the complexity of their choice that, in its turn, increases the level of their negative emotional state. People who feel pleasure and satisfaction buying online are disposed towards novelty, changes and self-dependence. Making decisions they trust themselves, rely on their experience and feelings and are ready to choose more complicated tasks and act in untried ways.
THE DETERMINANTS OF SEXUAL SATISFACTION: AN INTEGRATIVE MODEL

Emilie Wawrziczny
Emilie Constant
Jean-louis Nandrino
Karyn Doba
University of Lille (Villeneuve D’ascq, France)

Numerous studies have identified factors influencing sexual satisfaction, showing the importance of individual and relational factors, as well as variables related to the social and cultural environment of individuals. Nevertheless, there is a lack of models combining the most important factors to explain sexual satisfaction. In that line, the main objective of the present study is to explore the relevance of each of these factors and their relationships in an integrative model. Four hundred and seventy-two individuals in marital relationship for at least 1 year participated in this study, including 333 females and 139 males. The characteristics of their couple relationship, their physical and emotional health, and the quality of their social relationships were assessed using self-report questionnaires. We used a PLS approach, which is based on a system of multiple and simple linear regressions (Step 1). This model was compared based on the gender (Step 2). The model revealed that the quality of care and social support affected sexual satisfaction. This effect was mediated by emotional health which influences the quality of dyadic adjustment, which in its turn, influences sexual satisfaction. There were no direct links between these variables and sexual satisfaction. In particular, factors such as age and the presence of sexual disorders decreased sexual satisfaction while cultural factors such as religion had no impact. The comparison of the two gender models did not reveal any effects. This study provides a comprehensive model that combines important factors to better manage sexual problems in the couple. Sexual satisfaction is a major research issue to improve: the well-being of individuals and the quality and stability of the conjugal relationship.
The interpersonal relationships between teachers and students have significant outcomes to both groups of them. Cognition and cognitive process are significant contributors in the development and quality of a such close relationship. More accurately, intuitive and attributional appraisals are two such constructs. Whether partners perceive their relationship as positive or negative, and which interpretations they make about the relationship influence their motivation, behavior and emotions. In addition, emotions are inherently experienced in close relationships, and they are significant formulators of future behavior. Accordingly, this study aimed to examine students’ and teachers’ attributions and emotions for the perceived quality of the between them interpersonal relationships, and the impact of attributions on emotions. The participants were 250 students, 7th, 8th and 9th grades, boys and girls, and 50 teachers of both genders. Students and teachers came from the same classes from 10 state schools from various regions from Greece. Data were collected at the half of the second school term of the total three terms, in order to be adequate time for the participants to form an impression about their interpersonal relationships. The results from multivariate and univariate analyses between and within groups revealed that (a) students and teachers attributed their satisfactory interpersonal relationships mainly to the self, followed by self-other interactive- related factors, whereas each group attributed the unsatisfactory interpersonal relationships to the other, (b) the more good relationship both teachers and students perceived they had, the more intense the positive emotions, whereas the more negative relationship they perceived that they had, the more intense the negative emotions, (c) both intuitive and attributional appraisals of the relationship influenced the emotions, particularly in the perceived bad teacher-student relationship, and (d) the relative strength of the effect of the attributional dimensions on the emotions varied between the perceived good and bad interpersonal relationships, between the group of teachers and the group of students, and across the various emotions. The findings were discussed for their applications in enhancing students’ and teachers’ interpersonal relationships, via the intervention of reappraisal attribution-based programs.
TEENAGER’S TENDENCIES TO GADGET ADDICTION IN LEARNING ENVIRONMENTS WITH DIFFERENT ACCOUNTABILITY RATINGS

Gulshat Shakirova
Kazan Federal University (Kazan Russia)

Technologization of the society and uncontrolled use of digital devices are the main reasons for the gadget addiction. According to studies, 89% of teenagers use Internet and gadgets in a daily basis. Consequently, teenagers become more vulnerable to technological innovations (Soldatova, 2013). This kind of information pressure on a teenager’s psyche leads to changes in his/her learning environment. The methodology of the study is based on the activity theory (Rubinshtein, 1946; Ananyev, 1967; Leontev, 1972) and its fundamental principle towards the unity of consciousness and activity. It is assumed that a high accountability rating (measured by the federal standardized exam) of learning environment is an indirect indicator of teenagers’ involvement in educational activities. In this regard, the hypothesis of the study is as following: the tendency to gadget addiction appears in the groups of boys and girls differently in learning environment with a low accountability rating. The research sample consisted of N=178 teenagers aged from 12 to 15 of which 91 were boys and 87 — girls. Data sources included demographic survey and the tendency for gadget addiction scale (Zinchenko, Tkhostov, 2016). Data analysis is performed using measures of descriptive statistics. The main results of the study indicate that there are no differences between samples with high and low accountability ratings of learning environments (temp = 1.97; p ≤ 0.05). The interrelation between the tendency for gadget addiction and gender (r = 0.28; p≤0.05) is set in addition with the lack of connections on this scale with high and low accountability ratings of learning environments. Low tendency for gadget addiction is set in the group of boys, and high tendency for gadget addiction is set both in the groups of boys and girls. Thus, the hypothesis of a study has confirmed partially; tendency for gadget addiction is not connected with the accountability rating of learning environment but has peculiarities with regard to the gender variable. This research was supported by Russian Foundation for Basic Research, Grant № 17-29-02092.
WHAT IS INTERNATIONAL PSYCHOLOGY AND WHY PARTICIPATE?

Robert Cleve
Saajan Bhakta
The Chicago School of Professional Psychology
(Chicago, USA)

The field of International Psychology (IP) is relatively new and encompasses a number of frameworks, including: cultural, cross-cultural and indigenous psychological paradigms. The Chicago School of Professional Psychology (TCSPP) developed this PhD and MA program in 2009 and 2012 respectively. The programs are each non-licensure with a research rather than clinical focus and it highlights distinct concentrations based on academic background: Trauma and Organizations and Systems for the PhD and an additional track of Environmental for the MA. The aims of the IP program can be conceptualized as a vision to which the discipline aspires, that is, the creation of a contextualized, internationally relevant, and responsive psychology. It encompasses: "Understanding challenging contemporary topics that are not geographically bound and which have a psychological dimension (cause, effect, mediation, moderation); designing contextualized, ethical, and socially responsible actions to address these challenges and support individual and social well-being" (Stevens & McGrath, 2017, p. 21). Students are required to conduct research outside of the borders of the United States (U.S.) and follow unique guidelines that support cultural nuance for ethical and methodological design elements. With a specific Emic/Etic framework informing the research engaged in for the final deliverable of a dissertation, Berry et al., (2011) assists the researcher with positioning themselves from within or outside of a given cultural system. The projects require dual IRB consideration from both TCSPP and the host country affiliation or point of entry for data collection. The program supports a robust curriculum in research and included two out of country Field Experiences for the PhD and one for the MA. This program is being introduced to meet the conference goal of advancing psychological knowledge and practice and further supports ethical and environmental considerations. References Berry, J. KNOWLEDGE OF AND ATTITUDE TOWARDS AIDS IN TURKISH UNIVERSITY STUDENTS

Ibrahim Yakın
Kadir Has University Graduate (Istanbul, Turkey)

Nuran Aydemir
Izmir Katip Çelebi University (Izmir, Turkey)

The present study aimed to investigate the knowledge of and attitudes toward AIDS among Turkish university students. For this purpose, previously developed, and psychometrically tested 21 item AIDS knowledge scale and 17 item AIDS attitude scale were applied to 1403 university students who enrolled in five different universities in Izmir by using convenience sampling. Almost a fourth of the participants (63.1%) were female. The age range was changing between 17-54 with a mean and standard deviation of 20.94±2.66. Results showed that 39% of the sample had sexual experience and the mean age for the first sexual experience was 18±2.32. There was also a significant difference on gender in terms of having sexual experience or not. Almost all of the participants (98.4%) reported previously heard something about AIDS, 77.1% read something about it, however, just 3.6% reported knowing someone with AIDS. Only 43.4% of the participants had a higher level of knowledge about AIDS, whereas 46.6% had favorable attitudes toward AIDS. Additionally, it was found that participants who were more knowledgeable about AIDS also had more positive attitudes toward it. In terms of the differences caused by age, gender, income and spiritual faith on knowledge and attitude, it was found that as the age increases the total knowledge and the scores of the factors of the knowledge scale increase as well. On the other hand, there was no relationship between age and attitude. Gender creates no significant difference on either total knowledge score or knowledge scale’s factors. On the other hand, gender creates a significant difference in the total attitude score, and in the positive attitude towards contact with people with AIDS factor and on stigma factor which are all favor in females. Income also creates a significant difference on knowledge scale’s protection factor. Lastly, the existence of a spiritual faith creates a significant difference on total AIDS knowledge score and knowledge scale’s factors, total attitude scale and attitude scale’s factors.
RELATIONSHIP COMMITMENT AND ROMANTIC ADVICE SEEKING: OWN AND OUTSIDER PERSPECTIVES

Ezgi Beşikci
Uşak University (Uşak, Turkey)

Christopher R. Agnew
Purdue University (West Lafayette, USA)

The current research examined romantic advice seeking, an important communicative process operating between an individual involved in a romance and their social referents. Based on theory and past findings, we hypothesized that greater relationship commitment is associated with lower advice seeking. We examined (1) the hypothesized association between one’s own commitment and romantic advice seeking, and (2) whether someone outside of the romance, when provided with commitment information about the involved intimates, would also respond regarding the intimates’ advice seeking as predicted. In Study 1 (N=210), we tested the association between commitment and romantic advice seeking, as well as the hypothesized mediational roles of relationship conflict, problem solving efficacy, and disclosure about the romance, in this association. Results of two serial path analyses indicated that higher levels of commitment were associated with less perceived conflict in the relationship ($\beta= -.14, p < .001$) and more perceived efficacy in solving problems within the dyad ($\beta=.52, p < .001$), which, in turn, was associated with less negative disclosure about the romance ($\beta= -.39$ and $-.34, p < .001$, with conflict and efficacy in the model, respectively) and lower likelihood of seeking advice ($\beta=.70$, and $ .68, p < .01$, with conflict and efficacy in the model, respectively). In Study 2 (N=85), we tested experimentally the effect of perceiving commitment by an outsider on the perceived likelihood of one’s seeking advice about relationship problems. Findings revealed that when an outsider reads about a hypothetical friend’s romance described as highly committed, the outsider expected the friend to disclose more about positive aspects (M= 7.24, SD=1.28,) and less about negative aspects of their romance (M= 4.60, SD= 1.40), as compared to those who read about a friend’s romance described as low in commitment (M=4.91 SD= 1.56; F (1,81) = 51.31, p < .001, partial eta squared=.39, and M=5.75 SD= 1.40; F (1,81) = 15.37, p < .001, partial eta squared=.16, for positive and negative disclosure, respectively). We did not find significant differences in expected likelihood of advice seeking from an outsider’s perspective.
PERSONAL BARRIERS TO INNOVATIVE LEADERSHIP: STRUCTURAL ASPECTS OF MOTIVATION, LEADERSHIP STYLE, AND SOCIAL IDENTITY

Vera Gryazeva-Dobshinskaya
Yulia Dmitrieva
Svetlana Korobova
Vera Glukhova
South Ural State University (Chelyabinsk, Russia)

The high pace of innovative development of organizations demands effective training for innovation leaders. The training can be optimized by differentiating the groups based on the identification of the personality resources (Gryazeva-Dobshinskaya, Dmitrieva, Glukhova, 2010, and 2016) or the barriers as suggested in the study. Innovative leadership is perceived as a system phenomenon with the two sub-systems (activity aimed at changing and maintaining the functioning methods), which is confirmed in the studies of the balance of the sub-structures of motivational, creative and stylistic leadership characteristics that are personality resources (Gryazeva-Dobshinskaya, Dmitrieva, 2015). The purpose of the study is to expose structural grounds for differentiation of managers that enables for identification of specific personality features that act as barriers to innovative leadership. Design Sampling of the managers is differentiated into groups by the leadership styles, motivation of failure avoidance, and hope for success ratio. Based on the data of diagnostics of the leadership styles, achievement motivation and social identity, discriminant analysis, and factor analysis were performed in each group. Participants: 165 managers who deal with innovations projects. Methods Leadership styles were diagnosed based on the MLQ by B. Bass, J. Avolio (Avolio, 2004) including the scales: Transformational Leadership and Transactional Leadership. Achievement motivation was diagnosed based on the TAT method by H. Heckhausen (Sobchik, 2002) that exposes motivation of the hope for success and motivation of the failure avoidance. Social identity of the subjects was diagnosed using the Role Relations Of Social Subjects With Creative Personalities method by V.G. Gryazeva-Dobshinskaya with co-authors (Gryazeva-Dobshinskaya et al., 2008) based on the psycho-semantic method by J. Kelly that exposes the structure of the social identity. Results Outcomes of the factor analysis have been analyzed by the sampling group options based on the structure of the achievement motivation and leadership styles. Barriers to the innovation leadership development, such as specifically weak social identity of I in the presence of high motivation of the failure avoidance, lack of integration of the social identity and transformational leadership, and others, have been identified. Identifying specific barriers to innovative leadership in managers allows for optimizing training through its differentiation.
THE FORMS OF SOCIAL SKILLS TRANSFER IN PARENT-CHILD RELATIONSHIPS

Valentina Kunitsina
Ekaterina Yumkina
St-Petersburg State University (St-Petersburg, Russia)

The study was prepared with the financial support of the RFBR grant, project No. 18-013-00904. Family is the first agent of human socialization, in which parents promote some forms of children behavior and reject others. The TV, internet, literature are also existed in a field of parent control. Since 2014, we have conducted research on the social skills formation in intergenerational relationships. The aim of this presentation is to analyses a specific methods, which parents use for social and socio-psychological skills and abilities transmission. In general terms, social skills are the complex of ways that person uses in purposeful interaction with other people, which is based on the processes of social cognition and learning. The object of the study was the youth (N=93 people — 58 girls and 35 boys, average age of 25 years). The research method is a survey. The study was conducted in several stages. Our analyses was focused on parental preception. There are two channels of social skills transfer through parental preception: verbal and nonverbal. Moral norms, orders and rules are carried through verbal level.

Family orders are related to fundamental standards of life. They are more formalized and sanctioned. The rules expresses the specificity of family informal relations and relate to those aspects of behavior that are more or less desirable ("not be late for a meeting"). Non-verbally transmitted: a) specific operations and methods of performing actions and b) emotional expression. It is found that, mothers transmits a large proportion of social skills. Socio-psychological aspects of relationships predominates in the parental perception (60% of the total) and includes prudence, gentleness, the ability to see the good in a person, forgiveness. Basic communication skills are in the second place (27% — to be polite; to apologize). Third place consisted of self-control skills and self-knowledge (7%). The abilities to manage household life, to maintain family leisure activities, to manage finances and respect the boundaries of others are encouraged in family orders and rules. In this study, we considered in detail only the parental instructions as one of the many forms of social skills transmission.
ACCEPTANCE AND COMMITMENT THERAPY (ACT) IN THE MANAGEMENT OF ADVERSE EVENTS IN WOMEN DIAGNOSED WITH BREAST CANCER (BC)

Maria Moschetto
Azienda Ospedaliera — Universitaria ‘Policlinico — Vittorio Emanuele’ (Catania, Italy)

The quality of communication between healthcare professionals and cancer patients plays a significant role; this communication has to provide a lot of information related to the illness and to the management of adverse events of therapy, being also directed to assure the best options of care to the patients, should not produce difficulty of psychological nature that will influence the adhesion to the therapy and, in last analysis, the daily life of the patient. The present study by the purpose of examining the effect of Acceptance and Commitment Therapy’ (ACT) on functional adaptation to the management of the adverse events of chemotherapy in women with breast cancer (BC). In this research available sampling method was used and among patients with BC admitted to Oncologia Medica Unit of ‘A.O.U.V.E.P’ of Catania and who had registered to participate in this research, 44 womens were selected and they were randomly divided to two groups: control (CG) and experiment (ACT) who received 1 ACT session of 2 h. Psychological (distress, illness cognition, cognitive fusion, avoidance and self-compassion) and physical symptoms and quality of life (as related to health) were assessed at baseline, at midi, post chemotherapy cycle and follow-up at 3 months after the last treatment session. Linear mixed models were used to assess ACT session effects over time, and participant characteristics at baseline were tested as moderators of ACT effects. Results showed extended improvement for ACT group compared with usual care in both psychological of distress and physical symptoms (P>0.001). Mediation analysis indicate that the effects of treatment were mediated by cognitive avoidance. ACT may be considered to be an effective intervention approach for treatment of distress in women with breast cancer. It can be said that increasing in acceptance of thought and feeling associated with cancer and increasing in psychological flexibility that is the main goal of ACT has lead to these changes. Further work is needed to investigate the effectiveness in other oncology population as well as investigate potential characteristics which may interact wit this interventions.
EXPERIMENTAL RESEARCH INTO CONSCIOUS SELF-REGULATION IN FIRST-GRADERS WITH DEVELOPMENTAL DELAY

Nataliya Babkina
Russian Academy of Education (Moscow, Russia)

The lack of conscious self-regulation plays a primary role in terms of a disordered character in children with developmental delay (DD). The study aimed to analyze and systematize occurrences of conscious self-regulation in DD affected children’s cognitive activity to provide scientific reasoning behind special educational conditions required for intentional development of self-regulation. 60 children aged 7-8 years were involved in the study, with 20 typically developing schoolchildren and 40 — with DD. Various conscious self-regulatory skills were studied: realization and understanding of activity tasks, determination and adherence to an activity program, acquiring and maintaining the learned actions, self-monitoring in the middle of the task and making a final self-assessment. The study's outcome analysis emphasizes the following efficacy indicators of self-regulation: work capacity fluctuations, skill automaticity readiness and transferring self-regulation skills to new conditions. Different types of support and their impacts on the efficacy of self-regulation also factored into the study. The practical methods used in the study are the «Dotting test», the «Visual pattern test», the «Toulouse-Pieron attention test». Methods of mathematical statistics were applied to analyze the study outcome. The study identified and described four levels of conscious self-regulation development in cognitive activity of children with different learning capacities. According to the generalized analysis of the experimental study’s outcome, the children of 7-8 years with DD proved to have a non-sufficient level of conscious self-regulation in cognitive activity and to differ from their typically developing age-mates in terms of conscious self-regulation development and skills. In group tasks, the DD first-graders were slower in the following actions: getting it together and deciding how to perform actions and the sequence of actions, self-monitoring in the middle of the task, making the final self-assessment and correcting their mistakes. Changing test conditions, providing help in activity performing significantly improved results. Special intervention programs that develop conscious self-regulation in activity and behavior of children with DD are required to realize children's cognitive and personal skills and abilities and to provide access to high-quality education. Intervention programs should be differentiated and provided according to the children's individually diagnosed level of conscious self-regulation.
THE TYPES OF COMPETITIVENESS STRATEGIES IN PROFESSIONAL ACTIVITY

Olga Klyueva  
Tver State University (Tver, Russia)

Human activity (professional and production-related) occurs within the context of explicit or implicit competition and proves to be more or less productive and creative. Competitiveness of personality is a complex, multidimensional construct. Operationalization and measurement of the competitiveness of personality without due regard for personal and situational interactions reduces the content of the notion. Competitiveness requires a high degree of personal energy, flexibility, intelligence, and creativity in regulating activity. However, enlarging the domain of psychological studies has necessitated the study of personality in the context of the natural social situations in which it functions. This structural and functional analysis allows expansion of the description of the phenomenology of the competitiveness of personality as well as classification of the strategies of competitive behavior. In this study competitive-behavior strategies (1,064 critical incidents in professional activities) were analyzed using the Critical Incident Technique and thematic content analysis. To classify the data set, I used two-step cluster analysis as an exploratory method and analyzed the cross-tables of several categorical variables using the log-linear method of model selection. I applied the Solution Tree method for categorical variables to build a dependent-variable hierarchical model with the relevant predictor values. Through analysis of the results of the cluster analysis, the hierarchical model, and the functional and situational analysis of the context, it is possible to single out and validate three types of competitiveness strategies: the dependent, irrational, destructive, short-term strategy (quasi-competitiveness); the dependent, rational, constructive, short-term strategy; and the free, rational, constructive, long-term strategy. Study of the nature of competition and a subject’s competitive-behavior strategies is required to analyze, predict, and correct destructive strategies for enhancing performance.
ENVIRONMENTALISM: AN ASSESSMENT OF RIGHT-WING AUTHORITARIANISM, ATTRIBUTIONAL COMPLEXITY AND SYSTEM JUSTIFICATION

Merve Burcu Balcieli  
National defense university (Ankara, Turkey)

Derya Hasta  
Ankara university (Ankara, Turkey)

In this research, awareness of environmental problems and its relationships between variables of right-wing authoritarianism, attributional complexity and system justification has been examined. In addition, the mediator effects of attributional complexity and system justification in the relationship between the variables, awareness of environmental problems and right-wing authoritarianism, were tested through a mediation analysis. Also it was investigated that, whether the participants’ level of awareness on environmental problems differed in terms of gender. 318 University students (207 female, 111 male) participated in the study. Demographic Information Form, Perceived Environmental Consequences Scale, Right-Wing Authoritarianism Scale, Attribution Complexity Scale and System Justification Scale were used to collect data. Results of the research showed that while system justification negatively predicts environmentalism (awareness of environmental problems), on the other hand attributional complexity predicts it positively. Also mediation analysis indicated that, the relationship between environmentalism and right-wing authoritarianism was mediated by both attributional complexity and system justification. Furthermore, there was gender differences in the studied variables. In terms of gender difference it was found that, women demonstrated higher level of environmental awareness and attributional complexity than men while women’s right-wing authoritarianism and system justification levels were lower than men’s.

PECULIARITIES OF LIFE-SENSE ORIENTATIONS OF PERSONALITIES IN THE CONTEXT OF SELF-DETERMINATION IN ADOLESCENCE

Maria Bataeva  
Moscow Pedagogical State University (Moscow, Russia)

The present article considers the questions of semantic sphere of a person in youth in the context of professional and personal self-determination. The main emphasis is made on the study of the peculiarities of life-sense orientations of adolescent personality. Special attention is paid to the peculiarities of life-sense orientations of a person, their content and orientation at this stage of ontogenesis. The results of the empirical research of semantic sphere of personality are described. They are obtained with the usage of the technique "Value-based Orientation" by M. Rokich, the reflective self-report inventory "Who Am I?" by V. Muhina, the "Life-Sense Orientations" test by D. Leontiev, and statistical data processing. According to the results of the research, the author concludes that the formation of life-sense orientations of adolescent personality has its own specific features depending on a number of influencing factors. They are as follows: involvement in professional activity, presence or absence of a partner and composition of parental family. The value of the analysis of peculiarities of life-sense orientations of adolescent personality is determined by the dramatic impact of this age stage on the formation of value system and worldview. It enables creating an internal autonomous system of personal landmarks and content of value-semantic sphere of personality. Personality develops and shapes an individual orientation of life path interacting with moral values and spiritual and social foundations.
WHICH FACTORS PREDICT ORTHOREXIA NERVOSA IN WOMEN? RESULTS FROM TWO INDEPENDENT STUDIES.

Anna Brytek-Matera
SWPS University of Social Sciences and Humanities
(Warsaw, Poland)

Orthorexia nervosa is described as a fixation on health-conscious eating behaviours according to subjective criteria with overly care for one’s health, obtrusive thoughts on being healthy, lack of flexibility in diet, long-term planning and negative impact of food choices on social interaction and quality of life. Although orthorexia nervosa was first described in the 90., so far, there is no clear understanding of its construct. The aim of the study was to determine which factors predict orthorexia nervosa in two independent studies (among non-clinical and clinical samples). The general predictors registered were eating behaviours, physical activity, eating disorder attitudes, body composition, as well as body-related behaviours. We hypothesize that orthorexia nervosa would be more likely to be predicted by restrictive eating behaviour and high level of health-related physical activity among non-clinical sample of young women. We next examined our hypothesis that higher levels of eating pathology and greater appearance orientation as well as weight concern would uniquely predict orthorexia nervosa among clinical sample (eating disorder female patients). One hundred twenty-five young women (non-clinical sample) and 55 eating disorder female patients (clinical sample) aged 18-35 years participated in the research. The Eating Habits Questionnaire, the ORTO-15 test, the Three-Factor Eating Questionnaire, the International Physical Activity Questionnaire, the bioelectrical impedance analyzer, the Multidimensional Body-Self Relations Questionnaire and Eating Attitude Test were used in the present study. We used a structural equation model for predicting orthorexia nervosa. Our hypothesis have been confirmed partially among a non-clinical sample of young women. While, in a clinical sample of patients with eating disorder orthorexia nervosa was predicted by higher levels of eating pathology, higher cessation-related weight concern, higher level of investment in a physically healthy lifestyle and higher appearance orientation. Our findings broaden the current knowledge about orthorexia nervosa and its predictors. Further research of the psychological features and characteristics of this pathological eating behaviour might be necessary to provide information for more effective treatment interventions within non-clinical and clinical populations.

DRAMATHERAPY METHOD

Milan Valenta
Palacky University Olomouc (Olomouc, Czech Republic)

The presentation will be focused on the use of dramatherapy method with people with intellectual disabilities (in the school environment and in institutions for adults with mental disabilities). Drama therapy as a therapeutic method for people with drug addiction in a psychiatric hospital will also be discussed (five years of experience from the Psychiatric Hospital Kromeriz − the Mandala community and from the psychiatric department of the Olomouc Military Hospital − Detox). The use of drama therapy in the preparation of students of special education as the method of personal-social training of students will be explained.
THE CONTINUITY OF DEPRESSIVE SYMPTOMS IN ADOLESCENTS, AND THE RELATIONSHIPS BETWEEN MINDFULNESS AND DEPRESSIVE SYMPTOMS

Irem Orak
Buse Calkan
Ecem Sonmez
Gizem Tetik
Istanbul Aydin University (Istanbul, Turkey)
Mesut Yavuz
Istanbul French Lape Hospital / Istanbul Aydin University (Istanbul, Turkey)

It was reported that mindfulness increase the risk of development of depressive symptoms (Kuyken et al. 2012). However there are still limited number of study about this topic in adolescent population. The aim of this study is to investigate the persistence of depressive symptoms in three months in an adolescent population. The associations between depressive symptoms, mindfulness levels and behavioral problems will also be examined. 687 adolescents (52 % female, n=357) aged between 14 and 17 included in this study. Child depression inventory (CDI), Mindfulness attention awareness scale (MAAS), and strengths and difficulties questionnaire (SDQ) self report form were applied to participants. CDI were re-administered to participants after the first evaluation. Paired sample t test was used to compare CDI scores of the adolescents. Pearson-product moment correlation test was used to evaluate the correlation coefficients between the scales. Binary logistic regression analysis was used to determine the prediction power of mindfulness, age, gender, and behavioral problems on depression. The CDI scores did not differ significantly three months after the first evaluation. CDI scores were negatively correlated with mindfulness, and positively correlated with emotional problems, inattention/hyperactivity problems, conduct problems and peer relation problems subscale scores of SDQ. Regression analysis revealed that low mindfulness and behavioral problems significantly predict depression. The results revealed that depressive symptoms do not decrease spontaneously after three months in adolescents. Nowadays, antidepressants are widely used in the treatment of adolescent depression (Mojtabai et al. 2016). We suggest that mindfulness practices may increase the treatment success in adolescents with depressive symptoms. The results also indicated that comorbid psychological and behavioral problems should not be overlooked to get better treatment outcomes. References 1) Kuyken W, Crane R, Dalgleish T. Does mindfulness based cognitive therapy prevent relapse of depression. BMJ. 2012 9;345:e7194 2) Mojtabai R, Olfson M, Han B. National Trends in the Prevalence and Treatment of Depression in Adolescents and Young Adults. Pediatrics. 2016; 138(6). pii: e20161878
THE EYE-TRACKING STUDY OF READING IN GRADES 2 AND 3 IN RUSSIAN

Aleksey Korneev
Ekaterina Mateveeva
Tatiana Akhutina
Lomonosov Moscow State University (Moscow, Russia)

In recent decades the eye tracking methodology was actively used in studies of the structure and development of reading skills. A significant number of studies have observed the development of reading comprehension, investigated the changes in reading strategies, and traced existing strategies of reading and their relationship with the level of cognitive functioning of children. The dynamics of development of reading technical skills are mostly studied using children reading in different languages, but there is a lack of studies, which analyze reading in Russian on early stages of development of this skill. The objectives of our study were to assess the differences in eye movements for silent reading in Russian for students in the second and third grades. In a total 78 second grade students and 66 third grade students participated in the study. We recorded eye-movements of children during they read sentences from a corpus specifically developed for reading studies in the Russian language. In addition we assessed their reading skill by independent test (“Reading of regular and irregular words”) and their cognitive abilities by neuropsychological battery. The primary general analyses of eye movements showed that eye movements during reading do not differ in second and third grades due to the variability of state of reading skill. We separated children with relatively good development of reading skills in both grades. The comparison of these groups showed that third-graders make fewer fixations when reading, and the total fixation duration is significantly less compared to second-graders. The results allow to conclude that development of the skill leads to optimization of eye movements from second to third grade. The comparison of eye-tracking data showed that number and duration of fixations strongly correlate with the productivity and speed of reading of both regular and irregular words. In addition we reveal the correlation between characteristics of eye movements and state of executive functions, functions of visuo-spatial information processing and functions of regulation of activation.
DYADIC COPING AND PSYCHOLOGICAL WELL-BEING IN THE DYAD OF PARTNERS WITH DISABILITIES

Natalya Shipova
Kostroma State University (Kostroma, Russia)

The study was supported by RFBR, project 18-313-00243. The stressfulness of life in marriage today raises the issue of couple coping. The framework of my research in dyadic coping is grounded in the works of G. Bodenmann, T.L. Kryukova, E.V. Kuftyak. To study dyadic coping in the dyad of partners with disabilities. Test scales, projective techniques, interview(s). Target group: 15 couples, where one of the partners has a disability (mainly disorders of the musculoskeletal system), while the other is disability-free (M = 36.5 years old). Delegated coping is salient in couples with typical development, rather than among partners with disabilities (U = 23.5; p = 0.045). Significant differences have also been found on the health status scale: there is a high degree of satisfaction (U = 29 with p = 0.047) among partners with regulatory development (M = 15.89; SD = 2.67) compared with disabled partners (M = 15, 89; SD = 2.67). The cohesion of a couple for partners with disabilities is determined by communication under stress (R = 0.95; R2 =0.89, β = 0.44; p = 0.002) and personal delegated coping (R = 0.95; R2 = 0.89 , β = 0.73; p = 0.00004). Adaptability of the dyad depends on communicative input of partners in stressed condition (R = 0.79; R2 = 0.63, β = 0.79; p = 0.001). At the same time, for partners with typical development, cohesiveness of the couple is affected by the negative coping of one of the partners (R = 0.94; R2 = 0.87, β = 0.86; p = 0.01), total dyadic coping (R = 0.94; R2 = 0.87, β = -1.36; p = 0.006) and its estimate (R = 0.94; R2 = 0.87, β = 2.13; p = 0.002). Thus, cohesion and adaptation of the dyad are regulated by a variety of strategies of dyadic coping. There also seem to be significant differences in the preferences of dyadic coping strategies in couples with one disabled partner.
The aim of the study was to test the effectiveness of two methods of reducing the misinformation effect, which occurs when exposure to misleading information presented after an event distorts the memory for that event. The tested were warning against misinformation and the new method, namely the training on unreliability of human memory including familiarizing participants with the specificity of memory functioning and typical memory errors. 556 people (mean age: 17.63, SD = 2) participated in the experiment. The three-step standard procedure on misinformation effect was used. The experimental design was: 2 (misinformation: present vs. absent) x 2 (training: present vs. absent) x 2 (warning: present vs. absent). Participants watched a video, then were presented with the description of the film, which in misled group contained incorrect details. Afterwards they took part in the training—depending on the group—on memory failure or soft skills. Finally, participants completed the memory test regarding the film, which in the warned group was preceded by information about possible discrepancies between the film and its summary. A series of planned comparisons were performed. Misled participants were more prone to misinformation than non-misled ones: (F(1, 540) = 94.38; p < 0.001; eta-squared = 0.15). Training turned out to be an effective method of reducing susceptibility to misinformation F(1, 540) = 9.77; p = 0.002; eta-squared = 0.02) as well as warning: F(1, 540) = 28.64; p < 0.001; eta-squared =0.05). The so-called tainted truth effect, i.e. the poorer functioning of the memory of people who have been warned about nonexciting discrepancies, was observed: F(1, 540) = 23.11; p < 0.001; eta-squared = 0.04. Not only the warning, but also the training reduces prone to misinformation. This is particularly important in view of the existence of the tainted truth effect that may affect a witness who has not been exposed to misinformation but has been warned against of it. The main advantage of using training is that it reduces the unwanted side effect of the warning, which can result in improved eyewitness testimony. Second study confirmed the effectiveness of training in a shortened version.
SEXUALITY IN CANCER PATIENTS: A STUDY ON FEMALE SEXUAL DYSFUNCTIONS IN WOMEN WITH BREAST CANCER

Maria Moschetto
Azienda Ospedaliera — Universitaria ‘Policlinico — Vittorio Emanuele’ (Catania, Italy)

Breast cancer (BC) is the most common cancer among women. The diagnosis and treatments of BC negatively affect quality of life (QoL) and sexual functioning (SF). Cancer treatments, including surgery, chemotherapy, radiotherapy and hormone therapy, can directly affect body image, disrupt relationship closeness and sexuality. The beauty of the breast is an important aspect to femininity, self estimate and self confidence in women. Sexuality appear less important than the short and long-term adverse effects of treatment in cancer patients. Sexual Dysfunction is when at least one aspect of sexual response cycle does not function properly. It may be libido, arousal or orgasm that is involved. The purpose of the present study was to assess to determine the QoL levels of patients with BC during chemotherapy (A) and follow-up (B) and to find out the problems that affect their QoL and SF. The data were collected using the ‘36-Item Short Form Health Survey’ (SF-36), a set of generic, coherent, and easily administered quality-of-life measures and the ‘Female Sexual Function Index’ (FSFI) a multidimensional scale for assessment of sexual functioning. Overall QoL for this sample (N=135) was moderate and treatment procedures caused important problems that had a negative effect on physical, psychological, social aspects of QoL. In addition, the main causes of sexual dysfunctions were in group A lack of arousal (2.33) and lubrication (2.42) while in group B lack of sexual desire (2.62) and arousal (2.35). The real impact of psychological aspects of therapy on female sexual functions should be prospectively studied. Evaluation of the above variables in BC women is actually the only way to allow them to face a relevant aspect of their QoL, most of the times neglected both by health professionals and themselves too. Importance of data will suggest hospital institutions to consider sexual it as a key point in cancer rehabilitation.
EMOTION-RELATED CONTENTS IN CHILDREN’S STORYBOOKS: AN EXAMINATION OF BESTSELLERS IN CHINA AND THE UNITED STATES

Ruyi Ding
Qian Wang
The Chinese University of Hong Kong (Hong Kong, China)

Children’s storybooks serve as a powerful educational and socialization tool in various domains of development, through which culturally valued behavioral and socioemotional tendencies are transmitted to the young generation. This study focused on emotion-related contents in bestselling children’s storybooks in China, a prototypically collectivistic culture, and the US, a prototypically individualistic culture, to examine potential cultural variations in emotion socialization (i.e., the process that children learn about their emotion functions through interaction with a variety of socialization agents). Texts of 38 books in China and 42 books in the US were analyzed by three trained coders (one Chinese coding Chinese books, one American coding American books, and one bilingual coding all books). Coding units were subject–verb and verb–object propositions. Compared with American books, first, Chinese books contained a smaller proportion of positive (e.g., happiness; China:41.89% vs. US:54.11%) versus negative emotions (e.g., sadness; China:58.11% vs. US:45.89%), $\chi^2=10.41$, $p<0.001$. Moreover, Chinese books contained a smaller proportion of powerful (e.g., anger; China:26.79% vs. US:44.39%) versus powerless negative emotions (e.g., sadness; China:73.21% vs. US:55.61%), $\chi^2=12.12$, $p<0.001$. Second, Chinese books contained a smaller proportion of self-attributions (e.g., I am sad; China:15.71% vs. US:31.08%) versus other-attributions of emotions (e.g., you are sad; China:84.29% vs. US:31.08%), $\chi^2=21.546$, $p<0.001$. Third, Chinese books contained a smaller proportion of incidents in which emotions resulted from personal (e.g., winning a prize or making a mistake; China:15.71% vs. US:31.08%) versus social events (e.g., being visited by a friend or being scolded by an adult; China:80.77% vs. US:56.95%), $\chi^2=36.25$, $p<0.001$. Fourth, Chinese books contained a smaller proportion of incidents of supportive reactions to others’ negative emotions (e.g., “What’s wrong, Pete?”; China:53.49% vs. US:80.95%, $\chi^2=7.63$, $p<0.001$) but a greater proportion of incidents of teaching reactions (e.g., “If you lose your turn in a game, you shouldn’t throw a fit”; China:41.86% vs. US:14.29%, $\chi^2=8.23$, $p<0.001$), while Chinese and American books both contained small proportions of incidents of unsupportive reactions (e.g., “Mom just stands there and watches Kiki cry”; China:4.65% vs. US:4.76%). The findings suggest that social harmony and group goals (vs. personal well-being and individuality) are still relatively more emphasized in emotion socialization in contemporary China than in the US, consistent with prior cross-cultural research on emotion socialization and emotion functions.
EMOTIONAL MEMORY CONSOLIDATION ACROSS THREE AGE GROUPS: THE EFFECTS OF TESTING TIME, ENCODING TYPE AND EMOTIONAL DIMENSIONS

Hande Kaynak
Cankaya University (Ankara, Turkey)

Individuals are more likely to recognize emotional words than neutral words in an immediate testing. On the other hand, memory for emotional words may also be enhanced in a delayed testing due to memory consolidation process. In this regard, the effect of testing time on memory for emotional words require further investigation. Moreover, relatively little is known about the effects of two major dimensions of emotion (valence and arousal) and the effect of encoding type (intentional and incidental) on consolidation process across age groups. The present study examined how the emotional memory consolidation process would be altered by the encoding type and the emotional dimensions in a recognition experiment that tested memory either immediately or delayed (30-minute delay) for young, middle-aged and older adults. 313 volunteers participated: 130 young adults (mean age, 21.83 years, 66 F), 104 middle-aged adults (mean age, 51.92 years, 54 F), and 79 older adults (mean age, 74.83 years, 43 F). In the study session, the emotional words were presented on a computer screen. While the participants in the intentional encoding condition were asked to learn words, the participants in the incidental encoding condition were told to simply count vowels. After either immediately or 30 minutes of retention interval, memory was assessed with an old/new recognition task. A 3 (Age) x 2 (Testing time) x 2 (Encoding type) x 2 (Arousal) x 3 (Valence) mixed ANOVA was conducted. The results showed that young adults recognized more accurately compared with middle-aged and older adults. The differences for immediate and delayed testing were significant; the pattern varied in all age groups. Memory for valence and arousal levels of words also showed a significant effect. Moreover, the words encoded incidentally were recognized better in middle-age and older adults, but not in young adults. It was demonstrated that the delayed testing of emotional words was more effective for memory consolidation. The older participants recognized better when they were tested over a delay, especially for incidentally encoded words. This study highlights the importance of incidental encoding, by which memory for emotional words was enhanced in older adults.
DEVELOPING SKILLS OF EFFECTIVE BEHAVIOR IN CONFLICT SITUATIONS IN PARENT-CHILD RELATIONSHIPS DURING ONLINE PRACTICUM

Ksenia Mostinets  
*Moscow State University of Psychology and Education*  
(Moscow, Russia)

Problems of aggressiveness in parent-child relationship are increasingly becoming the subject of scientific research in Russia. Spreading information about the dangers of such methods of influencing child’s behavior as slaps, shouts, and threats, as well as spreading ideas of humane and personal approach to raising children, forces parents to reconsider their methods of child rearing. Using the Internet as a psychological counselor in matters of parent-child relationships has virtually become the norm of modern society. However, with an abundance of videos, webinars and online courses aimed at correcting relationships between parents and children, we’ve observed lack of online courses enabling to work out relevant skills. An online practical course developed by us was tested on 27 female participants aged from 30 to 42 years old, with one to three children. It combines an individual (online platform lessons) and group (webinars lead by a psychologist) approach and allows each participant to work on their personal stories. The course comprises four successive stages 1) analysis of current situation (tests, questionnaires, diary of observations), 2) description of a problem situation including thoughts, feelings, and actions of both parties of the conflict situation (as full as possible), 3) lessons with practical tasks (which outcomes are checked by the curator and guidance on how to achieve the best possible results are provided) 4) description of an ideal situation (elaborated by participants using initial description as a starting point and the instruments they’ve got at the previous stages). Participants who have fulfilled the main tasks of the course regard it as being efficient and positively influencing family relationships. 17 participants reported a decrease in the level of aggression in the family and reduction of conflict situations as the result of 5 practical lessons and of keeping a diary. We consider the possibility to use the acquired experience on a larger scale, i.e. to expand target audience, trainers and coaches and to introduce other topics.
THE INFLUENCE OF WEIGHT ON THE PERCEIVED AGE OF A PERSON

Tatyana Shkurko
Southern Federal University (Rostov-on-Don, Russia)

The “perceived age” of a person is his or her age attributed by another person in the process of perceiving one’s appearance. The works of researchers demonstrated that the perceived age (not chronological) mediates the processes of interpersonal communication and interaction (Ballard et al., 2005; Kotter-Grühn, 2012). The rapidly developing market of medical and aesthetic services for rejuvenation of appearance responds to the request of the modern people to look younger than their years. Scientists speak of “years saved” (Zimm et al., 2013), on “ageing resistance” (Ballard et al., 2005), on “ageing management” (Bennett et al., 2017). In contemporary studies (Uotinen et al., 2005; Christensen et al., 2009) it is shown that the perceived age of a person is directly related to his or her biological age and predicts the risk of one’s death. At the same time, the influence of weight on the perceived age has not been studied, which is what our study is devoted to. The study involved 94 people. At the first stage, 30 women aged 18 to 49 years who attended weight loss courses were photographed before and after weight loss. 36 persons aged 20 to 51 years (24 women and 12 men) who did not attend special weight loss courses were photographed also. Information was obtained about the height, weight, body mass index of respondents. Further, 96 photos in a random order, was submitted to 28 evaluators (ordinary people ranging in age from 22 to 45 years) to estimate the age of the study participants. Wilcoxon and Mann-Whitney criteria were applied to the obtained data. Conclusions: 1) women who have undergone weight loss courses, began to look younger than they looked before weight loss; 2) the results of weight loss in women vary depending on their attitude to their appearance, social needs and parameters of psychological well-being; 3) men and women who do not attend weight loss courses look younger or older than their years, depending on their weight and body mass index (those who look younger have less weight and index). This study is conducted in the frameworks of research project № 17-18-01260 supported by Russian Science Foundation.
VIDEO GAME AND CHILDREN WITH MOTOR AND LITERACY DIFFICULTIES: THE EXAMPLE OF A NEW FRENCH VIDEO GAME FOR CLASSROOM TRAINING

Eric Lambert
University of Poitiers (Poitiers, France)

The goal of this talk is first to briefly synthesize studies on the impact of the practice of serious game and video games on literacy development. The majority of serious games for the learning of written language have not been scientifically validated (except GrahoGame, Saine et al, 2010). Video games are part of our daily lives, and in recent years, studies have shown the role of video games on executive functions. Several researches have shown that the practice of "action video games" has an impact on attention, spatial cognition or perception skills (Bediou et al., 2017). Regarding literacy, some studies (mainly research by Franceschini et al., 2013; 2017) have shown that the practice of video games has an impact on reading skills for children with dyslexia. This effect could result from an increase in attentional skills. In a second part, we will present our own video game on touchpad (under development). First, the goal of this video game is to help with the detection of students with a developmental coordination disorders and with reading disabilities. The second goal is to improve the level in literacy of students with learning disabilities. Our game consists of 9 mini-games for training motor coordination, rhythm skill and visual-spatial planning. One hundred and seventy grade 3 students participated in a first validation of the game by playing all the mini-games over several sessions. The objective of this study was to validate the ability to identify learning difficulties through the results of the different mini-games. The level of literacy was assessed through reading and writing tests. The results showed that it is possible to identify students with difficulties in learning written language but also motor coordination. More specifically, the visuo-spatial planning training mini-games were good indicators of learning disabilities. This study showed that the use of a video game in the classroom can be a useful tool to help teachers identify school-related difficulties.
EMOTIONAL ATTITUDE TO YOUR APPEARANCE AND APPEARANCE OF THE SPOUSE: ANALYSIS OF RELATIONSHIPS WITH THE RELATIONSHIP OF SPOUSES TO THEMSELVES, OTHERS, THE WORLD

Tatyana Shkurko
Vera Labunskaya
Southern Federal University (Rostov-on-Don, Russia)

The study was carried out within the framework of the socio-psychological approach to the interpretation of the physical appearance, its assessments and self-assessments (V. Labunskaya, 2017). The study analyzes the relationship of emotional, partially unconscious attitude to one’s physical appearance (PA) and to PA of a partner with basic social and psychological needs (inclusion, control, affect), with the attitude to oneself, to others (partner, mother/father, children), to important phenomena and concepts (family, marriage, love, freedom, money, divorce), with the types of interpersonal relationships between married men and women. The empirical object of the study: 104 people-52 couples (married life varied from 5 months to 30 years). Age of respondents: 19-59 years. Research methods: 1) Method of "assessment and meaningful interpretation of oneself PA and its conformity to gender and age constructs" (V. A. Labunskaya); 2) Colour test of relations (A. M. Etkind); 3) Methods of diagnostics of interpersonal relationships (T. Leary in the adaptation of L. N. Sobchik); 4) Questionnaire of interpersonal relations (W. Schutz, adapted by A. A. Rukavishnikov). Spearman correlation analysis was applied to the obtained data of the samples of men and women. The results of the study: 1) in men and women the emotional attitude to their PA is closely related to the attitude to themselves; emotional attitude to the spouse is associated with the attitude to him or her; 2) in women, the assessment of their PA is directly related to the emotional attitude to their PA; in men, the assessments of their PA (face, physique, integral assessment) are not related to their PA, but with the attitude to PA of their spouses; 3) only in women were found some relationships to their PA and PA of their partners with the types of interpersonal relationships; 4) women’s attitude to their PA is associated with the need for inclusion, men’s — with the need for love; 5) men who emotionally reject their mothers are dissatisfied with the appearance of their wives. This study is conducted in the frameworks of research project № 17-18-01260 supported by Russian Science Foundation.
Acceptance of certain anti-democratic attitudes and values, acceptance of nationalistic views, and manifesting the ethnic distance towards different ethnic minorities is thought to be connected to a specific structure of the personality of the individual. Individuals with authoritarian worldview often manifest a tendency to obey the authorities and groups. It is thought that there is a connection between authoritarianism and acceptance of anti-democratic attitudes. Also the acceptance of a system of views and values, which include attitudes towards their national affiliation and attitudes towards members of other ethnic groups, can be influenced by a socio-economic and cultural factors, but also by the individual factors, such as a particular structure of personality, which Adorno et al. call authoritarianism. In this paper, we explored the relationship between authoritarianism as a dimension of personality, level of national attachment among Macedonians and Albanians, ethnic distance towards different ethnic groups who live in Macedonia and the acceptance of anti-democratic attitudes. The survey was conducted on 240 respondents, high school students. Authoritarianism is measured by F-scale, constructed by Adorno, the national attachment is measured with the Scale of Havelka and Rot. We used the Scale for measuring of social distance constructed by N. Rot, and the Scale for measuring attitudes towards human rights, constructed by Popovski & Trajkovski. The results of the survey indicate the existence of a negative correlation between authoritarianism and attitude to human rights (r= -0.36, p<0.01), we speak of the thesis that the respondents whose authoritarianism is more pronounced, are more inclined toward accepting the anti-democratic attitudes. Also authoritarian personalities are more prone to accept nationalistic views and to demonstrate the greater ethnic distance from others. We found statistically significant correlation between authoritarianism and exclusive national attachment (r=.43,p<.01) and between authoritarianism and prominent national attachment (r=.34,p<.01). Regarding the ethnic distance, 44.23% of respondents manifested strong ethnic distance, a very strong 16.38%, and 26% average level of ethnic distance. The highest level of ethnic distance among Macedonians is towards Albanians, and also Albanians manifest the highest level of ethnic distance towards Macedonians. Also we found significant correlation between nationalism and ethnic distance (r=.45,p<01).
Statistical data pointed out that the number of people who commit a crime and entering prison is increasing day by day (TUIK, 2018). This situation has required the examination and improvement of the psychological conditions of the people entering the prisons. Past researches indicated that depression is often seen as a psychological disorder among prisoners (Fazel ve Danesh, 2002). Recent studies were reported the meaningful relations between depression and psychological resilience (Haase, 2004). The present study was conducted to find the mediating effect of perceived social support between resilience and depression in prisoners. Participants were 494 prisoners at different type of prisons from Izmir, Turkey. A cross-sectional questionnaire design was used. Questionnaire measures of psychological resilience, depression, perceived social support, and demographic form were administered. Pearson's correlation and mediation analyses were carried out to test research hypothesis. Initial correlation analysis results indicated that greater psychological resilience level significantly associated with less depression level and greater perceived mindfulness and less perceived social support. Mediational model showed that relationship between psychological resilience and depression was significantly mediated by perceived social support. According to this result, it was emphasized that perceived social support was crucial role for prisoners’ psychological health, relation with resilience and depression. The implication of the result was discussed with suggesting possible protective factors. It was expected that this study will contribute to literature and practice with improving the adaptive strategies to adverse effects of prison life.
LEARNING STRATEGIES IN SECONDARY EDUCATION: A STUDY ABOUT THE VARIATION IN THEIR DEVELOPMENTAL LEVEL FOR SPANISH STUDENTS

David Lanza
Universidad a Distancia de Madrid (Madrid, Spain)

Vanesa Sánchez
Universidad de La Coruña (Coruña, Spain)

In recent years learning strategies have become one of the topics that aroused great interest among scholars in the field of educational psychology. This interest has determined them to conduct researches focused on exploring their impact on the academic achievement, the learning of a second language and their link with the teaching style. Nonetheless, less attention has been paid to other aspects that can explain their development during secondary education. This study aims to know if the use level of the learning strategies varies according to the grade, gender and the type of school that students attend. Therefore we applied a Learning Strategies Questionnaire to a total of 355 secondary students (185 boys, 170 girls) of the first (n= 157) and fourth grade (n=198) from six schools with different ownership –public, private and State subsidised– in Lugo (Spain). Our results reveal that students have an adequate level of learning strategies. Notwithstanding, first graders show a higher global competence of their use than fourth graders (p<.001). Concretely, the first ones obtain higher levels in the scales of motivation (p<.001), attitude (p<.05), thought formulation (p<.001), transference (p<.001), critical thinking (p<.001), reflexion (p<.01), planning (p<.001) and evaluation (p<.05). On the other hand, male students reflect better emotional control than female (p<.001). In contrast, female students show a better level of organization (p<.001) and evaluation (p<.01). Lastly, students in public schools show a lower general competence level in the use of their learning strategies than their counterparts in State subsidised (p<.01) and private schools (p<.05). We can conclude that secondary students’ learning strategies worsen as they advance in their academic path. These data indicate that teachers not only rethink their pedagogical practices, but they also review the didactical materials employed in their classes; mainly in public schools. Besides, it would be convenient to carry out concrete actions in order to improve the learning strategies, e.g. through workshops on study techniques. In this case, the person in charge bears in mind that students, according to their gender, have different necessities and should conduct personalized actions taking into account their particular gaps.
FOCUS GROUP INTERVIEWS ON EXPERIENCES OF PREGNANT WOMEN WHO CONCEIVED VIA ASSISTED REPRODUCTIVE TECHNIQUES

Zulal Törenli Kaya
Başkent University Faculty of Medicine (Ankara, Turkey)

Özlem Bozo
Middle East Technical University (Ankara, Turkey)

Infertility and involuntary childlessness are among the most devastating and stressful situations in patients’ life. The literature revealed that the negative effects of previous experiences could be proceeded regardless of achieving pregnancy. In Turkish literature, the findings about this subject are scarce; both qualitative and quantitative studies are necessary (Boz et al., 2018). Based on this knowledge, this study started out with the research question of “What are the experiences of pregnant women who conceived via assisted reproductive techniques (ART)?”. With this aim, two focus group interviews were conducted. The participants were eight pregnant women conceived via ART. Their ages ranged between 28 and 37. Each session took approximately two hours and a semi-structured interview was used. The analysis was done through thematic analysis. Results revealed that the women’s feeling related to infertility was organized under the superordinate theme named as feeling like an “empty can” on the basis of a metaphor used by one participant. This feeling contained all the participants’ infertility related experiences within itself because they felt “empty” due to their childlessness. This superordinate theme was divided into three subordinate themes, namely, idealization of life with children, intense negative emotions including feeling aggrieved and feeling alone and misunderstood, and maladaptive coping strategies including social withdrawal, faith or confusion, and masking weaknesses. In the groups, all the participants idealized a life with children and this was their biggest motivation. This led them to have intense negative emotions during infertility. Under the heading of negative emotions, five women (62.5%) felt aggrieved, seven women (87.5%) felt alone and misunderstood by their social circle. As a way of coping, five women (62.5%) used social withdrawal, four women (50%) had faith in pray, three women (37.5%) chose abandonment of religiousness, and all the participants masked their weaknesses and pretend to be strong. The results were consistent with the previous findings that infertile women feel “inadequate” (Domar et al., 2012), have an idealized family life (Cooper-Hilbert, 1998), have negative emotions, isolate themselves from society (e.g., Domar et al., 2012; Glover, McLellan, & Weaver, 2009) and use religious beliefs (Latifnejad Roudsari et al., 2014).
The studies of the uncertainty and risk acceptance role in medical decisions are limited. The united intellectual and personal potential of a person concept lays grounds for research of medical decisions prerequisites and the role of uncertainty and risk acceptance in them. A quasi-experimental comparison of students and professionals allows us to conclude indirectly about the development of physicians in their profession. The participants. 419 people (332 women, average age 25.3, SD = 11.7): 59 practicing doctors (35 women, average age 41, SD = 12.8), 130 medical students (92 women, average age 19.1, SD = 1.6); control group: 43 realtors (36 women, average age 45.7, SD = 9.4), 187 psychology students (169 women, average age 19.8, SD = 1.3). Realtors are chosen as a control group, as their profession implies other risks. Badner’s Questionnaire (Kornilova, Chumakova, 2014), Personal factors of decision making (LFR, Kornilova, 2003), Melbourne Decision Questionnaire (Kornilov, 2013). Using Student’s t-test for independent samples, significant differences were established. Medical students differ from practicing doctors in risk readiness (t = -4.754, p < .001, higher among students), vigilance (t = 2.015, p = .046, higher among doctors), hyper-vigilance (t = -4.212, p < .001, higher among students). Medics differ from the control group in intolerance to uncertainty (ITU, t = 2.059, p = .040, higher among medics), procrastination (t = -3.819, p < .001, lower among medics). Differences between combined groups of students and professionals are found in rationality (-2.313, p = .021, higher among professionals), tolerance for uncertainty (TU, 2.216, p = .029, higher among students), supervigilance (t = 4.961, p < .001, higher among students). The results allow us to speak about the principles of development in the profession. Comparison with the control group lays ground for conclusions about the specifics of the medical professions. The development of TU and rationality are not specific for physicians (who have initially higher ITU and characterized by decrease of risk readiness. The development of a medic implies reducing of unproductive copings in favor of vigilance, and at the same time reducing risk preparedness. Completed with the support of the RFBR, project 17-06-00130a.
THE IMAGE OF THE CLIENT IN THE REPRESENTATIONS OF NOVICE COUNSELING PSYCHOLOGISTS — MEMBERS OF THE TUTOR’S GROUP AT THE SPBU PSYCHOLOGICAL CLINIC

Elena Kuznetsova
Elena Zinovyeva
Saint-Petersburg State University (Saint-Petersburg, Russia)

Most modern approaches to the training of counseling psychologists are based on the skills training. Much less attention is paid to the process of consultants personal changes and experiences, such works are still quite rare. Wagner and Hill [Wagner, Hill, 2015] showed that consultants undergo cognitive, emotional and personal transformation in the training process. Our previous study [Zinovyeva, Salitova, 2018] showed that the first stage in the dynamics of the experience of a novice specialist is associated with comparing the image of himself with the image of an ideal specialist. The consultant describes himself as negative, and the internal image of an ideal specialist as always positive. Gradually, self-assessment statements become less categorical, polar comparisons no longer occur, the self-image becomes more realistic. Finally, the image of the ‘internal specialist’ gives way to the image of the ‘client’. The purpose of this research was to study the developing of the client’s image among novice counseling psychologists. Methods: narrative analysis of reflexive diaries. There were analyzed 240 diaries of tutor’s group participants organized at the SPbU Psychological Clinic. The client’s image in the representation of novice counseling psychologists undergoes a transformation. Initially this image is blurred and undefined, the consultants focuses on analyzing their own feelings about counseling situation and actions to resolve clients request. Gradually, the client’s image is formed into one of three patterns: 1) “resisting client”, unpredictable and insecure; 2) “fragile client”, which can be wounded by any word, action, interpretation; 3) “ideal client”, who willingly speaks and changes after the any intervention. Finally, the client’s image becomes detailed and filled with real characteristics that reflect personal characteristics. Consultants begin to see the person before them. At the same time, consultants rather answer the question “who is this person for me”, than “what kind of person is in front of me” and don’t apply theoretical knowledge to describe the personality. So, the gradual formation of the client’s image is the second stage of the consultant’s professional development of personality. As in the first stage, there is a transformation from the inner representations to more realistic ideas.
METHODS OF ART-PEDAGOGICAL INFLUENCE ON EMOTIONAL INTELLIGENCE OF CHILDREN IN EDUCATIONAL ENVIRONMENT

Natalia Brakamonte
Saint Petersburg University (Saint-Petersburg, Russia)

The method of art-pedagogical influence allows you to develop and adjust: the ability to recognize and control your feelings; the ability to understand and accept your feelings; the ability to use your emotions for the benefit of yourself and others, to recognize and recognize the feelings of others, to imagine yourself in their place (for example, empathy); the ability to communicate with children, adults (parents, teachers). The longitudinal study was conducted on the basis of preschool organization for 4 years. The sample consisted of 20 families with one and two children aged five years. The method of art pedagogy included game therapy, art therapy and psychogymnastics, including training to improve parent-child relationships, creating a favorable atmosphere in the group (11 classes with a set of exercises), various developmental individual classes for children, consultations for parents. Psychodiagnosics: conversation, observation of child-parent relationships, individual observation of children and in the group, the questionnaire of parental attitudes, the test "strategy of family education", drawing tests, anxiety test. In 30% of the surveyed families there is a moral and physical abuse of the child, including by one parent or by older children; in 40% of cases the parents are divorced or unmarried, but nevertheless both are involved in the upbringing of children; 30% of children are underdeveloped. In the transforming experiment 60% of children, 45% of them—within 1-3 years, of them 22.2 %— within three years. 80% of children revealed anxiety and problems with communication, behavior. There is a significant relationship between the indicators of anxiety in the child and the style of education in the family, the relationship of the parent to the child. Systematic work both with children and together simultaneous work with parents allows to reveal the most vulnerable sides of manifestation of emotion from both sides. Joint execution of exercises, modeling, drawing, elements of applied art allow expressing feelings both in the process of work, and at the time of obtaining the result and its evaluation. The experience of joint experiences has a positive impact on the construction of communication in the future.
Caregiving for dementia patients has negative effects on the psychological health and decreases the quality of life of caregivers, and also causes stress and burden on caregivers (e.g. Cuijpers, 2005). The fact that the caregiving process is stressful and affects the caregiver’s psychological health increase the importance of psychological interventions for caregivers of dementia patients. Studies related to interventions for caregivers of dementia patients showed that cognitive behavioral therapy (CBT) was found to have the strongest support (Gallagher-Thompson & Coon, 2007). In the light of the literature, this study aims to develop CBT based intervention for dementia caregiver, and intervention will be derived primarily from the works of Beck and Stress Process Model (Pearlin et al., 1990). This study is planned to consist of two parts. In the first part, literature review, expert consultation and pilot study will be conducted. In the second part, the developed manual will be tested with 25 participants who give care to the patients with moderate dementia. Participants will receive 12 sessions CBT based intervention. Outcome measures will be stress, burden, psychological symptom, depression, and quality of life. Measurements taken before and after intervention will be compared using t-test. It is expected that participants’ stress, depression, psychological symptoms and burden levels will decrease and their quality of life will increase. The compelling nature of caregiving increases the importance of interventions. While such an intervention is necessary in terms of the stress, quality of life, burden and psychological health of caregivers, such interventions are needed to improve the quality of caregiving, as chronic stress on dementia patient reduces the ability to provide optimal care (Chamine, Fonareva, & Oken, 2014). In addition, although many CBT-based interventions have been developed for caregivers of dementia patients in the literature, the lack of such a study in Turkey draws attention. It is thought that such a study will contribute to literature and will provide a basis for future studies which will be done in Turkey.
AUTOMATIC VS. CONTROLLED ACTIVATION OF RACIAL BEHAVIOR:  
THE ROLE OF IMPLICIT RACE-RELATED STEREOTYPES

Eirini Charami-Roupa  
Mary Canellopoulou  
Deree-The American College of Greece (Athens, Greece)

In light of solid data derived from research on implicit social cognition, any previously encountered information or experience can potentially exert influence on future encoding as well as on performance in an array of cognitive tasks, at the absence of conscious and/or intentional recollection of relevant knowledge structures. In the present study, a group of white Caucasian college students (N=90, m=48, mean age=21.93; SD= 2.87) performed a computerized version of Asch’s classical perceptual task, while being exposed to three versions of subliminally presented non-verbal material involving race-related stereotypes. Results indicated that race had a significant effect (2-way ANOVA analysis: F[2, 84] = 38.55, p=< .001, partial n2= .0479 and ANCOVA analysis: F[1,83] = 4.61, p=.035, partial n2= .053 ) on automatic racial behavior based on observational ratings. The latter was reflected on the scores derived from a widely-used racism scale (Pearson correlation: r(89) = .206, p=.026) but was unrelated to one other measure of controlled behavior for self-rated hostility. Such findings confirm previous research documenting the role of implicit racial attitudes on automatic racial behavior as well as the variable effect of type of processing (automatic vs. controlled) on stereotypical thinking in a laboratory context. It is suggested that implicit racial stereotypes may constitute abstract schemas which can potentially impact social behavior in real life settings, outside conscious awareness, and that such behavior could also be explained through race-specific beliefs.
THE ROLE OF PERSONAL FACTORS IN APPLYING OF MORAL DISENGAGEMENT MECHANISMS IN ADOLESCENCE

Sergey Molchanov
Olga Almazova
Kirill Kirsanov
Lomonosov Moscow State University (Moscow, Russia)

The modern world provides various forms of moral dilemmas in real-life situations. Adolescence as self-determination period pushes teenagers to moral challenges that lead to different outcomes including potential deviant behavior. Adolescents socialization is realized in global informational society that is characterized by high level of social uncertainty and contradictory system of social norms and values when huge information flow increase the possibility to confront deviant behavior. Own deviant behavior have to be interpreted and mechanisms of moral disengagement of own actions can be used to justify yourself and to save self-esteem for themselves and social environment (A. Bandura). Activation of moral disengagement mechanisms correlates with personal features that provide the perception and interpretation of social relations. Our goal was to investigate the role of personal factors and moral development in applying of moral disengagement mechanisms to justify deviant behavior. We proposed that basic assumptions, autonomy type and level of moral development define the specifics of moral disengagement mechanism use. Our method included written examination of adolescents. Several questionnaires were used: moral disengagement mechanisms and moral judgments measurements, autonomy technique, basic assumption technique. The data consists of 120 adolescents aged from 14 to 17 years old. The results showed adolescents preferences in applying of mechanisms of moral disengagement. The level of moral judgments correlated with applying mechanism of moral disengagement. Personal factors define the intensity and choice of mechanism of moral disengagement. Different types of autonomy have nonlinear correlations with use of mechanisms of moral disengagement. The perception of the world as unfriendly and non-controlled correlates with active use of mechanisms of moral disengagements. The study was supported by the Russian Foundation for Basic Research under the project 19-013-00823.
IDENTIFYING MULTIDIMENSIONAL EXTENDED PSYCHOSIS PHENOTYPES AT SCHOOL

Fonseca Pedrero Eduardo
Alicia Perez-Albeniz
Adriana Diez
Javier Ortuño
Universidad de La Rioja (Logroño, Spain)
Beatriz Lucas
Universidad de Valencia (Valencia, Spain)

The main goal of the present study was to explore the latent structure of multidimensional psychosis liability in school settings. Moreover, associations with mental health adjustment, academic achievement, and neurocognition across the latent profiles were compared. Participants were 1506 students, 667 males (44.3%), derived from random cluster sampling of 34 schools and 98 classrooms. The mean age was 16.5 years (SD = 1.36, Range=14-19 years). Various tools were used to measure mental health, academic performance, and neurocognition. Based on schizotypal traits, psychotic-like experiences, and bipolar-like experiences, four latent classes were found ("protective", "healthy", "high positive psychosis liability", "high psychosis liability"). Both of the high psychosis liability latent groups scored significantly higher on emotional and behavioral problems, suicide ideation and attempts, and negative affect, and lower on positive affect and subjective well-being, compared to the two non-risk groups. Moreover, these liability groups had a significantly higher number of failed academic subjects compared to the non-risk groups. In addition, no statistically significant differences in efficiency performance were found in the neurocognitive domains (Executive Function, Episodic Memory, Complex Cognition, and Social Cognition) across the four latent profiles. This study allows us to improve the early identification of adolescents at risk of serious mental disorder in educational settings in order to reduce the incidence and burden associated with these kinds of mental health problems and help affected young people to succeed academically, socially, behaviorally, and emotionally.
THE BURNOUT SYNDROME DIAGNOSTIC USING EYE TRACKING

Artem Kovalev  
Oksana Klimova  
Galina Menshikova  
Valentina Barabanschikova  
Lomonosov Moscow State University (Moscow, Russia)

The burnout syndrome includes three distinct states in which people feel emotional exhaustion, display a detached attitude towards others and experience a low sense of their efficacy at work. One of the most known methods of burnout syndrome evaluation is the Maslach Burnout Inventory (MBI). MBI consists of three scales — emotional exhaustion (EE), depersonalization (DEP) and reduced personal accomplishment (RPA). The aim of this study was to develop a new method of burnout syndrome diagnostic in athletes using the eye tracking. 34 professional figure skaters (ice dancers) with experience in skating of more than 10 years participated in this research. According to their results providing by MBI figure skaters were divided into 3 groups: persons with great values of RPA, persons with great values of DEP and persons with low burnout level (NORM). The experiment session involved 30 presentations of the texts with different meanings (positive, negative, neutral). Eye movements were recorded binocularly (SMI RED 120; 120 Hz) while participants visually explored a text for grammatical error detection.

Two-way ANOVA with repeated measures revealed the significant differences in eye movement parameters between groups of participants. Fixation count and fixation duration were significantly lower in RPA group while they observed positive texts (F=3.843, p=0.032) in comparison to other groups. At the same time these eye movement parameters were significantly higher in NORM group for negative texts. RPA and DEP groups also payed more attention to negative words. Thus the results showed that figure skaters suffering from burnout syndrome are tended to avoid parts of the texts related to negative fragments of their professional activity. The motivational sphere impairment is suggested to be a reason of such avoidance behavior. Eye-tracking data as a behavioral indicator was in consistent with questionnaire results. Therefore the developed method may be considered as an objective burnout syndrome diagnostic procedure. The research was supported by the grant from Russian Foundation of Basic Research, project # 19-013-00799.
The concept of posttraumatic growth is defined as a positive psychological change as a result of struggle with stressful life events. Considering Turkey’s frequent encounter with natural disasters, studying both short and long-term consequences of earthquakes is a matter of utmost importance. This study was conducted in order to examine the effects of Marmara Earthquake on local residents 16 years after the event. Within the scope of this study, the effect of social support, positive affect and disclosing about trauma on PTG was investigated. In the scope of this study, a total of 187 people (100 women, 87 men) who have witnessed Marmara Earthquake and who still live in the region, aged between 33 and 58 were reached out. Participants were recruited by snowball sampling method. Participants completed Demographic Information Form, Posttraumatic Growth Scale, Multidimensional Perceived Social Support, Traumatic Experience/Earthquake Experience Scale, Positive Negative Affect Scale and Level of Disclosure of Trauma. In this study, a mediation analysis was conducted via using Process model with 5000 bootstrapping samples along with updated mediation procedures (Hayes, 2018). The results showed that disclosing about trauma mediated the relationship between the perceived social support and posttraumatic growth. In addition, positive affect mediated the relationship between the perceived social support and PTG. It was found that the participants showed moderate levels of PTG. Although there was no significant difference in the total score of PTG compared to gender, it was found that women showed higher level personal strength component of PTG than men. In addition, it has been observed that the severity of the traumatic event is negatively related with PTG. The relationship of between disclosing of trauma and PTG was found. In line with this finding, this information can be provided in psychosocial education. In psychosocial treatments, appropriate conditions can be established for the person to express himself / herself. If the person does not want to talk about trauma, it might be appropriate to specify other ways to express himself / herself (typing, etc.).
SKIN COLOR PERCEPTION AND SELF-CONSCIOUSNESS IN YOUNG CHILDREN: A STUDY IN TWO FRENCH PRESCHOOLS

Jennifer Kerzil
Université Catholique de l’Ouest (Angers, France)

Researchers generally agree that babies (from 0,3) perceive color much before being able to name it (around 4,5). Gérard, Bilinski and Dugas (1989) have found that children are able to recognize and categorize colors from 3,5 years old. In the USA, social psychologists have long been interested in the perception of skin-color in children (black vs white), while in Europe, most experiments (mostly in cognitive science) have focused on objects’ color perception (blue, red, yellow and green). Yet, in France, in terms of skin-color, there is a majority group (whites) and minority groups (different skin-colors from light to dark brown). In America, authors have shown the effects of skin-colors in terms of racial attitudes (Kowalski, 2003; Williams, Boswell and Best, 1975) and concluded that children with darker skin-color have lower self-esteem (Rosenberg and Simmons, 1970). According to Piaget (1932), a child comes to discover himself through a progressive comparison of his own body with other people’s bodies, starting from his parents and peers. Thus, our study aims to assess young children’s skin-color perception and its consequences. The methodology was based on directive interviews and a material composed of different photographs. The children, aged from 3 to 6, went to two different schools: a white majority school located in the country side (N= 51) and a diverse school located in a suburban neighborhood (N=35). Children were asked “which color are you?”, “which color is he or her?”, had to categorize pictures (4 women, 4 men, 4 children from 4 ethnical groups – Arabic, Asian, European and African) and answer to questions about skin-color and babies. The results show that children in the predominantly white school acquire a knowledge of their own and other children’s skin-color later than children who live and attend school in a diverse environment. It also shows that, even when they are from mixed couples, children have difficulties to imagine that a white or black woman can have a baby with a man who does not have the same skin-color. In light of these findings, we discuss the impact of skin-color differences among adopted children.
Cancer and dementia are two of those diseases that require care. Caring for the patients with such diseases is challenging for caregivers and is associated with many psychological health outcomes (e.g. Coope et al., 1995; Vanderwerker et al., 2005). Of all caregivers, the ones giving care to dementia patients were found to be affected more negatively than others by the caregiving process (Pinquart & Sörensen, 2003). Thus, it seems to be important to examine the underlying factors of this difference. Perception of social support, which is one of the protective factors in terms of psychological health, might be one of those factors responsible for the difference mentioned above. Therefore, the purpose of this study is to compare social support perceptions of dementia and cancer caregivers. 210 caregivers, 99 of whom were caring for dementia patients and 111 of them were giving care to cancer patients, participated in the study. Participants completed demographic information form and Multidimensional Scale of Perceived Social Support. Independent samples t-test was used for the analysis of the study. Caregivers of dementia patients and caregivers of cancer patients did not differ in terms of their perceptions of social support. When social support perceived from different sources were examined, significant differences were found between two groups. Caregivers of dementia patients perceived higher support than caregivers of cancer patients from their families and friends, while caregivers of cancer patients perceived more support from significant others. Since the caregiving process has detrimental effects on caregivers, it is important to determine the factors that may protect these individuals from negative psychological outcomes. For this aim, the levels of perceived social support of the cancer and dementia caregivers were compared. While participants did not differ in terms of their total perceived social support scores, they did differ on their scores of perceived social support from different sources. It can be suggested that less support perceived from significant others might put the caregivers of dementia patients into the risk of negative psychological outcomes.
ASSOCIATIONS BETWEEN PERCEIVED POSITIVE AND NEGATIVE PARENTAL CONTACT AND ADOLESCENTS’ INTERGROUP CONTACT EXPERIENCES

Sabahat Cigdem Bagci
Hazal Gungor
İzikt University(Istanbul, Turkey)

While consequences of direct intergroup experiences on intergroup attitudes and behaviors among children have been frequently studied in the literature, less research is devoted to the understanding of predictors of intergroup contact in childhood and adolescence. Moreover, studies have not yet revealed how both positive and negative contact among children and adolescents are formed in the light of parental positive and negative intergroup contact. This study aimed to examine the association between perceived parental positive and negative contact and adolescents’ own positive and negative contact experiences and tested various affective, cognitive, and behavioral mechanisms as mediators: perspective-taking, intergroup anxiety, outgroup attitudes, and approach behavioral tendencies. A total of 325 7th and 8th Year Turkish students completed questionnaires in classrooms (Mage = 13.46, SD = .75), including measures of self-reported child and parental positive and negative intergroup contact, outgroup perspective-taking and intergroup anxiety, as well as attitudes and behavioral tendencies towards outgroup members. Structural equation models were used to test the meditational associations. Results demonstrated that perceived negative parental contact was directly and strongly associated with negative, but not positive, adolescent contact, whereas parental positive contact had a direct positive association with adolescent positive contact. We further found that perceived parental positive contact was related to higher perspective-taking and lower intergroup anxiety which promoted approach behavioral tendencies which was, in turn, related to more positive and less negative contact among adolescents. Findings provide important knowledge about how perceived parental intergroup contact is translated into children’s contact experiences. Implications of the findings are discussed in the context of the role of parents on shaping children’s intergroup behaviors and perceived intergroup contact valence. The study highlights the critical function of parental positive and negative contact on the formation of adolescents’ contact behaviors.
RECEPTION OF POETRY AFFECTS CREATIVE THINKING: IT INCREASES OR DECREASES CREATIVITY DEPENDING ON THE TYPE OF POETIC METAPHORS

Malgorzata Osowiecka
Alina Kolarczyk
SWPS University of Social Sciences and Humanities
(Warsaw, Poland)

There are several studies that have examined how humans produce metaphors (Paivio, 1979; Chiappe, 2007), but little is known about metaphor comprehension, especially within the context of poetry. Moreover, most psychological research on poetry has focused on the influence of text structure (i.e., rhythm, rhymes) on emotional reception of poems (e.g., Lerdahl, 2001; Obermeier et al., 2013). Previous research has also examined the relationship between poetic training and creativity (e.g., Andonovska-Trajkovska, 2008; Baer, 1996). However, our research focuses on the influence of poems as creative products that may affect receivers’ levels of creative thinking. Poetry reception can involve readiness to notice similarities between remote categories, which can be a crucial ability in generating creative ideas. Thus, poetry comprehension can change readers’ creativity. This influence, however, likely depends on the type of poetry received. We hypothesized that recipients’ reception of novel and open metaphors results in more flexible and original thinking, whereas reception of conventional, well known, and closed metaphors results in less flexible and less creative problem-solving. In two experimental studies, participants were assigned to two conditions: poetry reading and non-poetic text reading. Participants read poems (Study 1 = narrative/open metaphors; Study 2 = descriptive/conventional metaphors) or control pieces of non-poetic text. Before and after the reading manipulation, participants were given a test to determine levels of divergent thinking (i.e., fluency, flexibility, originality). In Study 1 (N = 107), participants showed increased fluency and flexibility after reading a narrative poem, while participants who read the non-poetic text showed a decrease in fluency and originality. In Study 2 (N = 131) reception of conventional, closed metaphorization significantly lowered fluency and flexibility of thinking (compared to reading non-poetic text). The most critical finding was that poetry exposure could either increase or decrease creativity level depending on the type of poetic metaphors and style of poetic narration. Our presentation would contribute a new perspective on exposure to poetry in the context of creativity and discusses possible individual differences that may affect how this type of art is received.
PSYCHOLOGICAL WELLBEING AND DIFFICULTIES OF ADOLESCENTS INVOLVED IN DIFFERENT TYPES OF SCHOOL BULLYING

Irina Volkova
Elena Volkova
Herzen State Pedagogical University (Saint Petersburg, Russia)

A considerable number of Russian and international studies are dedicated to various psychological aspects of bullying among adolescents. Associations with specific types of bullying (psychological, social and physical) are less reported. The goal of current study is to estimate factors of wellbeing and difficulties for victims and bullies of psychological, social and physical types of abuse through complex survey. Study sample consisted of 724 adolescents of 11-18 age. Wellbeing parameters were assessed with Psychological Wellbeing Scale by C. Ryff (54-item version). Mental health difficulties were assessed with Strengths and Difficulties Questionnaire by R. Goodman. Bullying behavior was revealed with Bully/Victim Questionnaire by D. Olweus. Results showed that there were more bullies among boys for all three types of bullying. For victims, there were more boys than girls for psychological and social bullying. Considering international reports, this may reflect some national sample specifics. Victims of all forms of abuse lack environmental mastery and self-acceptance, and have more difficulties in emotional and peer domain, than other children. Survivors of physical bullying are also less able to build positive relations with others. Victims of social bullying are lower on goal orientation and have hyperactivity/inattention problems. Victims of psychological bullying face emotional, behavioral, hyperactivity and peer-related difficulties, and have deficiency in all wellbeing parameters. All bullies have lower scores for purpose in life. Bullies with physical aggression type showed less prosocial behavior, and are also characterized by less environmental mastery and self-acceptance. Aggressors in social bullying have difficulties with peers and are less oriented for personal growth. Those who utilize psychological bullying, have discipline difficulties, lack self-acceptance and environmental mastery. Results suggest that although there are some commonalities, physical, psychological or social type of bullying targets different wellbeing domains.
VALUES AND SEMANTIC BASES OF LIFE SITUATION CHANGES

In modern psychology generally accepted the idea of the changing context challenges that become a source of change, requiring the individual to adopt new strategies of interaction with the world. One acts as an active subject of changes in one’s own life and self-changes. The basis of life choice is the person’s awareness of the importance of the existing life situation, his interests and opportunities, the requirements of the situation and the consequences of the choice. The most important basis for the realization of life choice is the system of values and meanings. The aim of the study was to identify the value-semantic basis of preferences of school graduates entering a nonresident University and moving to another city. 257 respondents (M=17.44 years). 110 first-year students, who left their hometown ("mobile" group); 147 first-year students, who remained in their hometown ("non-mobile" group). Purpose-in-Life Test of J.Crumbaugh and L.Maholic (adapted by D.Leontiev); values inventory of S. Schwartz; survey. The findings indicate differences between the groups. For "mobile" group the values relating to openness to changes are more meaningful. The value of "Stimulation" (the desire for novelty) occupies the 4th rank place in the "mobile" group and the 9-th rank place — in the "non-mobile" group. The values of conservation — "Conformity" (p=0.001), "Security" (p=0.012), "Tradition" (p=0.009) — are statistically significantly higher for the "non-mobile" group. The overall level and all indicators of meaningfulness of life in the "mobile" group is lower than in the "non-mobile" group (p<0.001). The increase in indicators of life meaningfulness in the "mobile" group entails in identification of new meanings and search of new opportunities. This can be the basis for preference changes in the life situation. In the "non-mobile" group the usual situation is more attractive, which keeps from changes. In the "mobile" group the future time perspective is more attractive due to the hopes associated with it that encourages changes. Thus, when making a decision to change the life situation, the system of values and meanings is more significant than behavioral readiness for changes. Supported by RFBR project 18-013-00703.
THE EFFECT OF PARENTAL PSYCHOLOGICAL CONTROL ON BULIMIA NERVOSA SYMPTOMS: THE MEDIATION EFFECTS OF ANGER AND LONELINESS

Şerife Inci Şalvarlı
Dokuz Eylül University (Izmir, Turkey)

Çiğdem Günseli Dereboy
Adnan Menderes University (Aydın, Turkey)

The aim of this study was to investigate the relationship between perceived parental psychological control and the symptoms of bulimia nervosa, as well as to investigate the mediation effects of anger and loneliness on these variables. The sample comprised 740 students from Adnan Menderes University, Aydın. Psychological Control Scale, Edinburgh Bulimic Investigatory Test, UCLA Loneliness Scale and Trait Anger and Anger Expression Scales were administered to participants. Data were analyzed by stepwise multiple regression analysis and Sobel test. Results showed that an increase in perceived parental psychological control was associated with an increase in symptoms of bulimia nervosa. Stepwise multiple regression analyses revealed that the level of experienced anger, suppression of anger, psychological control perceived from the mother and the feeling of loneliness predict the severity of bulimia nervosa symptoms. In the mediation model, perceived psychological control from the mother predicted bulimia nervosa symptoms through two different mediating variables: firstly, higher levels of perceived maternal psychological control predicted feelings of loneliness and symptoms of bulimia nervosa. Secondly, perceived maternal control predicted in turn suppression of anger and bulimia nervosa symptoms.
THE CORRELATION BETWEEN STRESS-RESISTANCE RESOURCES AND
HARDINESS COMPONENTS OF TEACHERS WORKING UNDER STRESS

The actual study was aimed to reveal the correlation between stress-resistance resources and hardiness components of teachers working under stress. The research was conducted in teachers working under long-term innovation stress related to branch specific reforms and new forms of inclusive education practical usage implementation (N=41). The assessment methods included the hardiness survey, the job stress survey (JSS), the coping questionnaire (SACS), the checklist designed to get data about coping means. The results revealed the correlation between components of hardiness, job stressors assessment, typical coping behavior models and functional state self-regulation means of teachers. The results shown that: (1) engagement as a component of hardiness is negatively related to implementation of contradictory job requirements ($r=-0.317; p=0.043$) and to conflicts with other organizational departments ($r=-0.449; p=0.003$) as intensely assessed stressors; (2) control as a component of hardiness is negatively related to implementation of new and unknown tasks necessity ($r=-0.396; p=0.01$), to contradiction between tasks and professional functions ($r=-0.339; p=0.03$), to conflicts with other organizational departments ($r=-0.384; p=0.013$); (3) risk taking as a component of hardiness is negatively related to implementation of unpleasant and contradictory duties ($r=-0.539; p=0.00$), to insults and personal affronts ($r=-0.405; p=0.009$), to proper management absence ($r=-0.409; p=0.008$) and to conflicts with other organizational departments ($r=-0.372; p=0.016$). The overall hardiness level negatively correlates with implementation of unpleasant and contradictory duties ($r=-0.406; p=0.008$), with crises situation coping ($r=-0.309; p=0.05$) and conflicts with other organizational departments ($r=0.426; p=0.005$). In other words, if the influence of these job stress factors increases, risk of hardiness level reduction will appear. The overall hardiness level ($r=0.383; p=0.013$) and all its components correlate with prosocial coping behaviour like social contact finding (engagement, $r=0.354; p=0.034$; control, $r=0.333; p=0.034$; risk taking, $r=0.312; p=0.047$). The overall hardiness level is negatively related to resource-intensive means of functional state self-regulation such as volitional effort. The data confirm: teachers with different hardiness level apply fundamentally different stress-resistance resources. These results allow to elaborate differentiated training programs for teachers targeted for: development of effective stress-resistance resources and maintaining work performance prolonged high level.
EMOTIONS AND PREDICTION IN A CASINO GAME: THE PILOT STUDY

Yulia Krasavtseva
Margarita Chimiris
Lomonosov Moscow State University (Moscow, Russia)

Anticipatory emotions, consisting of cognitive and affective components, play a role in decision-making, especially when the predicted outcome of an event is either validated or invalidated, prompting an affective response (Miceli, Castelfranchi, 2015). The aim of this study was to examine relations between anticipatory emotions, predictions, affective reactions and personality traits in the context of risky decision-making. 119 undergraduate students and adults participated in this pilot study, aged 17 to 50 (m=23.61), 81% women. The following questionnaires were employed: Personal Decision-Making Factors (Kornilova, 2003); Impulsiveness Scale (Eysenck et al., 1985); and the Subjective Risk Intelligence Scale (Craparo et al., 2018). A new experimental decision-making task was introduced: Emotions and Prediction In a Casino game (EPIC). Participants were given a roulette representation of a risky choice and asked to predict the outcome as well as to rate their emotions before and after the game using the Self-Assessment Manikin (Bradley, Lang, 1994). In a low-risk scenario (7/8 chances to win) anticipatory pleasure was significantly negatively correlated with the result prediction (-.298). In a riskier scenario (6/8 chances to win) anticipatory arousal was negatively correlated with the pleasure emotion (-.326) and vice versa (-.265). A higher result prediction was linked to a lower pleasure reaction (-.437). In all scenarios, pleasure (.492), arousal (.590) and dominance (.551) before and after the result were positively correlated. Impulsiveness was significantly negatively correlated with reactive pleasure (-.499) in a low-risk roulette scenario, and positively related to anticipatory pleasure (.449) in a no-risk scenario. Empathy was negatively related to anticipatory (-.361) and reactive arousal (-.358). Emotional stress vulnerability and negative attitude toward uncertainty were both negatively correlated with anticipatory and reactive arousal and dominance, in low-risk and no-risk scenarios. Rationality was positively associated with outcome prediction (.356) and reactive arousal (.343). Risk readiness correlated positively with anticipatory pleasure (.380) and negatively with anticipatory arousal (-.367). Higher anticipatory pleasure associated with lower result expectations and significant correlations between anticipatory and reactive emotions suggest a strong link between cognitive and affective components in risky decision-making. Supported by the Russian Foundation for Basic Research, project 17-06-00130.
THE DARK TRIAD AND BIG FIVE PERSONALITY TRAITS IN ANABOLIC-ANDROGENIC STEROID USERS AND NON-USERS

Razieh Chegeni
(Bergen, Norway)

Dominic Sagoe
Ståle Pallesen Bergen
University of Bergen (Bergen, Norway)

Atefeh Maleki
Alzahra University (Tehran, Iran)

There is a dearth of studies on the personality of anabolic-androgenic steroid (AAS) users. We thus conducted a cross-sectional investigation of the Dark Triad (Machiavellianism, narcissism, and psychopathy) and Big Five (extraversion, agreeableness, conscientiousness, neuroticism, and intellect/imagination) personality taxonomies of AAS users and non-users. A sample of Iranian weightlifters completed a questionnaire containing demographic questions and measures of AAS use (lifetime) as well as personality (the Dirty Dozen reflecting the Dark Triad, and Mini-IPIP assessing the Big Five). The sample included 193 AAS users (females: n = 86; age: M = 26.89, SD = 7.12) and 257 non-users (females: n = 127; age: M = 23.06, SD = 3.18). Adjusted binary logistic regression (controlling for sex and age and including all personality traits) was conducted to identify associations between personality traits and AAS use or non-use. Compared to non-use, AAS use was positively associated with age (OR = 1.15, CI = 1.034 -1.277), psychopathy (OR = 1.26, CI = 1.089 -1.467), narcissism (OR = 1.27, CI = 1.127 -1.420), and extraversion (OR = 2.08, CI = 1.522 -2.840). Furthermore, AAS use was inversely associated with agreeableness (OR = 0.48, CI = 0.345 -0.654) and conscientiousness (OR = 0.47, CI = 0.371 - 0.596). The results highlight personality traits representing risk factors as well as protective factors for AAS use. This may have implications for both preventive measures as well as for AAS dependence treatment. A limitation of the present study is its cross-sectional design precluding causal conclusions and lack of control for premorbid personality functioning.
EVALUATION OF THE EFFECTIVENESS OF VIRTUAL REALITY IN THE EDUCATIONAL PROCESS

Artem Kovalev
Yulia Rogoleva
Lomonosov Moscow State University (Moscow, Russia)

Innovative technologies in education are active methods of forming competences based on students and their involvement in the educational process interaction. The effectiveness of virtual reality (VR) application as educational technology has been an open question for a long time. From the one side VR opens up new possibilities for students by allowing physical exploration of objects that are inaccessible in reality. From the other side the psychological mechanisms of effective VR application in education are unclear. The purpose of this research is to estimate the effectiveness of VR using in foreign language studying. The participants were 42 (20 males and 22 females) students from Lomonosov Moscow State University aged from 18 to 23 and they were divided into 2 groups. The first group received information in a foreign language (in English) presented in the form of typed texts. The second group received the same information using VR system Samsung Gear VR. We used application “Discovery VR” to provide short informational videos to participants. All subjects had the same level of foreign language proficiency. Each group studied 10 topics with neutral content devoted to the life of animals. After each presentation of information the subjects knowledge were evaluated by tests. In addition all participants had to write a short summary of the studied material. The results showed that there were no differences in learning level between groups. Group using VR system demonstrated high values of presence effect. However the group that worked with texts, prepared more detailed summary than subjects that used VR system. In spite of its motivating properties (as reflected in presence ratings), educational process in VR may overload and distract the learner, resulting in less opportunity to build learning outcomes. Thus we concluded that using of VR in education may offer a unique opportunities for subjects only in special information presentation conditions. The research was supported by the grant from Russian Foundation of Basic Research, project #18-29-22049.
Although cross-cultural studies using nation as unit of analysis have showed many important cultural differences across many areas of psychology, whether nation is meaningful unit of analysis to capture cultural similarities and differences has been an important controversy in (cross) cultural field. Moreover, cultural differences within national groups have been generally ignored. Also few studies that examined within cultural differences based on regional or basic socioeconomic variables generally yielded inconclusive findings. One of the reasons for these results might be these studies have used different value or attitude measurement that were developed by Western value perspectives basically to determine cross-cultural differences. At the context of these methodological issues, the goal of present study is to address cultural homogeneity or heterogeneity of cultural value orientations within a culture (nation). To test these hypotheses, we collected data from 26 cities through cluster sampling technique which represents different regions of Turkey with total of 2600 participants. The value scales that generally used in cross-cultural studies (Schwartz’s PVQ; world value map scale of WVS and INDCOL) were used to measure cultural value orientation along with Turkish Value Scale that are developed and validated in Turkish cultural context. Various ANAVOs were conducted to capture within cultural differences and similarities as regional clusters and basic SED variables (gender, income, religious orientation, vb.) serving as independent variable on value dimensions measured though different value and attitude scales. The results indicated important within cultural variations, especially according to regional cluster (urban vs rural), gender and religiosity on cultural values. More importantly, even though using different value survey generally confirmed some important within cultural variances, the pattern of differences and effect size have varied across different measures in which some of the findings are inconsistent way. Findings of current study were discussed methodological and measurement issues in (cross) cultural field. The current findings support the idea that within cultural variations is also important to understand influence of culture and the need for indigenous measurement to capture potential within cultural variations. *The research was supported by Turkish Science Foundation (TÜBİTAK)-Grant no: 215K188
ARE GRANDIOSE NARCISSISTS MORE ADAPTIVE? THE ASSOCIATIONS BETWEEN TWO TYPES OF NARCISSISM AND EMOTION REGULATION DIFFICULTIES

Pelin Bintas-Zorer
Sedef Tulum-Akbulut
Dokuz Eylul University (Izmir, Turkey)

Narcissism which has been increasingly prevalent in Western cultures has two different types as grandiose and vulnerable. Earlier studies indicated that grandiose narcissism was associated with more adaptive features such as psychological well-being, self-esteem and self-efficacy, whereas vulnerable narcissism was linked to more maladaptive features such as negative affectivity. Difficulty in emotion regulation is one of the maladaptive characteristics that is associated with mental health. Research showed that as the narcissistic features increase, mood fluctuations also increase; therefore, it is important to regulate emotions for better adaptation of narcissistic individuals. To the best knowledge of the researchers, only one recent study (Zhang et al., 2015) has focused on the relationship between two types of narcissism and emotion regulation difficulties. Hence, further evidence is needed to confirm the differences between two forms of narcissism and emotion regulation. Present study aimed to expand the previous literature by investigating the associations between difficulties in emotion regulation with grandiose and vulnerable narcissism in a Turkish sample. The sample of the study consisted of 511 participants (386 women, 185 men). The participants completed Narcissistic Personality Inventory, Hypersensitive Narcissism Scale and Difficulties in Emotion Regulation Scale. The associations of grandiose and vulnerable narcissism with difficulties of emotion regulation were tested by using multiple regression analyses. The regression analyses showed that grandiose narcissism was positively associated with difficulties in controlling impulsive behavior when experiencing negative affect and negatively associated with lack of awareness of emotional responses and clarity of emotional responses. On the other hand, vulnerable narcissism was positively related to non-acceptance of emotional responses, limited access to effective strategies, and difficulties in controlling impulsive behavior when experiencing negative affect. The results of the study supported the previous work by suggesting that grandiose and vulnerable narcissists differ significantly in the sense of emotion regulation skills, an important sign of psychological functioning and development. Grandiose narcissists seem to be psychologically more adaptive and flexible than vulnerable narcissists. Our findings may contribute to the recent interest in the differentiation between grandiose and vulnerable narcissism in terms of psychological well-being and adjustment.
THE EFFECT OF INTER-PARENT AND CHILD-PARENT RELATIONSHIP QUALITY ON PERCEPTIONS OF DEVELOPMENTAL OUTCOMES OF CHILDREN OF SAME-SEX PARENTS

Joel Anderson  
Australian Catholic University (Sydney, Australia)

Yasin Koc  
University of Groningen (Groningen, Netherlands)

The number of same-sex couples across the globe is increasing, and there is a subsequent rise in the prevalence of children being raised within same-sex parented families. In this presentation, we present a series of studies in which we aim to increase understandings of the psychosocial factors that shape perceptions of same-sex parented families, with a focus on the role of the quality of various relationships within the family. To achieve this, we present participants with a vignette describing a family situation involving a seven-year-old male child being raised by either gay male, lesbian, or heterosexual parents, before asking the participants to rate their perceptions of the couple, and the child’s relevant developmental outcomes (including perceptions of social, emotional, and academic adjustment, likelihood of being bullies, and perceptions of parent-child attachment). Across a series of studies we manipulated the quality of the relationship between the parents, and between the parents and the child. An interesting pattern of results emerged as a function of the sexual orientation of the parents, and the quality of these inter-familial relationships, which are discussed in light of informing therapeutic intervention decisions for children’s psychological and psychosocial development.
THE REPRESENTATION OF WORK IN PEOPLE WITH DIFFERENT INDIVIDUAL MENTAL RESOURCES

Tatiana Dudnikova
Natalia Volkova
Russian Academy of Sciences (Moscow, Russia)

The implicit representation of people about work has not yet been the subject of a psychological research. Thus, the research question arises whether people with different mental resources differ in their views on work? The paper is devoted to the revealing relations among the features of the organization of the concept "work" as a correlate of the individual picture of the world and indications of human mental resources. The multiple design was used including assessment of individual mental resources (temperament, fundamental personality traits, character traits, cognitive styles, intelligence and motivation) and directed associative experiment (stimulus word "work"). Participants of the experiment were 1110 persons aged 17-31 years. We processed the data by mathematical, linguistic and statistical approach: primary data were subjected to be analyzed using HCA. It should be noted that only the first reaction to the stimulus word was considered since many researchers believe that the first reaction is the most independent from social desirability and it may allow us to reveal the implicit notions about the object under research. The results of the study showed that the concept is formed by such cognitive features as interesting, fascinating and exciting. However, it was found that more active and more emotional people perceive work as interesting, responsible, hard and favorite, and less emotional and less active people — as interesting, hard, difficult, and responsible. More active and more emotional people are distinguished by high indicators of such cognitive styles as field independence, tolerance and motivation. They are pedantic, demonstrative and anxious. Less emotional and less active people are characterized by such cognitive styles as rigidity of cognitive control, impulsiveness and reflexivity. They demonstrate such traits of character as stickiness, emotivity and cyclothymicity. Based on the data obtained, we concluded that despite the place that work takes in people’s lives, the implicit ideas about it differ in people with different individual mental resources and develop based on the social interaction offered by culture in which person lives, and the choice of those that corresponds to characteristics of individuality. The study was supported by RSF grant (project № 18-18-00386), Institute of Psychology RAS.
FLEXIBLE FUNCTIONAL STATES’ SELF-REGULATION AS A FACTOR OF WORK SUCCESS

Alla Kuznetsova
Anna Leonova
Tatiana Zlokazova
Lomonosov Moscow state university (Moscow, Russia)

Efficient functional states’ self-regulation helps to achieve good results at tensed work conditions and healthy behavior at home domain (Sonnentag, Mojza, Binnewies & Scholl, 2008; Kuznetsova & Titova, 2016). The developed skills of emotional states’ self-regulation traditionally are viewed as one of the key competences in socionomic types of work. At the same time, modern and tensed work environment requires the developed ability to cope with work stress and to maintain the proper level of emotions manifestation in order to perform well in nearly all occupations. The goal of the research is to reveal the relations between the ability to activate flexible functional states’ self-regulation and the level of work success. In the study, 240 professionals participated (IT specialists, HR-managers, psychologists) with different term of employment in industrial and service organizations (90 men and 159 women, from 18 to 55 years old). The experts divided all participants into two groups, using organization criteria of work success evaluation. The methods included: the job analysis technology and a set of questionnaires to assess: (1) the subjective evaluation of job stressors and work strain (Spielberger, 1996; Leonova, 2002); (2) typical coping behavior models and frequently used means of states’ self-regulation (Hobfoll, 1994; Kuznetsova, 2003); (3) the flexibility of regulatory processes (Morosanova, 2001); 3) special checklist for designed to get data about rest planning (Kuznetsova & Luzianina, 2005). The data analysis (based on descriptive statistics, t-test, Spearman’s correlation analysis, multiple regression analysis) revealed: successful specialists with the highest level of states’ self-regulation flexibility demonstrated: (1) the stronger resilience to the tensed work situations, (2) the highest level of adequate coping means implication. It is discussed that efficient functional state’ self-regulation could also be interpreted as a professional competence that helps differentiate exemplary performers from typical employees.
Abstract

A leader is a figure who is considered a role model. In the context of local government leadership, a leader is a figure who is expected to accommodate every single interest for a mutual wellbeing. This study aimed at examining how a local leader performs his leadership. Data were collected through semi-structured interview. The transcript of the interview was then analyzed using interpretative phenomenological. The interviewed subjects in this study were the local leaders of East Kalimantan. The results of this research found that the transformational leadership style was performed by the heads of Kalimantan local government. This leadership style stood for its local interest. This research discovered that the transformational leadership style addressed various issues in East Kalimantan. There are some characteristics of transformational leadership illustrated by the Regent of Kutai Kertanegara and former Deputy Governor of East Kalimantan. 1) They involved the people as stakeholders and derived the local wisdom to address various issues in the region he leads. 2) They converted the bureaucratic strategy into a “taking initiative” approach. 3) They encouraged the realization of economy transformation by utilizing local products.

Workplaces are often thought of as full of stress and politics, anywhere in the world. Recently, the impact of these factors on employee wellbeing is increased by more recent advancements in job automation and digitization, coupled with mobility and increased connectivity demands lead to individuals’ disconnection from their established long-term relationships. Better interpersonal relationships at work can help overcome these impacts. Conditions for that are available to any human being: meet each relationship partner’s needs at each time in the relationship. To further specify this approach, a cross-cultural study of employee satisfaction in workplace relationships with their immediate leaders, peers, and others in their organization as well as preferred kinds of relationships and needs at each stage of relationships, revealed cultural specificity in Russia and USA. Study demonstrates that congruent with the societal cultures, workplace relationships help increase wellbeing of employees in each of the two countries.
THE EFFECT OF TRANSFER TYPES ON THE LABOR’S ROLE IN OWNERSHIP ASSIGNMENT

Zhanxing Li  
Xi’an Jiaotong University (Xi’an, China)

Liqi Zhu  
CAS Key Laboratory of Behavioral Science, Institute of Psychology (Beijing, China)

First possession and labor are two main elements that people often consider to assign ownership. These two factors sometimes conflict with each other, which may cause many ownership disputes. Previous studies showed that creation and value change would turn people to outweigh the role of labor. However, many of these studies were conducted in the “take” transfer condition. In this study, we recruited eighty-five undergraduates (Mage = 20.31) as subjects and designed four types of transfer scenarios, and proposed that ownership transfer types would affect adults’ ownership assignments based on first possession or labor rule. In the scenarios, a man either takes or steals or borrows or just finds another person’s items and modified them. The modification either makes the items changed creatively or stay in the original state. Different extents of value change (large vs. small) were also discriminated and matched with the variation of creation. Subjects were asked to judge whom the modified items should belong to. The results showed there were significant interactions between transfer type and creation, F(3, 252) = 4.35, p = 0.01, ηp2 = .049, as well as between transfer type and value change, F(3, 252) = 10.69, p < 0.001, ηp2 = .113. While people were more likely to assign ownership to the first possessor in the take, steal and borrow conditions, they did not show such preference in the find condition. Moreover, such tendency varied depending on the creation and the extent of value change. People did not show an apparent preference to the first possessor or the labor in the find condition. The study shed light on our understanding of daily property conflict and the court decision.
PROFILES OF PSYCHOLOGICAL CONTROL, TEACHER SUPPORT, ACADEMIC SELF-EFFICACY AND THEIR RELATIONS WITH STUDENT LEARNING OUTCOMES

Xu Xiaobo
Pang Weiguo
East China Normal University (Shanghai, China)

Accumulating evidence suggest that high achievement-oriented psychological control (APC) may lead to academic maladjustment. According to the stress buffering hypothesis and self-efficacy theory, teacher support and student academic self-efficacy could buffer the detrimental impact of APC on learning outcomes. Using latent profile analysis (LPA), the present study aimed to examine the profiles of parental psychological control, teacher support, student academic self-efficacy and their relations with student learning outcomes (i.e., learning engagement, test anxiety, and academic achievement). Six hundred and sixty four high school students (223 boys and 441 girls) with the age ranging from 15 to 17 years (M = 16.01 years, SD = 0.47 years) were recruited to complete scales that measuring APC, teacher support, academic self-efficacy, learning engagement, and test anxiety. Academic achievement was assessed by student’s grades of Chinese, Math, and English in mid-term examinations. The results revealed three profiles. Profile 1 (the overwhelmed group, 19% of the sample) was characterized by high APC, low teacher support, and low academic self-efficacy. Profile 2 (the neglected group, 43%) was characterized by low APC, low teacher support, and low academic self-efficacy. Profile 3 (the well-balanced group, 38%) was characterized by low APC, high teacher support, and high academic self-efficacy. Significant differences in learning outcomes were found among these three profiles. Specifically, the well-balanced group demonstrated the highest level of learning engagement, followed by the overwhelmed group and the neglected group. In contrast, the well-balanced group experienced the lowest level of test anxiety, while the overwhelmed group suffered most from test anxiety. In addition, the well-balanced group achieved higher academic achievement than the overwhelmed group and the neglected group, while no significant difference was found between the later two groups. These findings suggested that learning outcomes were affected by complicated interactions among APC, teacher support, and student academic self-efficacy. Implications and future directions were discussed in detail.
CULTURE-COMMON AND SPECIFIC ASPECTS OF CHINESE INDIGENOUS PERSONALITY: RELATED TO CHINESE PERSONALITY DIMENSIONS AND HEXACO MODEL

Kung-Yu Hsu
Shao-Chun Chuang
National Chung-Cheng University (Chiayi, Taiwan)

The main purpose of this study is to examine the culture-common and specific aspects of Chinese indigenous personality by comparing the relationships between seven Chinese personality traits that measured by Multidimensional Personality Inventory for Chinese Youth (MPICY) and HEXACO personality dimension measured by HEXECO-60. MPICY was recently developed according to the seven Chinese indigenous personality traits that was derived from Yang’s (1999) findings: Competence, Industriousness, Other-orientedness, Agreeableness, Extraversion, Large-mindedness, and Optimistic. Yang (2006). Claimed that only three dimensions of Chinese indigenous personality dimensions are correspondent to American Big Five. This issue of cultural universality of personality traits was investigated further in this study. To aim this research objective, we explicated the relationships between Chinese personality traits and HEXACO dimensions in the framework of Multitrait-Multimethod matrix (MTMMM) that included three different ratings (self-rating, peer-rating and teacher-rating). We recruited 450 participants to fill in the different rating versions of MPICY: 192 participants for self-rating, 186 participants for peer-rating and 72 participants for teacher-rating. Based on past research findings and theoretical considerations, four models were set in confirmatory factor analysis: NTNM for null model, CTCU for two cultural factors model, CTCU for four altruism factor model and CTCU for eight factor model. The results showed that CTCU for eight factor model was achieved the satisfactory level in the all of fix indexes. Five culture-common dimensions and three culture-specific dimensions were set in this eight factor model. The culture-common dimensions are: Industriousness and Conscientiousness, Other-orientedness and Honesty-Humility, Optimistic and Emotionality (former ones are Chinese personality dimensions and later ones are HEXACO model), Agreeableness, and Extraversion (the same label in these two models); the culture-specific dimensions are: Large-mindedness, Competence (Chinese personality dimensions), and Openness to Experience (HEXACO model). This study provided a strong evidence that combined the different rating and different cultural framework of personality traits to demonstrate culture-common and specific aspects of Chinese personality traits. The implication of research results were discussed in the framework of cross-cultural and indigenous psychology.
VALIDATION OF THE KAWASAN SECONDARY SCHOOL ADMISSION TEST

Fajrianthi Fajrianthi  
Dimas Aryo Wicaksono  
Universitas Airlangga (Surabaya, Indonesia)

Kawasan Secondary Schools are eleven junior high schools with superior quality and facilities compared to other secondary schools in Surabaya. The Kawasan Secondary School Admission Test (KSSAT) was a part of the government project to address the uneven distribution of education quality in the city. Its development is following the steps of test constructions suggested by Crocker and Algina (1986): identification of the primary purpose and target behavior of the test; determining a set of test specification; creating, reviewing, and pilot-testing a pool of items; revising and field-testing items; determining the statistical properties and establishing reliability and validity of items and the final form of the test; and developing user guidelines of the test. This research aimed to provide various forms of validation evidences for the KSSAT, which are crucial for better admission decisions and to establish legal standing of the its application. Participants were 2718 students of 7-grade in 2016. KSSAT consists of verbal, numerical, and figural dimension. Confirmatory factor analysis, internal consistency (Cronbach's alpha and composite reliability) analysis, and discriminant and convergent validity analysis were carried out. The measurement model was found fit with a second-order factor model (CFI = .985, TLI = .979, RMSEA = .021, CMIN = 69.188, df = 32), implying evidence of the internal structure of the KSSAT. Discriminant validity was established. However, the result also found low composite reliabilities (verbal = .495, numerical = .365, figural = .368) and Cronbach's alpha (verbal = .351, numerical = .344, figural = .286) and lack of convergent validity. The findings suggest improvements for KSSAT.
PSYCHOMETRIC PROPERTIES OF KAWASAN SECONDARY SCHOOL ADMISSION TEST UTILISING RASCH METHODS

Dimas Aryo Wicaksono
Fajriantni Fajriantni
Universitas Airlangga (Surabaya, Indonesia)

The purpose of this study was to evaluate the psychometric properties of the Kawasan Secondary School Admission Test (KSSAT). KSSAT consist 185 items with three subtests, verbal, numerical, and figural subtest and was developed to assess student’s ability which would decide their admission to Kawasan Secondary Schools. Kawasan Secondary Schools are eleven favorite junior high schools in Surabaya. A total of 2718 students of 7-grade was sampled out of 5436 test takers. The KSAT is an aptitude, or ability test, as opposed to an achievement test. An aptitude test measures the ability to learn or to develop proficiency in an area. Rasch analysis was used to measure item and person separation reliability, item difficulty, standard error, and person and item fitness for the model. The Infit (Weighted) values for the verbal ability ranged from 0.940 to 1.060, and for the numerical ability from 0.870 to 1.170, then for the figural ability ranged from 0.880 to 1.150. Moreover, The Outfit (Unweighted) values for the verbal ability range from 0.780 to 1.090, and for the numerical ability its value from 0.800 to 1.310, then for the figural ability, ranged from 0.770 to 1.230, this test can be classified as high stake test, then according to Wright and Linacre (1994) that reasonable item Mean-square ranges for INFIT and OUTFIT is from 0.8 to 1.2, thus it can be said that these 185 items are good and at reasonable values. The difficulty level of the items will vary. First, for the verbal ability its difficulty level range from -4.110 logits to +3.410 logits, associates with standard error from 0.040 to 0.130 logits. The difficulty level of the numerical ability items range from -2.890 logits to +1.640 logits, with the standard error from 0.040 to 0.080 logits. Meanwhile, for the Figural abilities, its item difficulty range from -2.030 logits to +1.830 logits, associates with standard error from 0.040 to 0.070 logits. All of these standard errors have small values which closer to zero point, it means that the indicator of difficulty estimation are quite precise, due to large calibration sample.
EXECUTIVE FUNCTION AND INTERNALIZING PROBLEMS: EXAMINING MECHANISMS

Yiji Wang
East China Normal University (Shanghai, China)

Internalizing problems, characterized by symptoms of depression and anxiety (Bongers, Koot, van der Ende, & Verhulst, 2003), are among the most prevalent developmental psychopathologies in school-aged children (CDC, 2013; O’Connor, Dearing, & Collins, 2011). High internalizing problems are associated with children’s maladjustment in cognitive and academic functioning (Bub, McCartney, & Willett, 2007), peer interaction (Henricsson & Rydell, 2006), and behavioral development (Burt, Obradović, Long, & Masten, 2008). Recent studies revealed that poor executive function is among the etiology of internalizing problems (e.g. Hatoum et al., 2017; Nelson et al., 2018; Wang & Dix, 2017). Yet, the mechanisms through which poor executive function may promote internalizing problems are still unclear. Consistent with the ecological perspective of development (Brofenbrenner, 1994), this study thus proposed three mechanisms at individual and environment levels—peer difficulties, academic performance, and self-perceived school competence—and examined whether they may contribute to understand the longitudinal associations between executive function and internalizing problems in school-aged children. We used a longitudinal data (N=1,364) drawn from the NICHD Study of Early Child Care and Youth Development (NICHD, 1999). Children’s executive function was assessed in the 1st grade with experiments. Teachers reported peer difficulties and academic performance in 4th grade and internalizing problems in 6th grade. Children reported their perceived school competence in 6th grade. Using structural equation modeling (SEM), we examined three mediating hypotheses: peer difficulties, academic performance, and self-perceived school competence will independent mediate the relations between 1st-grade executive function and 6th-grade internalizing problems. The SEM model fit the data well, \( \chi^2 = 470.03, p = .00, CFI = .89, SRMR = .05, \text{RMSEA} = .06, 90\% \text{CI [.05, .07]} \). Results supported our research hypotheses. This study contributed unique findings that the influence of executive function on subsequent internalizing problems was indirect via three mechanisms at the individual and environmental levels, including peer difficulties, academic performance, and self-perceived school competence. The findings highlight the roles of individual and environmental processes in understanding the influence of executive function on internalizing problems in elementary school.
ATTACHMENT AND ITS IMPLICATION IN THE FIELD OF TOURISM

Girish G.
The Catholic University of Korea (Seoul, South Korea)

Researchers widely used attachment theory in different disciplines in different context. Attachment was studied and explored in tourism perspective mainly on understanding attachment towards a destination, festival, event and so on. Few examples of attachment that is popular in the context of tourism are destination attachment, place attachment, event attachment and most recently exhibition attachment. Couple of studies explored host attachment and technology attachment and even a study on pet attachment was also studied, focusing on leisure behavior. Few other kinds of attachment such as tour leader attachment, trust attachment, consumers’ emotional attachment was also studied by researchers. A comprehensive review on previous studies published in the top five tourism academic journals such as Tourism Management, Journal of Travel Research, Annals of Tourism Research, Journal of Hospitality and Tourism Research and International Journal of Hospitality Management were carried out to analyze attachment. The journal articles related to attachment were retrieved from Science direct, SAGE and Wiley, which are the database for the top five tourism journals. After extensive review, findings were discussed on dimensions such as categorization and conceptualization of attachment and operationalization of attachment. Finally, conclusion and implications are made.

EXIT, VOICE, LOYALTY, AND NEGLECT: BEHAVIORAL REACTIONS TO PERCEIVED JOB INSECURITY AND THE MEDIATING ROLE OF RELATIVE DEPRIVATION

Ümran Yüce-Selvi
Eskişehir Osmangazi University (Eskişehir, Turkey)
Nebi Sümer
Sabancı University (İstanbul, Turkey)
Yonca Toker
Middle East Technical University (Ankara, Turkey)

Job insecurity, as a serious concern about the continuity of the job in the future, is one of the most important employment stressors and has detrimental effects on both employees and the organizations. Past research indicates that people’s reactions to job loss threat vary. This study investigates employees’ behavioral reactions to perceived job insecurity within the framework of Hirschman’s (1970) exit-voice-loyalty-neglect model. This model focuses on the mechanism that directs employees to exit from the organization, voice their stress to change the current situation, scrutinize their loyalty to the organization, and prefer to remain silent when they perceived job insecurity. Specifically, this ongoing study focuses on the mediating role of egoistic and fraternal relative deprivation in the association between perceived job insecurity and behavioral reactions. The sample will be 600 white-collar employees from Turkey. The proposed model will be tested via path analysis. We expect that perceived job insecurity predicts egoistic relative deprivation and this in turn, predicts exit, loyalty and neglect responses. Fraternal relative deprivation, however, is expected to predict voice responses. This study will contribute to the current literature by uncovering the mechanism that shapes employees’ behavioral reactions to perceived job insecurity.
THE PERCEPTION OF CHILD SEXUAL ABUSE IN TURKEY: A PHENOMENOLOGICAL STUDY WITH THE MOTHERS OF CHILDREN AGED 3 TO 6 YEARS

Nur Baser Baykal
Istanbul Sabahattin Zaim University (Istanbul, Turkey)

Hale Nur Kılıç Memur
Marmara University (İzmir, Turkey)

Seval Erden Çınar
Marmara University (İstanbul, Turkey)

Child sexual abuse (CSA) is an important social problem affecting millions of children and their families all around the world. CSA causes widespread devastation in children’s lives since victims of it are wounded deeply in cognitive, emotional, psychosocial spheres. Adequate knowledge on the issue and right parental attitudes are known to play important roles in both prevention and amelioration of the consequences of CSA. Thus, the aim of this study is to investigate the perceptions of mothers on CSA in Turkey. In this study, in order to explore the phenomenon of the perception of mothers in Turkey on CSA, phenomenological design, one of the qualitative methodologies, was used. 15 mothers (from 26-37 years of age) who have children aged between 3-6 years, participated in structured interviews consisting of 14 questions. Interviews were transcribed thoroughly and analyzed using MAXQDA 18 (qualitative data analysis computer program). Participants described nine main themes about CSA. The most outstanding three themes were (1) wrong attitudes (from family and environment), (2) what to do in case of CSA and (3) protective-preventive behaviors. Mothers often reported wrong attitudes as expressing affection to children by touching special parts of their body (lips, butt), exposing improper content in social media, and lack of family communication. In the case of a possible CSA, mothers frequently reported that they would go to police, seek psychological support, give emotional support to their children and try to talk the event with children. Reported protective-preventive behaviors included training parents, informing the child (ex: privacy education), establishing a secure relationship and love in the family. Perceptions and awareness of mothers regarding to CSA are quite important in the prevention of CSA. Current study reveals that participants have general knowledge on CSA and consequences of it, yet they lack some knowledge on the signs and symptoms as well as wrong familial attitudes and prevention programs. In the light of the results gathered by this study, it is thought that informative and educational materials on CSA such as training manuals, short movies or public service advertisements can be useful for the prevention of CSA.
THE MEDIATING ROLE OF BODY ATTITUDES ON THE RELATIONSHIP BETWEEN CORE BELIEFS AND EATING BEHAVIORS IN TURKISH COLLEGE STUDENTS

F. Elif Ergüney Okumuş
Istanbul Sabahattin Zaim University (Istanbul, Turkey)

H. Özlem Sertel Berk
Istanbul University (Istanbul, Turkey)

Eating behaviors affect health in multiple ways and eating disorders are regarded as the most serious clinical outcome of those behaviors. College students are presented to be a risky population for disordered eating behaviors. From a cognitive behavioral perspective, behaviors are shaped through attitudes which are originated from core beliefs. Core beliefs about eating and body attitudes are important contributors of disordered eating behaviors and it is assumed that understanding the relationship between these factors help guide their treatment and preventive studies in particular. Thus, the aim of this study is to investigate the mediating role of body attitudes on the relationship between core beliefs and eating behaviors. The population for the study consisted of 729 volunteer students (200 male and 529 female) enrolled in various state and foundation universities in six different cities of Turkey. A sociodemographic form, Body Image Questionnaire, Eating Disorder Belief Questionnaire, Eating Disorder Examination Questionnaire, Depression, Anxiety and Stress Scale were administered. A cross-sectional design was employed and a mediator regression analyses was used to assess the mediating role of body attitudes on the relationship between core beliefs and eating behaviors. Results indicated that sub-types of core beliefs together explained 46 % of the variance in disordered eating behaviors while controlling gender differences and psychopathology levels. Linear mediator regression analyses resulted in a decrease in the predicting effect of core beliefs (total score) on disordered eating behaviors (total score) while controlling the mediating effect of body attitudes. This partial moderation was statistically significant according to Sobel test (Z=4.57, p<0.001). The results of the study suggested that core beliefs had an effect on disordered eating behaviors via attitudes partially, which show consistency with the cognitive theories and previous studies. Hence, it is essential that the prevention programs should consider these risk factors.
COMPARISON BETWEEN MOTHER AND FATHERS OF CHILDREN WITH ASD ON PSYCHOLOGICAL RESILIENCE, COGNITIVE EMOTION REGULATION, EMOTIONAL STATUS VARIABLES

Nuray Mustafaoğlu Çiçek
Mujgan Inozu
Hacettepe University (Ankara, Turkey)
Ferhunde Öktem
Hacettepe University Emeritus (Ankara, Turkey)

Autism spectrum disorder (ASD) affects not only the child, but also the whole family since the child constantly needs care. Caregiving mothers reported more stress, anxiety and depression both compared with mothers of healthy developed children (Abbeduto et al., 2004) and fathers of child with ASD (Herring et al., 2006). Previous research have pointed out that psychological resilience can be accepted as an important protective factors associated with stress (Bitsika, Sharpley, and Bell, 2013) and individual emotion regulation skills have a role in resilience ability (McCubbin and McCubbin, 1999). In this study, it is aimed to compare levels of psychological resilience, cognitive emotion regulation strategies and emotional status (stress, anxiety, depression levels) of fathers and mothers who have children with ASD. 139 pairs of parents of children with ASD (Mmothers=39.29, SD=7.17 and Mfathers=42.55, SD=7.16) were included in the study. Participant parents filled out socio-demographic information form, Psychological Resilience Scale for Adults (Friborg, et al., 2005), Cognitive Emotion Regulation Scale (Garnefski, Kraaij, and Spinhoven, 2002) and Depression Anxiety Stress Scale (Lovibond and Lovibond, 1995) individually.

One-way MANOVA analyses revealed that mothers and fathers of children with ASD did not differed from each other in resilience, emotion regulation and general psychopathology symptoms. Moreover, Actor Partner Interaction Model (APIM) analysis was carried out to investigate the interaction among psychological resilience, cognitive emotion regulation strategies and depressive feelings of parents. Adaptation indices of the variables were found to be appropriate in the described model (X2(df)=0.45(4), p=0.33, CFI=0.99, RMSEA=0.03, NNFI=0.99). It was found that fathers’ acceptance of ASD diagnosis, which is important cognitive emotion regulation strategy, plays a significant role in reducing mothers’ depressive level (β=-.17, p<0.05). The results suggest that motherhood or paternity may not associated with different level of psychological resilience; emotion regulation and stress, anxiety and depression. However, it is quite possible that parents’ cognitive emotion regulation skills could affect each other’s psychological states. This result sheds light on the need to study the interaction of caregiving with special needs in parents in later studies.
Incestuous abuse is prevalent in South African context and has long-term negative effects on the survivors’ personality structure. Adult incest survivor patients (ISPs) frequently seek therapy from mental health professionals on daily basis due to myriad of psychological symptoms such as intimacy, relationships and parenting difficulties, revictimization and high-risk sexual behaviours, and mental disorders such as depression and anxiety, posttraumatic stress disorder, complex trauma, dissociative, eating and personality disorders. This article describes the experiences of therapists involved in the treatment of this population of patients. Treating adult incest survivor patients (ISPs) poses numerous countertransferential issues for the therapist and often leads to unsettled therapeutic relationship. Most trauma therapists treating adult incest survivor patients face myriad of clinical presentation, including primitive psychological defense and intractable transference issues that are integral part of the psychotherapeutic encounter. The aim of this study was to investigate the subjective perception of psychotherapists treating adult incest survivor patients. A qualitative paradigm, particularly Interpretative Phenomenological Analysis, was employed to achieve the aim of this research and thus four experienced trauma therapists were interviewed for the purposes of generating data for this study. A psychodynamic conceptual framework was adopted to make meaning of the therapists’ perceptions of ISPs. Overall, participants concluded that providing psychotherapy treatment to ISPs was a demanding and challenging experience. Their felt sense seemed to stemmed from two main factors, namely, the inherent transference complexities and intricacies involved in treating this population of patients, and secondly, from the apparent incapability on their part, to handle ISPs’ needs and vulnerabilities. More specifically, most participants reported that they perceived ISPs as ambivalent, self-sabotaging, resistant, uncooperative, frustrating, rejecting, and dissociated. Furthermore, ISPs were also described as naïve and unassertive, protective, and pleasing of others, as well as psychologically harmed, having sexual relations with others, guarded regarding their personal psychological scars, and suspicious. The implications of the current findings suggest a need for trauma therapists to conversant with the importance of countertransference-transference matrix in the treatment of incest survivor patients.
CREATIVITY AND ADAPTIVE RESOURCES OF THE PERSONALITY IN CHILDHOOD

Vera Gryazeva-Dobshinskaya
Yulia Dmitrieva
Svetlana Korobova
Vera Glukhova
South Ural State University (Chelyabinsk, Russia)

This paper considers the relevancy of investigating the correlation between creativity and adaptive resources in children of the senior preschool age. It presents the results of an empirical study of the characteristics of creativity, the structure of psychometric intelligence, and personal creative and adaptive resources of children. The study was carried out using the Torrance method for diagnosing the imaginative creativity as adapted by E.E. Tunic, the Weschler WISC intellectual test for children, and Rorschach tests. Participants 122 children 6-7 years old who entered the lyceum on a competitive basis were included into the study sample. The childrens’ IQ was higher than 115 points. The entire sample was divided into 4 groups according to the ratio of originality values to elaboration values: 1) 25 preschoolers with a level of originality and elaboration above the average for the entire sample; 2) 22 children with a high level of originality; 3) 25 preschool children with a high degree of elaboration; 4) 50 children with a level of originality and degree of elaboration below the average for the sample.

The obtained division of preschool children into groups and the correctness of group assignments based on the characteristics of creativity and adaptive resources is confirmed by discriminant analysis. We analyze the correlation of the characteristics of creativity, intelligence, and personal adaptive resources of children. We reveal the characteristics of the relationships between creativity, intelligence, and personal adaptive resources in groups of children with different levels of originality and degree of elaboration. The characteristics of creativity and adaptive resources are most closely related in the group of preschool children with a high level of originality and elaboration. The factor structure of the characteristics of creativity, intelligence and personal adaptive resources was determined in the entire sample of children and in each of 4 groups. In the group of preschool children with a high level of originality and degree of elaboration, the structure obtained is maximally integrated: Creativity is linked at the same time with personal adaptation resources, and with the IQ and its components (verbal and non-verbal intelligence).
PHYSICAL ACTIVITY AND POSTTRAUMATIC GROWTH IN PATIENTS TREATING WITH MAINTENANCE HEMODIALYSIS: A LONGITUDINAL STUDY

Yaping He  
Shanghai Jiao Tong University (Shanghai, China)

Maintenance hemodialysis is a life-saving therapy but burdensome to patients with end-stage renal disease. A range of studies indicate psychological distress is common in dialysis patients, but less is known about the positive psychological experience among them. The current study aims to use a longitudinal design to investigate the posttraumatic growth (PTG) in patients treating with maintenance hemodialysis, and examine the predicative role of domain-specific and overall physical activity (PA) on PTG. Patients were recruited from two dialysis centers in Shanghai, China. A total of 150 patients (female: 43.3%, mean age: 59.87±11.31) completed the Posttraumatic Growth Inventory (PTGI), International Physical Activity Questionnaire, and Hospital Anxiety and Depression Scale. Follow-up survey was administered at 12 months after the first assessment, with 118 patients completing the survey. Ten patients died and 22 patients dropped out. Analysis of variance were conducted to examine the association between PA and PTG. Patients treating with hemodialysis on average endorsed 12 of 21 areas of growth indicated by PTGI at a moderate to a very strong degree. The most frequently endorsed item was “I am better able to accept the way things work out” (94.7%), followed by “I can better appreciate each day” (89.3%), and “I have more compassion for others” (88.0%). More than half of patients (54%) did not meet the World Health Organization PA recommendation (≥150 minutes moderate-vigorous PA per week). Household PA was a main source of physical activity energy expenditure, followed by leisure and transportation-related PA. Higher levels of household, leisure, and overall PA were associated with higher levels of PTG at T1 at T2. Furthermore, higher levels of overall PA at T1 predicted an increase in subsequent PTG, controlling for the PTG at T1 and psychological distress at T2. Positive psychological growth may be a common psychological response among patients treating with dialysis, in addition to psychological distress. Physical activity appears to be a modifiable factor which could foster the experience of PTG following the burdensome treatment.
MATERNAL FACTORS ON EMOTIONAL REGULATION AND BEHAVIORAL PROBLEMS OF HEALTHY ADOLESCENTS WITH SIBLINGS WITH ASD

Nuray Mustafaoğlu Çiçek
Hacettepe University / Bursa Teknik University (Ankara, Turkey)

Müjgan Inozu
Hacettepe University (Ankara, Turkey)

Studies of the effects of autism spectrum disorder (ASD) on siblings who has no psychological diagnosis, reports various and inconsistent results (Tekin-İftar and Kutlu, 2013; Wing, 2012). Although there are studies suggesting that having a sibling with ASD may have positive effect of psychosocial development of healthy siblings (Kaminsky and Dewey, 2002; Macks and Reeve, 2007); however, it has also been reported that especially in adolescence with siblings with ASD emotional and behavioral problems are higher compared to peers who has healthy siblings (Gillberg, Gilberg, and Steffenburg, 1992; Hastings, 2003). It is also thought that emotional regulation skills and behavioral problems of adolescent have been depended on the attitudes of their parents (Bloch and Weinstein, 2009; Cavkaytar, 2013; Wing, 2012). In this study, it was planned to examine the relationship among the emotional regulation skills, social difficulties and emotional-behavior problems of the healthy adolescent siblings of children with ASD and maternal psychological resilience and emotion regulation strategies, and emotional problems (depression, stress, anxiety).

The study sample occurs by 71 mothers of adolescents with healthy development between the ages of 9 and 20, who have siblings with ASD. Mothers have been answered Resilience Scale for Adults (Friborg, Barlaug, Martinussen, Rosenvinge and Hjemdal, 2005) and Depression Anxiety Stress Scales (Lovibond and Lovibond, 1995) for themselves; Emotion Regulation Checklist (Shields and Cicchetti, 1997) and The Strengths and Difficulties Questionnaire (Goodman, 1997) for their healthy adolescence children. Correlations analysis among mothers and their adolescence children's variables has been stated. Associations among mothers’ psychological resilience, emotion regulation strategies and emotional states (depression, anxiety, stress) and their adolescence children's emotional and behavioral problems points out that support for mothers means also support for the other healthy children of the mother. Researches in this issue also will be pioneer for the further research and prevention intervention studies for psychologically risky adolescence such as siblings of children with ASD.
THE DYNAMICS OF SUBJECTIVE WELL-BEING AMONG THE RECURRENT FLOOD VICTIMS: THE DEVELOPMENT AND TESTING OF AN INTEGRATED MODEL

Chandita Baruah
Don Bosco University (Guwahati, India)

Dilwar Hussain India Guwahati
Indian Institute of Technology Guwahati (IITG)
(Guwahati, India)

The Indian sub-continent is recognized for the occurrence of many natural disasters, predominantly devastating floods. The northeastern region of India, especially the state of Assam, is endowed with many natural water resources making the area highly flood prone. However, despite such recurrent adversity, very few studies have investigated subjective well-being of such population. An integrated model of subjective well-being (SWB) is proposed and tested by combining the subjective wellbeing homeostasis theory and the theory of conservation of resources. Indicators derived for the integrated model include both subjective as well as objective variables contributing to the SWB. The sample consists of 306 randomly selected participants from the two severely flood affected areas of Assam (India)-Majuli Island and Dhemaji District using a cross-sectional survey study design. The structural equation modeling was used to test two hypothesized integrated models (a direct and a meditational path model). The results indicated that the SWB homeostasis is maintained within the normative range of 60-70 points on a 0-100 point scale continuum. The analysis of the direct path model showed that education, safe shelter, personality traits (extraversion, neuroticism, agreeableness and openness), object and condition resources, psychological buffers (optimism and perceived control) and negative affect significantly predicted SWB. The meditational path model indicated that optimism is a significant mediator variable between predictors (personality dimensions of agreeableness, conscientiousness, and neuroticism; positive affect, object and condition resources) and outcome variable (SWB). This study validates the role of various factors included in the SWB homeostasis model and further extends the model by including other significant factors proposed by COR theory such as different types of resources and environmental stressors. The testing of the integrated model provided insights into the dynamics of the SWB Homeostasis in terms of identifying the crucial factors responsible for the maintenance of SWB in the context of the present sample. These internal buffers may be addressed in psychosocial intervention programs for the vulnerable population who are at risk of homeostatic breakdown.
LET ME GUESS WHO YOU ARE: THE EFFECT OF EMPLOYMENT STATUS ON IMPRESSION FORMATION AMONG GREEK COLLEGE STUDENTS

Anna Moutsio
Chrysanthi Nega
Ioanna-Sofia Spentza
The American College of Greece-Deree (Athens, Greece)

Empirical research uncovering the underlying processes and constituents of impression formation has dominated the field of social psychology, with recent studies focusing on how employment status may affect it (Orgambidez et al., 2011). However, insofar, no studies have been conducted with a Greek sample. The aim of the present study was to investigate the effects of employment status on impression formation. It was expected that individuals presented as employed would be more positively perceived compared to their unemployed counterparts. Additionally, stereotypical thinking was expected to act as a covariate for the above causal relationship. In a Greek sample, 121 college students were presented with a list of traits describing a hypothetical individual, either employed or unemployed and were asked to provide a brief written description. Continuing, participants reported their impressions through a 16-adjective Likert scale, encompassing either positive or negative adjectives. Lastly, all participants completed the Implicit Person Theory Measure, a scale measuring stereotypical thinking tendencies. A 2x2 ANCOVA analysis, controlling for the covariate of stereotypical thinking — which was not related to impression formation (p=.147) — indicated that participants formed significantly more positive impressions for the employed, rather than the unemployed individual. Both main effects of employment status (p=.033) and type of adjective (p<.001) was significant, as well as their interaction effect (p<.001). These significant findings add to the existing literature that employment affects impression formation and provide the underpinnings for future research on Greek populations. Results are theoretically explained through Asch’s (1946) basic principles on impression formation and the centrality of employment in one’s identity, as well as the modern society.
FUNCTIONAL ORGANIZATION OF THE CEREBRAL CORTEX IN STAND-UP COMEDIANS WHILE SOLVING HUMOROUS CREATIVE TASKS

Liudmila Dikaya
Igor Dikiy
Southern Federal University (Rostov-on-Don, Russia)

The brain correlates of creativity studies have been developing intensively in the last decades. To aid in the search of the creativity’s brain correlates one could study other complex forms of psychic activity, alike the creative one. Such a form of psychic activity, akin to creativity in its psychological mechanisms, could be humour generation. The aim of the research was to study of functional organization of the cerebral cortex in stand-up comedians while solving humorous creative tasks. The subjects were 78 stand-up comedians; the mean age being 23, with 38 men and 40 women. The methods of psychological testing and electroencephalography (EEG) were used. Statistical processing of data was done using the PC software bundle STATISTICA 13.0. Performed were the comparative analysis using the Student’s t-test and the post hoc analysis. After the Torrence creativity test, the subjects were divided into two groups: those with the high level of creativity (32 people) and those with the average level of creativity (46 people). The EEG registration was performed using 64 scalp electrodes using the multichannel electroencephalograph «Neirovizor-136» («MKS», Russia). In solving the functional tests, the subjects performed the verbal (think of a humorous ending to a famous poem) and non-verbal (looking at the droodles and answer the question, «What could be shown on that picture?») creative tasks. It was proposed to find an original and humorous solution at the same time. They had to decide whether his/her decision was insight-based or not as well. To analyse, five-second artefact-less EEG segments were chosen; in each of them the coefficient of coherence values of each subject were averaged in theta, alpha, beta and gamma frequency bands. We revealed: EEG coherent connections in the right hemisphere prefrontal cortex areas and interhemispherical connection in the occipital cortex areas of both hemispheres are stressed in the insight-based method (both original and humorous solutions). Based on that we can conclude the similarity of these EEG correlates of creativity and humour. The differences between these EEG correlates show in that the specific areas for the insight-based humour generation were the right hemisphere occipital areas.
In the field of couple and family psychology, the Dyadic Adjustment Scale of Spanier (1976) is “a viable force” for the measurement of relationship quality. Considering the discrepancies across studies regarding the structure of the DAS, the principal objective of this study is to describe the factor analysis and validity of the DAS among married intellectual Vietnamese adults living in Hanoi. The first steps of the study were the translation (from English to Vietnamese and vice versa) and the investigation of the semantic validity. After these steps, a total of 301 married intellectual Vietnamese participated in the study. Exploratory factor analysis yielded three factors with 23 items accounting for 44.42% item variance named cohesion, consensus and satisfaction. The affective expression factor meanwhile has not been reproduced on the current sample. However, two of the four items (4 and 6) of this factor are dispersed in the consensus factor. For models with three latent correlated factors, confirmatory factor analysis by AMOS (version 22.0) indicated an acceptable statistical fit ($\chi^2=523.54$, df=224, $p<.001$, GFI=.86, AGFI=.83, TLI=.83, CFI=.85, RMSEA=.07 (90%CI=.059, .074). The value of the internal consistency was good for the whole scale ($\alpha=.87$), the marital consensus subscale ($\alpha=.86$) and acceptable for the subscales referring to the satisfaction and cohesion ($\alpha=.69$ and .76 respectively). The Spearman-Brown split-half reliability (=.68) was within acceptable range. The value of the correlation between the version of even-numbered and odd-numbered items was great ($r=.81$, $p<.001$). The final scale solution was considered satisfactory for the application on the intellectual Vietnamese sample. Nevertheless, using this scale among other population must be well put into serious consideration.
FOLLOW UP OF LONG-TERM KNOWLEDGE RETENTION OF CHILDREN EXPOSED TO SCHOOL — BASED PREVENTION PROGRAM AGAINST CHILD SEXUAL ABUSE

Fotini-Sonia Apergi
Evangelia Paikopoulou
Chrysanthi Nega
Eva-Manolia Syngelaki
The American College of Greece-Deree (Athens, Greece)

Child sexual abuse (CSA) is a recognized public health concern worldwide that has attracted the attention of professionals due to its long-term negative consequences on the physical and psychosocial wellbeing of children. In Greece, preventive efforts are scarce even though one out of five children become victims of sexual abuse before the age of 18 years. The objective of this study was to assess the long-term effects for elementary school children (6-9 y.), one year after participating in a 50-minute, school-based sexual abuse prevention intervention program. The sample consisted of one hundred and sixty-one (81 girls) elementary school-aged children from three grade levels: second (N= 55), third (N= 53), and fourth (N= 53). Knowledge retention was assessed via the Greek version of the Children’s Knowledge of Abuse Questionnaire R-III (Gangos, Nega, & Apergi, 2018), administered in three time intervals of pre-intervention, post-intervention, and follow-up, one year later. A 3x3 mixed Analysis of Variance was conducted with time of testing (pre, post, follow-up) as the within-subjects variable and, grade (2nd, 3rd, 4th) as the between-subjects. There was a significant increase of children’s knowledge on CSA concepts in the follow-up compared to pre-intervention knowledge levels (p<.001). In terms of grade, results showed that third graders obtained higher scores compared to both first and second graders (p<.001). These findings confirm the long-term effectiveness of a school-based 50-min CSA intervention program delivered to children up to third grade. Conclusion or some discussion on implications of the results. This study can be considered a valuable input concerning the gap in the literature of long-term effectiveness of school-based CSA prevention intervention methods. The effectiveness of the current prevention program has been reaffirmed both in terms of time and of the age of the children exposed to such interventions. Implications include the need for additional research demonstrating long-term retention of knowledge and skills as well as developing evaluation measures that focus on behavioral intentions.
ETHNO-NATIONAL ATTITUDES AS PREDICTORS OF INTERCULTURAL COMPETENCE IN RUSSIAN UNIVERSITY STUDENTS

Irina Novikova
Marina Gridunova
Alexey Novikov
Dmitriy Shlyakhta
Peoples’ Friendship University of Russia (Moscow, Russia)

The development of intercultural competence (ICC) is one of the most important theoretical, applied, and practical psychological problems in the changing and globalizing world. The Developmental Model of Intercultural Sensitivity (DMIS) by M.J. Bennett is one of the most applied ICC models in modern psychology. DMIS proposes to consider the ICC as a process of changing of “the orientations toward cultural difference”: from ethnocentrism to ethnorelativism. Russian psychologists O.E. Khukhlaev and M.Y. Chibisova developed a Russian-language technique “Intercultural Competence Scale” for ICC diagnostics based on the DMIS, that includes 4 subscales: Minimization, Absolutization, Ambivalence, Acceptance. Minimization and Absolutization correspond to ethnocentric orientations according to the DMIS. Ambivalence is a transitional orientation from ethnocentrism to ethnorelativism. Acceptance corresponds to ethnorelative orientations according to the DMIS. We suppose that one of the ICC predictors is the ethno-national attitudes, which O.E. Khukhlaev et al. are considering as an individual’s predisposition to assess of the ethnicity. The purpose of present research is to show that the ethno-national attitudes can determine the severity of ICC scales in Russian university students. The sample includes 219 (75% — female) first–third year university students. ICC was measured with the author’s modification of “Intercultural Competence Scale” by O.E. Khukhlaev & M.Y. Chibisova, which successfully passed a psychometric testing. Ethno-national attitudes (nationalist, patriotic, neutral, negativist) were determined with the “Scale of ethno-national attitudes” by O.E. Khukhlaev, I.M. Kuznetsov, and N.V. Tkachenko. The descriptive statistics methods, coefficients Cronbach’ α and McDonald’s ω, Spearmen’ correlation analysis, and the multiple regression analysis was used for statistical analysis in the R software environment, version 3.3.2. Findings of our research showed that nationalist ethno-national attitudes are the strongest predictor of studied ICC scales, i.e. its have a negative impact on Acceptance and Minimization, but positive impact on Absolutization. Patriotic ethno-national attitudes have positive impact on Acceptance and Ambivalence, but negative impact on Minimization. Neutral and negativist ethno-national attitudes have less impact on ICC scales, which is mediated by gender and professional orientation of students. Thus the obtained data showed that ethno-national attitudes, especially nationalist, are significant predictors of ICC and should be taken into account while ICC development.
ORGANIZATIONAL CULTURE AND PROACTIVE BEHAVIOR: ON THE EXAMPLE OF EDUCATIONAL ORGANIZATION

Olga Abramova
Alexander Tatarko
National Research University Higher School of Economics (Moscow, Russia)

Proactive behavior in recent years has received a new wave of close attention in research and is regarded as an important component of a successful life strategy in an organization. Students’ proactivity is a predictor of their success in the future, therefore conditions in educational institutions that increase their proactivity is an important task of education. In our study, using different faculties of Higher School of Economics, we looked at two types of organizational climate: bureaucratic and innovative, determined through which mediators organizational climate affects perceived proactive personal behavior and proactive behavior at the group level. The study involved 191 HSE students. Data was collected online. We assumed that important mediators of the relationship between organizational climate and students’ proactivity are perceived autonomy, trust in the organization, satisfaction with university studies, and innovation self-efficacy. The analysis of the proposed 4 mediation model confirmed the hypotheses about the positive mediation connection between the innovative climate and perceived proactivity at the individual and group level through organizational trust and innovation self-efficacy and the positive mediation connection between the innovative climate and perceived proactivity at the individual level through satisfaction. Nevertheless, the negative mediation connection between the bureaucratic organizational climate and the proactivity of students through the same mediators was not significant. Innovative and Bureaucratic Organizational climate showed direct effect on Autonomy: positive — for Innovative climate and negative — for Bureaucratic climate. Thus, this study added an understanding of what tools needed to stimulate the most effective behavior of students for their further success – proactive behavior. Creating an innovative organization climate with, high levels of trust, job satisfaction, innovation self-efficacy leads students to choose a proactive pattern of behavior in learning activities.
POSTTRAUMATIC GROWTH AMONG SUICIDE SURVIVORS AND WHOSE LOVED ONE ATTEMPTED SUICIDE

Tolga Köskün
Aydın Adnan Menderes University (Aydin, Turkey)

Mehmet Eskin
Koç University (Istanbul, Turkey)

Suicide is a serious public health problem. Approximately 800,000 people die by suicide annually and even more people attempt suicide. Every suicide affects 6-24 people. Although there are many studies focused on negative psychological effects of suicide on suicide survivors (Brent et al., 1996) there are few studies examining the positive effects (Levi-Belz, 2015). The current study aims to examine the roles of core beliefs, event-related ruminations, religious coping styles, attitudes towards suicide and cultural orientations in post-traumatic growth (PTG) among suicide survivors and whose loved ones attempted suicide. 348 university students whose a loved one attempted or completed suicide participated in the study. The sample consisted of 204 women and 144 men aged between 18-32. All participants completed post-traumatic growth inventory as well as instruments measuring posttraumatic stress disorder (PTSD) symptoms, core beliefs, event-related ruminations, religious coping styles, attitudes towards suicide, cultural orientations, suicide related variables (time elapsed since the suicide, suicide method, guilt) and demographic characteristics. In order to evaluate how well total score of PTG is predicted, stepwise multiple regression analysis was conducted. Furthermore, mediational analysis was applied to examine the effects of challenges to core beliefs and event-related ruminations on PTSD and PTG relationship. According to the results all variables explained 29% of the variance in posttraumatic growth \[F(7, 328) = 18.89, p< .001\]. In the final model, acceptability of suicide was negatively but positive religious coping, deliberate rumination and challenges to core beliefs were positively related to PTG. Event-related ruminations partly mediated both the relationship between challenges to core beliefs and PTG, as well as the relationship between challenges to core beliefs and PTSD. Consistent with the literature, positive religious coping, deliberate rumination and challenges to core beliefs predicted PTG. In addition, as a previously unconsidered variable, acceptability of suicide was negatively related to PTG. Considering cultural differences in attitudes toward suicide, studies employing cross-cultural designs may be useful for a better understanding of PTG in the context of suicide.
STIMULUS QUALITATIVE BISECTION AS A PROBLEM OF INNER PSYCHOPHYSICS

Ihor Lubashevsky
Ren Namae
University of Aizu (Aizu-Wakamatsu, Japan)

Within the classical bisection task subjects are asked to classify a trial stimulus with respect to its proximity to one of two given stimuli from the same perceptual continuum. It is widely accepted that this bisection is characterized by the geometric mean and a plausible explanation of the effect can be found, at least, in works by Luce, (e.g., Psychometrika, 1961, 26, 151). However a meta-analysis of classification data (Kopec, Brody, Brain and Cognition, 2014, 74, 262; Levy, et. al, Frontiers in Integrative Neuroscience, 2015, 9, 44) reports that the bisection point can exhibit more complex behavior depending on the ratio of referent stimuli and changes from the geometric mean to the arithmetic mean as this ratio increases. In the present work we propose a mathematical theory of stimulus bisection turning to the ideas of inner psychophysics based on Teghtsoonian’s hypotheses and uncertainty of human evaluation of stimulus intensity. Following Lubashevsky (Physics of Mind, Physics of Life Reviews, 2019, also arXiv:1806.11077) a physical stimulus is assumed to cause the emergence of its image in the mental space which is characterized by a certain magnitude representing the stimulus perceived intensity. On one hand, these images are caused by external stimuli and their magnitude bears the information about the intensity of the corresponding stimuli. On the other hand, the individual structure of such images as well as their persistence after emergence is determined only by the properties of mental space on its own. Finally, the mental operations of image comparison and their scaling are defined in a way allowing for the bounded capacity of working memory. Dealing with the introduced measure of the stimulus comparison we demonstrate that the bisection problem is characterized by the geometric mean when the ratio of referent stimulus amplitudes belongs to a certain finite interval. Its lower boundary is determined by Ekman’s law (Weber’s law for inner psychophysics). The upper boundary is determined by the stimulus incommensurability. Outside this interval the bisection is characterized by the arithmetic mean. The results are compared with experimental data.
DISCRIMINATION THRESHOLD AND HABITUATION IN NEWBORN INFANTS AND FOETUSES FOR NOCICEPTIVE AND AUDITORY COMPLEX STIMULI

Rosana Tristão
University of Brasilia (Brasilia, Brazil), Catholic University of Brasilia (Brasilia, Brazil)

Monica Lemos
Neonatology and Maternity Unit of the University Hospital de Brasilia (Brasilia, Brazil)

José Jesus
Ricardo Freire
University of Brasilia (Brasilia, Brazil)

One big challenge for the psychophysics area is to understand the early origin of complex stimuli perception as music and nociception. Music perception on foetuses has been described in habituation, categorical perception, sound preferences and recall tests. Nociception has been described in habituation tests in convenience studies of infants’ response to painful procedures. I’ll present two sets of data using habituation paradigm comparing complex information processing by foetuses, premature and term newborns by physiological and behavioural response. The first study investigated the temporal dimension of rhythm and source of music in foetuses of 41 pregnant women (mean 34.7±2.4 gestational weeks) evaluating: heart rate (HR) and movement and body organization observed during ultrasound exams in response to folkloric lullaby sung by: 1. adult male voice in slow pace (Adagio); 2. adult male voice at fast pace (Allegro); and 3. mothers’ voice in slow pace (Adagio). The second study investigated 13 dyads mothers-newborns, premature and term (38.2±2.2 gestational weeks), and their reaction to four repetitive nociceptive stimuli through COMFORT behavior pain scale, HR and including salivary cortisol levels testing maternal-infant stress effect. In the first study the dimensions movement and body organization were sensitive to the change between the first and last two stages indicating perception of sound source. "Movement" was sensitive when changed between the first and second stage. HR varied significantly between paces and decreased to baseline to maternal song. In the second study, the data revealed a varied pattern of behavioural response and 46.2% infants habituated to nociceptive stimulation, 38.5% showed sensitization and 7.2% didn’t change across trials. Cortisol and HR reaction to nociceptive stimuli decreased along trials, though maternal stress predicted infant baseline and shaped post heel lance cortisol and behavioural profile \( R=0.69, p=0.010 \). Foetuses showed discrimination to music paces and habituation to maternal voice. Prematures modulated their response to painful procedures in the first day of life, but it seems to suffer the effect of maternal stress level. We conclude that foetuses both in and out womb as at term infants were able to show behavioural and physiological habituation response to complex stimuli.
Students’ subjective well-being in school is accepted as an important goal for educational system. Subjective well-being is related with school adjustment (Huebner, Gilman, 2006) and lead to higher academic performance (Quinn, Duckworth, 2007). At the same time, learning motivation is recognized as one of the crucial non-cognitive factors related to students’ academic achievement (Pintrich, De Groot, 2003). In this study we ask the question about relationships between students’ subjective well-being in school and learning motivation. Subjective well-being is defined as satisfaction with school positive and negative affect toward school, relationships with classmates, and learning motivation is defined within the framework of self-determination theory (SDT; Ryan, Deci, 2000). The sample consisted of 1247 students of 3rd grade balanced by gender with age range from 9 to 10. The Survey of well-being was based on previously existed instruments: Russian version of Brief Adolescents’ Subjective Well-Being in School Scale (Tian, Wang, Huebner, 2015), Russian version of Classmates’ Friendship Relationships Questionnaire (Turilova-Miščenko, Raščevska, 2008). The analysis of internal structure of the instrument was done within the framework of Multidimensional Item Response Theory (MIRT; Reckase, 2009) and it allows us to form general Subjective well-being index. Motivation toward reading and math was measured by Russian version of Elementary School Motivation Scale (ESMS-R) (Guay, Chanal, Ratelle, Marsh, Larose, Boivin, 2010). Two scales both for reading and math were used for the analysis: intrinsic motivation and external regulation (extrinsic motivation). All instruments were translated in Russian according adaptation standards and have appropriate psychometric properties. Multiple regression analysis was used to test if subjective well-being significantly predicted reading and math intrinsic and extrinsic motivation. Gender was used as control variable as almost all variables showed gender differences. The results of the regression indicated that subjective well-being explain 16% of reading and 14% of math intrinsic motivation (R²=.16, F(2, 1238) = 114.504, p = .000 and R²=.14, F(2, 1238) = 99.298, p = .000), and 1% of reading and 2% of math extrinsic motivation.
IS VIDEO GAMING RELATED TO BODY MASS? A META-ANALYSIS

Caroline Marker
Markus Appel
University of Würzburg (Würzburg, Germany)

Timo Gnambah
Leibniz Institute for Educational Trajectories (Bamberg, Germany)

Non-active video gaming has been discussed to be positively associated with body mass and overweight. However, empirical findings have been mixed. This indicated a need for estimating the average effect size of the relationship between body mass and video gaming. We identified 753 potentially relevant studies through different search strategies including databases (e.g., PsychINFO) and grey literature. An eligible study had to contain (a) a measure of body mass (i.e., body mass index, body fat percentage), (b) a measure of video game use (e.g., frequency of video gaming), (c) data on their zero-order relationship, and (d) the sample size. The effect sizes were pooled using a random effects model with a restricted maximum likelihood estimator (Viechtbauer, 2005). Analyses of study heterogeneity, possible moderators, and publication bias were conducted. Additionally, we tested the displacement effect of physical activity by video gaming time with the help of a meta-analytic structural equation model (MASEM; Cheung & Hong, 2017). Across k = 24 samples and 32 effect sizes (total N = 38,097), the mean effect (corrected for sampling error) of the relationship between video gaming and body mass was $r = .09$, 95%CI [.03, .14]. Hence, higher video gaming was positively associated with higher body mass. This relationship was significant, but there remained significant total heterogeneity, $Q(31) = 593.03$, $p < .001$, $I^2 = 95.13$. In the sensitivity analyses, we found a significant moderation for the age groups. Compared to adults, children and adolescents showed a significantly lower relationship between video gaming and body mass. The respective indirect effect (displacement of physical activity by video gaming) was significant, $B = .01$, 95%CI [.00, .02]; it explained 7% of the total effect of video gaming on body mass. This result should be interpreted with caution because of the small sample of primary studies. Our meta-analysis identified a small significant correlation between video gaming and body mass that was qualified by participants’ age. In summary, sedentary video gaming is only weakly associated with overweight and obesity, physical activity might play a mediating role, and the effects are strongest for adults.
The aim of the study was to explore the differences in the occurrence and evaluations of life events that antecede extreme alterations in flourishing in one-year time. Study was conducted as a part of the Croatian longitudinal well-being study funded by Croatian Science Foundation. Studied variables were flourishing assessed at two time points (1-year interval) as a measure of well-being, life events experienced between the two time points, evaluations of positivity and negativity of experienced events and demographic variables. Out of total N=2465 who completed both initial survey (2016=T1) and the 1st follow up (2017=T2) we selected two extreme groups of participants with biggest change in flourishing from T1 to T2. Group 1 consisted of 5.6% of participants with biggest drop in flourishing (N= 138, flourishing change: M= -13.79, SD=4.39), while Group 2 consisted of 5% of participants with biggest improvement in flourishing (N= 123, flourishing change: M=12.76, SD=4.15). At time 1, Group 1 showed significantly higher levels of flourishing compared to Group 2 (t(246)= 13.74, p=.00). At T2 Group 2 showed higher results at flourishing compared to group 1 (ΔM= -14.83, t(246)=16.78, p=.00). In both groups majority of participants were women, with at least high school diploma, half of them where married. Participants in Group 1 more often had kids (χ²(2)=10.3, p=.00) and were on average 5.6 years older (t(246)=3.5, p=.00). Regarding experienced life events, Group 1 experienced on average 6.67 of all events, compared to Group 2 with 8.54 events on average. If top 10 events are taken into consideration, group 1 experienced six positive events, two negative events and two ambivalent. Group 2 experienced eight positive events and two ambivalent. Additionally, two groups did not differ in average positivity of experienced events (F(1)=0.45, p>.05) or average negativity (F(1)=0.34, p>.05), but group 1 rated positive events more negative (F(1)=7.11, p<.05) compared to group 2. Results are discussed in the framework of broaden-and-build theory.
«PERSONAL OCCURRENCE» AS AN INTEGRATIVE PSYCHOTHERAPY TARGET: EMPIRICAL RESEARCH OF EFFECTIVENESS

Yulia Ogarkova (Dubinskaya)
Higher School for Interdisciplinary Personality Investigation and Development (Moscow, Russia)

“Personal experience/occurrence” was widely analyzed in a philosophical, cultural, spiritual, and finally, psychological, psychotherapeutic aspect. Being an integral psychological characteristic, it presents a «time slice», current diagnostic personality portrait in a whole variety of its manifestations.

Here we’ll consider not what is called «experience», but what is called «occurrence» — a short-time period during which a significant event occurs.

The current research was developed in collaboration with the Co-Brain Laboratory (Skolkovo Institute of Technology) and an experimental-instrumental complex for studying the visual and auditory human perception (IPRAS).

The aim was to study the psychometric and encephalographic correlates of the psychotherapeutic process based on the personal occurrence therapy by the modern integrative modality “DMO-approach” (in DMO the personal occurrence is postulated as a target of therapy; DMO — differential (varied and scaled) modification of occurrence).

The experiment consisted of psychotherapeutic minisessions with participants using four types of psychotherapeutic interventions. In total, 110 mini-sessions were conducted, 22 sets of measurements of the control group (changes in psychophysical and psychometric characteristics without the therapeutic interaction) were done.

The following apparatus and psychometric techniques were used: encephalography; SAN-technique (V.Doskin); personal anxiety manifestation scale (J.Taylor, V.Norakidze); emotional state self-assessment (A.Wessman, D.Riks); «Existence scale» questionnaire (A.Lengle, K.Orgler); subjective scaling technique.

Control measurements were conducted before/after each mini-session. Observations and primary data allow to summarize as preliminary the following results and trends: EEG- and psychometrical correlates of 4 various therapeutic interventions by the autobiographical subjective occurrence reconsolidation were observed; a statistically significant increase of emotional elevation, self-confidence, vigor was detected during the therapy, especially during the stage of direct intervention to the autobiographical subjective occurrence; the delta rhythm power increase in the frontal and midline electrodes, associated with recalling information from autobiographical memory, was observed; significant differences in EEG accompanying with no response in psychometrics were observed in the analytical stage, that could be the partial interpretation for the depreciation phenomena in analytical psychotherapy.
THE ROLE OF VULNERABLE NARCISSISM IN THE PREDICTION OF DAILY DYSFUNCTIONING AMONG INSTAGRAM USERS

Yusuf Coşku İnceler
Deniz Köroğlu
Merve Topcu
Çankaya University (Ankara, Turkey)

Instagram is a very popular social media application. Narcissism was found to be related with Instagram use. However, most of the findings are upon the relationship between grandiose narcissism (GN) and Instagram use. Limited research about Instagram use has focused on the role of vulnerable type of narcissism. Vulnerable narcissism (VN) manifest itself with higher levels of anxiety, overreacting to criticism and failure, presence of inadequacy and emptiness feelings, and socially avoidant behaviors (Casale, Fioravanti, & Rugai, 2016). It was thought that vulnerable narcissism may be related to negative effects of Instagram use on individuals’ daily functioning. The predictive role of vulnerable narcissism on individuals’ reporting decrease in daily functioning was examined. Participants who have Instagram account enrolled in the study. A cross-sectional online survey prepared. Data gathering process is enduring. Informed consent, socio-demographic form (SDF) and the Hypersensitive Narcissism Scale were given to the university students whose ages are changing between 16 and 30. In SDF, the participants asked detailed questions about their Instagram use (e.g., average time spent on Instagram, age-onset, etc.) and whether their functionality in daily life is influenced by their Instagram use or not. Frequency analyses and Logistic regression analysis have been applied. 788 participants included in the study. Participants were divided into two groups according to whether they report that Instagram use decrease their daily functioning (Gr1, n = 246) or not (Gr2, n = 542). Logistic regression analysis results revealed that vulnerable narcissism predicted the decreased daily functioning group significantly (Wald Z = 24.5, Exp(B) = 2.001, p <.05). One unit increase in vulnerable narcissism increases 58% likelihood of being in Gr1. It can be concluded that although the relationship among vulnerable narcissism and frequency of or time spent on Instagram have not been well-established like among grandiose narcissism, these results revealed that those with vulnerable narcissistic patterns may be affected more negatively than grandiose narcissism. Since Instagram reinforces the ideal, feelings of failure and inadequacy may lead higher anxiety. These feelings may yield avoidant behaviors in social media. Therefore, decreased frequency of use or time spent on Instagram can be a manifestation of social avoidance.

Key words: Vulnerable narcissism, daily functioning, Instagram
We are now almost 20 years into the genomic era. In this time, significant progress has been made in genomic science. For example, genetic markers have been identified for a number of traits, including criminality, intelligence, health, and psychological disorders. Genetic data pools are large, with some countries having genetic data of virtually the entire population. International data sharing is a key strategic priority, both for scientific and economic development. However, these advancements also pose threats to individuals' fundamental rights, such as right to privacy or non-discrimination. These threats are particularly serious due to the scale of data breaches. For example, over 1.3 billion data breaches have been reported in 2016 alone. Direct to consumer testing and genomic medicine are now a reality, with increasing number of people using these services. Despite the growing use of genetic information, to date, few concrete steps have been taken to address possible misuses of genetic information, with very few countries having passed first specific laws regulating use of genetic information. This is a particularly serious situation, as the level of general knowledge of genetics is very low, including for the key professionals such as doctors, lawyers and psychologists. This talk reports the results of an international investigation that used the International Genetics Literacy and Attitudes Survey (iGLAS) to collect data from a large sample of the general public and key professionals (N>7,000). In particular, we were interested in responses of lawyers, as compared to other professional groups. The results show that genetic knowledge is low even among the well-educated; and also suggest that all groups have a wide variability of attitudes and beliefs in relation to genetic data. The results highlight the need for greater efforts to disseminate genetics knowledge. It is possible, that increased knowledge will lead to reduced polarisation in opinions and help develop appropriate regulation for genetic information.
THE RELATIONSHIP BETWEEN VULNERABLE NARCISSISM & SELF DISCLOSURE AMONG DYSFUNCTIONAL INSTAGRAM USERS

Deniz Köroğlu  
Yusuf Coşku Inceler  
Merve Topcu 
Çankaya University (Ankara, Turkey)

Social media has substantial impact on individuals’ lifestyles. Sharing something about us has become an ordinary ritual of the daily life. Self-disclosure can be defined as a tendency to giving information about themselves. Self-disclosure comprises of the amount, honesty-accuracy, consciously intent, positive-negative nature, and control of general depth or intimacy of disclosure (Wheeless & Grotz, 1977). Previously found that vulnerable narcissistic patterns affect the self-disclosure (Christofides, Muise, & Desmarais, 2009). Vulnerable narcissism (VN) is found to be associated with socially avoidant behaviors, sensitivity to failure and being criticized, the presence of high levels of anxiety, and feelings of emptiness and inadequacy. However, research focusing on the association between self-disclosure and vulnerable narcissistic patterns in the context of Instagram is limited (Casale, Fioravanti, & Rugai, 2016). In this paper the relationship between VN and self-disclosure among dysfunctional Instagram users was examined. A cross-sectional online survey was prepared. 246 Instagram users who are university students age ranged between 16 to 30 years (M = 21.39, SD = 1.790), and reported a decrease in daily functioning in their life due to Instagram use included in the study. 22% (n = 54) of these participants are male, 78% (n = 192) of them are female. Informed consent, socio-demographic form, the Hypersensitive Narcissism Scale and Self-Disclosure Scale were given to the participants. Correlational analysis revealed that VN is significantly and negatively correlated with intent (r = -.15, p < .05) and honesty-accuracy (r = -.28, p < .01) dimension of the self-disclosure. Also, VN is significantly and positively associated with positive-negative nature (r = .20, p < .01) and control of general depth or intimacy (r = .39, p < .01) dimension. For regression analysis, significantly correlational dimensions, namely, intent, honesty-accuracy, positive-negative nature, and control of general depth or intimacy, of Self-disclosure were entered into the analysis. Results revealed that the model was significant in the prediction of VN (F(4,241) = 16.205, p < .001). Control of general depth or intimacy (t = 5.122, p < .01, 95% CI[-.10, -.22]), honesty-accuracy (t = -3.521, p < .01, 95% CI[-.20, -.06]), and positive-negative nature (t = 2.353, p < .05, 95% CI[.01, .15]) dimensions of Self-disclosure. R2 determined that significant dimensions could explain the variance of VN with the proportion of 21%. Moreover, unique contribution of the control of general depth or intimacy, honesty-accuracy and positive-negative nature accounting for predicting VN were 9%, 4%, and 2% respectively. That is, vulnerable narcissistic patterns may influence the control behavior of individuals. Furthermore, these patterns may influence positive-negative self-presentation, intents, and honesty socially of individuals. VN is a type of narcissism which includes high anxiety levels, social avoidant behaviors, inadequacy & emptiness feelings, and intolerance to criticism and failure. Since Instagram reinforces the ideal, as the vulnerable narcissistic patterns increase, individuals may feel more failure, emptiness and inadequacy resulting higher anxiety. These may lead being less honest with themselves, less intention to disclose, and more control behavior. It can be said that vulnerable narcissistic patterns may lead individuals to behave, act and think in a socially desirable way in which they tend to withdraw honesty, decreases intent of self-disclosure, and presenting themselves in a positive or negative manner with exercise control.
WEIGHT PERCEPTIONS AND THEIR IMPACT ON THE RELATIONSHIP BETWEEN WEIGHT AND HEALTH

David Dias Neto  
ISCTE – Lisbon University Institute (Lisbon, Portugal), Ordem dos Psicólogos Portugueses (Lisbon, Portugal)

Telmo Mourinho Baptista  
Ana Sousa Ferreira  
University of Lisbon (Lisbon, Portugal)

Catarina Marques  
ISCTE – Lisbon University Institute (Lisbon, Portugal)

The present study analyzes the mediating role of weight distortion and weight self-criticism in the relationship between actual weight and perceived health, well-being, body satisfaction and emotional eating. 806 individuals were selected from a Portuguese national study on nutrition. They were divided into two groups according to self-reported dieting. A multiple mediation model was estimated using Structural Equation Modeling (SEM). A valid model was obtained in which weight self-criticism is a partial mediator of the relationship between weight and body satisfaction and a full mediator of the relationship between weight and emotional eating for the non-dieter group. For the dieter group, full mediation of weight self-criticism is observed in the relationships between weight and health, well-being and body satisfaction. For weight distortion, no mediation effect is found in either group. The results highlight the importance of weight perceptions in understanding the influence of body weight on several aspects of health and well-being. The type of weight perception is also relevant. A critical attitude towards weight is more determinant than the distortion in weight appraisal.
THE COMMAND “DELETE” REALLY MATTERS DESPITE THE INTENTION TO REMEMBER: ON THE FURTHER DEVELOPMENT OF THE “GOOGLE-EFFECT”

Gleb Laskov
Alexey Bukinich
Veronika Nourkova
Lomonosov Moscow State University (Moscow, Russia)

The mnemonic “Google-effect” consists of a tendency to forget information after the command “save” is assigned to a computer (Sparrow, Liu, Wegner, 2011). Although this phenomenon is well-documented, there is still much to learn about, especially in the context of the discussion about the impact of digital technologies on higher cognitive functions. The present study explores whether the “Google-effect” would remain if the participant has an explicit mnemonic goal to remember the material. In other words, we studied how the interaction between computer operations and the participant’s goals affects the recall of the material. We employed within-subject design with two independent variables: “mnemonic goal” (remember; do not remember; no clear goal as a control condition) and “operation” (save; delete; skip as a control condition); and one dependent variable (the delayed choice of a stimulus). Seventy student volunteers (10 males) took part in the computer game requiring identifying themselves with a private detective. At Session 1 the participants were exposed by a set of photographs representing possible offenders, criminal instruments, and pieces of evidence. Each photograph was accompanied by a combination of a mnemonic goal and a computer command, e.g. “remember + save”. A week later, at Session 2 the participants were instructed to choose one out of four given stimuli (previously exposed + a distractor) relying upon their intuitive feeling of the wrong and right answers. According to the generalized linear model based on the absolute number of stimuli choice per participant, the significant effect of “operation” (Zw = 15.208, p < 0.001) may be revealed. There is no significant effect neither for “goal” (Zw = 1.127, p = 0.569) nor for “operation”-“goal” interaction (Zw = 8.54, p = 0.074). There is a significant difference between “save” and “delete” values of “operation” variable (Zw = 11.993, p = 0.001, B = 0.811). Taken together, the data show that the participants remember stimuli followed by “delete” operation significantly better regardless the goal, which was performed. Thus, contrary to our predictions, the “Google-effect” appears to have a universal influence on the level of recognition despite to the goal to remember.
DETERMINERS OF LABOR BEHAVIOR: LABOR OBJECT VS CULTURE MINDSET, S. RUBINSTEIN VS G. HOFSTEDE

Irina Vasileva
Institute of Psychology RAS (Moscow, Russia)

Comparison of object and cultural determiners of labor behavior is the main investigation purpose. Object as a behavior determiner was first considered by S. Rubinstein (1922). He found that subject’s mentality is entirely conditioned by its interaction with the object. Another important factor which causes the performers’ mindset is cultural attitudes (G. Hofstede, 1984). The main four of them are power distance (PDI), uncertainty avoidance (UAI), individualism (IDV), masculinity (MAS). The national cultural dimensions scores differ sufficiently. For example, the ratios of Russian/US scores are 36/62 (MAS), 39/91 (IDV), 93/40 (PDI) (Latova & Latov, 2007). All indicators differ by about two times. The scores are significantly connected with important labor behavior characteristics. The high masculinity suggests a proneness to conflict. The higher individualism is closely related to lower propensity to work assistance. The more power distance figure is a predictor of greater personal alienation in relations with the supervisor as well as the less readiness to interact with him/her and less satisfaction of their interrelations etc. G. Zhuravlyov and colleagues have conducted a survey of operational personnel on ergonomic questionnaire in boiler-and-turbine workshops of Russian and US power plants (Zhuravlyov et al., 1992). Some of results of this survey concerning conflict behavior, work assistance and relation to supervisors were highlighted and reviewed from comparing perspective noted before. Given that the cultural dimension scores mentioned above sharply differ, we should expect different responses from Russian and American respondents. However, they were similar, if not identical despite significant differences in their mentality. We explain this contradiction by specific connections of team shift members with labor tools. All units of workshop equipment are operating as a single machine. This is specific feature of power equipment. It is a common labor tool connecting all member of team shift and making them interdependent on each other. This condition imposes specific rules on them. Work assistance, compromise strategy, clear personal relations and so on are obligatory framework to get final output. Both Russian and American operatives clear understand these terms and perform similarly despite their cultural differences. Labor object seems to be the most important determiner of labor behavior.
SOCIAL AND PSYCHOLOGICAL FACTORS DETERMINING YOUTH’S ATTITUDES TO CRYPTOCURRENCY

Timofey Nestik
Tatiana Drobysheva
Maria Gagarina
Institute of Psychology RAS (Moscow, Russia)

The relevance of the study is explained by the fact that socio-psychological determinants of attitudes toward cryptocurrencies are not revealed. The objectives of the study were to verify “Attitudes toward cryptocurrencies questionnaire” and identify factors of attitudes toward Bitcoin. Bitcoin was chosen because of relative reliability and predictability compared to other cryptocurrencies (Ammous, 2018). Sample: 262 participants; aged 17 to 33; males 45%. The choice of respondents was based on research by Bohr et al., (2014). Methods: associations, “Value Scale”, “The Moral Foundations Questionnaire” by J. Haidt; Money Beliefs and Behaviors Scale by A. Furnham; The Baseline Confidence Scale of L. Haff and L. Kelly. Confirmatory factor analysis proved three-factor structure of the questionnaire. A nuclear-peripheral structure of social representations about Bitcoin was formed on the basis of P. Vergès analysis of associations. A linear regression analysis showed that beliefs in the potential of cryptocurrency as a payment instrument (R = 0.611; R² = 0.373; F = 21.629 with p <0.001) are directly related to people-centered care, value of freedom and inversely related to sanctity; associated positively with confidence in the financial system and negatively in the government. Age and gender are also matter. Worries about the introduction of cryptocurrency are directly related to (R = 0.567; R² = 0.321; F = 14.972 with p <0.001) a negative attitude to money, the value of self-confidence, age, confidence in financial system and government and inversely related to trust in people and money anxiety. Willingness to use cryptocurrency in perspective directly depends on (R = 0.507; R² = 0.257; F = 17.676 with p <0.001) trust in money power, orientation towards independence in actions, age, gender and is inversely depends on trust in the government. The data states that the intention to use cryptocurrency is directly related to the desire for financial autonomy and distrust to social institutions.
NEEDS FOR HELP AS PREDICTOR OF DISORDERED EATING AMONG UNIVERSITY STUDENTS

Sanna Sinikallio  
University of Eastern Finland (Kuopio, Finland)

Kirsi Honkalampi  
Niko Flink  
University of Eastern Finland (Joensuu, Finland)

Noora Seilo  
Kristina Kunttu  
Finnish Student Health Service (Helsinki, Finland)

Eating disorders (EDs) are severe psychiatric conditions manifesting in extreme eating behaviors, negative affectivity and body dissatisfaction. EDs typically develop during adolescence and young adulthood afflicting mostly females. Subclinical symptoms of EDs are known to be associated with elevated risk for developing full-blown ED and various health risks. Students reporting symptoms of EDs remain often undetected in regular health examination. A duration of 10–15 years between the onset of symptoms and seeking help has been found. This study aimed to examine the students’ perceived needs for help and their significance with respect to having risky ED symptoms. The data were derived from a nationwide health survey conducted among Finnish university students in 2016 with self-administered questionnaire. There were 3028 respondents in this study, 65% were female. The mean age of the respondents was 25 years. SCOFF questionnaire was used for detecting risk for EDs, General Health Questionnaire (GHQ) was used to screen psychiatric symptoms. The perceived need for help in various life areas (e.g. coping with stress, mood, self-confidence etc) was inquired. Comparisons between low and high risk ED groups were performed with t-tests and $\chi^2$ -tests. Categories of needs for help were studied as predictors of ED symptoms using logistic regression analysis. A total of 313 students (10.1%) scored positive on SCOFF screening. Students in high risk ED group showed more (p=0.000) psychiatric symptoms than those in the low risk group. Among low ED risk group the most frequent needs for help were coping with stress (24.6%), self-confidence (13.6%) and mood (13.6%) whereas in the high risk group the most frequent needs for help were in coping with stress (38.7%), weight control (35.5%) and self-confidence (33.9%). In logistic regression analyses need for help in self-confidence (B=1.992; CI=1.422-2.789; p=0.000), weight control (B=4.781, CI=3.513-6.507; p=0.000) and mood (B=1.532; CI=2.175; p<0.05) emerged as independent predictors of risk for ED. Students at risk for developing EDs have more minor psychiatric symptoms. Students’ needs for help in self-confidence, weight control and mood may indicate risk for developing ED symptoms.
THE LONGITUDINAL ASSOCIATES OF CYBERBULLYING AND CYBERVICTIMIZATION IN A TURKISH CYPRIOT ADOLESCENT SAMPLE

Fatih Bayraktar
Eastern Mediterranean University (Famagusta, Cyprus)

Cyberbullying is a new form of bullying which occur through using information and communication technologies (ICTs) (Slonje & Smith, 2008). When compared with traditional victimization, cyberbullying victimization (cybervictimization) had been found to be related with more psychosocial problems (Juvonen and Gross, 2008). Although the empirical studies on cyberbullying and cybervictimization started in early 2000s, it is still valuable to make research on this field because of enduring changes in ICTs. Also most of the research in cyberbullying-cybervictimization is cross-sectional and longitudinal studies are needed to examine the risk and protective factors. Therefore the main aim of our study was to find the individual level risk and protective factors of cyberbullying and cybervictimization in a two-wave longitudinal data (time interval: one year). Based on the gaps and inconsistent results of previous research (ex: Aboujaoude et al., 2015; Dooley et al., 2015) a series of individual level factors (i.e. face to face bullying/victimization, cyberbullying/cybervictimization, narcissism, callousness, popularity/unpopularity, status insecurity, face to face and cyber prosocial behaviors (both as recipient and giver) and media use) in Time 1 have been examined as predictors of cyberbullying and cybervictimization in Time 2. A total of 268 adolescents (143 females, 124 males, 1 missing; Mean age=14.7, SD =.52) have been recruited from public schools which settled in two districts of Northern Cyprus. Machiavellianism Scale for Adolescents, Childhood Narcissism Scale, Face-to-Face Bullying and Prosocial Behavior Scale, Cyberbullying and Cyber-Prosocial Behavior Scale, Inventory of Callous-Unemotional Traits and Social Status Goals Questionnaire was used as measurement tools (Cronbach Alphas were between .72 and .91). The results indicated that cyberbullying in T2 was predicted by cyberprosocial behavior as giver ($\beta=-.41$), unpopularity ($\beta=-.48$), narcissism ($\beta=.23$), and status insecurity ($\beta=-.24$) in T1. Moreover unpopularity ($\beta=.39$), callousness ($\beta=-.25$), cyberprosocial behavior as recipient ($\beta=-.53$), and blog use ($\beta=-.27$) in T1 predicted cybervictimization in T2. All coefficients were standardized and significant between $p<.001$ and $p<.05$. The results indicated that cyberbullying was related with the indicators of high status in general whereas cybervictimization was suggested to be linked with lower social status, lower new media literacy and emotionality (as opposite of callousness).
YOUNG ADULTS’ PERCEPTION OF DEMOCRACY AND THEIR CITIZENSHIP ATTITUDES: ESTONIAN EXAMPLE

Kristi Kõiv
University of Tartu (Tartu, Estonia)

During the early years of the 2000s young people in Estonia were increasingly alienated from mainstream politics, but nowadays a new media was proposed as a mean vehicle for new forms of civic engagement for young people (e.g. Kaun, 2013). In a democratic, European-oriented transformation with a focus on a more liberal economy, a research question was evoked: How have Estonian young adults constructed their citizenship attitudes and perception of democracy indicators? 360 university students aged 18-30 were examined by Citizenship Behaviour Questionnaire by Zalewska & Krzywosz-Rynkiewicz (2011) and scale of democracy indicators by V-Dem report (2018). Estonian data were analysed from three study areas: (1) young adults perception of democracy indicators, (2) profiles of young adults’ democracy behaviours and (3) relationship between perception of democracy and citizenship activity.

CONCERN AND EXPERIENCE OF AGGRESSION AND VIOLENCE IN THE WORKPLACE OF PRIVATE SECURITY PERSONNEL: EFFECTS ON SUBSTANCE USE, PSYCHOSOMATIC HEALTH AND TURNOVER INTENTION

Alexander Herrmann
Christian Seubert
Juergen Glaser
University of Innsbruck (Innsbruck, Austria)

Aggressive and violent acts were identified as a major threat to workers’ health and well-being. Negative effects on sickness absence, decreased productivity, and turnover intention highlight also the economic importance. Although aggressive and violent incidents constitute a main issue of private security work, research in this field is sparse. In a cross-sectional online survey with 683 German-speaking security guards, we assessed a) the prevalence of different facets of workplace aggression/violence; b) associations with employees’ substance use, psychosomatic health and turnover intention; c) the mediating role of concern about workplace aggression/violence with respect to a stressor-strain model. We further incorporating the assumption, that concern about aggression/violence can have similar effects as actual exposure. Predictors comprised an exposure index (physical attacks, witnessed attacks, verbal threats, sexual harassment; α[4]=.70), and the concern about aggression/violence [1]. Outcomes were assessed by established instruments: turnover intention (α[4]=.90), psychosomatic health (α[12]=.87), and substance use (alcohol [1], cigarettes [1] and pharmaceuticals [1]). For the past 12 months, high prevalence were reported (verbal threats 53 %, witnessed attacks 38 %, physical attacks 31 %, sexual harassment 5 %) and substantial or extreme concern about aggression/violence was expressed (23 %). Spearman’s rank order correlations showed positive associations of concern about –and the experience of- aggressive/violent incidents with smoking (r = .11; p < .01 / r = .15; p < .01) and increased use of pharmaceuticals (r = .22; p < .01 / r = .18; p < .01). Excessive alcohol consumption was only associated with the actual exposure to aggression/violence (r = .11; p < .01). Both
concern and exposure showed positive effects on psychosomatic health (\( r = .20; p < .01 / r = .26; p < .01 \)) as well as turnover intention (\( r = .12; p < .01 / r = .11; p < .01 \)). Concern mediated the effect of aggressive/violent experiences on psychosomatic health (indirect effect, .03; 95%-Boot CI [ .03; .09]) but not on turnover intention. Our data contribute to the sparse research on private security work by providing prevalence and effects on key constructs, especially for the German-speaking industry.

PAIN PERCEPTION IN BORDERLINE, HISTRIONIC AND SCHIZOTYPAL PERSONALITY DISORDERS

Spyridoula Bourtzoni
Phil Reed
Swansea University (Swansea, United Kingdom)

Anecdotal clinical evidence suggests that patients with Personality Disorders (PDs) might report and experience greater pain than other patients. A relatively new line of research has been focusing on acute and chronic pain perception of individuals suffering from Borderline Personality Disorder (BPD). To the author’s knowledge, there is a lack of research in the current literature regarding pain perception and other types of PDs. The aim of the present study was to explore any potential association between the perception of acute pain of individuals with BPD, Histrionic and Schizotypal PD Characteristics. In order to investigate those associations, a quasi-experimental, between-subject design was implemented. We recruited 52 participants for the needs of our study. The independent variable of the study was the PDs traits and the dependent variable was pain perception, as it was assessed by the use of PDQ-4, SF-MPQ, Pain Threshold and Tolerance and Galvanic Skin Response. Pain was induced by using a cold-pressor task and was evaluated by physiological and behavioural self-report tools. The results of our study showed a significant association between Histrionic PD and McGill 1 and 2 task results. To the author’s knowledge, this is the first study that investigates the relationship between Histrionic PD and acute pain perception. No significant results were produced regarding pain perception in relation to BPD and Schizotypal PD. Our results should await confirmation by larger studies. The limitations of our study were thoroughly assessed and guidance for future research has been provided.
TESTING CLASSICAL ASSUMPTIONS OF COGNITIVE DISSONANCE THEORY ACROSS TURKEY, ETHIOPIA, AND KENYA

Şeyma Sevgican
Cem Şafak Çukur
Faqih Yasin Khatib Omar
Ahmed Mohammed Dawd
Ankara Yıldırım Beyazıt University (Ankara, Turkey)

Cognitive dissonance theory (CDT) is one of the most influential social psychological theory which implicitly or explicitly has affected the formulation of many Western-based psychological theories and models. However, some of the cross-cultural studies have challenged the universality of basic assumptions of CDT that the dissonance based experiences are basically individualist Western phenome. The cross-cultural studies which mostly yielded inconsistent findings about cultural validity of CDT were based on comparing individualist culture (e.g., USA or Canada) with East Asian culture. Surprisingly, there was almost no study to test the basic assumptions of CDT experimentally across different "collectivist" cultural contexts. Therefore, the main purpose of the current study is to test the classical assumption of CDT experimentally in Turkey and African cultural context (Kenya and Ethiopia). Different reformulations of CDT with different types of dissonance have been offered after the original cognitive dissonance formulation (Festinger, 1957). However, to test validity of original cognitive dissonance assumptions in which aversive feelings of dissonance based on particular inconsistencies that related to attitude change, current study basically used one of classical experiment paradigm ("attitudinal effect of justification") developed by Freedman (1964). A total of 440 participants from each country (Turkey, Kenya, and Ethiopia) were randomly assigned to different justification groups while doing an unpleasant task. The unpleasant task which mainly involved evaluating very long and different tables were developed for this study to make sure cultural equivalence of manipulation. Using justification and timing of justification as predictor variables, we conducted a 3 (justification: high, low vs. no) X 2 (timing of justification: after vs. before task) ANOVAs within each cultural groups separately to test hypotheses. The overall findings supported the main assumption of CDT in which participants in the high justification and control conditions rated the task as boring compared to participants in the low justification condition across the countries. However, findings based on different dependent variables (e.g., willing to participate in a similar task or recommending the task to others, etc.) were not consistent with CDT assumptions.
TELEMEDICINE SERVICE: COUNSELING REQUESTS

Tatiana Sheredeko
Medical Center «PrimaMedica» (Moscow, Russia)

Online psychological counseling is a new medium that is quickly becoming commonplace (Barak & Grohol, 2011). It has been shown to rival traditional face-to-face counseling practices in terms of effectiveness (Barak, 2008; Berger, 2015; Reynolds et al., 2016; Richards & Vigano, 2013). Obviously, there are new challenges and dilemmas presented by this channel of communication between the counselor and client: from ethical issues (Barsky, 2016; Reamer, 2013) to ways of improving effectiveness (Barak & Grohol, 2011; Weatherford et al., 2016). Clinic PrimaMedica has a team of psychologists. Our counselors has commenced online practice at platform Yandex.Health in June 2018. In the first 4 months of service, the team of 11 psychologists (representing a wide range of counseling approaches — from dialectical behavior therapy to art therapy to neuropsychology) delivered 494 counseling sessions. The current study includes a descriptive analysis of client demographics and psychological problems the clients identified as their key reasons for seeking help. Among the clients that requested counseling, age ranged from 18 to 52 year with the modal category of 29 years of age. Just over half of all clients were males. This latter finding is especially surprising as males comprise a clear minority of clients in face-to-face counseling practice. Among key reasons for seeking help, affective problems (such as anxiety/panic attacks, fear, anger, guilt/shame, distrust, etc.) constitute two thirds of all counseling requests. Further analyses reveal additional information about counseling requests. Overall, we find that: 1) our online counseling helps males seek psychological help they otherwise would not ask for, 2) people mostly seek help with their emotional life rather than with their behaviors or interactions with others.
HOW IT WAS TOLD OR WHAT: THEORY OF MIND IN NARRATOR’S POSITION REINTERPRETATION OF OTHERS’ MEMORIES RETOLD

Julia Zaitseva
Saint Petersburg State University (Saint Petersburg, Russia)

Storytelling supports the Theory of Mind (ToM) construction in childhood (Miller, 2012; Guajardo, Watson, 2002). Can the high performance in Theory of Mind test in adults («Reading the mind in the eyes» RMIE scores, Baron-Cohen et al., 2001) predict better understanding and memorizing shared personal stories? Autobiographic memories are coded, contextualized and exchanged in forms of self-narratives, and its narrative structure is as important as its content. Do we keep in mind the narrator’s position as well as a theme of the narrated story or do we reinterpret it according to our own cognitive schemas? Does our ToM promote memorizing it from author’s point of view? Method: 25 dyads of young adult peers shared 3 autobiographical self-narratives (about personal childhood, present life situation, and possible future), and listened to several experimenters’ stories constructed in different narrative structures (proactive/defensive type, optimistic/pessimistic tone, agency/communion theme, and redemption/corruption consequence). Half of the participants also used RMIE stimuli as associations to memorize stories. In a week, participants came back and retold all the stories to the experimenter. We compared the concordance of narrative structure (coded by two experts) measured in groups of different RMIE performance, and procedures of memorizing (MANOVA, Chi-sqr). ToM performance in adulthood works as a mediating factor of narrative positions understanding and memorizing (in case of high and average level of ToM). Association with images of eyes of a motivated and emotional person increases narrator’s positions reconstruction in retold stories (differently in case of different narrative structures, more in the average level of ToM group). High intra-individual concordance of self-narrative scheme results in more frequent reinterpretations of others’ narrative position. Results discussed in the frame of Dialogical Self (Hermans, Hermans-Jansen, 1995) valuation theory.
GAMIFICATION IN EMPLOYEE RECRUITMENT AND SELECTION

Ioannis Nikolaou
Konstantina Gerogiou
Athens University of Economics and Business (Athens, Greece)

Our study explores the validity of a game-based assessment method assessing candidates’ soft skills. Using self-reported measures of performance (job performance, OCBs and GPA), we examined the criterion-related and incremental validity of a game-based assessment, above and beyond the effect of cognitive ability and personality. Our findings indicate that a game-based assessment measuring soft skills (adaptability, flexibility, resilience and decision making) can predict self-reported job and academic performance. Moreover, a game-based assessment can predict academic performance above and beyond personality and cognitive ability tests. The effectiveness of gamification in personnel selection is discussed along with research and practical implications introducing recruiters and HR professionals to an innovative selection technique.

EFFECTS OF DIALECTICAL BEHAVIOR THERAPY SKILLS GROUP ON MOOD AND RELATIONAL SKILLS OF PATIENTS WITH SUBSTANCE DEPENDENCE DISORDER

F. Isil Bilican Yurteri
Istanbul Medeniyet University (Istanbul, Turkey)
Elif Celebi
Istanbul Sehir University (Istanbul, Turkey)
Birgül Gulen
Huzyef Barham
Mustafa Cetinkaya
Istanbul University (Istanbul, Turkey)

Dialectical Behavior Therapy (DBT) A group of patients with substance dependence disorder received a modified version of the DBT skills training group. The participants were 18 to 34 years old 9 males who were followed up in inpatient and outpatient clinics in a major state hospital in Istanbul for treatment. The participants had poly-substance dependence and comorbid diagnoses including ADHD, major depressive disorder and antisocial personality disorder. Participants were asked to refrain from using substances during the study. Random 15 urine tests were gathered to determine substance use status. Patients with mental retardation and psychosis were excluded from the study. Patients completed a 20-week DBT skills group only modified for substance abuse disorders. Beck Depression Inventory (Beck, et al., 1988), Difficulties in Emotion Regulation Scale (DERS, Gratz & Roemer, 2004) and Interpersonal Problem Solving Scale (Cam & Tumkaya, 2007) were administered pre and post treatment. Findings showed a significant decrease in depressive symptoms from pre-treatment to post-treatment. The practical and clinical implications of the study will be discussed in relation to the DBT literature for substance dependence groups.
The vocational self-determination of adolescents in modern Russia becomes a family task as it requires the resources of the teenager’s family (Konshina, 2018). In recent years, many foreign researches are devoted to the role of the parental family involvement to the vocational self-determination in adolescence. The "Parent Career Behavior Checklist" (Keller, Whiston, 2008) was created to measure the parental involvement ("Support" and "Actions") to the vocational self-determination in adolescence. The parental involvement positively correlates to career decision making self-efficacy and career maturity in adolescence. The study was aimed to explore the Adolescents' Personal Professional Perspective (APPP) (Klimov, Pryazhnikov) formation due to parent career behavior. 190 pupils (89 male, 101 female), age 15-17, from Moscow schools (9th — 11th grades) participated in the research. Five groups of adolescents with different perception of parent career behavior were distinguished: "Highly involved parents" (43%), "Interested parents" (21.1%), "Detached parents" (13.7%), "Involved mother and Distant father" (12.6%), "Distant mother and Involved father" (9.6%). The results showed that adolescents, whose parents are perceived as "Interested" in their vocational self-determination, demonstrated the lowest average scores of the APPP components. The highest scores of the APPP "Professional choice", "Value-semantic orientations", “Orientation in the socio-economic situation”, “Opportunities”, “Overcoming obstacles” were shown by adolescents that perceive their parents as "Detached". Adolescents from this group may be forced to independently build their personal professional perspective. The group of adolescents with "Very involved parents" showed the highest scores of the personal professional perspective components "Goal-setting" and "Overcoming obstacles". Probably, adolescents from this group can count on the support and involvement of their parents, including financial support, and by the way can improve their professional plans for the long term. Adolescents perceiving their parents as less involved in their professional self-determination show a higher level of orientation in the socio-economic situation and a more adequate level of aspirations. Probably, the situation of the forced necessity of vocational self-determination in adolescence contributes the active search for information about the current situation in the world and the formation of an adequate level of claims.
AMBIVALENCE TO ORGANISATIONAL CHANGE AND EXHAUSTION: THE MODERATING ROLE OF JOB CRAFTING

Maria Vakola (Athens, Greece)
Socratis Costas
Athens University of Economics and Business (Athens, Greece)

Change recipients’ reactions to change are of critical importance for change success. Many studies explored these reactions antecedents and outcomes but failed to recognize that reactions to change are not ‘black and white’ (i.e. support or resistance to change but may involve both positive and negative evaluations of the change at the same time. Ambivalence is defined as an attitude comprising both positive and negative reactions to an object (Kaplan, 1972). The purpose of this paper is to explore change recipients’ ambivalence in an organizational change context. More specifically, ambivalence to change can be perceived as a stressful factor by the employees because there is the requirement to invest the effort to adapt to it. Therefore, it is hypothesized that ambivalence would be positively related to the daily levels of employees’ exhaustion. The second set of hypotheses is related to the moderating role of job crafting. Job crafting has been recognized as a strategy that facilitates adaptation to organizational change because job crafters deal with new and threatening situations effectively by regulating their work environment (Petrou, Demerouti, & Schaufeli, 2018). Specifically, within an organizational context, job crafters may deal with change by seeking job resources, by seeking challenges, or by reducing demands. The survey sample consisted of thirty-seven employees who participated in a diary study completed a set of questionnaires for five working days. Participants were office employees of a large cosmetics and natural beauty products international company recently acquired by a Spanish giant. At the time of the study, the employees were experiencing changes as a result of the acquisition. The results of the data collection confirmed the positive relationship of ambivalence and daily exhaustion. Results also showed that the only dimension that moderated the relationship between ambivalence and change was reducing demands. Discovering whether there are other reactions such as ambivalence and how these are related to positive change outcomes may reveal important conditions that can explain how can a change initiative be managed and supported.
IDENTIFYING THE KEY BELIEFS UNDERLYING ADAPTATION TO HEAT IN QUEBEC’S ELDERLY POPULATION

Pierre Valois
Denis Talbot
Jean-Sébastien Renaud
Maxime Caron
David Bouchard
Université Laval (Québec, Canada)

Temperatures caused by heat waves can have a deleterious effect on human health, most notably on the elderly, as they often present physiological factors making them more vulnerable to heat (Tairou et al. 2010; Cheng et al. 2018; Glass et al. 2018). This intolerance to high heat is exacerbated by the fact that despite their vulnerability, the elderly do not necessarily perceive themselves as being more vulnerable than others (Kalkstein and Sheridan 2006; Bélanger et al. 2014). As risk perception is often linked to the adoption of adaptive behavior, this could hinder their adaptation to our changing climate. Thus, using the theory of planned behavior (Ajzen 1991, 2005) and some variables from the health belief model, this study aimed at developing a better understanding of the key behavioral determinants of older people in the adoption of pro-adaptive behaviours to protect themselves from periods of high heat. Using a telephone sample of 1,002 persons aged 65 years or more, this quantitative study allowed us to explore the decision-making process of seniors in a way that led us to illustrate specific variables that could be targeted for awareness raising. Our results show that all three proximal factors of the theory of planned behavior (i.e., attitude, social norms and perceived control) had a statistically significant effect on the elderly intention to adapt. More so, behavioral intentions were a significant predictor of the adoption of adaptive behaviors. This information could help in the creation of personalized messaging, designed to target specific beliefs shown in our study to have an impact on the elderly’s intention to adopt adaptive behaviors. Our study shows that increasing elderly people’s intention to adapt should increase their adaptation to high heat, which could help protect the health of this at-risk population.

ORGANIZATIONAL JUSTICE, JOB SATISFACTION AND COMMITMENT: EXPLAINING UNDERLYING MECHANISMS THROUGH QWL AND PSYCAP

Abhishek Totawar
Rahul Sukumaran
Indian Institute of Management Tiruchirappalli (Tiruchirappalli, India)

Ranjeet Nambudiri
Indian Institute of Management Indore (Indore, India)

Justice or a sense of fairness is an essential element at creating a positive workspace. Further, organizational justice has been identified as an antecedent of job satisfaction and organizational commitment. However, there is silence regarding the underlying mechanism governing these relationships within this literature. Positive psychology has gained ground since more than a decade and is becoming increasingly warranted given the negativity encapsulating many of today’s organizations. Thus, standing on the theoretical premises of the social exchange perspective and the conservation of resource theory, we identified
that quality of work life (QWL), and psychological capital (PsyCap) mediate the influence of organizational justice on job satisfaction and organizational commitment. We tested our mediation model on a sample of 440 employees from the Indian industry. Standardized measures of the key variables were used. Our findings unfold the underlying mechanism, wherein QWL and PsyCap mediates the influence of organizational justice on job satisfaction and organizational commitment. Firstly, our findings advances the knowledge on job satisfaction and organizational commitment. Secondly, it provides an impetus to research in this domain by identifying QWL and PsyCap as intervening variables. In addition, the implications are brought about by explaining organizational justice in the context of positive psychology.

THE EFFECT OF SOCIAL DISTANCE AND DIFFERENT MORAL CONTEXTS ON PERCEPTION OF INTENTIONALITY AND MORAL EMOTIONS

Zeynep Ecem Piyale
İşik University (İstanbul, Turkey)

Sevim Cesur
İstanbul University (İstanbul, Turkey)

Classical attribution bias theories posit that people tend to attribute less intentionality toward themselves and also in group members. Later developed Construal Level Theory (Eyal, Liberman and Trope, 2008) approached attributions as different construals affected by psychological, temporal or social distances. It was claimed that different construals would have an effect on moral judgments as well. Perception of intentionality is also a very essential component of moral judgments and has been studied in moral psychology, however, the importance of context is overlooked both explaining moral judgments and perception of intentionality. Shweder, Much, Mahapatra and Park (1997) elaborated morality in context and culture dependent and articulated that moral judgments can change across cultures and individuals. Later on, Rozin, Lowery, Imada and Haidt (1999) found that even emotions felt towards moral violations can differ across different moral contexts explaining Autonomy-Anger, Contempt-Community and Disgust-Divinity link (CAD-triad). This research aimed to connect attribution bias and Shweder’s three moral ethics and sought to find interaction between moral domains and social closeness within perception of intentionality. Also, connection between moral emotions and different moral domains and the importance of social closeness were investigated. For this purpose, an experimental design was constructed and social distance and moral ethics contexts were manipulated and change in the perception of intentionality and moral emotions were analyzed. As expected, results demonstrated attribution bias in Autonomy and Community violation evaluations but not in Divinity violations. Moreover, Autonomy-Anger, Disgust-Divinity links were revealed but Contempt-Community relation was not observed. Findings showed different results when social closeness was placed in the interaction. When the CAD-triad was analyzed with different social distance conditions the link between Disgust-Divinity link in close condition was lost. Possible explanations were discussed in terms of theoretical perspectives.
AVOIDING MECHANICAL RESTRAINT ON PSYCHIATRIC PATIENTS IN ITALY: A CASE-STUDY ON ORGANIZATION IN A “NO RESTRAINT” WARD

Eleonora Alecci
Sapienza University of Rome (Rome, Italy)

Mechanical restraint is a widely used practice in Western psychiatric wards. Some studies have underlined the clinical risk of restraint procedures, as well as the impact on the care process and on the well-being of the healthcare team. For these reasons, policies of reduction and abolition of restraint practices are currently implemented in many countries. This contribution intends: (i) to summarize the Italian and international situation regarding the use of restraint in mental health services; and (ii) to present the results of an organizational analysis conducted on one of the few (21 on 285) Italian psychiatric wards where mechanical restraint devices are avoided. The aim is to investigate the key points of a “no restraint” choice, which may be extended to other mental health care structures. Research questions: How is the ward organized? How are “crises” (e.g. aggression by patients) faced by the team? Methodology: qualitative case study, ethnography (six-week long participant observation, interviews), constructivist grounded theory approach. Participants: 8 medical assistants, 15 nurses, 5 psychiatrists. Data analysis procedure: analysis of field notes and interviews (N-Vivo). Results show that key points of the ward organization are: — strong cohesion and “sense of the group” between staff members; — motivational, ideological and historical factors; — functional protocols of management. Understanding and reducing the use of restraint practices should be a relevant scientific objective for research in the psychological field, both clinical and organizational. This research may be useful in order to implement mental health policies, services and systems.
THE PROCESS OF FORMING A 3D IMAGE OF AN OBJECT IN THE BRAIN AS A CONNECTOM

George Losik
Victoria Gladkaya
Yury Vilchuk
National Academy of Sciences of Belarus (Minsk, Belarus)

To study the temporary process of forming a 3D image of an object in a person’s memory by its circular perception. The formation of an image of a 3D object differs from the formation of an image of a 2D object. The 3D trajectory of the perception is registered in a computer in the process of the circular perception of the 3D object. Further parametric analysis of the trajectory is performed and segments are located.

The experiment showed that the subject at the beginning of the perception covers the surface of an unfamiliar object with a network of “places of interest”. Therefore he: a) primarily mentally covers the scope of his future perception space – honeycomb (as in the study of 2D space established by John O’Keefe, May-Britt Moser, Edvard Moser); b) randomly starts the perception by rotation, the percept honeycomb remembers regardless of the result, so as not to percept them again; c) when he detects a place of interest, he stops and comprehends; d) after reflection, remembers the picture of the place as a photo and emotion; i) makes a maneuver in the place of perception, leaves the place and randomly starts a new search, examination of new honeycombs, in view of the revision of the place already found.

The process of forming a 3D image of an object in the brain as a spatial phenomenon can be considered as a hard-ware (connectom) of this object. The topology of an image of an object is formed as a network of vertices of a graph (a network of hubs) and a network (like “walkways” between hubs), vector-defined edges of the graph; vector set edges of the graph; it is not affected by the sequence in which subjects pass through places of interest, but only their vector topology relative to each other. The separate connectom is formed for each object for a homogeneous representative group of subjects.
CAPTURING ENGAGEMENT AMONG TEACHER IN THE STATE-OWNED INCLUSIVE SCHOOL

Ika Kristiana
Airlangga University (Surabaya, Indonesia)

This study aims to describe the characteristics of teachers’ engagement toward inclusion. Research question is how the characteristics of teachers who are engaged with the inclusive school. Case study designs are used to depict research phenomena. The total participants were 19 people. Data was collected through FGDs and interviews. Data analysis followed the Yin case analysis step (2009). Categorical theme as research findings illustrate the characteristics of teachers who have an engagement toward inclusion. The categorical themes include devoting attention in teaching, creativity in teaching strategies, selfless sacrifice in work, fulfilling oneself with positive emotions while interact with students, attention and emotional closeness with students, collaboration with shadow teachers, open communication with parents, and becoming an inclusion agent. The findings indicate that engagement as a psychological state shows strong affective tone, high levels of arousal, absorption, and the outpouring of energy to work. Considering the characteristics of teachers’ engagement from this research findings to be an important basis for elaborating on further research on processes, factors, and the impact of teacher attachments toward inclusion.

EVALUATION OF A BRIEF, AVATAR-GUIDED ACT-BASED INTERVENTION FOR CHRONIC PAIN MANAGEMENT

Orestis Kasinopoulos
Maria Karekla
University of Cyprus (Nicosia, Cyprus)

Acceptance and Commitment Therapy is an empirically supported intervention for the management of Chronic Pain. Increasing demands for cost reduction in healthcare services in addition to obstacles regarding physical access to treatment, highlight the need for innovative, cost-reducing, digital self-management interventions. Low adherence, nonetheless, is a significant challenge often faced in digital interventions, which may impact treatment effectiveness and result in high dropout rates. Very few digital interventions appear to be planned for adherence a-priori, when designing an intervention. In addition, there is a lack of brief digital interventions with minimum human contact, in the field of CP. The purpose of this study was to design an adherence focused, brief, Avatar-led intervention for CP management and evaluates its effectiveness. Sixty-four participants were randomly allocated to an intervention group (ALGEApp) or an active control group (relaxation techniques). Both groups significantly contributed to improvements in the short-term on primary treatment outcomes of pain daily interference, quality of life, secondary treatment outcomes of mood and process outcomes of acceptance and psychological flexibility. However, AlgeaApp demonstrated these improvements to a greater extent than the control. Satisfactory adherence and completion rates were found in favor of the ALGEApp intervention group, compared to digital trials literature. Overall, the brief Avatar-led ACT-based intervention appeared to be well accepted by chronic pain sufferers. We hope to shed more light on the potential of brief and innovative planned-for-adherence digital interventions, on reaching and engaging users who may not have easy access to treatment, while providing a set of skills to help them manage their pain through a home-based self-care approach.
CLASSROOM CHALLENGE: DOES SELF REGULATED LEARNING PREVENT STUDENTS TO DO CYBERSLACKING?

Ermida Simanjuntak  
Nur Ainy Fardana Nawangsari  
Rahkman Ardi  
Airlangga University (Surabaya, Indonesia)

Internet access in the university campus influences study behaviour of university students in the classrooms. Students use internet during lectures not only for academic purpose but also for non-academic purpose. The tendency to access internet for non-academic material during lectures is defined as cyberslacking. Students’ cyberslacking is considered as a challenge for lectures to encourage students’ engagement in the classrooms. Some researches mention that self regulated learning (SRL) influences cyberslacking behaviour. Self regulated learning is students capability to direct their cognition, affection and behaviour to achieve their learning goals. Students with high self regulated learning tend to focus internet use for accessing study materials during lectures. SRL are included capacity to regulate motivation, regulate effort, planning, attention focusing, task strategies, using additional resources and self instruction. Participants in this study are students from the Faculty of Medicine, Nursing and Pharmacy as those Faculties are in the area of health treatment that involve some ethics in their field of study. This research aims to explore the relationship between students cyberslacking behaviour in regard to self regulated learning which is considered as important factors in learning. Participants are university students in the faculty of Medicine, Nursing and Pharmacy (N = 405). Data were collected using cyberslacking scale and self regulated learning scale. Cyberslacking scale and self regulated learning scale have Cronbach Alpha coefficient of 0.925 and 0.759. Results show that there is a significant correlation between cyberslacking behaviour and self regulated learning (r = 0.22, p < 0.000). Self regulated learning correlates with cyberslacking behaviour. Students with high SRL are more focus during lectures so that they prevent to access internet for non-academic materials. In contrary students with low SRL tend to use internet for non-academic purpose such as social media, news, entertainment websites and gaming. Further research of cyberslacking behaviour should consider internet literacy to enhance self regulated learning for more academic access purpose.
CROSS-CULTURAL STUDY OF ATTITUDE OF COMPANY EMPLOYEES TO MANIPULATIONS OF MANAGERS

Liubov Ryumshina
Southern Federal University (Rostov-on-Don, Russia)

Currently manipulations are a common phenomenon throughout the world. They are represented in all life spheres of society, including the working relations. At the same time, with the emergence of transnational companies, it became clear that in order to study the relationships of employees in them one needs to understand the characteristics of their national cultures. The goal of our work was to study the means of manipulative influence of Russian and British managers, and the attitude of their subordinates towards it. The survey and the method of expert assessments were taken as the main methods. A total of 393 people took part in the study. The study results showed that, despite the existence of socio-cultural differences in the managers’ choice of the manipulative means and the attitude of their subordinates towards it, generally there was a low relationship satisfaction in groups where managers had a manipulative style of management. At the same time the most preferred relationships both for the employees of Russian and British companies were ones based on dialogue. The study shows that, on the one hand, relationships are determined by the socio-cultural characteristics, on the other hand, there are forms of communication that are unacceptable to people regardless of their cultural background. Such as manipulations. Based on the received data, dialogical relationships that underlie democratic relations can contribute to the unity and integration of people not only in business relations.
PSYCHODIAGNOSTIC PRACTICES IN RUSSIA AND BEYOND

Lucia Bombieri
Tomas Jurcik
Karina Grigoryan
Helen Kovalenko
National Research University Higher School of Economics (Moscow, Russia)

Anastasia Onatskaya
(Moscow, Russia)

Although the Diagnostic and Statistical Manual (DSM-5) and International Classification of Diseases (ICD-10) in their current editions are widely distributed internationally and provide a common diagnostic language for mental health clinicians, it is unclear to what extent clinicians in various countries appropriately apply the criteria provided by these manuals. In the current ongoing study, we provide clinicians (clinical psychologists and psychiatrists) in five countries (Russia, Australia, Serbia, Italy, and Turkey) with three different clinical vignettes of patients depicting an affective, an anxiety and a psychotic disorder profile that meet DSM-5/ICD-10 criteria and ask them to provide a preliminary diagnosis. For the preliminary findings with our Russian sample (N=42; 76.2% female; 23.8% male), most participants identified as clinical psychologists or psychologists (58.5%) and the remainder as psychiatrists(41.5%). Both clinician subsamples were similar in age (Overall M=35.56; SD=8.67) and years of training (Overall M=7.95; SD=2.68) in their respective fields. Due to differences in training emphases, we expected psychiatrists to be more accurate in their clinical impressions than psychologists and to use diagnostic manuals more frequently. Our expectations were generally supported. Psychologists were more frequently incorrect (52.0%) than psychiatrists (18.8%), for the affective disorder case vignette, X2(1, N=41)=4.53, p=.03. This same pattern was found with the anxiety disorder vignette (psychologists incorrect=75.0%; psychiatrists incorrect=35.3%), X2(1, N=41)=6.46, p=.01. However, despite frequent errors for both groups, there was no difference for the psychotic disorder vignette (psychologists incorrect=47.6%; psychiatrists incorrect=58.8%), X2(1, N=38)=0.47, p=.49. Another difference emerged in the use of manuals (DSM or ICD). There was a non-significant trend for psychiatrists to use them more often (47.1%) than psychologists (20%) for the first case, X2(1, N=42)=3.47, p=.06. This trend became significant for the second case vignette (psychiatrists= 52.9%; psychologists=16.0%), X2(1, N=42)=6.4613, p=.01, as well as the third vignette (psychiatrists=64.7%; psychologists=4%), X2(1, N=42)=18.27, p<.001. In sum, clinicians do not consistently apply international diagnostic criteria, and this pattern may be more pronounced for psychologists in Russia. Educational, regulation, and training differences and cultural-historical factors may partly explain these findings. Study limitations, future research, training standards, and clinical implications are discussed.
REFERENCE TO AS A PREDICTOR OF AN INDIVIDUAL'S ACTIVITY IN THE GROUP

Elena Kuzmina
Military University of the Ministry of Defense of the Russian Federation (Moscow, Russia)

Reference to as a predictor of an individual's activity in the group. E. I. Kuzmina, professor of psychology, Military University of the Ministry of Defence of the Russian Federation. The correlation of reference and activity is carried out from the standpoint of the subject-activity theory of S. L. Rubinstein, the reflexive-activity approach of E. Kuzmina, the concept of activity of N. F. Dobrynin, referential theory of G. Hyman, T. Newcomb, R. Merton. Relationship activity and reference was detected in the experiment conducted by Z. Kuzmina with students UGPI (20 study groups) using author's method: self-assessment (based on the method of semantic differential Osgood) and value orientations (Z. Kuzmina, 1973), referentially and sensorimotor integrator, mounted by V. Nikolayev on the basis of the principle by F. Gorbov. It turned out that the most referential members of the group assumed the function of decision-making of the joint problem under uncertainty. With the help of the reference method and sensorimotor integrator the core of the collective was revealed (Kuzmina Z., 1987), which includes the most referent members of the group. The study conducted in the special purpose units (Kuzmina, Kholmogorov, 2011) revealed a moderate relationship between the reference index of the group and the group performance ($r=0.887$, at $p<0.01$); it is proved that the core of the team increases the activity of group members in achieving socially significant goals. In the business game on the basis of self-assessment and reference was carried out the free choice of the core team. Perception of own activity and efficiency leads the subject to self-assessment as significant in the reference group, in the country, in the world. Literature: 1. Kuzmina E. I., Kholmogorov V. A. Group reference to. — M.: Ugresh printing house, 2011. — 193 p. 2. Kuzmina Z. V. The core of the collective. Psychology of a developing personality. M.: Pedagogy, 1987. — 240 p. Chapter 8, P. 134. 3. Kuzmina Z. V. Research of features of self-assessment of the personality in the conditions of success and failure: dis abstract. for the degree of candidate of psychological Sciences. WHICH ACTIONS LEAD TO AFFECTIVE WELL-BEING: SHORT-TERM EFFECT OF MOTIVES FOR ACTIONS ON AFFECTIVE STATES

Petra Anić
Marko Tončić
Ingrid Brdar
University of Rijeka (Rijeka, Croatia)

Happiness is experienced to greater extent when engaged in some activities compared to others (Waterman et al., 2008). Previous research has been inconsistent regarding the relationship between activities and happiness. Some research findings show that hedonic motives are related more with positive and negative affect than eudaimonic (Huta & Ryan, 2010) whereas other studies show that only eudaimonic behaviors are associated with greater positive affect (Steger, Kashdan, & Oishi, 2008). The aim of this study was to explore the effect of motives on positive and negative affect, both on intrapersonal and interpersonal level. A sample of 121 students (87 female, aged from 18 to 25) completed three questionnaires: PANAS (Watson et al., 1988), motivation for activities (Huta, 2007), and orientations to happiness (Peterson et al., 2005). The dispositional level scales were administered at the beginning of the study. In the experience sampling study participants specified current activities and motives for engaging in these activities and assessed their affect five times a day for seven consecutive days via hand-held devices. The data were analyzed using hierarchical linear modeling. Hedonically motivated activities decreased negative affect more than eudaimonically motivated activities. This effect is more pronounced for participants with generally higher negative affect. Motivation for activities had no effect on positive affect. Furthermore, there were no delayed effects of motives on affect, at least when delays within the same day were analyzed. On the interpersonal level, both hedonic and eudaimonic motives are weakly related only with higher positive affect. The findings show that hedonically motivated activities contribute to affective well-being by reducing negative rather than increasing positive affect (based on intrapersonal level result). Regarding eudaimonically motivated activities, which are related to long term goals, future studies should explore longer periods of time and analyze more specific activities.
TELEMEDICINE SERVICE: COUNSELING REQUESTS

Tatiana Sheredeko
Medical Center «PrimaMedica» (Moscow, Russia)

Online psychological counseling is a new medium that is quickly becoming commonplace (Barak & Grohol, 2011). It has been shown to rival traditional face-to-face counseling practices in terms of effectiveness (Barak, 2008; Berger, 2015; Reynolds et al., 2016; Richards & Vigano, 2013). Obviously, there are new challenges and dilemmas presented by this channel of communication between the counselor and client: from ethical issues (Barsky, 2016; Reamer, 2013) to ways of improving effectiveness (Barak & Grohol, 2011; Weatherford et al., 2016). Clinic PrimaMedica has a team of psychologists. Our counselors has commenced online practice at platform Yandex.Health in June 2018. In the first 4 months of service, the team of 11 psychologists (representing a wide range of counseling approaches — from dialectical behavior therapy to art therapy to neuropsychology) delivered 494 counseling sessions. The current study includes a descriptive analysis of client demographics and psychological problems the clients identified as their key reasons for seeking help. Among the clients that requested counseling, age ranged from 18 to 52 year with the modal category of 29 years of age. Just over half of all clients were males. This latter finding is especially surprising as males comprise a clear minority of clients in face-to-face counseling practice. Among key reasons for seeking help, affective problems (such as anxiety/panic attacks, fear, anger, guilt/shame, distrust, etc.) constitute two thirds of all counseling requests. Further analyses reveal additional information about counseling requests. Overall, we find that: 1) our online counseling helps males seek psychological help they otherwise would not ask for, 2) people mostly seek help with their emotional life rather than with their behaviors or interactions with others.
The broad autism phenotype (BAP) refers to a set of subclinical behavioral characteristics qualitatively similar to those presented in autism spectrum disorders (ASD) but milder in their expression. This phenotype has been observed not only in relatives of people with ASD but also within the general population. Recently, it has been suggested that the studies with the BAP population could help to gain a better understanding of the developmental trajectories of autistic tendencies (Landry and Chouinard 2016). However, before conducting these studies, it is necessary to develop specific tools for measuring this phenotype in the general population. Precedent available questionnaires have reported bad psychometric properties and multiple factor structures different from the BAP or ASD current DSM-V definition. In two previous studies, we adapted one of the most worldwide used questionnaires to assess the BAP, the Broad Autism Phenotype Questionnaire (BAP-Q; Hurley et al., 2007) to the Spanish population and we assessed its psychometric properties using both exploratory factor analysis (from the classic theory, Godoy-Giménez et al., 2018) and Rash analysis (item response model). Our previous analyses revealed that the BAP-Q has some factor malfunctioning, which is in line with previous literature. Likewise, the Rash analyses indicated that BAP-Q items have shown higher levels of BAP severity than those presented by the community sample. Considering the above-mentioned information, we highlight the need to develop new specific tools which assess the BAP in accordance with the most current ASD definition in the DSM-V. Accordingly, we propose that these new tools should conceptualize the ASD and the BAP in the same spectrum and differentiates them in terms of severity. This research was supported by a grant (PSI2015-65248-P) from the Spanish Ministry of Economy and Competitiveness, co/founded with ERDF (FEDER) funds. MGG is supported by a pre-doctoral grant by the Ministry of Education, Culture, and Sport (FPU2015-01562).
'GOOD', 'HAPPY', 'SUCCESSFUL', 'RIGHT' AND 'GENUINE' CHOICES: WHAT'S THE DIFFERENCE?

Anna Fam
Anna Menschikova
National Research University Higher School of Economics (Moscow, Russia)

In spite of importance of choice processes in our life, they rarely become a special object of psychological research. Firstly, most approaches focus on the result, rather than on the process of choice and aspects of its experience; however, the way the choice is made matters most. Moreover, choice quality is considered as objective, rather than subjective category; nevertheless, subjective experience of choice is not the same as its external evaluation. Further, choices are usually analyzed “in general” — however, choices of different subjective significance and quality radically differ by their phenomenology (Fam, 2015). And, finally, for scientific study, choices are mainly simulated in special lab conditions — though real life decisions differ a lot from those modeled in labs. In the current study we aimed to investigate differences in the subjective experience of various “high”-quality choices (HQC) made in real life situations. We asked respondents (N=455, tested online) to make free descriptions of five types of HQC (how they understand ‘good’, ‘happy’, ‘successful’, ‘right’ and ‘genuine’ choices) by finishing the following sentences: “As for me, this choice is...”. Analyzing the data, we used content analysis, expert groups, phenomenological analysis and psycholinguistic analysis of text (Linguistic Inquiry and Word Count program (Pennebaker et al., 2015)). According to results, a ‘good’ choice is associated with lack of regret and other negative feelings, bad consequences, harm for oneself and others; it is usually compared with something better. Hence, ‘good’ choice is not positive — but simply NOT a negative one. For most respondents, a ‘happy’ choice is associated with luck, fortune, spontaneity and unpredictability of result, an optimal relation of input and outcome. On the contrary, a ‘successful’ choice takes place in situations when a person works hard for achieving high results, using rational strategies. A ‘right’ choice is the most ambivalent (proper, but unpleasant; associated with moral values and volition), and a ‘genuine’ one is the most agentic, authentic and subjectively free. Thus, speaking of choice is hardly meaningful without specifying its subjective quality. There are many important phenomenological differences between these five types of HQC, concerning their process, subjective experience and other parameters.
The effect of psychological factors on negative social media and technology attitudes in the elderly

Fatma Adalet Şahin
Aslı Aslan
Mersin University (Mersin, Turkey)

Dinc Dilem
Cag University (Mersin, Turkey)

It is a well known fact that older adults have historically been late adopters to the world of technology compared to younger adults. Many studies have been conducted to understand possible reasons. However, psychology and motivation have been overlooked factors for the most of the time. The purpose of this study is to examine the predictive effect of psychological factors such as cognitive flexibility, Inferiority Feeling on attitudes towards the use of social media and technology in older population in Turkey. The study group was composed of 300 elderly aged 50 and above. In this study two different groups of older adults were compared. The first group (which leans toward younger, more highly educated) has relatively substantial technology assets, and also has a positive view toward the online platforms. The other group (which tends to be older and less educated) is largely disconnected from the world of digital tools, and also has a negative view toward the online platforms. The research data were collected by using the Cognitive Flexibility Scale, Inferiority Feeling Scale, Attitude Scale for Social Media and Technology Usage, and face to face interviews. There were significant differences between age groups and education levels on Inferiority Feeling Scale and Attitude Scale of Media and Technology Usage. Older age group scored less than younger age group on all Attitude Scale of Media and Technology Usage subscales. As education level increased and age decreased, positive attitudes increased and inferiority feeling decreased. There was a negative relationship between inferiority feeling scale and attitude scale. In addition, there was a negative relationship between Inferiority Scale and Cognitive Flexibility Scale. Inherent resistance to learn new technology play some role in elderly population for being less able to learn new technology. There are psychological reasons as well as cognitive and physical reasons underlying the resistance of older people to use technology as successful as young people. We can find technological and psychological solutions to eliminate psychological reasons.
ECOPSYCHOLOGY AS A NEW PERSPECTIVE IN BALANCING THE INTERRELATION OF HUMAN PSYCHE AND PLANETARY WELL-BEING

Kleio Apostolaki
International Ecopsychology Society (Chania, Greece)

Marcella Danon
International Ecopsychology Society (Cascina la fura, Italy)

The anthropocentric nature of Psychology has misled the role of natural environment, leading psychoanalysts in their later writings, such as Jung, to emphasise the role of Nature in their writings and the negative consequences of the loss of connection of human with nature in human psyche (Sabini, 2008). The theory of Biophilia as the “innately emotional affiliation of human beings to other living organisms” (Wilson, 1980) has presented and Ecopsychology in 1993 has been introduced, as a proposal of direction of Psychology worldwide in order to include Nature as a cooperator and counsellor to individual and planetary well-being (Roszak, 1993). In this presentation, an increasing body of research will be reviewed, especially from the area of environmental psychology but also from the practice of exposure to Nature from multiple disciplines. These demonstrate how contact with natural environments can enhance positive affect; (Ulrich and Simons, 1986) and benefit the treatment of mentally ill (Levitt, 1991). The role of Nature in Mental Health will be explored and how the techniques of psychotherapy from different perspectives can be used in A numerous of positive outcomes of the reviewed researches lead us to conclude how the “greenish” of Psychology is important to fill the gap of the Nature deficiency in the Science of Psychology and the need of Ecopsychology can be central in supporting ideas within counselling and psychotherapy which position Nature as fundamental to revitalising and reconnecting humans within a reciprocal healing relationship to Nature (Jordan, 2015). Even though there is a numerous research on the field of natural approaches in human well-being and therapy, the field of Ecopsychology it is characterized by a transdisciplinary approach that makes it suitable to stimulate and consolidate the creation of a peculiar methodology, to be applied in many different operating areas not only therapeutic, but also educational, organizational and recreational, to promote environmental awareness starting from a psychological — individual and in group — work.
TYPOLOGY OF INDIVIDUALITY: PROBLEMS AND SOLUTIONS

Alexey Kalugin  
Perm State Humanitarian Pedagogical University (Perm, Russia)

Elena Volkova  
Institute of Psychology RAS (Moscow, Russia)

There are two well-known opposed strategies for exploring individuality. The first strategy (probabilistic) is based on the uniqueness of each person. The second (essential) comes from the philosophy of Plato in explaining individual differences through emphasizing the priority of qualitative differences over quantitative ones, through typology. It is important that these types were obtained empirically and reflected the originality of different levels of individuality, i.e. would be external and internal manifestation of the generalization of multi-level properties of individuality. The study is to identify these types of individuality. Participants of the study were Russians. 1100 persons aged 18 to 31 years (73% female) were recruited. A complex of methods revealing the multi-level properties of individuality was used: temperament, fundamental personality traits, character traits, intelligence, cognitive styles, motivation, value, spiritual abilities, and personality values (81 indicators). Statistical processing techniques of empirical data included descriptive statistics; principal component analysis (PCA, Varimax; scree plot), hierarchical cluster analysis (Ward’s method, Euclidean distances), one-way ANOVA (Scheffe post hoc test). PCA allowed us to reduce 81 variables into 4 main components explaining 38.4% of the variance of the primary scales. The first factor characterizes the spiritual and value component of the individuality, the second factor reflects the emotional component, the third factor unites the intellectual and motor activity, the fourth factor – the communicative activity. Based on HCA, we identified four groups of respondents that differ in these integral indicators. The significance of group differences was confirmed (ANOVA). The first type included non-adaptive respondents with low hardiness and motivation that tend to seek social support in difficult life situations. The second type unites persons with more expressed psychotic traits, excitability, low level of meaningfulness of life, intelligence, and value of family and profession. When they face the problem they ignore it. The third type is represented by emotional, stuck respondents, who prefer shutting other people out in difficult life situation. The fourth type covers active respondents with a high level of hardiness, spirituality, meaningfulness and value of life. They try to work hard and solve any problem. The study was supported by RSF grant (project № 18-18-00386), Institute of Psychology RAS.
DYADIC COPING AND PSYCHOLOGICAL WELL-BEING IN THE DYAD OF PARTNERS WITH DISABILITIES

Natalya Shipova
Kostroma State University (Kostroma, Russia)

The stressfulness of the modern world raises the question of coping in a pair. The understanding of dyadic coping is based on the research of G. Bodenmann, T.L. Kryukova, E.V. Kuftyak. Objective: to study dyadic coping in the dyad of partners with disabilities. Methods included test scales, projective techniques, interviews. The sample consisted of 15 pairs, where one of the partners has a disability (mainly disorders of the musculoskeletal system), and the second — the normative development (M = 36.5 years). Main results: delegated coping is more pronounced in the group of partners with typical development than among partners with disabilities (U = 23.5; p = 0.045). Significant differences were also found on the health status scale: there is a high degree of satisfaction (U = 29 with p = 0.047) among partners with regulatory development (M = 15.89; SD = 2.67) compared with disabled partners (M = 15.89; SD = 2.67). The cohesion of a couple for partners with disabilities is determined by communication during stress (R = 0.95; R² = 0.89, β = 0.44; p = 0.002) and own delegated coping (R = 0.95; R² = 0.89 , β = 0.73; p = 0.00004). The adaptation of the dyad is influenced by the communication of partners during stress (R = 0.79; R² = 0.63, β = 0.79; p = 0.001). At the same time, for partners with a typical development, cohesiveness of the couple is affected by negative coping of the partner (R = 0.94; R² = 0.87, β = 0.86; p = 0.01), total dyadic coping (R = 0.94; R² = 0.87, β = -1.36; p = 0.006) and its estimate (R = 0.94; R² = 0.87, β = 2.13; p = 0.002). Thus, cohesion and adaptation of the dyad are influenced by different strategies of dyadic coping, and there are also significant differences in the preferences of dyadic coping strategies depending on the presence of disability among partners. We assume different roles and styles of coping partners in a relationship depending on the state of health.
SENSITIVITY AND ITS CONNECTION WITH PERSONAL TRAITS

Regina Ershova
Ekaterina Yarmotz
State University of Humanities and Social Studies
(Kolomna, Russia)

Aron and Aron (1997) developed the Highly Sensitive Person Scale (HSPS) to measure individual differences in sensory-processing sensitivity (SPS). The purpose of the present study was the psychometric evaluation of the Russian version of Highly Sensitive Person Scale (HSPS, Aron & Aron, 1997) and to investigate how sensory processing sensitivity (SPS) is related to personality traits of energy; outgoingness; conscientiousness; emotional stability; openness to new experience and to pupillometry parameters. 860 respondents participated in the study: 350 undergraduate university student volunteers (117 males, 233 females, average age 18.2 and 510 social media users (380 females, 130 males, average age 22.6. Results did not confirm the initial linear model of the construct (Aron & Aron (1997), nor the three-factor solution described in British and American studies. The hierarchical cluster and confirmatory analyses employed for the operationalization procedure suggest that sensory processing sensitivity (SPS) can be described in a two-factor model consisting of 'Ease of Excitation' and 'Low Sensory Threshold' subscales. The result showed than SPS is negatively connected with stability, dynamism and persistence. With respect to pupillometry, the results showed that low threshold of sensitivity may be connected with the length of the parasympathetic phase, the depth of reaction and activity of the pupil contraction phase, emotional instability, agitation at the start of reaction.

DIGITAL TECHNOLOGIES IN THE LIGHT OF THE CULTURAL AND HISTORICAL THEORY

Regina Ershova
Tatiana Koryagina
State University of Humanities and Social Studies
(Kolomna, Russia)

Every year, the changes that occur in the cognitive, emotional, motivational, spheres of children and adolescents are becoming more distinct. What is the reason for this kind of transformation? The Russian psychological tradition explain this transformation as a result of an interaction between a human being and its cultural environment. The study of 350 students showed a decrease in working memory, psychological well-being, changes in the time perspective balance, and emotional stability in Internet addicted students. In addition, it was shown that the idea of technical talent and multitasking of the generation Z is overvalued.
THE EVALUATION OF A SCIENTIFIC AND TECHNOLOGICAL DIVULGATION ACTIVITY IN AN ADOLESCENT SAMPLE IN SPAIN

Silvia Ubillos Landa

University of Burgos (Burgos, Spain)

Ana Victoria Pérez Rodríguez
Fundación Centro de Estudios para la Ciencia, la Cultura Científica y la Innovación 3CIN Gerente (Salamanca, Spain)

Cristina González Pedraz
Fundación Centro de Estudios para la Ciencia, la Cultura Científica y la Innovación 3CIN Investigadora (Salamanca, Spain)

Alicia Puente Martínez
University of the Basque Country (San Sebastián, Spain)

This study presents the evaluation of a community and scientific divulgation activity (Hiperbaric Challenge, HC) conducted in Spain aimed towards improving the scientific attitudes, opinions and vocation in secondary education students. The program was carried on using the Responsible Research and Innovation perspective (RRI) along 2018. It included the design and construction of an inertia car by students who later participated in a public and competitive car race event. The first aim was to test gender differences in attitudes, values and open science. Second, this study evaluated the efficacy of the divulgation activities using the RRI perspective. A cross-sectional design was used to test the differences by sex (N= 277, men: n=168 and women: n=104). The mean of age was 17.05 years (DT=3.49; ranged from 12 to 41). Then, 37 participants participated in the car race event. Thus, a repeated measure pre/post-test design with an experimental and equivalent control group (37 participants per group, 36 men and 1 woman) was used to evaluate the efficacy of the Program. The responses were collected via online. Results indicated that men showed higher interest for scientific and technological issues, crafts and machines, scientific vocation, competitiveness for personal development, values and strengths and communicative skills than women. However, there were no differences in knowledge and opinions towards science and technology, attitude towards open science, labour creativity, competitiveness by objectives, cooperative learning, and in teamwork abilities by sex. Regarding to the second objective, change scores (post-pre) showed that intervention had a positive impact on scientific and technological students’ knowledge and opinions, personal attitudes, and attitudes towards open science. The program also increases creativity, the interest for handmade activities, the personal development competitiveness, the cooperative learning and group integration. In conclusion, in general men present more interest for scientific and technologic activities than women. The efficacy of the Hiperbalic Challenge program has been confirmed. After the instruction, the scientific and technological knowledge, attitudes and scientific opinions increased, demonstrating the RRI perspective is fundamental in the future to be able to work on educational systems.
Dating violence has become more visible in the last decade, mainly due to its high prevalence. Moreover, young people often deny having been assaulted by their partner, only until they reach physical aggression. This phenomenon is closely related to the sociocultural constructions of gender roles that shape the dynamics of violence among young couples. The aim of this study is to explore the psychosocial factors associated with dating violence in university students, and compare their relative weight in two Latin American countries. The present cross-cultural study implemented mixed methods design. In the first place, we conducted a quantitative study among students from Chile (N = 335) and from Peru (N = 465). Subsequently we performed interviews with informative sampling in order to explain variations in outcomes (6 in-depth interviews with students). In general, our results yielded surprisingly low levels of reported violent behaviours among participants from both samples, Chile and Peru. Moreover, we confirmed that, at a quantitative level there were significant differences between men and women in terms of reporting more physical violence, detachment and sexual violence. Gender stereotypes, ambivalent sexism, negative family atmosphere and negative self-esteem, would act as risk factors associated with the presence of dating. On the other hand, trust, communication skills, autonomy and positive self-esteem were identified as protective factors. These findings coincide with the thesis that those who share traditional believes about gender roles and maintain relatively negative vision of themselves, are more likely to engage in violent behaviours. The results of the present investigation point to the existence of similarities in the patterns of results obtained in both countries. However, the low prevalence of violence in university samples is striking. This may be due to the contextual factors of the prevailing culture that affect the normalization of violent behavior or the specifics of the university samples characterized by maintaining relatively more fair relations of courtship. It is proposed for future research to deepen the phenomenon of unseemly abuse in dating relationships, in order to contrast how the levels of violence reported in previous studies are permeated by social desirability.
The vast majority of previous studies on the lexicon of individual differences were focused only on dispositional traits and adjective lexicon. The purpose of the present research was to discover: 1) the structures of the Polish lexicon of emotional states; 2) the relationship between emotional states and personality. Eight judges selected 27,819 personal descriptors (adjectives, participles, nouns and verbs) from the unabridged Universal Dictionary of Polish Language (100,000 entries). The selected person-descriptive terms were classified by thirteen judges, according to the taxonomy proposed by Angleitner et al. (1990), resulting in 1,219 descriptors of emotional states. After morphological, semantic and familiarity analyses this list was reduced to 322 descriptors and was used in self-rating study (N = 404). A principal component analysis revealed a five-factor structure of the Polish lexicon of emotional states: four factors described the content, and one described the intensity of emotions. This structure was correlated with a six-factor structure of the personality lexicon and previous taxonomy of emotional states. Research shows the connection between emotional states structure and structure of personality measured by HEXACO and Polish Big Six. In HEXACO analysis it was found that Agreeableness has negative correlation with Rage and Emotionality has positive correlation with discovered emotional factor named Empathy. Moreover, the positive connection between Extraversion and Arousal was found. Similar results were found after comparison between discovered emotional factors and Polish Big Six. Extraversion is correlated with Arousal; Neurotism with Anger and Agreeableness with Empathy. Research shows not only the new lexical structure of emotional states but also the link between this structure and personality.
COMMUNITY RESILIENCE IN CONTEXTS OF COLLECTIVE DISADVANTAGE: RESTORING SUBJECTIVE AND SOCIAL WELL-BEING

Anna Wlodarczyk
Catholic University of the North (Antofagasta, Chile)

University of the Basque Country (San Sebastián, Spain)

Resilience has aroused a growing interest in recent decades. As its next step in theoretical and applied progression, the stress and coping researchers should attempt to advance conceptual definitions of Community Resilience and to offer assessments instruments which could adequately evaluate it in different contexts of collective disadvantage. We propose that Community Resilience could be operationalized as a capacity of a community or system to cope with collective adversities, to regulate collective emotions, and to make adequate use of community resources and social capital, in order to foster collective efficacy. First, we developed a 51-item version of the Community Resilience scale composed of 23 attributes grouped in the 3 dimensions (Kappa $K = .866$, $p < .05$; 2 judges, 23 pairs of observations) and evaluated the content validity of the scale following the V of Aiken procedure ($V < .70$). In the next step, we administrated both the full 51-item version and a reduced 12-item version. The administrated a questionnaire containing these and auxiliary measures in 3 different samples from 2 countries (Argentina: $N_1 = 480$ and $N_2 = 957$ and Chile $N_3 = 196$). The results indicated adequate reliability indices for both versions and in all the 3 samples. Confirmatory Factor Analysis confirmed that the measure we used to evaluate Community Resilience was composed by three dimensions: Emotional Regulation, Social Capital and Collective Efficiency. Moreover, by the means of cross-validation procedure we established configural and metric invariance between the two countries. Regarding convergent and divergent validity, we found positive and significant correlations with Communal Mastery, Social Integration, Social Well-being and Positive Socio-Emotional Climate, and rather low correlations with individual resilience. This research attempted to identify the ways to promote community resilience with the purpose of empowering communities and generate sustainable social change.
EMBODIMENT OF EMOTIONAL WORDS IN FIRST AND SECOND LANGUAGE

Olga Marchenko
Moscow State University of Psychology and Education
(Moscow, Russia)

Nikita Guryanov
Humboldt-Institut (Berlin, Germany)

Approach and avoidance are the two most essential motivational states, which are activated in evaluating of incoming stimulus as good or bad. Such evaluation automatically produces a readiness for approach or avoidance behavior. It has been shown, that negative emotion induces avoidance behavior (for example, to produce arm extension), relative to an approach behavior (for example, to produce arm flexion) (Chen, Bargh 1999, Hengstler et al. 2014). As approach and withdrawal motivational system is something fundamental it can be hypothesized, that there no matter if the native or foreign language is used, it will be anyway activated. From another hand there are studies showed that a foreign language provides greater emotional distance in comparison to the native language (Pavlenko 2012). Thus, the aim of the study was to determine the degree of an embodiment of the affective terms in native and a foreign language. Fifty-eight native Russian speakers (13 men) aged 18-24 (m=20, SD=1,4) participated in the study. Same words with positive and negative valence were used in Russian and in the English language. In congruent condition participants were asked to click the key "unpleasant" on the upper side of the screen by a mouse (moving the hand away of the body) or pleasant on the downside of the screen by mouse (moving the hand toward the body). A position of keys was reversed for incongruent condition. The frequency of hand movements in opposite to the correct key direction was greater for incongruent condition (moving the hand toward the body) than in congruent condition (moving hand away of the body) for negative words in the native language (Chi-square=7.694, p<.01) as well as in foreign language (Chi-square=9.812, p<.001). According to these data, one can suggest that there are signs of the embodiment of a native language as well as a foreign language. Even using foreign language while extracting meaning, human perform an appropriate action involuntary as a certain attitude is actualized. The study was supported by RFBR, project № 17-36-01131.
IMPACT OF A HIV / AIDS PREVENTION PROGRAM USING FEATURE FILMS

Agnieszka Skorupa
Michał Brol
Anna Pyszkowska
University of Silesia in Katowice (Katowice, Poland)

Although a lot has been done all over the world in the area of HIV / AIDS prevention, further actions are still required. According to UNICEF, by 2030, the number of new HIV infections among adolescents will increase by almost 60% (Korndoerfer et al., 2011). Scientific articles and reports has shown some proves that films can increase efficiency of prophylaxis actions (Herrman, Moore, Becky, 2012). We have conducted a series of an interactive workshops dedicated to junior high school and high school students on the prevention of HIV / AIDS using elements of psychological work with the movies. One of the main assumptions of the project was the implementation of peer education — the project coordinators involved psychology students who were trained to conducted workshops at schools. A total of 586 students participated in the workshops. They were filling up knowledge test and attitude toward people with HIV/AIDS test before and after the workshop. The demographic variables and the empathy level were also controlled. Three films were used during the workshop: "Girl, positive" (N = 375), "Dallas Buyers Club" (N = 206) and "Philadelphia" (N = 78). There were statistically significant changes in attitudes towards people with AIDS and those infected with HIV, as well as, the increase in the level of knowledge about HIV and AIDS in each of the three groups. Stigmatizing attitudes (Z = 15.44) and negative judgments about patients have been reduced (Z = 12.81). There was an increase in fear of infection (Z = 9.34). It has also been shown that emphatic care (b * = − 0.29, r2 = 0.08) and the ability to take on the perspective of the other person (b * = − 0.28, r2 =0.08) are the significant predictors of lower stigmatization. The results shows that feature films can be an effective tool in HIV/AIDS prevention. The final step of the project was the conference for teachers who were trained during the event how to conduct their own classes with the use of program scenario.
IDENTITY EFFECTS IN DIGITAL RESOCIALIZATION

Madrudin Magomed-Eminov
Ekaterina Karacheva
Olga Kvasova
Olga Savina
Lomonosov Moscow State University (Moscow, Russia)

Process of resocialization acquires permanent life-span character. Identity is considered as incomplete transient, a project and not the final result of socialization. Purpose of the study. Analyze identity transformations in re-socialization under the influence of digital technologies, which appears to become one of the promising areas for the study of identity effects. Research design included two series: 1) comparison of real and virtual identity and changes occur, 2) identity transformation of young people involved in Japan culture. Content and narrative analysis of adolescents’ Internet blogs, pages in social networks, original questionnaire for socio-cultural changes influenced by mastering a different culture, “Who am I?”. A survey included 790 people, 185 in first series, 605 in second. Study shows the difference (p<0.05) in teenagers’ views of identity in real and virtual world: self-categorizations: girls more often than boys use objective criteria in estimating their image in the eyes of Internet friends (rs=-.446); between the presence of objective categories in answers to “I’m in real world?” and “I am online?” (rs= .452), subjective and objective answers to “I’m in Internet?” (rs= -.447). The 2-d series: 3 types of identity transformation were demonstrated: with positive effects of transformation, neutral and negative. Positive — featured by expansion of communications, culture interests, positive goals and spiritual values. Neutral — perseverance to solve their own life tasks with means of other culture for better adaptation. Negative associated with declined interests, low academic performance, asocial behavior, alienation from customary values of his culture. Significant differences (p<0.05) between positive and neutral, as opposed to negative in terms of prospective and retrospective time orientation. Positive and neutral group accepts values of different culture and builds future prospects associated with it, without rejecting values of its culture both in present and in the past; negative — perceives negatively the past associated with customary culture and does not see prospects in future with preferred culture. Modern information digital technologies create opportunities for re-socialization, allowing to overcome the space-time and sociocultural constraints, as well as to increase marginalization. (appropriating values of another culture, not accepting them).
DEVELOPMENT OF THE SCALE OF CAREER SUCCESS AND PROFESSIONAL SATISFACTION OF DANCERS

Maria Aleksandrovich
Pomeranian Academy in Slupsk (Slupsk, Poland)

Herbert Zoglowek
UiT The Arctic University of Norway (Alta, Norway)

We based our research on the idea, that career is "the individually-perceived sequence of attitudes and behaviors associated with work-related experiences and activities over the span of a person’s life." (Hall, 1976; p. 4). Success is the sum of various successes in certain social roles such as husband, boss, father, friend or part-time as a success that achieves a person in a particular field, for example, a career, advancing, being a valued manager (Maxwell, 1994). The intrinsic factors of success (sense of responsibility, need to achieve something, self-esteem, individual development, joy from the work) then the extrinsic ones (wealth, influence, status, material accomplishment) (Eith, Harald & Claudia, 2011). The intrinsic factors of success in professional dance career are: love to the art of dance; ambition, which motivates a dancer; work ethic, which helps a dancer to achieve his/her goals; self-awareness, which allows a dancer to reach new career levels; knowledge seeking, which makes a dancer open for new experiences. The extrinsic factors of success in professional dance career are: full-time employment of a dancer at a national or international dance company; leading role(s) performance; highest ranking of a dancer in a company; finalist or winner at national or international level dance competition; dance talent recognized for by national or international organization (Chua, 2015). Data collection was carried out online (pilot study 2016-2017; validation 2017-2018). A link to the questionnaire was posted on the most popular dance forums and Facebook. The sample consists of 107 professional dancers (83 female, 24 male; Mean Age = 25,09). Statistical analysis was done in SPSS Statistics v. 23 (descriptive statistics, exploratory factor analysis). The final form of the scale consists of 20 items/5 factors (Professional success; Satisfaction from being a professional dancer; Satisfaction from professional collaboration; Health satisfaction; Satisfaction from family life). The aim of the present study was to gain deeper knowledge of and to operationalize the success and satisfaction in dancing. Consequently, the Scale of Career Success and Professional Satisfaction of Dancers (SCSPSD) was developed and proved to be a reliable tool to assess the professional satisfaction of dancers.
THE METHODOLOGICAL QUALITY OF META-ANALYSES IN BEHAVIORAL AND SOCIAL SCIENCES: LEADS FOR ENHANCEMENTS ACCORDING TO AMSTAR2

Victoria Leclercq
Charlotte Beaudart
Sara Ajamieh
Ezio Tirelli
Olivier Bruyère
University of Liège (Liège, Belgium)

The growing interest for evidence-based practice is leading researchers, clinicians and policy makers to search the best evidence to make decisions. In view of this, results of meta-analyses (MAs) are often used because they are lauded to provide robust evidence that synthesize information from multiple studies. However, the validity of MA’s conclusions relies upon the rigorous procedures that authors applied. Therefore, this meta-research study aims to characterize and review the methodological quality and meta-analytic practices of MAs published in the field of behavioral and social sciences. We evaluated a random sample of 207 MAs indexed in PsycINFO database in 2016. Two authors independently extracted methodologic characteristics of all MAs and checked the presence of the 16 items of AMSTAR2 (A MeaSurement Tool to Assess systematic Reviews 2). AMSTAR2 is a tool developed by Shea et al. in 2017 to assess the methodological quality of MAs that classifies them in 4 categories: critically low, low, moderate and high. In our sample of 207 MAs, the rating overall confidence of 196 (95%) MAs was critically low and only 3 (1.5%) was moderate or high according to AMSTAR2 criteria. It was found that the choice of statistical methods was appropriate in 87% of the cases and the publication bias was well evaluated in 70% of the MAs. However, much improvement is needed in data collection and analysis. Indeed, we found very few published research protocol (only in 11% of the MAs), a lack of comprehensive literature search strategy (in 44%), insufficient assessment and interpretation of risk of bias in individual studies included (in 37% and 29% respectively) and rare presentation of a list of excluded studies (in 11%). According to AMSTAR2 criteria, the methodological quality of MAs of our sample was critically low with many serious flaws. The weaknesses identified in this study refer to a lack of consistency in the method used to perform meta-analyses in behavioral and social sciences. If some critical items identified with AMSTAR2 were given more consideration, the published MAs could make a leap in methodological quality and thus gain in robustness and reliability.
HELPING OURSELVES TO HELP OTHERS: ANALYZING CONFLICTS IN NPOS FROM VOLUNTEERS AND PAID STAFF PERSPECTIVE

Lourdes Munduate
Rocio Lopez-Cabrera
Alicia Arenas
Francisco Medina
University of Seville (Seville, Spain)
Martin Euwema
Catholic University of Leuven (Leuven, Belgium)

Nonprofit organizations (NPOs) are identified by the importance of working towards a mission based on common values and commitment as well as for their organized structure, non-profit distribution, self-government and voluntary character (Etzioni, 1993; Salomon & Anheier, 1997). Indeed, the coexistence between volunteers and paid staff justifies the need to study which conflicts exist in this sector (Studer, 2016). However, although some conflict examples between volunteers and paid staff have already been described (McDuff, 2011; Pearce, 1993) for our understanding, a theoretical framework to study conflict in this sector is still missing (Bendersky & Hays, 2012, Jehn, 1997, Jehn & Mannix, 2001). This study analyzes the existing conflicts in a NPO organization, applying the traditional typology of organizational conflict, as well as its causes, considering the perspective of volunteers and paid staff. To this aim, the analysis of how power influences the conflict types observed by these collectives will be also taken into consideration. Following a semi-structured interview design seven homogeneous focus-groups discussions, formed by 8 to 10 key informants each, were organized at the regional base of a NPO in Madrid. A total of 60 participants (35 women, 25 men) took part in this activity. Verbatim transcripts were analyzed using the Atlas.ti program (v.7.5.2), following the template analysis as a methodological strategy (King, 2004). Results confirmed the existence of task, relationship, process and status conflicts. Four specific sources of conflict were identified: a) work overload; b) decision making processes; c) resources and work dynamics and d) emotional discomfort and stress. Paid staff and volunteer’s interaction are a main source of conflict due to their different perspectives regarding their responsibilities and who should have the power to make relevant decisions. New changes in NPOs dynamics, where “managerialism” is growing (Kreutzer & Jäger, 2011), by means of introducing administrative procedures as well as power imbalance perceptions are provoking uncertainty and distrust among different collectives and hierarchical levels. These changes, together with an increase in administrative duties, which are not considered a priority by either local paid staff or volunteers, promote conflicts and decrease commitment and motivation while intention to leave is increasing.
PHOBOS AR. AN EXPERIMENTAL STUDY ON THE POTENTIAL OF AUGMENTED REALITY FOR ANIMAL PHOBIA TREATMENT

Tom Van Daele
Thomas More University of Applied Sciences (Antwerp, Belgium)

Fernando Tarnogol
PsyTech LLC (Buenos Aires, Argentina)

The use of augmented reality (AR), which aims to merge virtual elements into the view of the physical world, has become increasingly mainstream, in particular for entertainment purposes. Similarly to the long-standing tradition of virtual reality exposure therapy, applications in clinical practice are also starting to emerge, mostly in the context of the treatment of specific phobias. This study aims to explore the potential of a first, markerless smartphone application that could have potential for the treatment of animal phobias. Our aim was to evaluate whether the iOS application ‘Phobos AR’ could elicit feelings of anxiety in a non-clinical population, when performing behavioural approach tasks (BATs). A second goal was to explore whether means of delivery (iPhone versus iPad) had an impact on self-reported anxiety severity. One hundred eleven first-year students of applied psychology were exposed to one animal of their choosing (options: rat, pigeon, snake, cockroach, spider, frog and dog) for which they reported some level of discomfort (which was however assessed as non-phobic, using the Severity Measure for Specific Phobia — Adult questionnaire). Students were randomly allocated to either smartphone (N=55) or tablet (N=56) condition, after which they ran through three 3-step BATs of increasing intensity. Since all participants were not phobic of the chosen stimuli, not standard BAT-outcome of the total amount of steps taken before ceasing exposure was of interest, but the reported anxiety during each of the different steps. Results showed a gradual increase of self-reported anxiety within each of the 3 BATs, 135.77 < F(2, 220) < 185.37, ps< .001, and a significant increase of self-reported anxiety between the first (M=.98, SD=1.28) and the last rating (M=4.56, SD=2.88), t(1,110) = 16.15, p<.001. No significant differences in self-reported anxiety were found between both conditions. In conclusion, this study demonstrates that an AR application is able to induce self-reported anxiety in a non-clinical population. Further research has to compare this technique to other approaches, including virtual reality and imaginary exposure and also explore its potential in clinical populations. AR does, however, seem to hold promise as a meaningful tool for the treatment of animal phobias.
LIFE AND FAMILY VALUES SIMILARITY IN INTER-ETHNIC AND INTER-FAITH COUPLES

Elena Chebotareva
Moscow State University of Psychology and Education (Moscow, Russia), National Research University Higher School of Economics (Moscow, Russia)

Intercultural families are the integral part of modern society, important institution of mutual influence of different cultures, of person’s identity transformation. The studies of marital adjustment and satisfaction, values and attitudes consistency in inter-cultural couples provide contradictory results. To resolve contradictions in this area, comparative studies of inter-cultural families of different types are important. The aim of the study was comparative analysis of life and family values in inter-cultural couples, differing by ethnic and religious affiliation of spouses. The participants: 138 people (69 couples) — 20 mono-ethnic Russian, 30 — inter-ethnic, interfaith (women — Russians, Orthodox, men — Arabs, Muslims); 19 — inter-ethnic, with a common religion (wives — Russian, husbands from the Transcaucasian region, Christians). The age was 23 — 47 years old (M = 36), the marriage experience was 3 — 24 years (M = 6.3). The main methods: S. Schwartz “Value Survey”, “Marital Role Expectations and Aspirations» (Volkova), Marital Satisfaction Test (Stolin, Romanova, Butenko), descriptive statistics, Mann — Whitney U- test, paired T-test. In inter-cultural couples, the spouses’ life values coincidence is significantly less strong than in mono-cultural ones. But in couples with common religion differences in life values reflect not so much the contradictions, but the complementarity of traditional gender values. There are also much more differences in family values and family role attitudes in inter-cultural couples than in mono-cultural ones. Common religion in the inter-ethnic couples contributes to greater satisfaction with marriage and greater consistency in the spouses’ estimations of their relationship. In inter-faith couples, marriage satisfaction is the lowest, but the degree of agreement between spouses is higher than even in mono-cultural couples, which indicates more open communication. Thus, the different cultures of spouses (both ethnic and religious) optimizes the process of comparing values and family attitudes. Despite a number of difficulties, spouses from inter-cultural couples in general have more consistent ideas about their family life. The results can help to understand better the mechanisms for the implementation of cultural and personal values in family relationships, the processes of adjustment in intercultural couples, and to develop effective methods of psychological assistance to such couples.
GROUP AND INTERDEPENDENCE PSYCHOLOGY HEALTH: THE PERFORMANCE’S PERSPECTIVE

Cholichul Hadi
Ilham Nuralfian
Samian Samian
Airlangga University (Surabaya, Indonesia)

Fattah Hanurawan
State University of Malang (Malang Indonesia)

The value systems group underlying competitive, individualistic, and cooperative situations exist as a hidden curriculum beneath the surface of school life. This hidden values curriculum permeates the social and cognitive development of children, adolescents, and young adults. Each type of interdependence has a set of values inherently built into it and those values determine whether diversity is viewed as positive or negative. When a situation is structured competitively, individuals work against each other to achieve a goal that only one or a few can attain (Johnson & Johnson, 1989). Individuals’ goal achievements are negatively correlated; each individual perceives that when one person achieves his or her goal, all others with whom he or she is competitively linked fail to achieve their goals. Thus, individuals seek an outcome that is personally beneficial but detrimental to all others in the situation. Psychological health is the ability to develop, maintain, and appropriately modify interdependent relationships with others to succeed in achieving goals; to manage social interdependence, individuals must correctly perceive whether interdependence exists and whether it is positive or negative, be motivated accordingly, and act in ways consistent with normative expectations for appropriate behavior within the situation. The method used quantitative approach with experimental factorial combined Research and Development (R&D) design. Four studies have directly measured the relationship between social interdependence and psychological health. The sampling technique that was used in this research was multistage sampling. The samples studied included 98 students of Psychology Faculty in Universitas Airlangga. The findings result indicated that: (a) working cooperatively with peers and valuing cooperation result in greater psychological health than does competing with peers or working independently; and (b) cooperative attitudes are highly correlated with a wide variety of indices of psychological health, competitiveness was in some cases positively and in some cases negatively related to psychological health, and individualistic attitudes were negative related to a wide variety of indices of psychological health. Based on theoretical review, and previous findings it could be hypothesized that the interdependence could improve group performance especially psychological health.
CORRELATION BETWEEN SOCIAL ACTIVITY AND BASIC NEEDS SATISFACTION IN YOUNG PEOPLE

Rail Shamionov
Saratov State University (Saratov, Russia)

Social activity of young people is multidirectional. Adherence to a certain type of activity is conditioned by various socio-psychological phenomena. In accordance with Deci & Ryan’s concept (1985; 2002), realization of basic needs (autonomy and competence) has a direct, positive influence on the subject’s internal motivation for activity. However, their influence on specific types of social activity has not been studied. Such scientific knowledge can help to understand internal determination of social behavior. Presupposition of the importance of basic needs satisfaction factor in adherence to certain types of young people’s social activity. 305 people took part in the study M=21.1 SD=3.1 (35.4% male). The questionnaire aimed at evaluation of inclusion into various types of social activity, the Basic Needs Satisfaction in General Scale (Johnston M.M., Finney S. J., 2010) have been used. The purpose of the study was to study the correlation between characteristics of psychological well-being and adherence to social activity of the youth. Inclusion into various types of social activity is determined by various indicators of basic needs satisfaction. Satisfaction of the need for competence is the most important one for various types of activity (leisure, civil, socio-economic, educational, developmental and spiritual). Leisure activity is associated with satisfaction of all basic needs (in autonomy, competence and interrelation with others). Protest and radical protest activity are negatively related to satisfaction of the need for autonomy and competence. It was concluded that the experience of self-efficacy, the ability to solve various existential tasks is the main factor for a number of types of social activity. It is positive for the most common and prosocial types and negative in the case of protest types of activity. A high subject position (autonomy) is more clearly manifested in those who implement leisure and religious activity, and less clearly in individuals who implement protest activities. The research results can be taken into account for risk management of young people’s social activity. The study was funded by the grant of the Russian Scientific Fund (project № 18-18-00298).
Meaning is defined as an understanding of the life, established in line with the beliefs, values, and objectives of the individuals. Many research recently revealed that the existing meaning, assumptions, and beliefs are violated after traumatic life events. However, due to there is no scale to measure this construct, Park et al. (2016) developed the Global Meaning Violation Scale (GMVS). GMVS is a 13 items tool in order to directly assess the violations to exist global meaning after traumatic life events. Therefore, the aim of the present study was to examine the psychometric properties of the Turkish form of GMVS. The sample of the study consisted of 586 (426 Female, 154 Male, 6 other) adults. Participants’ ages ranged from 18 to 60, with a mean of 26.4 (SD= 6.92). The research consisted of Socio-demographic Information Form, The Core Belief Inventory (CBI), The Stress Appraisal Measure (SAM), Depression Anxiety Stress Scales (DASS-21), PTSD Checklist-Civilian Version Scale (PCL-C), and Global Meaning Violation Scale (GMVS). The exploratory factor analysis, similar to the original scale, yielded 3 factors which accounted for 50 % of the total variance. These are ‘belief violation’, ‘intrinsic goal violation’, and ‘extrinsic goal violation’ subscales. Cronbach alpha coefficients for the ‘belief violation’, ‘intrinsic goal violation’, and ‘extrinsic goal violation’ subscales were .77, .79, and .87, respectively. The relationships between GMVS, DASS-21, PCL-C, and SAM were examined in order to evaluate the concurrent validity of the scale. There were positive and significant relationships between the GMVS subscales, depression, anxiety, stress, and PTSD symptoms. However, the subscales were differentially related to the subscales of SAM. For discriminant validity, GMVS subscales were compared with those of the CBI in terms of appraisals and distress. In addition, hierarchical regression analysis was conducted to examine the utility of GMVS. After controlling for CBI, GMVS was significantly associated with well-being outcomes of depression, anxiety, stress and PTSD symptoms. Our findings supported the reliability and validity of the GMVS in a Turkish sample. The psychometric characteristics of the Turkish version of the GMVS were discussed in light of the relevant literature.
DEVELOPING AND TESTING METHODS OF STUDYING THE FORMATION OF ETHNOCULTURAL IDENTITY IN ONTOGENY

Ludmila Shaigerova
Alexandra Dolgikh
Yuri Zinchenko
Roman Shilko
Olga Vakhantseva
Lomonosov Moscow State University (Moscow, Russia)

From the position of the cultural-historical approach, the formation of self and the development of the value system, mediated by the social environment, are the most important developmental objectives in the childhood. Under the influence of the digital society, the social environment and its impact on child development are changing. One of the most important aspects of development is the formation of ethnocultural identity in ontogeny. In order to study the formation of ethnocultural identity, a method was developed and tested. The study involved 21 children aged 4 to 13 years. Ten images were chosen: five photos of children of different ethnicity or races, and five images of positive and negative characters from popular cartoons. The cartoon characters were selected in accordance with the age and gender preferences. To assess children in photographs and the cartoon characters, some personality traits were offered: kind, cheerful, greedy, smart, etc. After looking at each picture or photograph using iPad, the child was asked to assess the children in the photographs, the cartoon characters, and themselves (“me”) from the point of view of all the proposed traits. The discursive analysis showed that the selected stimulus material (cartoon characters) corresponds to the preferences of preschool and primary school children and younger teens. It evoked interest in children and made it possible to identify and evaluate the cartoon characters, the children in the photographs and the self. The results show that this methodology corresponds to the goal of identifying sensitive periods in the formation of ethnocultural identity. It also makes it possible to consider the psychological formations and the leading activity in the preschool and school periods, as well as the characteristics of the development of modern children under the influence of the digital society. The method requires further refinement, considering the influence of the emotions demonstrated by the children in the photos on the attribution of personality traits to them. In addition, a bigger sample will allow not only a qualitative but also a statistical analysis of the results. The research was supported by the Russian Science Foundation (project No 15-18-00109).
EXPLORING UNIVERSITY LECTURERS’ EMOTIONAL INTELLIGENCE NEEDS IN MANAGING WORKPLACE CHALLENGES

Eucharia Chinwe Igbafe
University of South Africa (Pretoria, South Africa)

This study investigated how Nigerian university lecturers cope with challenges posed to their emotional intelligence. The objectives of the study were to explore, to identify and describe the experience and impact of workplace challenges on university lecturers. A phenomenological/qualitative research approach was employed. The sample comprised 24 lecturers who were teaching staff at universities located at South-South and South-East geopolitical zones of Nigeria. The sampling method employed was non probability, purposive sampling. The data collection through semi-structured individual interviews on three occasions occurred in the course of two years. Informed consent was sought from the selected lecturers and interviews were audiotaped, transcribed and analyzed with the support of Atlas ti software. Emotional Intelligence was examined according to the narrated experiences of the university lecturers. These narratives defined university lecturers’ ability to adapt, adjust and sustain themselves as an outcome of dual strategies, depending on the purpose or environmental situation. Thus, the findings indicate that positive and negative behavioural change and selective relationship; personal expectations and institutional job description outcomes (achieving the goals of teaching, research and community engagement as main job description), spiritual resilience and emotional resilience guided strategies of managing workplace challenges. Other issues that affected the application of Emotional Intelligence included emotional history (remembrance of past events with emotional significance) as well as lack of formal support from the institutions. These findings have both theoretical and practical implications. Theoretical implications reveal better understanding of issues that interfere with authentic application of Emotional Intelligence in dealing with workplace challenges. From an application perspective, the findings have implications for the institutional policy to drive inclusion of Emotional Intelligence training as academic continuing professional development to strengthen and improve the Emotional Intelligence of university staff to ensure high quality adaptability, adjustment and self-sustenance. The researcher concluded that there is a need to organize seminars and workshop at various departments through discussions to identify priority needs before institutional policy is actualized.
UNDERSTANDING SEXUAL VIOLENCE VICTIMISATION IN MIGRANTS, SEXUAL AND GENDER MINORITIES IN LIGHT OF A OTHERING BASED STRESS MODEL

Lotte De Schrijver
Ines Keygnaert
Ghent University-International Centre for Reproductive Health (ICRH)(Ghent, Belgium)

Sexual violence [SV] is a major public health issue with potential socio-economic consequences and physical, mental, sexual and reproductive health consequences. Migrants, Applicants for international protection and Refugees [MAR] are highly vulnerable to SV victimisation, as are Sexual and Gender Minorities [SGM]. This study aims to identify common vulnerabilities for SV victimisation in both groups and to understand the underlying mechanisms in order to build an integrative and intersectional theoretical model. A critical interpretive synthesis [CIS] was applied to analyse peer-reviewed and grey literature on SV in SGM & MAR in the areas of public health, social science and sexual rights and policies. Through an inductive and interpretative combination of findings on SV from different approaches and study fields, a CIS allows to understand phenomena and to construct a new coherent theoretical insight. By categorising and interpreting the identified vulnerabilities, consequences of SV and barriers for seeking help upon SV victimisation through a socio-ecological model, we highlight the commonalities within and differences between SGM & MAR populations on an intrapersonal, interpersonal, community and societal level. The impact of SV on the lives of MAR & SGM may be far greater than in the general population due to specific risk factors emerging from the vulnerable situation in which they find themselves. The specific vulnerabilities seem mainly related to their minority status and are often the result of experiences of stigmatisation, prejudice and discrimination. The processes and outcomes of intersectional othering based stress in these populations can be combined in a preliminary theoretical model to understand the mechanisms behind the increased vulnerability for SV victimisation in MAR & SGM. Further empirical research testing this theoretical model is key to identify how existing SV prevention strategies and care programs designed for SV victims in the general population, should be adapted to decrease the perceived help-seeking barriers for MAR & SGM SV victims. Interventions should target breaking the circle of increased SV vulnerability in MAR & SGM.
SEXUAL VIOLENCE IN MIGRANTS, APPLICANTS FOR INTERNATIONAL PROTECTION AND REFUGEES: A CRITICAL INTERPRETIVE SYNTHESIS

Lotte De Schrijver
Tom Vander Beken
Ines Keygnaert
Ghent University-International Centre for Reproductive Health (ICRH)(Ghent, Belgium)
Barbara Krahé
University of Potsdam (Potsdam, Germany)

Sexual violence [SV] is a major public health issue with potential negative socio-economic effects and physical, mental, sexual and reproductive health consequences. Migrants, Applicants for international protection and Refugees [MAR] are vulnerable to SV victimization. This study aims to review evidence on the prevalence of SV in MAR in Belgium, its possible risk factors, consequences and the help-seeking behaviour of those affected by it. A critical interpretive synthesis was applied to analyse 86 academic and 52 grey literature documents related to the topic of SV victimisation in MAR in Europe. By categorising and interpreting the identified vulnerabilities and consequences of SV and barriers for seeking help after SV victimisation through a socio-ecological model, we highlight the importance of the role played by ruling policy and funding frameworks in the matter and how interpersonal dynamics and intrapersonal processes may interplay in the continuation of SV and re-victimisation of this mobile population. Clear and comparable prevalence data on SV in MAR in Belgium are lacking. Some of many challenges identified for conducting prevalence studies on SV in this population include the lack of a clear definition of the concerned population and acts of SV that would be required to generate high-quality and comparable data. Risk factors and consequences of SV in MAR are in nature comparable to those in the general population but may have a different impact. Additionally, MAR face several barriers in finding appropriate help after SV related to cultural and languages differences, their legal status etc. SV in MAR in Europe is probably more frequent than in the general population, however representative studies confirming this hypothesis are lacking. The impact of SV on the lives of MAR may be far greater than in the general population due to specific risk factors emerging from the vulnerable situation they find themselves in. When providing care to MAR SV victims, the complexity of interplaying determinants of SV in MAR should be considered.
SEXUAL VIOLENCE IN SEXUAL AND GENDER MINORITIES: A CRITICAL INTERPRETIVE SYNTHESIS

Lotte De Schrijver
Tom Vander Beken
Ines Keygnaert
Ghent University-International Centre for Reproductive Health (ICRH)(Ghent, Belgium)
Erick Janssen
Institute for Family and Sexuality Studies (Louvain, Belgium)

Sexual and gender minorities [SGM] have been identified as a risk group for sexual violence [SV] exposure. SV can have long-lasting negative effects on well-being and physical, mental, sexual and reproductive health. This study provides a review and synthesis of research findings on the prevalence, risk factors and consequences of SV in SGM, and help-seeking behaviours after SV victimisation. A critical interpretive synthesis and review was conducted to assess the prevalence of SV in SGM in Europe, vulnerabilities and consequences of SV, and help-seeking behaviours of victims. Both peer-reviewed and grey literature on SV in SGM in the areas of public health, social science, and sexual rights and policies were included (N=125). Findings confirmed a higher risk of SV exposure for SGM, and revealed specific sexual orientation and gender identity [SOGI]-related vulnerabilities, consequences of SV, and barriers to help-seeking after SV victimization. Minority stress [MS] – resulting from SOGI-related stigma, prejudice, and discrimination – emerged as a possible mediator for increased vulnerability for SV and its consequences in SGM. Minority stress appears to increase the risk of experiencing SV in SGM, to SV having a larger and more lasting impact, and to creating barriers for victims who wish to seek help after SV. The combination of multiple-minority identities may increase the impact and probability of SV victimization. Further research is needed to help improve our understanding of the role of minority stress in vulnerability for SV in SGM and to inform the development of prevention and intervention programs addressing MS and related risk factors.
IMPACT OF RELEVANT EPISODIC EVENTS ON THE RESULTS OF IMPLICIT MEASUREMENTS OF THE ATTITUDE TOWARDS SPEEDING

Irina Plotka
Nina Blumenau
Baltic International Academy (Riga, Latvia)

Dmitry Igonin
SIA “Laterna” (Riga, Latvia)

Zhanna Vinogradova
Daugavpils University (Daugavpils, Latvia)

Vladislav Syritsa
Baltic International Academy (Riga, Latvia)

The aim of the research is to study the impact of relevant episodic events on the results of implicit measurements of the attitude towards speeding. Hypothesis: newly developed associations with the object of attitude fade out slower if they contradict the old ones, and faster if they correspond to them. Research questions. How have implicit attitudes towards speeding changed as a result of the impact of contextual factors? What influence did the context factors have on the results consistency of implicit and explicit measurements of attitudes towards speeding? Have the correlations between implicit and explicit attitudes towards speeding and personality traits changed as a result of contextual impact? How did the retest delay weigh in on? Participants: 66 drivers (37 male, 29 female) aged 20 to 67, Mdn = 40.5, driving experience from 1 to 40 years, Mdn = 15. Implicit measurements — the procedure of specially designed Self-Concept IAT to measure implicit associations related to speeding. Implicit measures based on specially designed Self-Concept IAT to measure implicit associations related to speeding. Explicit measurements — self-reported procedures: “Driver questionnaire” to measure attitude towards speeding and Cross-cultural shortened form of Zuckerman–Kuhlman Personality Questionnaire “ZKPQ-50-CC” to measure personality traits. Contextual factors: two videos: one of them with negative emotional valence, the second one—with positive emotional valence, that could affect attitudes towards speeding affectively. Experimental design “before-after” was used. After the first session of the experiment, the videos were demonstrated. Each participant watched one video. Retest for different groups was conducted either immediately, or with a one-week delay. After the impact of both positive and negative videos, some of the participants showed a tendency to change their implicit or explicit attitudes towards speeding. The correspondence of the results of measurements of implicit and explicit attributes is affected both by the context and by personal traits of participants. Artificially created contextual events affected the system of correlation links between implicit and explicit attitudes towards speeding. The correspondence of the results of measurements of implicit and explicit attributes is affected both by the context and by personal traits of participants. The effect of experimental impact immediately after viewing the videos and a week later for the positive and negative videos was different.
EYE MOVEMENT STRATEGIES IN PERCEPTION OF FACIAL ATTRACTIVENESS

Galina Menshikova
Anna Pichugina
Lomonosov Moscow State University (Moscow, Russia)

In modern studies the concept of holistic processing in face perception is actively discussed. The role of holistic processing can be measured using the face inversion effect (FIE): subjects have difficulty recognizing the inverted faces. Despite accumulating empirical evidence on this issue, some central questions remain yet unanswered. One of them concerns the impact of holistic processing on eye movement strategies during face perception. In our study we explored the influence of FIE (upright versus inverted faces) on eye movements strategies in the task of assessing facial attractiveness. Stimuli were 10 photographs (5 female and 5 male faces). For each photograph 9 modifications were created which impaired the facial attractiveness, namely the distance between the eyes or between the mouth and nose has been changed. Stimuli were presented in upright and inverted orientation for 2 seconds. Thirty two participants (17 F, 15 M, age range 18-25) were tested. Their task was to rate the perceived attractiveness of the upright or inverted faces on a scale from 1 to 9. During the execution participant’s eye movements were recorded. A repeated-measures 2x2 ANOVA with the factors orientation (upright, inverted) and attractiveness (high, low) revealed significant interaction between them (F=8.45, p<0.03). The dispersion of attractiveness scores was higher for upright faces. The eye movement parameters were analyzed for two groups with high and low average scores of facial attractiveness. For high attractive faces saccade amplitudes and peak velocities were significantly higher (p<0.01) for inverted faces. There were no significant differences in these parameters for low attractive faces. The AOI analysis showed differences in the fixation locations: fixations were concentrated on the eye and nose regions for upright faces and on the nose and mouth regions for inverted faces. The AOI patterns were similar for low and high attractive faces. These findings suggest that the holistic processing is tightly related to eye movement strategies in the task of assessing facial attractiveness. The results can be applied in automated face recognition systems, in biofeedback devises, in technologies aimed to improve cognitive rehabilitation, etc. The study was funded by RFBR grant, project №18-013-01087
As an organization defending LGBTI rights in Cameroon where same-sex behavior is criminalized, Alternatives-Cameroun have launched since 2016 a program designed to analyze and fulfill the needs of LGBTI who want to have children. The first step was a community-based study conducted in 2017 which shows that more than 80% of LGBTI want to have children and out of them, more than 80% want to have them through sexual intercourse with opposite sex. This implies and other step in the program: analyzing how they would choose their mate to have children and under which conditions would they accept to have children with the chosen mate. Methods We conducted an interview using a form where we filled information related to criteria given by participants in order to have children. We collected 22 interviews from 13 gay men and 9 lesbians. Findings Gay men would want to have children with ladies who are: preferably bisexual, beautiful, clean, full of integrity, respectful and financially stable. Lesbians on their side, would want to have children with a man who I physically attractive, tall, older, financially able and ready to care for children, and yet not involved enough in the relationship with children to claim the children as theirs. This is to make sure children would belong to them ladies. Conclusion The process of having children in such a homophobic context is still complex and risky. There are still no facility to help those gay and lesbians having children. They would need psychosocial help and technical assistance. That is the next step we are looking for. By the way, we would try to help them find, contact and negotiate with, their ideal mate in order to have children. Nothing is sure if the “requesters” would find in the community someone who accept their conditions.
FACTORS OF PERSONAL PROFESSIONAL PERSPECTIVE IN ADOLESCENCE

Sergey Molchanov
Olga Chesnokova
Svetlana Churbanova
Nikolai Priazhnikov
Yulia Starostina
Lomonosov Moscow State University (Moscow, Russia)

Professional self-determination is an important developmental task in adolescence. Fundamental social-economical changes, high social uncertainty and value heterogeneity of social attitudes in modern Russia influence on process of defining professional plans in adolescence. There is a contradiction between tendency of patriotic moods and spontaneous professional self-determination with lack of moral-value understanding of social significance of process of professional self-determination accompanied by low creative investigation of professional choices and high role of old stereotypes about professions with underestimation of their civil and moral sense. The goal of the study was to investigate value-moral and personal factors of professional self-determination in adolescence. The data consists from more than 200 subjects aged from 15 till 17 years old. The method included the following questionnaires: the esteem of personal professional perspective (author — N.Priazhnikov) (Priazhnikov, 2016), identity status questionnaire (authors — O.Karabanova, V.Orestova) (Karabanova & Orestova, 2005), moral judgments “care-justice” technique (author — S.Molchanov) (Molchanov, 2010), value questionnaire (author S.Schwarz) (Schwarz, 2015), creativity level technique (author — F.Williams) creativity assessment Williams (Tunik, 2003), tolerance to uncertainty technique (author — T.Kornilova) (Kornilova, 2010). The data was collected in group form in schools from Moscow region and province. The result analysis showed a variety of understanding of personal professional perspectives — 3 cluster groups were depicted and described. The moral-value basis of future professional choices varies too — the value of labor differs depending on preferred moral judgments and value hierarchy in adolescence. There are correlations between status of professional self-determination and “achievement” and “universalism” as important values. The tolerance to uncertainty and level of creativity also plays an important role in personal professional perspective. Some differences in professional plans between adolescents from capital and province were revealed. The study was supported by the Russian Foundation for Basic Research under the project 18-013-01067.
MORAL BASIS OF SOCIAL INFORMATION-PROCESSING MECHANISMS APPLICATION IN INTERNET NETWORKS IN ADOLESCENCE

Sergey Molchanov
Olga Almazova
Nataliya Poskrebysheva
Kirill Kirsanov
Lomonosov Moscow State University (Moscow, Russia)

Moral development of modern adolescents in Russia is realized in new social situation of development where there is open informational environment with high social uncertainty and contradictions of social values, norms and standards. The lack of real involvement of modern adolescents in cooperative activities with peers and social practices, transfer of interests and communication to virtual space arouses risks to develop inadequate understanding of moral-value relations between people. The search of new approaches to system of factors and conditions that influence for positive socialization processes in adolescence is in the focus of investigation. Our goal was to investigate moral aspects of social information-processing mechanisms application in internet networks in adolescence. The data consists of 208 adolescents aged from 13 to 18 years old, 47% boys and 53% girls. The group of techniques included the questionnaire of preferred social information-processing mechanisms application in internet networks, internet addiction technique, moral judgments questionnaire, moral sensitivity technique, moral responsibility technique. The results allowed to define 3 groups of adolescents with different types of social information-processing mechanisms application and internet addiction. The relationship between the types of social information-processing mechanisms and moral regulation, responsibility and moral sensitivity was revealed. High efficiency of social information-processing mechanism application in internet correlates with postconventional levels of moral development and partly high moral sensitivity. Preconventional level of moral development lies in the basis of low efficiency of social information-processing mechanism application in internet networking. The study was supported by the Russian Foundation for Basic Research under the project 18-013-01080.
In cases when there are more than one official languages, the linguistic component becomes an important factor in the development of ethnocultural identity. However, the influence of the native and other languages that a person speaks on the affective component of the ethnocultural identity has not been thoroughly studied yet. The participants of the study were 56 schoolchildren (age range = 15-17) who are residents of the Republic of Tatarstan, where Russian and Tatar are both official languages. 27 participants (48.2%) speak Russian as their first language, and 29 (51.8%) speak Tatar as their first language. The hypothesis about the relationship between the first language and attitudes towards native speakers and towards Russian speakers if Russian is not the first language was tested. The participants were asked to choose from a list three social affects that they have towards people speaking their own language. Then participants whose first language is not Russian chose from the list the affects that they have towards Russian-speaking people. The list was comprised of 12 social affects. Findings. The most frequent chosen affects towards native speakers in both groups were “pride” (51.8%), “trust” (41.1%) and “respect” (35.7%). Less often, such affects as “compassion” (3.6%), “shame” (8.9%) and “disappointment” (8.9%) were chosen. Special data analysis was used for participants whose first language is Tatar to check the presence of connection between the choice of affects towards people speaking Tatar and towards Russian speakers. Using the $\chi^2$ criterion, it was shown that at the tendency level there is a relationship with the affect of “pride” ($\chi^2 = 3.190; p = 0.074$). Tatar-speaking participants are significantly more likely to feel “pride” towards people speaking their native language than to Russian speakers (48% vs 22%). The results showed a relationship between the native language and social affects towards native speakers and Russian speakers, if Russian language is not their native one, thus confirming the hypothesis about the native language as an emotional component of ethno-cultural identity in the case of two official languages. The research was supported by Russian Foundation for Basic Research, grant #17-29-09167.
THE ORGANIZATIONAL CULTURE AND IS INFLUENCE ON THE INDIVIDUAL PERCEPTION OF JOB INSECURITY

Liudmila Aksenovskaya
Anna Smirnova
Saratov National Research State University after N.G. Chernishevsky (Saratov, Russia)

The theoretical foundation of the study is The Opder approach to the organizational culture. The purpose of the study is to examine the role of the type of the organizational culture into the job insecurity perception. Participants were 347 male and 178 female employees holding in a variety of job positions in a large firm nested in several groups. The measures used in the present study are: the ‘Work-Related Behavior and Experience Pattern’ questionnaire (AVEM), the Survey of Perceived Organizational Support (SPOS), Organizational Justice Scale, the Job Insecurity Scale, the Order leadership type scale. Structural equation modeling were used to test the hypothesis. It was shown that Order leadership type and type of the culture created by leaders influence on perceived organizational support, organizational justice, job insecurity. Some types of leaderships is created culture of insecurity and it is influence on the individual perception of job insecurity.
INTERGROUP ADAPTATION PLATFORM OPPORTUNITIES AND RESTRICTIONS FOR THE SOLUTION OF POLYCULTURAL ORGANIZATION PROBLEMS

Liudmila Aksenovskaya
Saratov National Research State University after N.G. Chernishevsky (Saratov, Russia)

Aleksandr V. Bulgakov
L. S. Vygotsky Institute of Psychology, Russian State University for the Humanities (Moscow, Russia)

The concept of intergroup adaptation (IGA) in organizations (Bulgakov A.V., 2007) is a management platform for a multicultural organization. The platform includes a number of socio-psychological models that have been empirically tested in real life conditions of organizations, allows them to influence various groups of employees and managers, to optimize the system of management of the organization. IGA models are built in a single design, they highlight the criteria, indicators, diagnostic methods necessary to solve a research task. Models form a complex adaptive system of organizational knowledge, reveal their capabilities and limitations. Developed and implemented in practice: the basic model of IGA in organizations, the IGA model as a factor in increasing the effectiveness of training specialists, models of social psychological determinants of IGA in multicultural educational environments; model of psychological mechanisms IGA graduates of orphanages in a professional educational organization. The model of the emotional component of IGA as a factor of personnel management in a multicultural construction organization. The model was tested on a sample of 688 people, 6 construction organizations, age from 18 to 46 years old, 33% of women, 67% of men. The emotional component of IGA in the situation of informatization causes a resonance that can both give new resources and destroy the system of effective personnel management. When managing personnel, it is advisable to use empirical results. The model of involvement as the determinants of union members of the trade union. Tested on a sample of 629 people.— members of the trade union of 4 universities and 7 schools of the Moscow City Organization of the Trade Union of Public Education Workers. 4 factors of involvement are highlighted. 1 factor (weight 7,057) — social motivation as an integrative mechanism of involvement of union members. Factor 2 (weight 3,638) — targeted creative potential of trade union membership. Factor 3 (weight 2,2308) is an ambivalent organizational culture of a trade union organization. Factor 4 (weight 2,600) is the cognitive component of engagement. The factors became the basis of the socio-psychological and economic technologies.
TIME PERSPECTIVE CAN PREDICT ATTITUDES TOWARD DRIVING BUT NOT TRAFFIC VIOLATIONS

Antanas Kairys
Vytautas Jurkuvėnas
Olga Zamalijeva
Vilnius University (Vilnius, Lithuania)

Eleonora Seimiene
KOG Institute of Marketing and Communication (Vilnius, Lithuania)

Time perspective (TP) refers to the perception of temporal continuity and provides a basis for explaining human behaviour in a variety of settings. Research have shown that time perspective is related to wide range of behaviours (e.g., health, ecological behaviour or substance use) as well as other aspects of human functioning, for example well-being, identity status or reaction to stress. The study of Zimbardo, Keough and Boyd (1997) has shown that time perspective is a predictor of risky driving, however most of the participants in this study were students. Therefore, the question whether time perspective is related to driving attitudes and traffic violations in general population is still open. The sample consisted of 788 adults (mean age 39.4, SD = 12.4; 50.6% male). The sample represents the composition of Lithuanian driver population. Attitudes toward driving scale (16 items), was used to measure three dimensions of attitudes toward driving: a) Attitudes towards traffic violations and speeding; b) Attitudes towards penalties and c) Attitudes toward driving etiquette. Traffic violations were assessed using several self-reported dichotomous questions as well as composite score. Time perspective was measured using 10 items version of ZTPI (Danner, Treiber, & Bosnjak, 2016). Series of hierarchical linear and binary logistic regression analyses were conducted to test whether time perspective is a predictor of driving attitudes and traffic violations after controlling for sociodemographic factors. The analysis has shown that time perspective can explain up to 16% of variance in driving attitudes after accounting for sociodemographic variables. Present fatalistic, present hedonistic and future time perspectives were most important in the prognosis. However, time perspective accounted only for 1.5% of variance in traffic violations after controlling for sociodemographic variables and driving attitudes. The present research indicated that time perspective can play a significant role in attitudes toward driving formation. Other variables like driving norms or situational factors should be considered in planning research and programs promoting safe driving.
The last few years Greece has experienced an unprecedented influx of refugees searching for a better and safer life in the EU. According to UNHCR more than one million people have been forced to flee home countries in the Middle East and south Asia due to war and deprivation. This large vulnerable human flow has become a serious social issue in terms of ensuring not only refugees’ safe accommodation but also their harmonious integration in the host community. Given that refugees’ children are enrolled in local elementary schools it is more than vital to eliminate factors that could endanger their psychosocial adjustment and well-being. The Friendship Project (FP) is a school-based project designed by the Kent Refugee Action Network. It consists of 4 weekly structured lessons that aim to dispel children’s prejudicial beliefs and encourage their empathy and positive attitudes towards refugees. Its effectiveness is based on the successful combination of multicultural and antiracist theoretical approaches. Intercultural knowledge, values and skills of participants are the main objectives of this multifaceted program. The aim of our NSRF (National Strategic Reference Framework)-funded research was to adapt FP in Greek language and evaluate its longitudinal effectiveness in Greek students. We hypothesized that FP 1) generates more positive attitudes toward refugees, 2) cultivates intercultural empathy, 3) changes preferred acculturation strategy and, 4) prevents racial bullying. For the purpose of our quasi-experimental pre-test/post-test research, 234 elementary school students in Athens and Crete, aged 10-12, were enrolled and randomly allocated to condition (intervention vs control). All participants completed the same set of measures before, after and three months after the implementation of the program. Data analyses were conducted using SPSS 25 and M-Plus 8.0. Results showed that FP had a positive short and long-term impact on students’ attitudes toward refugees and preferred acculturation strategy. Small but positive changes were also found in case of intercultural empathy. These results indicate that FP is a valuable and easy to implement school prejudice-reduction program. Key words: antiracist school program, refugees, attitudes, empathy.
INVESTIGATION OF THE RELATIONS BETWEEN SOCIAL VIOLENCE AND CHILDHOOD TRAUMA WITH, MENTAL STATE AND SUBJECTIVE WELL-BEING

Ece Hosceylan
Halic University (Istanbul, Turkey)

Man-made disasters are the events that have serious traumatic effects because they threaten human life, affect the social background of life by creating a sense of fear, and interfere with the daily life routine and harm the physical and psychological integrity (Ganor, 2015). It is known that these traumatic events cause much more serious and long-lasting psychological effects than the natural traumas (Merrel, 2013). Social violence is one of the most important man-made disaster and it is gradually increasing on all over the world. Generally in literature, there were respectable amount of research on the psychological effects of social violence with the protective and risk factors. However, the purpose of this study is to investigate the relationship between childhood trauma and the level of social violence while researching people’s subjective well-being and psychological symptoms. Also it was aimed to examine gender differences among these factors. The research was conducted with 156 college students. Turkish versions of Childhood Trauma Questionnaire (Şar, Öztürk, İkikardeş, 2012) and Brief Symptom Inventory (Şahin ve Durak, 1994) and Subjective Well-Being Inventory (Tuzgöl Dost, 2005) were used. In addition to this, demographic informations and social violence that participants being affected were gathered from participants. Results showed that women were more affected from social violence than men. However, men showed more psychological symptoms than women. Also it is found that both childhood trauma and psychological symptoms were negatively correlated with subjective well-being, while childhood trauma was positively correlated with. There was no predictor variable found for being affected by social violence incidents. As a result, findings of this research were discussed by the preexisting literature about being affected by social violence. In addition to this, the relationship between all of the the variables of this research (being affected by social violence, subjective well-being, psychological symptoms, childhood trauma ) and gender differences among these variables were also discussed with the preexisting literature.
WHY DO OBESE PEOPLE TEND TO EAT WHEN FACING NEGATIVE EMOTIONS? CONTRIBUTION OF EMOTION REGULATION, DEPRESSION AND INTEROCEPTIVE AWARENESS TO EMOTIONAL EATING IN OBESITY

Clemence Willem
Marie-Charlotte Gandolphe
Karyn Doba
Jean-Louis Nandrino
University of Lille (Villeneuve d'Ascq, France)
François Pattou
University of Lille (Villeneuve d'Ascq, France)

Emotional eating is a problematic eating behavior, defined as the tendency to eat when facing negative emotions. It is known to be involved in overeating tendencies and weight gain of people suffering from obesity (Braden and al., 2016). Emotion regulation difficulties, such as difficulties identifying, describing and managing negatives emotions, as well as depression, are considered relevant risk factors of emotional eating in normal weight and obese individuals (Gianini and al., 2013). In addition, a growing number of studies also questions the role of interoceptive awareness in the development and maintenance of emotional eating. Interoceptive awareness can be defined as the ability to precisely identify and discriminate bodily states. A deficit in interoceptive awareness would therefore enhance emotion regulation difficulties and emotional eating by disturbing the identification and management of both visceral and emotional sensations (Murphy and al., 2017). The aim of the present study was to assess the impact of emotion regulation competences, interoceptive awareness and depression on emotional eating and weight gain in obese patients. 110 participants suffering from obesity (BMI≥30) were recruited in French hospital's departments of nutrition or bariatric surgery. Participants completed a set of self-report questionnaires assessing emotion regulation abilities (CERQ-DERS), interoceptive awareness (MAIA-FFMQ), depression (BDI) and eating behaviors (DEBQ-TFEQ). Relationships between variables were investigated using partial least squares path modeling (PLS-PM), a statistical approach for modeling complex multivariable relationships among observed and latent variables. Emotional eating predicted greater BMI in obese people (β=0.458 ; T=5.68 p=.00). Interoceptive awareness, especially the abilities to trust and describe body signal, predicted both emotion regulation difficulties (β=-0.442 ;T=8.9 p=.00 ) and depression (β=-0.29 ;T=5.21 p=.00). Depression mediated the relationship between emotion regulation difficulties and emotional eating. These findings support the idea that a deficit in interoceptive awareness and emotion regulation difficulties, by increasing the risk of depression and subsequent emotional eating, are relevant risk factors of weight gain and maintenance in obesity. They should be privileged targets of psychotherapeutic interventions for obese patients.
One of the most prevalent mental disorders, with significant social and economic consequences, is depression. Limiting its ever-growing impact is considered one of the biggest societal challenges. E-mental health applications have the potential to provide a substantial contribution to conventional treatment. Although there is strong evidence for the efficacy and effectiveness of such tools, general uptake in the mental health sector remains limited. As implementation of e-mental health is influenced by many factors, it is important to gain insight in which of these factors might impede or facilitate implementation. Within the Interreg NWE eMEN project, we run a Belgian implementation study in 2018-2019, making use of the e-mental health application, Moodbuster, which has been developed within the context of a number of EU projects, including the H2020 E-COMPARED and Interreg NWE projects. The Moodbuster application is a modular web-based platform with a connected smartphone application for mood monitoring. It is implemented in a blended depression treatment setting in this study but it can also be used as alternative to treatment-as-usual of adult patients with depression. Evaluation of the implementation process will be threefold with the assessment of the viewpoints of three actors: mental healthcare organisations (i.e., psychiatric hospitals and psychiatric departments of general hospitals), professionals and patients. All relevant mental healthcare organisations in Belgium (N = 131) are contacted to participate in the implementation study. They completed a questionnaire on their reasons for participation or refusal and attitudes towards technological applications in mental healthcare. Then, two psychiatric hospitals and two psychiatric departments of general hospitals are selected for participation. Professionals and patients of these organisations are given pre- and postimplementation questionnaires on themes such as attitudes towards technological applications in mental healthcare, motivation to participate, and evaluation of the Moodbuster tool. In addition, professionals and patients who are not willing to participate also complete questionnaires on their reasons for refusal. This presentation outlines the study’s research protocol, presents the first results and discusses how this Belgian study helps to gain insight in which factors promote or hinder large-scale implementation of e-mental health applications in the mental healthcare sector.
DO NAMES SPEAK A THOUSAND WORDS? AN EXPLORATORY STUDY ON NAME DROPPING AT THE WORKPLACE

Manu Prasad
Abhishek Totawar
*Indian Institute of Management Tiruchirappalli* (Tiruchirappalli, India)

Ranjeet Nambudiri
*Indian Institute of Management Indore* (Indore, India)

Name dropping, the individual tendency of drawing superficial references to desirable ‘names’, has been examined in the context of managing impressions with acquaintances (Bohra & Pandey, 1984; Lebherz, Jonas & Tomljenovic, 2009). Anecdotal evidences suggest that dropping of names might be a more pervasive social phenomenon than has been previously envisaged (Bering, 2009); this study attempts to explicate the pattern of name dropping behaviour within organizational settings by examining the motivation of individuals to engage in the same. A qualitative analysis of in depth interviews conducted with 30 middle level managers (across diverse industry backgrounds) indicates that influential ‘names’- typically organizational insiders higher up the hierarchy — are illicitly invoked by organizational members (actors) during persuasion attempts with colleagues/subordinates (targets) at the workplace. Such powerful ‘names’ are deliberately projected by actors as being in favour of a proposed idea or change initiative, in an attempt to gain target compliance for the same. The analysis reveals that names are likely to be dropped by individuals when met with continued resistance or opposition for their ideas/suggestions at the workplace; the behaviour is especially rampant when the veracity of the stated name drops is difficult for the targets to verify. By exploring the phenomenon of name dropping in organizational settings, this study intends to contribute to the expanding literature on proactive influence tactics while simultaneously broadening the managerial mental models on influence attempts at the workplace. References Bering, J. (2009, September 04). "So Then I Said to Roger Federer...": The Tricky Business of Name-Dropping. MEDIATING ROLES OF PERSONALITY CHARACTERISTIC ON THE RELATION BETWEEN EARLY MALADAPTIVE SCHEMAS AND DEPRESSION

Sinem Baltaci  
Eskişehir Osmangazi University (Eskişehir, Turkey)

Elif Ünal  
Middle East Technical University (Ankara, Turkey)

Bahar Köse Karaca  
Arel University (İstanbul, Turkey)

Tülin Gençöz  
Middle East Technical University (Ankara, Turkey)

Various studies have provided empirical support for the relationship between the early maladaptive schemas and psychopathology. However, personality characteristics are important aspects that should be taken into account to understand the vulnerability factors for depression. Consistent with this argument, few studies revealed that function of early maladaptive schemas were related to psychopathology through some personality characteristics. Thus, present study examined the relationship between early maladaptive schemas and personality traits on the route through which psychopathology tend to develop. In order to analyze the possible mediational roles of personality traits between the schema domains and depressive symptoms relationship, 431 adults (267 females and 164 males) whose ages varied from 19 to 55 were included. To determine the mediational hypotheses, three multiple mediation model were conducted via Hayes method. The results indicated significant mediational role of personality characteristics between schema domains and depression relationship. Specifically, neuroticism had significant mediator role between all maladaptive schema domains and depressive symptoms. Although mediator role of extraversion was found to be significant for Impaired Limits/Exaggerated Standards (ILES) and Impaired Autonomy/Other Directedness (IAOD) schema domains, it was not significant when the model included the Disconnection/Rejection (DR) schema domain. However, the association between DR schema domain and depression symptoms was significantly mediated by extraversion, agreeableness, and openness to experience personality traits. Results were discussed in the light of the literature.
EFFECTIVENESS OF AN INTERNET-BASED INTERVENTION FOR PROcrastination IN COLLEGE STUDENTS: A RANDOMIZED CONTROLLED TRIAL

Ann-Marie Küchler
Patrick Albus
Harald Baumeister
Ulm University (Ulm, Germany)

David Daniel Ebert
Vrije Universiteit Amsterdam (Amsterdam, Netherlands)

Procrastination, defined as irrational and voluntary delaying of necessary tasks, is widespread among college students and comes with serious consequences for the well-being of those affected. Internet- and mobile-based interventions (IMIs) offer a promising new prevention and treatment approach with the potential of reaching many students in need. Consequently, the aim of this study is to evaluate the effectiveness and feasibility of an IMI for procrastination based on Cognitive Behaviour Therapy (CBT) in a sample of college students. This randomized controlled trial is conducted within StudiCare, a large German project dedicating itself to mental health promotion of college students. "StudiCare Procrastination" is compared to a wait-list control group. The intervention consists of five consecutive modules on topics like psychoeducation, time-management or self-regulation. Participants are guided by e-coaches. From May to November 2018, N=120 college students were recruited at over 15 colleges in Germany, Austria and Switzerland. Assessment is still ongoing and takes place before, 6 and 12 weeks after randomization. Primary outcome is procrastination (Irrational Procrastination Scale). Secondary outcomes are depression, anxiety, stress, well-being, (academic) self-efficacy, intervention satisfaction, adherence and acceptance as well as risks and side-effects. Among examined moderators and mediators are treatment expectancy and sociodemographic variables. Analyses will be performed on ITT-basis. Preliminary results (completers only analysis, n = 78) point to a significant reduction of procrastination in the intervention group compared to the control group (ANCOVA: F = 11.527; p = 0.01; d = 0.54, 95% CI [.08; .99]). According to initial results, the intervention effectively reduces procrastination in college students. Therefore, "StudiCare Procrastination" could provide a low-threshold, cost-efficient way to help the multitude of students suffering from problems caused by procrastination. Final results will be presented at the congress.
PERSONAL DETERMINANTS OF THE RISKY BEHAVIOR OF MINORS (ON THE EXAMPLE OF “TRAIN SURFING”)

Irina Gorbenko
Elena Levanova
Tatyana Pushkareva
Moscow State Pedagogical University (Moscow, Russia)

“Train surfing ” is a method of transportation which consists in traveling on trains and other rail vehicles from the outside. Motivational aspects of the train surfers are: — “enjoy the speed and driving process”; — “car windows limit the ability to admire the surrounding space”; — “travel on the roof of the rolling stock is more comfortable, more convenient and allows you to enjoy the fresh air, unlike the carriage of the train filled with people, where it is stuffy and hot”; — “the carriage is full, it is impossible to enter it, and there is always room on the roof”, etc. Psychological features of adolescent train surfers: — desire for self-expression; — need for novelty; — propensity to risky behavior; — needs for autonomy, freedom, affiliation, significance; — the need to change their status in the system of social assessments, determining their place in the social hierarchy; — disharmony of personality; — changing established interests; — protesting behavior in relation to adults and to society in adolescents (Letter of the Ministry of Education and Science of the Russian Federation of May 24, 2017 N 07-2732 "On the Direction of Methodological Recommendations for the Prevention of train surfing among Minors").

The personal determinants of risky behavior of adolescents include: — impulsiveness; — low stress tolerance threshold; — low self-esteem; — isolation, detachment, hostility; — low emotionality, difficulties in awareness and expression of their feelings; — lack of meaning of life; — distortion of value orientations and moral concepts; — unwillingness to take responsibility for their actions, external locus control, etc. Risky behavior is interrelated with the emotional characteristics of the individual. Propensity to risky behavior is based on motivation and depends on the acquired life experience; it is interrelated with self-esteem and self-perception. Risky behavior is directly related to the value system of a person. The main personality determinants of risky behavior of adolescents engaged in train surfing are: — hostility, aggressiveness (including auto-aggression), irritability; — offense, guilt; — high severity of existential problems.
WHEN FAMILY ROLES ARE REVERSED: THE EFFECTS OF PARENTIFICATION AND SELF CONSTRUCTION ON EMOTION REGULATION

Deniz Bilger  
Bursa Uludağ University (Bursa, Turkey)

Fatma Oktay  
Süleyman Demirel University (Isparta, Turkey)

İlgün Bilekli  
Hacettepe University (Ankara, Turkey)

Emotion regulation (ER), which is defined as regulation of positive and negative emotions without repression, is known to be related to many favourable outcome (Gross, 2002). To date ER has been studied in the context of infancy, childhood and adolescence. However the effects of the distribution of intrafamilial tasks and roles have been neglected. Parentification is defined as the case that parent(s) and child(ren) interchange their primary roles and that child focuses only on satisfying his/her parents’ and siblings’ needs (Hooper, 2007). Parentification may be transferred to relationships in adulthood. The purpose of this study is to explore whether the parentified children have emotion regulation difficulties (ERD) in their adulthood depending on personality types and self-constructs. Reviewing the literature we hypothesized that childhood parentification (positive) and autonomous-related self (negative) predicts ERD in adulthood depending on personality types and self-constructs. Results

Goodness-of-fit indices from the proposed model were not satisfactory. Therefore, we established another model in which self construal and parentification are constructed based on personality, which we deemed as a fundamental trait. Revised model yielded acceptable goodness-of-fit indices: $\chi^2 (sd = 15, N = 285) = 32.678$, CFI = .962, RMSEA = .064. According to the model, emotional stability (the direct opposite of neuroticism) predicts the autonomous-related self positively ($\beta = 0.22$, $p < 0.001$), autonomous-related self predicts parentification negatively ($\beta = -0.19$, $p < 0.01$), and parentification ultimately were associated with difficulties in emotion regulation in emerging adulthood ($\beta = 0.15$, $p < 0.01$). Discussion In her model of family change, Kağıtçıbaşı (2017) postulates that autonomous-related self is the optimum self-type since it meets the basic human needs. Our findings are compatible with this conceptualization. On the other hand, heteronomous-related self didn’t reveal the expected positive relation with parentification. In addition, our study shows that personality types, as fundamental qualities, develop throughout the early life experiences and then shape emotion regulation abilities via the self and parentification.
SELF-CONFIDENCE AND SOCIAL COMPETENCE IN WILFULLNESS TO SHARE INFORMATION AMONG RADIO LISTENERS

Andik Matulessy  
Bawin Sri Lestari  
Universitas 17 Agustus 1945 (Surabaya, Indonesia)

Suryanto Suryanto  
Airlangga University (Surabaya, Indonesia)

In the modern era where everything is sophisticated and urban community were known for their individualism, actually, there is still have concern for others, almost every day through the radio Suara Surabaya, listeners share information, their participation is very helpful to the problems of other listeners, such as congestion problems and also the discovery of stolen car. From the hypothesis, we can conclude that there is a positive relationship between self-confidence and social competence with willingness to share information. Furthermore, researchers conducted research on Suara Surabaya radio listeners. Subjects were 75 person, aged from 22 to 55 years old. This research is quantitative research, with proportional sampling technique; the measurement is using multiple regression and partial correlation. Regression analysis results show F regression value of 88.564 with p = 0.000 (p < 0.005). And for conclusion there is a significant relationship between confidence and social competence with the willingness to share information. Obtained R2 = 0.703, meaning willingness to share information influenced by variable of confidence and social competence equal to 70.3%.
SEX DIFFERENCES IN SELF-REPORT EMOTIONAL INTELLIGENCE AND DARK TRIAD OF PERSONALITY

Fedor Derish
Dmitriy Kornienko
Perm State University (Perm, Russia)

The Dark Triad (DT) traits of narcissism, Machiavellianism and psychopathy have weak relations with general mental ability [Zajenkowski, Czarna, 2015] and describe malfunctioning interpersonal relationship [Austin et al., 2007]. The interpersonal relationships based on socio-emotional intelligence included communication competence [Diez, 1984], social intelligence [Gardner, 1993; Guilford, 1967] and emotional intelligence (EI) [Mayer, Salovey, 1997]. DT traits have unclear links with features of emotional intelligence: low affect and cognitive empathy [Turner et al., 2019], inadequacy of recognizing emotional conditions and correctly to respond to them [Lyons, Brockman, 2017]. Recent studies have data about stable sex differences only in degree of variance of self-report EI and DT. Thus our study was directed to test the hypotheses of correlation between DT and self-report EI by gender. A sample of 244 students aged 18-30 from different universities of Perm (54 % female) completed Russian translation of the Short-Dark Triad [Paulhus, Williams, 2014] and Questionnaire of Emotional Intelligence [Lyuisin, 2006, 2009]. The hypothesis was tested using bivariate zero-order Person correlation, t-test and Cohen’s d. We have found statistically significant differences for Machiavellianism (d=0,30), psychopathy (d=0,73) and control of emotional expression (d=0,70) in male group. Significant relations between self-report EI and DT were observed for narcissism and psychopathy. In male sample correlations of narcissism were in the range of 0,20 to 0,27 where it was related to managing emotions. In female group we found many correlations in the range of 0,18 to 0,39 with all components of self-report EI (except of control of emotional expression). Psychopathy of men had significant negative relations in both group for intrapersonal EI (for male from -0,22 to -0,29; for female from -0,19 to -0,22). In general narcissism is the “bright” feature of personality for socio-emotional efficiency while psychopathy is the “darker” trait. Sex differences were observed in male narcissism which associated with the pragmatic side of EI: managing emotions of other people and emotional self-regulation. However, all received relations were weak. “Dark” personality can be considered as a factor of social and emotional efficiency in interpersonal relationships.
IDENTIFYING WITH ONLINE GAME CHARACTERS: A TEMPORARY SHIFT IN PLAYERS’ SELF-PERCEPTION OR A LONG-TERM CHANGE IN SELF-CONCEPT?

Özlem İskender
Kastamonu University (Kastamonu, Turkey)

Psychological and social implications of playing online games, a popular activity all over the world, have been discussed in many studies. This study aimed to focus on online game characters, to express what it means to identify with an online game character in social psychological terms. Several studies, upon a literature review, were examined to see how identifying with a game character is conceptualized. It was concluded that two approaches to the issue could be distinguished. One approach, mainly based on Cohen’s (2001) conceptualization of identifying with media characters and Self-Discrepancy Theory (Higgins, 1987) state, online game characters are closer to one’s ideal self and by identifying with an online game character, players can temporarily reduce the discrepancy between their real self and ideal self (e.g. Klimmt, Hefner & Vorderer, 2009). It is assumed while playing players experience a change in their self-perception by identifying with their characters which have more desired aspects than themselves. Another approach indicates the experience may not be temporary. Based on Social Identity Approach, they state, in multiplayer games, affiliations with groups (in-game groups or game community in general) should also be considered when discussing identification. Not only identification with game characters, but also with in-game groups and game community as a whole are regarded as dimensions of identification. (e.g. Looy, Courtois, Vocht & Marez, 2012). Players even show in-group favoritism by favoring their in-game group’s members over opponent groups’ and those who play (i.e. community members) over those who don’t (Guegan, Moliner & Buisine, 2015). Overall, identification in online games is a multifaceted issue in which the experience goes beyond the moment of play. Players not only can experience different selves through identification with their game characters but also they can find groups to affiliate with and giving them a desired social identity. They not only imagine themselves to be in the virtual world through their game characters but also they “live” in it by identifying with virtual groups. Implications for commitment to online games will be discussed based upon the related theoretical framework.
ATTITUDES TOWARDS GIFTED EDUCATION IN THE SLOVENIAN UPPER SECONDARY SCHOOLS

Urška Žerak
Špela Brezovar
Mojca Juriševič
University of Ljubljana (Ljubljana, Slovenia)

Giftedness is an outstanding learning potential that will most likely develop, if a student at different developmental stages experiences appropriate learning opportunities based on his/her abilities, needs, and interests. Cultivation of positive attitudes towards gifted education is crucial to ensure that gifted students receive appropriate educational opportunities and provisions. At the presentation, the analysis of attitudes towards gifted education in Slovenian upper secondary schools will be discussed in the framework of the three-year evaluation project PROGA of enrichment provisions for gifted students. The sample included 912 students from four selective coeducational upper secondary schools, i.e. gymnasia, their teachers (N = 74) and parents (N = 273). Participants filled-out self-report questionnaire about attitudes towards gifted education on 5-point Likert scale; including some open questions to get deeper insight into the context. The results showed that teachers and parents generally tend to have neutral to positive attitudes towards gifted education (Mt = 2.90, SDt = .25; and Mp = 2.83, SDp = .34, respectively). Likewise, students report about the absence of negative attitudes (Ms = 2.80, SDs = .32), although it seems from students reports that gifted students do not want to stand out from their peers. Furthermore, ANOVA showed that groups of participants (i.e. students, teachers, and parents) differ statistically significant in their attitudes, F(2; 1256) = 3.59, p = .03. Post-hoc analysis with Bonferroni’s correction applied revealed that teachers hold significantly higher positive attitudes compared to students (t(984) = -3.14, p = .002); however, the effect size was low. The results will be reviewed from the perspective of Slovenian gifted educational context. The focus will be on the development of appropriate teaching approaches and communication in schools in order to gain positive experiences that will contribute to cultivation of positive attitudes towards gifted education. In the given framework, the vital role of highly competent teachers and mentors, who hold appropriate professional attitudes towards gifted education, will be highlighted.
THE EFFECT OF THE GROUP-BASED INTERVENTION FOR THE INTEGRATIVE COGNITIVE MODEL IN BIPOLAR DISORDER: A PILOT STUDY

Zeynep Mackali
Gulin Guneri
Sibel Cakir
Istanbul Arel University (Istanbul, Turkey)

The Integrative Cognitive Model, which is developed to understand and to explain the mood swings, assumes that extreme, conflicting and personalized appraisals regarding internal states have significant roles in mood swings. The aim of this pilot study was to investigate the effect of the 8-session group-based intervention for the Integrative Cognitive Model. The sample was composed of 20 patients with Bipolar-I and Bipolar II diagnoses. 10 of the participants were in the intervention group and the rest was the control group. Trait Anxiety Inventory, Beck Depression Inventory, Hypomania Checklist-32, Hypomanic Attitudes and Positive Predictions Inventory-41, Internal States Scale, Psychological Well-being Scale and The Satisfaction with Life Scale were applied for pretest, posttest, 1-month and 3-month follow-up. The effect of the intervention was examined in terms of clinical symptoms (depression, hypomania, anxiety) and psychological processes (hypomanic attitudes, psychological well-being and life satisfaction). The group sessions were held once a week for 1.5 hour. The main purpose was to identify related but conflicting appraisals and to develop more effective and functional ways to cope with changes in internal states (feeling-thought-physiological reaction). The analyses revealed that 8-session group intervention could make a change toward recovery in terms of depressive symptoms, psychological well-being and life satisfaction. The expected effect could not be observed among hypomanic attitudes. The findings of the research indicated that the group-based intervention of The Integrative Cognitive Model was quite effective and applicable. For the prospective researches, it is suggested that the effectiveness of this intervention might be examined in larger samples being composed of participants with different medical history and from different mood centers.
iGENERATION also known as GenerationZ are the people born in the year 1994 or later. It has been noticed that suicidal rates are higher among them in India. Tension, anxiety, loneliness etc. are prevalent which cause stress and it leads to depression and other psychological problems. The research aims to find out the major reasons of stress among iGeneration of India. Research questions: 1. Does family lead to stress among high school students? 2. What are the major contributing factors to stress among iGeneration of India? Hypothesis: 1. H0 — There is no significant relationship between family and stress of iGeneration. H1 — There is a significant relationship between family and stress of iGeneration. [II]: The standardized tool “Student’s stress scale” by Dr Manju Agarwal was finalized for data collection. Considering Purposive sampling technique, 1000 Indian students were the part of the study. The statistical tests employed for analyzing the data were Linear Regression, ANOVA test, F-test, Coefficient & P-Plot graphical presentation & SPSS (Statistical package of Social Science) software was used for running the statistical tests. [III]: 1. 58% sample population (students) experience stress due to their family. 2. 42% students’ experience stress due to other factors namely social, educational, peers, bereavement, separation, health etc. 3. 81% stress is experienced when family members interfere in personal matter, relationship among the family members is strained, parents favor siblings, parents don’t trust or beat & parents have extra-marital affair or are separated. 4. The null hypothesis (H0) is rejected and alternate hypothesis (H1) is accepted and the model is overall significant. [IV] It can be concluded that stress is prevalent but the surprising fact is family causes immense amount of stress in students’ life in India. In general, family is considered stress buster and peace-maker but the analysis show contrasting result. One of the reasons of distress and other psychological problems is their uncordial relationship with their family members. It is an eye-catching fact and should be considered by the stake holders of India and world-wide.
In suicidal behavior the decisive is how a person reacts to internal and external circumstances. Theoretical basis for the study includes the Leontiev’s model of suicide (2008), which deals with the existential dimension of personality. The model highlights predictors of suicide rejection: the presence of reflexive distance from one’s own life, which allows to take an active position; the feeling of meaningfulness, which is determined by connection with yourself, other people and the whole world. The presented hypothesis affirms that the groups with different clinical symptoms of suicidal behavior have different patterns of meaningfulness. The research is based on the database of Crisis Department of the Moscow City Yeramishantsev Clinical Hospital. 148 patients (from 16 to 69 years old; 107 women and 41 men) filled a test of psychodiagnostic methods about the features of self-regulation and the meaning sphere of personality. The research uses new methodological tool «The Sources of Meaning and Meaning in Life Questionnaire (Schnell, 2009; Bolotova, Leontiev, 2016). Common meaningfulness is considered a space of two relatively independent variables: “meaningfulness of life” (ML) and “crisis of the life’s meaning with a tense desire to look for it” (CLM). The data of suicidal ideation, self-harm and suicidal behavior were taken from the patients’ medical history. We used One Way ANOVA, z-score, hierarchical cluster and cross-tabulation analysis. There is approximately an equal amount of crisis patients’groups with such patterns of meaningfulness as: Meaning- loss: low ML at different CLM (often high); Meaning–stressed: high ML and medium-high CLM; Meaning–stable: high ML and low CLM. Patients with suicidal attempts have 1.5–2 times more Meaning-loss pattern, patients with only suicidal ideation have the Meaning-stressed pattern, and the patients without suicidal symptoms have the Meaning-stable pattern 1.5–2 times more often than the other groups. In case of the Meaning-loss the predictor of real suicidal risk is low ML, not the level of CLM: the group with suicidal attempts is distinguished by the alienation and low index of ML while the other two groups have high index of ML. The psychological diagnosis of meaningfulness patterns predicts the dynamics of the crisis much better than the clinical database.
PSYCHOLOGICAL ANALYSIS BY EXPERT WITNESSES BASED ON ALLEGED CRIMINAL OFFENSES OR COMPLAINTS: A FAULTY CONDUCT WITH SERIOUS CONSEQUENCES

Christian Mormont
University of Liège (Liège, Belgium)

Psychological analysis by expert witnesses based on alleged criminal offenses or complaints: a faulty conduct with serious consequences. In countries where Justice is regulated by the Statute Law (as opposed to Common Law) criminal cases are first investigated by a Judge whose task is to gather all elements of evidence and defence before the case is submitted to the Court. Expert reports are ordered by the investigative Judge during that preliminary phase. The usual mission entrusted psychologists is to assess the personality of the suspect, while respecting their presumed innocence, a legal right retained until proven guilty. A recent analysis of psychological reports produced by expert witnesses in Belgium has found many formulations that manifest a dramatic ignorance of the code of ethics for psychologists. It is frequent to see that psychologists describe the suspect, say as a paedophile (which is a medical diagnosis and not a penal category) based on the filed charge of sexual offense on a minor instead of on elements independent from the charge itself. Thus the assessed person is given as guilty and paedophile. By doing so, the psychologist does not respect the necessary neutrality and objectivity, nor ethical methods of psychological assessment, nor the concepts recognised by the scientific community, nor, evidently, the presumption of innocence. We will discuss in detail these problematic and alas frequent aspects of expert witnesses reports in reference to the code of ethics.
EFFECTS OF COMPASSION, SUBJECTIVE WELL-BEING AND PROACTIVE STRATEGIES ON WORK ENGAGEMENT AND WORKING ENVIRONMENT FIT AMONG A GROUP OF ITALIAN KINDERGARTEN TEACHERS

Paula Benevene
Simona De Stasio
Eleonora Tacconelli
Benedetta Ragni
LUMSA University (Rome, Italy)

The study is aimed at deepening the understanding how mutual compassion, subjective wellbeing and proactive strategies have an effect on work engagement and working-environment fit among kindergarten teachers; pre-schools contexts have been insufficiently addressed by the literature on workplace wellbeing and, more in general, in the mainstream of the positive psychology. The study reached a group of 319 full-time, in-service kindergarten teachers of Italian preschools. A questionnaire was administered, containing the Subjective Happiness Scale (Lyubomirsky & Lepper, 1999), the Santa Clara Brief Compassion Scale (Hwang, Plante & Lackey, 2008), the Utrecht Work Engagement Scale (Schaufeli & Bakker, 2004), the Proactive Strategy Scale (Salmela-Aro, 2009), the Teacher-Working Environment Fit Scale (Pyhältö, Pietarinen & Salmela-Aro, 2011), as well as socio-demographic questions (age, sex, years of teaching, marital status). Data were analysed using the structural equation modelling (SEM) approach. Results show that compassion and subjective happiness have a direct, positive, and total effect on work engagement, whereas the effects of compassion and subjective happiness on working fit suggested the association among these constructs is mediated by the proactive strategies. The current data show that early childhood teachers are more likely to develop higher level of work environment fit by drawing on positive, school-related relationships than by relying on their individual characteristics. Positive interpersonal relationships experienced in the school context can promote early childhood teachers work engagement protecting them from the risk of work-related burnout. Ultimately, the study’s findings suggest the importance of investing in the quality of the working environment.
THE ROLE OF PARENTAL STEM-SUPPORTIVE BEHAVIOURS IN FORMATION OF CHILDREN'S STEM CAREER INTEREST

Toni Babarović
Mara Šimunović
Ivo Pilar Institute of Social Sciences (Zagreb, Croatia)

According to many vocational theories parental support has an important role in children’s career development. It seems that parental behaviours can shape, increase, or modify children’s interests and steer their educational and vocational pathways. The aim of this study was to examine to what extent parental STEM-related behaviours can influence children’s vocational interest toward STEM occupations and activities. We measured parental STEM encouragement, parental STEM modelling behaviours, and parental provision of STEM materials as the predictors of children’s interest in STEM. The parental self-reported behaviour measures were collected around 15 months before we assessed children’s interests. The study encompasses 501 last-grade middle school children (age 14) and one of their parents. The results indicated a two-dimensional structure of the construct of children’s STEM interests. The first dimension was related to interest in the science-mathematics professional domain, while the second domain was related to interest in the engineering-technology domain. We examined the predictive power of parental behaviours for both of these interest factors, while controlling for children’s last-year school achievement in STEM subjects. We also examined the moderating effects of child’s gender on the observed regression paths. The results showed that parental behaviours were not significant predictors of students’ interest in engineering-technology professional domain. However, parental behaviours had predictive contribution in explaining students’ interest in science-mathematics professional domain, even after controlling for students’ previous STEM school achievement. It was shown that in case of boys, these interests were predicted by parental STEM encouragement and in case of girls by parental provision of STEM materials. Parents’ modelling of STEM-related activities did not show to have a contribution in explaining children’s interests, even after we took child’s gender into account. Parental behaviours explained up to 10% of variance in children’s STEM interest. The role of parental behaviour in formation of children’s vocational interests is discussed, and general findings were compared to those specific for STEM area. The importance of gender sensitive parental support in STEM educational and vocational field was accentuated.
RELATIONSHIP BETWEEN OBESITY AND ATTACHMENT REPRESENTATIONS IN COUPLES

Aida Jimenez
University of Puerto Rico (San Juan, Puerto Rico)

Jose Martinez
Carlos Albizu University (San Juan, Puerto Rico)

According to the World Health Organization, obesity has become a global epidemic. It is a highly prevalent condition with significant health and mental health implications. In this research obesity was studied using an attachment framework. The primary objective of this study was to evaluate the role of couple’s attachment representations on individuals’ weight status. A cross sectional anonymous survey, mixed method design was conducted. Two hundred and sixteen adults over the age of 21 who lived in Puerto Rico were selected using convenience sampling. Only participants who were married or cohabitating were included for analyses (N=140). Body mass index (BMI) was calculated from the individual’s height and weight and adult attachment was measured with the Experiences of Close Relationships-Revised (ECR-R) questionnaire Spanish translation. The sample consisted of 78 females and 61 males with a mean age of 42.7. The mean weight for females was 164.3 pounds while males was 198.5 (p=.003). There was statistically significant difference in BMI mean scores among gender (p = .003). Males obtained higher BMI scores (M=31.94, SD=8.99) than women (M=27.95, SD=4.93). Over 73% of the sample was overweight or obese. One-way ANOVA was performed to test differences between ECR-R scores and BMI classification. Results showed significantly lower ECR-R total scores with increasing BMI category (p=0.005) with healthy group scoring a mean of 92.61 (SD=11.09) and obese scoring a mean of 83.72 (SD=15.07). The lower the ECR-R scores, the lower the secure attachment. Participants were classified in different attachment styles: secure attachment (N=65), preoccupied (N=21), avoidant (N=16) and fearful (N=32). A chi-square test was performed to examine the relationship between the BMI and attachment categories. Those classified as having a fearful-avoidant attachment had a higher BMI score. Our findings suggest that weight seems to be related with attachment representations. Obese individuals had a higher insecure attachment than individuals with a healthier weight, with a tendency to a more fearful-avoidant style of attachment.
RANDOMIZED CONTROLLED FEASIBILITY TRIALS OF GUIDED PSYCHOLOGICAL INTERNET-INTERVENTIONS FOR PEOPLE LIVING WITH CHRONIC SOMATIC DISEASE

Eileen Bendig
Natalie Bauereiß
Harald Baumeister
University of Ulm (Ulm, Germany)

David Daniel Ebert
Vrije Universiteit Amsterdam (Amsterdam, Germany)

Jiaxi Lin
University of Freiburg (Freiburg, Germany)

Health-care of people living with chronic somatic disease (CSD) often focusses on the treatment of physical symptoms. Strong associations between CSD and psychological burden, especially depression, have been reported. High levels of psychological burden worsen outcomes for people living with CSD and limit quality of life. The trials aim at evaluating the feasibility and potential effectiveness of WIDeCAD and W-Decide (based on Cognitive-Behavioral-Therapy), ACTonDiabetes and ACTonCancer (based on Acceptance-and-Commitment-Therapy), four guided psychological internet-interventions for the treatment of psychological burden in people living with coronary artery disease, cancer or diabetes. In the course of four different, two-armed randomized waitlist-control feasibility trials, markers of feasibility as primary outcome (e.g. adherence, satisfaction with the intervention, recruitment strategies) and markers of target group-specific psychological burden as secondary outcomes (e.g. depression, anxiety, disease-related distress) were measured. Analyses are performed on an intention-to-treat-principle. Across four different trials with the same implementation logic, we randomized N=30 to N=60 people living with different CSDs. Results show that interventions are feasible and on average well-accepted by people living with CSD. However, several differences between different populations and therapeutic approaches with regard to primary and secondary outcomes emerged. Results of each trial are presented at the conference. Focus of the talk is on “differences-that-make-a-difference” in the field of tension between psychological internet-interventions for people with different CSDs. The trials contribute to the improvement and facilitation of mental health-care for people living with CSD by using innovative eHealth approaches.
Mental contamination (MC) is an internal feeling of dirtiness without having any direct contact with contaminated object/person. Previous studies have indicated that women who are victims of sexual assault express MC. Therefore; subsequent experimental studies have used the paradigm of the "dirty kiss" in non-clinical samples to evoke feelings of MC. This study first aims to examine the role of some vulnerability factors in MC. The second aim is to evaluate the impact of neutralization behavior on the feeling of MC by comparing the gender influence. Participants were 65 female and 56 male university students who were asked to complete a set of questionnaires, then they listened the scenario which includes forced kiss by an elderly person opposite to their gender. Then they completed MC form (T1) before randomly assigned to one of three conditions of physical washing, imagined condition or control group. Then MC form was completed again (T2) and lastly after 5 min delay (T3). Hierarchical regression analysis was conducted to examine MC related factors. The results indicated that fear of self, guilt, disgust sensitivity and propensity, and OC symptoms significantly predicted the degree of MC at T1. In order to examine the impact of neutralization behavior on the feeling of MC between gender groups with time, a 3 (time: T1, T2, T3) x 2 (gender) x 3 (neutralization conditions) design repeated measures MANOVA was conducted. The main effect of gender and time was significant (Wilks’ = .87, F (2,117) = 3.55, p < .01, η² = .12). The participants reported higher MC at Time2 and MC decreased significantly after neutralization effort. Furthermore, female participants reported significantly higher MC as compared to male participants. However, the main effect of neutralization condition and any interactions were not significant. Results suggest that several affective and cognitive vulnerability factors, as well as gender may be critical to the development and maintenance of pathological mental contamination and the washing urges. The gender difference may be due to moral and cultural codes on female impurity.
INCLUSIVE LEADERSHIP, LEADER-MEMBER EXCHANGE, AND EMPLOYEES’ VOICE BEHAVIOR: A DUAL-STAGE MODERATED MEDIATING MODEL

Rong Wang
Jianwu Jiang
Shenzhen University (Shenzhen, China)

While workforce diversity is considered as a strategic priority to provide contributions in dynamic, complex, and competitive organizational environments, both practitioners and researchers have increasingly looked to organizational inclusiveness, in order to make people of different identities be fully themselves and valued organizational members. Inclusive leadership refers to “leaders who exhibit openness, accessibility, and availability in their interactions with followers”. Using Relational Leadership Theory (RLT) as the overarching framework, the current study aimed to examine how inclusive leadership indirectly influence employees’ voice behaviors via leader-member exchange (LMX) as well as the boundary conditions of the focal relations. Data was obtained from a convenience sample of Chinese full-time employees. A total of 803 participants (323 females and 480 males) finished our survey. Results showed that: 1) LMX mediated the positive effect of inclusive leadership on employees’ voice behaviors. Specifically, inclusive leadership increased the qualities of LMX, and then, employees were likely to demonstrate voice behaviors; 2) leadership credibility moderated the aforementioned mediating effect of LMX (i.e., a first-stage moderated mediation), which was stronger (vs. weaker) at higher (vs. lower) levels of leadership credibility; 3) the magnitude of LMX’s mediating effect on the inclusive leadership-voice behavior relation also relied on employees’ achievement value (i.e., a second-stage moderated mediation). Such indirect effect was stronger when employees held higher achievement value. Our findings not only help to clarify the underlying mechanism of inclusive leadership-voice behavior relation, but also provide several important insights into practical implications, such as how to invoke inclusion practice in multiple ways to build inclusionary environments.
Victimization is an event or experience of violence, a process of making a person a victim of criminal assault, as well as a result of this process. It is necessary to study victimization because of its wide distribution in society and the many negative consequences for its victims. The purpose of the report is to present the text of a reliable and valid test methodology for assessing the degree of victimization of an adult for its use in research. Until now, such methods and tests for adults are missing in both national and foreign literature. Tasks for the test that determine the degree of victimization were obtained using a combination of external, deductive and inductive strategies. In the pilot study, two contrasting groups of 389 and 400 adult subjects took part. Comparison of their indicators allowed to select test tasks for men and women. A reliable and valid test has been developed for assessing the degree of victimization of adult individuals. Scales (subtests) of the test diagnose seven types of victimization: general and carried out victimization; the tendency to aggressive, self-destructive, dependent and non-critical type of victimization and the degree of the individual's vulnerability to manipulation. The test is standardized: the norms for males and females are given, allowing measuring the variance between the individual result of a particular subject and the average value in units of standard deviation. It is proven that the designed test satisfies the standard criteria of reliability, i.e. internal consistency, reliability of parts of the test, re-test stability. The developed test is valid because it satisfies all known criteria of validity: validation in the process of test construction, as well as content, "obvious", diagnostic, consensus, construct, convergent, contrast, and gender validity criteria. The essence of victimization is explained by the fact that the individual diagnosed with this test positively correlates with their likelihood for risky behavior, anxiety, depression and low self-esteem; and is negatively associated with assertiveness.
POSITIVE AND NEGATIVE INFLUENCES OF MASCULINITY ON MEN’S HELP-SEEKING PREFERENCES WITH REGARD TO EXPERIENCED VIOLENCE

Komlenac Nikola
Heidi Siller
Margarethe, Hochleitner

Background: For men, experiencing interpersonal violence and disclosing this experience to physicians can be associated with fear, shame or a sense of diminished masculinity. The current study analyzed the association between masculinity and men’s wish for physician-patient conversations to include questions about violence they might have experienced.

Methods: Participating in the study were 129 male patients (Mage=59, SD=15) at an Austrian hospital. In a structured interview, we asked patients whether they had ever experienced one of the following forms of violence: physical violence, sexual abuse, verbal abuse, repeated humiliation, serious threats or repeated bad treatment. We used a questionnaire to ask patients whether in the future they wanted their physician to ask them about possible experiences of violence. We assessed masculinity with the Gender Role Conflict Scale-Short Form (GRCS-SF). We calculated a logistic regression model, in which we entered the four scales of the GRCS-SF, and then conditionally excluded them if they did not make a significant contribution to the model.

Findings: Of the patients 56% reported at least one form of violence and 48% of all men wanted their physician to ask them about possible experiences of violence. Men who adhered to the masculine norm of being focused on work and being self-efficient were more likely to want this topic to be initiated by a physician than were men who did not adhere to these norms (OR=1.6, CI=1.1–2.3). Men who continuously tried to be more successful than other persons were less likely to want such conversations than were men who were not so competitive (OR=0.3, CI=0.5–1.0).

Conclusion: Experiences of violence should be an important part of physician-patient conversations with male patients, because a significant proportion of men is affected by experiences of violence and those men want their physician to initiate this conversation. As expected, some masculine norms act as barriers to men’s willingness to obtain help. However, other masculine norms are positively associated with men’s willingness to talk about experiences of violence. When dealing with violence experienced by men a gender-sensitive approach should be applied that considers negative and positive associations with masculine norms.
SOCIO-MORAL CLIMATE IN THE HOSPITAL: A MIXED-METHODS STUDY WITH HOSPITAL PHYSICIANS

Cornelia Strecker
Thomas Höge
University of Innsbruck (Innsbruck, Austria)

Stefan Höfer
Medical University of Innsbruck (Innsbruck, Austria)

In the hospital work setting, multi-professional collaboration is crucial for the success of the work in this setting, the health of the patients as well as the employees. Examples refer to finding and performing the best treatment for the patients or making ethically correct decisions. Especially in stressful situations, one has to be able to rely on her/his colleagues and to trust each other. A positive socio-moral working climate can provide a supporting organizational resource in this regard. The socio-moral climate (SMC, Verdorfer, Steinheider & Burkus, 2015) is part of the organizational climate and contains five dimensions (e.g., reliable appreciation and support, open and free communication, participative cooperation), which are able to promote (moral) personality development and health of employees. Based on a quantitative survey on SMC with N=217 hospital physicians within a larger research project, the following research questions resulted: Is a SMC also observable? Do the results of the observation replicate previous findings regarding SMC levels? Which antecedents and outcomes of SMC can be identified in this special work setting? After developing a SMC observation tool, the observation of SMC was applied in three different medical disciplines in a university hospital in Austria. Two observers accompanied in total 21 observations at medical meetings and rounds. Additionally, eight interviews regarding the SMC with resident physicians and physicians responsible for medical training were conducted. Analyses of the SMC observation showed that 45% of the observed communication contained SMC-relevant aspects. The observer agreement was satisfying and SMC total values per discipline corresponded with the results of the quantitative survey. Interview results showed the importance of the SMC dimension "reliable, constant appreciation and support" for motivation, well-being and health outcomes. Identified antecedents of a SMC were leadership styles and the understanding of hierarchical levels in the specific medical department. We innovatively developed and conducted a comprehensive mixed-methods study on SMC in hospitals, gaining the first observer-based rating tool for SMC in organizations for professional users. Furthermore, the findings provide interesting approaches for personal (moral) development and (organizational) well-being support of employees, both, for research and practice.
Forgiveness is a motivational behavior that nourishes interpersonal prosocial behaviors and inhibits adverse behaviors such as aggression, repining so on and so forth (McCollough, 2000). Recent studies indicate forgiving self, others and forgiveness by God have indirect effects on health related outcomes (Webb et. al., 2013). Self—forgiving and forgiving by others are protective of depression (Ermer, 2015), and suicidal attempt (Randy and Proulx, 2013). By reducing psychological stress forgiveness promotes resilience as well (Worthington, Griffin, Toussaint, Nonterah, Utsey & Garthe, 2016). In line with the previous findings, the purpose of this study was to examine the effectiveness of a forgiveness intervention on female participants who applied to a Family Center of Zeytinburnu Municipality and the relationship between the participants’ levels of resilience, forgiveness and depression before and after the intervention. In order to measure the variables Turkish versions of Heartland Forgiveness Scale (Bugay, Demir & Delevi, 2012), Beck Depression Inventory (Hisli, 1988), the Resilience Scale for Adults (Basim & Cetin, 2011) and a demographic form were used.

The intervention of Dr. Everett Worthington’s REACH for Forgiveness program (Worthington, 2006) translated into Turkish and some parts of it were adapted into Turkish culture, such as Forgiveness in Literature. The program was applied in three weeks with six sessions and each session lasted for 2.5 hours. Normally this intervention lasts for six weeks but we had to squeeze it into 3 weeks due to limitations in room use in the center. The Forgiveness Workbook provided weekly homeworks to the participants. Taking into consideration that forgiveness occurs in time, one month follow-up data collected from the participants. According to the initial results the intervention increased the psychological resilience. Two dimensions of forgiveness (forgiving self and others) are increased with the intervention and depression scores decreased; however these results were not statistically significant. The processing of the follow-up data is continuing. Nevertheless we can say that an intervention aiming at increasing forgiveness provide positive effects both on psychological resilience and depression levels of the participants of this study.
BLACK AND WHITE THINKING IN OUR CROSS SPECIES RELATIONSHIPS. “BLACK DOG SYNDROME” AND SUBJECTIVE VIEWPOINTS ON RELATIONSHIP

Christine Krouzecky
Lisa Emmett
Birgit Stetina
Sigmund Freud University Vienna (Vienna, Austria)

The investigated phenomenon of discriminating big black dogs (Big Black dog syndrome (BBD)) because of their color and negative related associations (Leonard, 2011) like misfortune or aggression shows inconsistent scientific findings. Some studies determine the BDS regarding to the assessment of responsibility and fault in a fictional scenario of a dog-bite case in females (Lum et al., 2013), other studies disproved the assumed poor prevalence of black shelter dogs being adopted (Sinski et al., 2016). The goal of the presented study was to examine if the BDS appears after the adoption process insofar as the dark color of the dog has an impact on the strength of the human-dog relationship and moreover if the dog’s color has an effect on the assessment of critical life events especially on the sense of coherence (SOC). Using a cross-sectional design an online study in German and English was conducted including the following instruments: Lexington Attachment Pet Scale (LAPS) (Johnson, Garrity & Stallones, 1992), Sense of Coherence Scale (SoC-29-Scale) (Singer & Brähler, 2014), Social Readjustment Rating Scale (SRRS) (Holmes, Rahe, 1967).

Additionally, the answers of the participants in regard to the color of their dog were coded by the standardized Nomenclatur of Coat Colors of the Federation Cynological International (FCI) (Denis, 2009) in dark, pale, mixed, white. Statistical analysis included t-test and Cohen’s d as concurrent effect size measure. There was no significant difference between dark and pale dogs in regard to the strength of the handler-dog relationship found (t(73)=-.063,p=.950,d=-.015). Moreover, data showed no significant difference between dark and pale dogs in view of the results of the SRRS (t(75)=0.000,p=.190,d=.303) and the SoC-29-Scale ((t(84)=1.193,p=.558,d=-.186). Data suggests consistent to previous studies that a dog’s dark color seems less important than expected. It could be argued that negative color related associations do not play a relevant role within the dog-owner relationship when the bond is already established. However, with regards to the in-group-bias (a preference for one’s in-group over the out-group; having prejudices against the out-group) (Brewer, 1979) the results show the relevance across species as highly relevant new finding.
PSYCHOPATHIC LEADERS: NOT ALL BAD?

Anna Sutton
Maree Roche
University of Waikato (Hamilton, New Zealand)

Meta-analysis has demonstrated that self-reported psychopathic traits are associated with lower job performance and well-being. The triarchic model of psychopathy identifies three constituent traits: boldness, meanness and disinhibition. While the latter two are conceptualised in terms of externalising psychopathology and associated with maladaptive behaviour and outcomes, the boldness trait represents fearlessness and social dominance, which are often prized in leaders. Therefore, we expect that the three traits would have distinct impacts in the workplace. In this study we have 3 aims. First, to evaluate a self- and other-report adaptation of the TriPM questionnaire for workplace settings. Second, to identify the impact of managers’ self-reported psychopathic traits on their well-being. Third, to identify the extent to which managers’ perceived psychopathy impacts on subordinates’ well-being. The self-report TriPM was adapted for use in the workplace by removal of items which lacked face validity and rephrasing to allow other-report. Two independent samples completed online questionnaires. Sample one (679 managers) self-reported on TriPM and job outcomes (well-being, burnout, engagement and job performance). Sample two (697 employees) reported on their managers’ TriPM and their own job outcomes. All subscales (self- and other-report) showed high reliability (α>.8). Regression analyses indicated that overall, boldness has a positive effect on both managers’ and employees’ work outcomes, while meanness and disinhibition have negative effects. Specifically, managers’ self-reported boldness positively predicts well-being, engagement and performance, and negatively predicts burnout; meanness increases burnout, decreases engagement and decreases performance; and disinhibition increases burnout and decreases well-being. Employees who perceive their managers as bolder have higher engagement, while managers’ meanness results in increased employee burnout, lower well-being and engagement, and disinhibition results in greater burnout and reduced performance. The TriPM represents a promising model for psychopathy in the workplace, able to distinguish between positive and negative work outcomes both for leaders and followers. This approach sheds light on why so-called psychopathic individuals may be successful at work and also highlights the need for organisations to recognise and reward boldness and its positive impacts at work while working to minimise the rewards for the associated psychopathic traits of meanness and disinhibition.
FAILURE TO OBSERVE WHAT IS IN PLAIN SIGHT: EXAMINING THE PHENOMENON OF INATTENTIONAL BLINDNESS

Eirini Charami-Roupa
Lena Pateraki
Ioanna Spentza
The American College of Greece (Athens, Greece)

Solid data derived from research on attention and perception have shown that people often fail to detect an unexpected object/stimulus when attention is allocated elsewhere, a phenomenon known as inattentional blindness (IB). The purpose of this study was to investigate the occurrence of IB with explicit and implicit measures. More specifically, the stimulus format (word/picture) and semantic categorization (congruent/incongruent) were explored with regard to the occurrence of IB. Additionally, individual differences in working memory capacity (WMC) were also tested. It was hypothesized that individuals who attended incongruent stimuli while being exposed to an unexpected stimulus, presented in the same format as the one attended to, would experience higher rates of IB, in comparison to other conditions. Further, it was expected that individuals with low WMC would be more prone to IB. Finally, an exploratory analysis was conducted to explore the potential relationship between eye movements and the occurrence of IB.

One hundred and twenty undergraduate college students were presented with pictures of fruits or furniture and the picture of a banana or the word "banana" (unexpected stimulus), while their eye movements were measured with the use of an eye tracking device. Participants also completed an OSPAN task assessing their WMC. Higher rates of IB were observed among participants who were exposed to incongruent stimuli when the unexpected object was presented in the same format (picture; p<.001), as well as among individuals with low WMC (p =.016). Results also showed that those who exhibited higher levels of IB tended to notice the unexpected stimulus when placed at center of the screen (p=.075) [(x,y) = (50%,50%) when (0%,0%) reflects top left of the screen)]. Current findings add up to the existing literature by confirming that certain variables, such as stimulus format and semantic incongruence between the attended and unexpected stimulus, as well as WMC, influence the occurrence of IB. The reasons why low WMC influences the occurrence of IB, and the ways in which a stimulus can capture attention implicitly are discussed.
THE RELATIONSHIP OF VICTIMIZATION WITH THE LOCUS OF THE CONTROL AND THE MOTIVATION TO AVOID FAIL

Viktor Sheinov
Belarusian State University (Minsk, Belarus)

Victimization is the tendency to become a victim of a crime, accident, harassment or aggression. Victimization is an event or experience of violence, the process of making a person a victim of criminal assault, as well as the result of this process. Victimization must be studied because of its wide distribution in society and the many negative consequences for its victims. The purpose of this article is to identify the alleged relationship of victimization with externality and the desire to avoid failure. The degree of victimization of the subjects was assessed using the author's method, the locus of control – a modified scale of J. Rotter. The predominant motivation of the subjects – the severity of the desire to achieve success or the desire to avoid failure – was diagnosed using the A. Mahrabian questionnaire, adapted by M. Magomed-Eminov. The reliability and validity of used methods is proven. For adults and children of both genders, the general and implemented victimization, aggressive and non-critical behavior are positively associated with externality, while general victimization and aggressive and dependent behavior is positively correlated with the desire to avoid failures. The role of gender is manifested in two ways: in dependent behavior, a female has a significant positive correlation with externality, while for a male there is only a statistically insignificant tendency of the same direction; in implemented victimization, women have a significant positive relationship with the desire to avoid failures, while for men there is no such connection. The analysis of the obtained results is given. The representativeness of the samples in the study was ensured by the inclusion of a large number of subjects (N = 560) – men (N = 216) and women (N = 344) aged from 17 to 77 years old representatives of a wide range of occupations, specializations, positions and regions and confirmed by the normal distribution of test results.
CONTEMPORARY GENDER RULES: A CROSS-CULTURAL COMPARISON

Sabine Sczesny
Christa Nater
University of Bern (Bern, Switzerland)

Laurie Rudman
Rutgers University (Piscataway, NJ, USA)

Gender inequality is an ongoing problem in social life and remains a crucial issue for many societies. One mechanism that contributes to the persistence of gender inequality across the world are gender stereotypes. These stereotypes can be descriptive, constituting culturally shared beliefs about the characteristics of women and men, and prescriptive, consisting of culturally shared beliefs about the characteristics that they should or should not have. Traditionally, people describe and expect women to be more communal (e.g., supportive) and men to be more agentic (e.g., dominant). When women display high-status traits (e.g., engaging in clearly dominant behavior) that are proscribed for them, women are penalized for violating the proscription (Status Incongruity Hypothesis by Rudman et al., 2012) This research aims to gain first knowledge on how achieved gender equality in a given country is associated with traditional gender rules. Therefore, the study was based on a 2 (Target gender: female, male) x 7 (Country: Sweden, Switzerland, U.S., Ghana, India, Turkey, Iran; ranging from high to low achieved gender equality, Gender Gap Report, 2017) between-subjects design. In each country, four groups of university students (N = 4,000 across all countries) indicated either how common or typical [descriptions] or how desirable [prescriptions] 120 characteristics were in women [or men] in their society. To assess the status typicality of these features, we asked two further groups of students to indicate how common or typical the 120 characteristics were in persons with high [or low] status in their society. Results revealed that the higher the achieved gender equality in a country, the less traditional are descriptions and prescriptions of agency and communion for women and men, and the less aligned are descriptions and prescriptions for men and high-status people as well as for women and low-status people. The cultural variation in gender equality is also reflected in variations in proscriptions for women, that is, in countries with greater achieved gender equality exist fewer proscriptions for women to display traits that are otherwise reserved for people of high in status and men.
HOW SUBLIMINAL PRIMING INFLUENCES INTERPERSONAL TRUST? THE MEDIATING ROLE OF PERSON-PERCEPTION

Jie Cai
Xianghong Sun
Jingyu Zhang
Chinese Academy of Sciences (Beijing, China)

Previous studies found subliminal word priming can improve interpersonal trust, but the inner mechanism is not fully understood. In this study, we first attempted to replicate the previous findings using Chinese words as priming materials. In addition, we wanted to explore which perception (person-perception, self-perception or situation-perception) could mediate such an influence. 105 Chinese participants first completed the Word judgment task, in which the priming word was either "trust" for the trust-promotion condition (N = 55) or "suspicion" for the trust-decrement condition (N = 50). After that, all participants performed the trust game and completed the perception measures. The result showed that participants in the trust-promotion condition sent higher amounts of money to the trustee in the trust game (M= 3.74; SD = 2.15) than participants in the trust-decrement condition (M= 2.32; SD = 1.48), t(86) = 3.630, p = .000. Person-perception mediated the influence between subliminal stimulus and interpersonal trust (LCLI=-0.8292, ULCI=-0.0903), but self-perception and situation-perception had no mediating effect (LCLI=-0.3168, ULCI=0.1843; LCLI=-0.5274, ULCI=0.0180, respectively). The result suggested that subliminal priming techniques could influence interpersonal trust in a Chinese context, moreover, such an effect might be related to person-perception. We discussed this finding within the literature of unconscious process and trust.
EFFECTIVENESS OF A COMMUNITY SPECIFIC INTERVENTION FOR FEMALE SURVIVORS OF GENDER-BASED VIOLENCE IN COLOMBIA

Alicia Puente  
University of the Basque Country (Donosti, Spain)

Silvia Ubillos-Land  
Jose Luis González-Castro  
Burgos University (Burgos, Spain)

Gina Marcela Arias  
Catolic University of Pereira (Pereira, Colombia)

Marcel Gracia  
University of the Basque Country (País Vasco, Spain)

This study assesses the efficacy of a group intervention in altering emotion regulation processes and coping and promoting adjustment in poli-victimized women in Colombia. Sample was comprised by 62 women who suffered political violence during the armed conflict in Colombia and are participating within The Ruta Pacifica de Mujeres (RPM) feminist organization. Using a repeated measure pre—post-test design, we first evaluate the role of emotions in conflict situations and analyze the emotional regulation processes involved in coping. Furthermore, we assessed a social-psychological intervention effectiveness focusing on the coping and emotional regulation training. The intervention included 3 sessions, training in coping and recognition and expression of self-emotions, and exercises promoting social support in women who participated actively in the RPM. Emotion regulation processes and adjustment were assessed at baseline and at the end of the intervention. After the intervention, participants reported greater increase in the use of coping and emotional regulation strategies. They used more social support, and instrumental actions for coping with the situation, but also, they used more positive reappraisal, venting and confrontation. In contrast they showed a greater decrease in emotional suppression and rumination, suggesting that the intervention had an impact on these tendencies. The findings suggest an emotion regulation intervention can positively influence emotional experiences and improve the emotional regulation skills in survived women, and thus promote the emotional expression of silenced violence.
THE WEEKLY RELATIONSHIP BETWEEN PSYCHOLOGICAL CONDITIONS, STRENGTH’S USE, AND FLOW

Crystal Hoole
Madelyn Geldenhuys
University of Johannesburg (Johannesburg, South Africa)

Organisations focus on positive organisational behaviour to increase positive organisational outcomes. They recognize that conducive environments that foster climates of meaningfulness, safety and availability, lead to employees feeling encouraged to use their strengths in their respective work roles. The use of personal strengths will lead to positive organisational outcomes such as increased levels of flow (ultimate state of engagement) and increased performance. Not much is yet known on the effects of psychological conditions on the use of one’s strengths and how that relates to positive constructs such as flow, and how these effects change over time. To encourage employees to use their strengths, organisations need to create and improve the right psychological conditions that will pave the way to strengths utilization and increased performance. Weekly diary studies provide a way of examining the relationships between strength use and its effects on positive work experiences and work outcomes. The following hypothesis are tested.

Hypothesis 1: Weekly psychological conditions of meaningfulness, safety and availability is positively related to strengths use. Hypothesis 2: Weekly strengths use is positively related to weekly Flow Hypothesis 3: Weekly psychological conditions indirectly influences flow through strengths use. Sampling, participants and data collection A non-probability sample of n = 98 participants from diverse South African backgrounds, resulting in 294 measurement occasions were obtained. Electronic and paper-based questionnaires were utilised. Participants completed a once-off questionnaire in week one, followed by weekly questionnaires for 3 weeks. Measures The instruments used were the Strength’s use scale, Work related Flow inventory and the Psychological Conditions Scale. Analysis Multilevel mediation analysis was applied in order to account for both within-person level (week level) and between-person level (individual level variations). Interclass Correlation Coefficients were determined to estimate if there were sufficient variation in the variables over the three week period. Findings Psychological meaningfulness, safety and availability had a direct positive effect on flow and strengths use respectively. Strengths use had a direct positive effect on flow. Both psychological meaningfulness and availability had a full indirect effect on flow through strengths use, while psychological safety had a partial indirect effect on flow through strengths use.
DEVELOPMENT OF EXECUTIVE FUNCTIONS IN PRESCHOOLERS OF TATARSTAN AGED 5—7: RESULTS OF LONGITUDINAL STUDY

Rezeda Popova
Larisa Bayanova
Kazan Federal University (Kazan, Russia)

Alexander Veraksa
Lomonosov Moscow State University (Moscow, Russia)

Contemporary neuro-psychological researches explore processes of volitional regulation of a child in a framework of the Executive Functions (EF) — neuro-cognitive processes, connected to the prefrontal zone of the brain. Researches of EF development in preschoolers are of great interest in Russia (e.g. Almazova et al., 2017), but longitudinal studies on this theme are few. The aim of this article is to explore the development of EF in the period between 5 and 7 years on the sample of Russian preschoolers. The theoretical foundation of research was the concept of “unity-and-diversity” (Miyake et al., 2000), that distinguishes three EF: Shifting, Updating, and Inhibition. The research was made in the kindergartens of Tatarstan in 2016-2018. The sample was 85 children aged 5-6 (40 boys and 45 girls). Children were tested at the age of 5-6 years and a year later. The test battery included subtests from the neuropsychological battery NEPSY-II: Sentence Repetition, Memory for Designs, the Inhibition subtest. To assess cognitive flexibility, the Dimensional Change Card Sort (DCCS) was applied (Zelazo, 2006). Wilcoxon Signed Ranks Test was used to assess the shear. These revealed that children’s ability to remember verbal information increases in the tested period (Sentence Repetition: 17.6 and 19.2 accordingly; Z=-4.550 p=0.000). The number of bonus scores of visual memory significantly increases (23.3 and 15.6 accordingly; Z=-4.157 p=0.000), whereas the level of spatial component significantly diminishes through the explored period (24.0 and 18.9; Z=-3.085 p=0.002). Children become faster in completing tasks (Inhibition subtest, Naming-time: 46.3 and 40.9 accordingly; Z=-3.732 p=0.000; Inhibition-time: 60.7 and 52.2; Z=-4.547 p=0.000), make fewer corrected mistakes (Inhibition subtest, Naming: 1.1 and 0.5 accordingly; Z=-3.732 p=0.000), demonstrate more flexibility in the tasks with switching execution stereotype (DCCS-Total: 19 and 19.9; Z=-3.437 p=0.001). Thus, at the age of 5-7 progressive development of EF happen. Concurrently visual memory is improved not due to the development of its components, but due to their better coordination with each other. Additionally, cognitive control grows in the tasks that don’t require switching the execution program. The research was funded by the Russian Foundation for Basic Research, Project № 17-29-02092 ofi_m.
THE RELATIONSHIPS BETWEEN TOLERANCE FOR UNCERTAINTY AND EMOTIONAL INTELLIGENCE IN INDIVIDUALS WITH DIFFERENT LEVEL CREATIVITY

Elizaveta Pavlova
Lomonosov Moscow State University (Moscow,Russia)

The research of (a) tolerance for uncertainty as a key feature in the regulation of creative thinking and (b) of the emotional intelligence as an expression of the unity of affect and intellect can be based on the concept of the united intellectual and personal potential. This study of the creative professionals gives grounds for the discussion of the prerequisites for success in these professions; their comparison with the representatives of different professions shows which dynamic regulatory systems (DRS) are formed alongside their creative activity.

Participants. 53 representatives of creative professions (writers, composers and directors), 11 women, average age 45.54 years, SD = 10.17; 239 psychologists, 48 women, average age 19.6 years, SD = 1.37. Measures: New questionnaire for tolerance to uncertainty, NTN (Kornilova, 2010a), EmIn Questionnaire (Lucin, 2009) diagnosed emotional intelligence, Cartoon Task (Kornilov, 2010b) diagnosed creativity. Student’s t-test for independent samples shows that the groups differ in intolerance for uncertainty (t = 2.920, p = .005), interpersonal intolerance (t = 3.873, p <.001) and creativity (t = -4.145, p <.001), while creative professionals are more creative and less intolerant. The correlations analysis (Spearman’s \( \rho \) coefficient) in highly creative representatives of both groups (contrast groups method used) shows that the creative professionals do not have any connections between the variables, whereas in highly creative psychology students, creativity is negatively associated with the intolerance for uncertainty (p = .045), and that is associated with intrapersonal emotional intelligence (p = .019). Thus, we established that creative professionals are not only more creative, but also less eager for clarity in the world of ideas and interpersonal communication, but both samples have the same emotional intelligence. High success in creativity can be explained by the interaction of factors such as acceptance of uncertainty and risk and emotional intelligence, but for people who chose creativity as their profession and have an extensive experience in the field, success is based on different components of the intellectual and personal potential.
**DIALECTICAL THINKING OF CHILDREN AT DIFFERENT LEVELS OF CULTURAL CONGRUENCE**

**Larisa Bayanova**  
*Kazan Federal University (Kazan, Russia)*

Children's behavior is regulated by certain rules. There are a number of invariant rules that are typical for a child of a given age. A 5- or 6-year-old child, for example, complies with safety regulations, hygiene rules, self-control rules and basic rules of relationships with adults, also known as the rules of compliance with adults’ expectations (obedience). These are culturally shaped rules. The adult uses social situations as a setting for passing on to the child a set of such rules (Vygotsky, 1956). The more age-specific rules a child fits into his or her behavior, the more culturally congruent the child is. The situation that has an established set of rules is referred to as normative (Veraksa, 2000). Developmental psychology still does not have an answer to how a child understands a rule in a normative situation; how a child chooses to behave in a normative situation whether adhering to or rejecting the rule. The study aimed at identifying the relationship between the child's cultural congruence and dialectical thinking, i.e. the ability to spot and resolve contradictory situations. The battery of tests was used to examine children's reasoning abilities (Shiyan, 1995), (Piaget, 1970), (Bayanova & Mustafina, 2016). The results of the empirical research showed that children comply with cultural rules more often if they understand that objective world preserves the consistency of their properties. Cultural congruence is connected with formal logical thinking. The relationship between dialectical thinking and cultural congruence is ambiguous. This way, with low and high levels of cultural congruence, the relation between dialectical thinking and cultural congruence is statistically significant. At a low level of cultural congruence, children with a low level of compliance with safety regulations score higher in dialectical thinking. At a medium level of cultural congruence, there is a high level of dialectical thinking when alternatives change. At a high level of cultural congruence, senior preschoolers who comply with the rules of obedience and hygiene are characterized by dialectic thinking of union and termination of actions. The research was funded by the Russian Foundation for Basic Research, Project № 17-29-02092 ofi_m.
Effluents are critical for maintaining the health of our aquatic ecosystems. In this study, we investigated the effects of a particular effluent on the growth and survival of four different fish species: *Cyprinus carpio* (common carp), *Brachydanio rerio* (zebra danio), *Gambusia affinis* (mosquito fish), and *Fundulus heteroclitus* (mummichog). We observed that the carp and zebrafish showed a significant decrease in growth rate and survival rates when exposed to the effluent, whereas the mosquito fish and mummichog were less affected. These findings highlight the importance of considering the diversity of aquatic species when designing effluent treatment processes.
PSYCHOPHYSIOLOGICAL CORRELATES OF SOCIAL PUNISHMENT

Anush Revazyan
Oksana Zinchenko
Vasily Klucharev
National Research University Higher School of Economics (Moscow, Russia)

Many studies suggest that prosocial norms play an essential role for economic decision-making (Fehr and Fischbacher, 2004; Melis and Semmann, 2010). However, the effect of norms can be broken when norm violations are not enforced (Fehr and Gächter, 2002; de Quervain et al., 2004; Gureck et al., 2006). Importantly, social norms can be reinforced by "second" parties that were directly affected by the norm violators and "third" parties that were not directly affected (Fehr and Fischbacher, 2004). The dictator game is an experimental situation where one player, the dictator, can choose how much endowment is offered to the partner. A recent electroencephalography study (Sun, 2015) showed that the medial frontal negativity (MFN) and P300 components of third-parties were modulated by perceived unfairness of the offers during the dictator game. Interestingly, increased P300 amplitudes were correlated with an increase in third-party punishment. No such correlation was found for the MFN. Here, we further investigated both neural markers of third-party punishment. Seventeen right-handed adults were instructed to play the dictator game with third-party punishment whilst simultaneous 64-channel EEG was recorded. We analyzed the epochs when participants (as a third-parties) observed the dictator's offers. We found an increase of the frontal MFN (200-230 ms), when participants observed unfair offers as compared to fair offers. This observation was confirmed with the permutation test. In contrast to Sun et al. (2015), we found a significant correlation between the level of third-party punishment and dMFN's amplitude (difference: MFN to unfair offers minus MFN to fair offers): Fz electrode, r = -0.516, p = 0.034 and FCz electrode, r = -0.509; p = 0.037. Our study suggests a strong link between third-party punishment and MFN, which has been associated with performance monitoring processes. Our results suggest that the MFN reflects the 'salience network' activation and could be an index for the detection of norm violations.

DO RELIGIOUS VALUES AND COLLECTIVE NARCISSISM SHAPE RELIGIOUS EXCLUSIVISM?

Rahkan Ardi
Diah Budiarti
Ahmad Iswahyudi
Stefani Liadi
Airlangga University (Surabaya, Indonesia)

The rise of religious exclusivism has become a challenge for people expecting peaceful co-existence with others. This preliminary study aims to validate the factor structure of inter-religious contact scale in student organization activists in Indonesia. This study is also purposed to analyse the strongest predictors for inter-religious contact. Independent variables include collective narcissism, fundamental religious belief, and kindly religious belief. There were 381 samples with different religions (Moslem, Christian and others) and ideologies (nationalist, religious fundamentalist, and others). Factor analysis showed inter-religious contact could have 1 factor structure. The result of regression analysis indicates that the higher collective narcissism and fundamental religious belief, the less they exhibit inter-religious contact. Meanwhile, the higher kindly religious belief, the more likely that they show inter-religious contact.
Objective is to create a socio-psychological classification of personality of females sentenced to imprisonment. Theoretical base of research: the theory of personality by A.N. Leontiev; statement of A.R. Ratinova about normativity value. Empirical base: the research was conducted on the basis of correctional institutions of the Federal Penitentiary Service of Russia in the Saratov region. Tested audience: 165 females convicted of acquisitive and violent crimes. Age: from 20 to 56 years. Methods of empirical research: questioning (personality peculiarities of socialization were investigated), conversation, testing (S. Schwartz questionnaire "Personality Value Orientations"; Plutchik-Kellermann-Conte questionnaire "Life style index"; test of life-sense orientations by DA Leontiev; the method of E. B. Fantalova "Free choice of values"). Methods of mathematical data processing: quantitative data analysis, percentage and frequency distributions, cluster analysis (k-means method), classification tree. The results of research: the most significant predictors for classification were obtained: registration in cases of minors, criminal record of relatives, shoots, drives to law enforcement agencies, indicators: reactive education, universalism, life sense orientation. According to the results of the analysis, two socio-psychological types of criminals were constructed. The first type audience ("asocial socially maladjusted") are distinguished by early involvement to criminality (from adolescence), the presence of convicted relatives, drives, a rejecting social environment in childhood, recidivism. In the system of values: focus on getting bright emotional experiences, new impressions. Protective mechanisms (reactive education) are expressed. This category includes the entire contingent of recidivating females and 60% of females who have committed minor crimes for the first time. The second type audience ("asocial externally socially adapted") commit crimes only in adulthood. They are satisfied with the process and the results of their lives, they internally accept themselves and the crime committed, there are few internal conflicts and psychological defenses. The crime is "embedded" in the system of life-meaning orientations of the individual. This type includes all females who have committed serious crimes and 40% of subjects who have committed minor crimes for the first time. Conclusions are the space of socio-psychological personality types of female criminals is meaningfully heterogeneous. There are different socio-psychological mechanisms for females to become involved in criminal activity.
INTERACTION OF CHILDREN WITH DOWN SYNDROME AND CAREGIVERS IN FAMILY TYPE BABY HOME

Ekaterina Shabalina
Rifkat Muhamedrahimov
Saint Petersburg State University (Saint Petersburg, Russia)

In the Russian Federation a large number of children with Down Syndrome (CDS) live in baby homes (BH) in which the social-emotional environment has been reorganized in recent years, but there is still no data on the impact of the program of changing the socio-emotional environment (CSEE program) on development of CDS in BH. Furthermore, the features of interaction of CDS with BH staff remain insufficiently studied. The current study was aimed to examine how the CSEE program effects the interaction quality of CDS and staff. It was assumed that indicators of interaction (II) of CDS and caregivers after the implementation of the program will positively differ from the corresponding II before the program. It was also suggested that changes in II may be observed in the course of the program implementation.

Longitude sample included 11 CDS — 6 girls and 5 boys, whose average age at the first stage was 24.6 + 10.8 months (M + SD), at the 2nd stage 37.6 + 11.6 months and at the 3rd stage — 51 + 12.8 months. Sample of sections included 21 CDS. At the first stage, there were 12 children (6 girls and 6 boys aged 25 + 11 months), at the training stage — 6 (4 girls and 2 boys, aged 35.5 + 15 months), at the stage of structural changes — 8 (3 girls, 5 boys aged 26.6 + 19.3 months), at the last stage — 21 children (9 girls, 12 boys aged 34.6 + 22.4 months). To evaluate the quality of interaction the Parent-Child Early Relationship Assessment (PCERA, Clark, 1985) was used. The results showed an improvement in the overall rate of interaction between CDS and caregivers, general II of CDS, staff and in a dyad, as well as individual specific indicators. At the same time, it was revealed that some II have significantly improved in the course of the program, and others — after its completion. In general, the data obtained demonstrates a positive impact of the CSEE program on the quality of interaction between CDS and caregivers.
WOMEN’S AFFECTIVE EXPERIENCES OF SUCCESSFUL ASSISTED REPRODUCTION

Tatiana Campbell
Carol Long
University of the Witwatersrand (Johannesburg, South Africa)

Women are increasingly choosing to have children later in life and assisted Reproductive Technology is becoming more common. Future mothers are more likely to be creating new life with the help of such technology. Existing psychological literature describes the strain associated with undergoing reproductive procedures and the potential pathological outcomes, but limited literature explores the lived experiences of women from their own perspectives. The objective of this study was to investigate the affective experiences of women who underwent successful IVF and its impact on their current experiences as mothers. In order to obtain a thick description of lived experience, a qualitative interview-based design was chosen. 5 women were interviewed about their experiences utilizing a semi-structured interview format. Data was subjected to thematic analysis. Women experienced the medicalization of their bodies as intrusive and impersonal. They were also very aware of how others judged them. They experienced their own minds as causing their infertility and felt deservedly punished. Experiences of loss were everpresent and multilayered. The IVF evokes painful feelings but also hope for the longed-for baby. The significance of the findings lie not only in the themes that emerged but also in the important process of giving voice to a potentially marginalized group. For these women, creating the future together with their children means processing the impact of their means of reproduction and coming to terms with their sense of having been othered and with their loss. The study holds implications for therapy and medical treatment of women undergoing IVF and also for interventions targeted at social change.
IDEAL-ACTUAL MATE MISMATCH AND RELATIONAL OUTCOMES IN ROMANTIC COUPLES

Elçin Gündoğdu Aktürk
Zonguldak Bulent Ecevit University (Zonguldak, Turkey)

The present study aims to ascertain how the discrepancy between ideal standards and romantic partner traits are associated with relationship constructs among romantic couples. In the field, Ideal Standards Model (Fletcher, Simpson, Thomas, & Giles, 1999; Fletcher, Simpson, & Thomas, 2000) has been used to study the consistency between ideal standards and actual partner qualities. Based on this model, the main prediction of the present study was that higher ideal-actual discrepancy would be negatively associated with relationship outcomes such as relationship quality, spontaneous reactions to partner, basic need satisfaction, and perceived partner responsiveness. Moreover, the discrepancy between ideal standards and current partner was expected to be associated with relationship outcomes not only for individual's own scores but also for their partner scores. Couples (N=154) participated in the study. Results of Actor Partner Interdependence Model analyses revealed that both actors’ and partners’ higher discrepancy was associated with lower perceived partner responsiveness, basic need fulfillment and relationship quality. The findings are in line with those of previous work and it can be concluded that central relational outcomes and processes are associated with ideal-actual mate mismatch. Fletcher, G. J. O., Simpson, J. A., & Thomas, G. (2000). Ideals, perceptions, and evaluations in early relationship development. Journal of Personality and Social Psychology, 79, 933–940. Fletcher, G. J. O., Simpson, J. A., Thomas, G., & Giles, L. (1999). Ideals in intimate relationships. Journal of Personality and Social Psychology, 76, 72–89.

A COPING STRATEGIES AND RESILIENCE IN ADOLESCENTS LIVING IN DISASTER AREAS IN REVIEW OF GENDER

Gusti Ayu Agung Noviekayati
Suroso Suroso
Tatik Meiuyuntariningisih
Pandu Prasukma
Universitas 17 Agustus 1945 Surabaya (Surabaya, Indonesia)

Flood is one disaster that occurred in Indonesia. This disaster cause severe damage especially in densely populated areas on the banks of rivers or periodically flooded areas. People living on the River bank of Bengawan Solo in particular sub-district TrucukBojonegoro East Java face periodic floods that come every year. This study aims to examine the relationship between coping strategies with resilience and gender differences in the resilience of adolescents living in disaster areas. The research subjects used as respondents in this study were 208 students of Bojonegoro Junior High School 5 (SMPN 5). Data analysis using the Pearson correlations and T-test. Based on the results of the analysis obtained results that coping strategies with resilience have a significant relationship. Coping strategies have a correlation coefficient of 0.81 and p =0 (p <0.05). The results of the analysis using the T-test obtained results for sex with resilience obtained by t score of 0.703 at a significance level of 0.044 (p <0.05) this means there are sex differences to significant resilience. The contribution of this study is to provide data on resilience and coping strategies for adolescents in flooded areas. This data can later be used to create an intervention program for adolescents who are experiencing flooding.
The increase of human aging is a phenomenon observed in world scale and allows the experience of several roles within the family. Consequently, more and more multigenerational families are emerging, formed by four or even five generations, being therefore more vertical. Thus, the objective of this research was to understand the role of great-grandparents, as well as the intergenerational repercussions of this role in their lives and in that of their great-grandchildren. More specifically it was intended: to analyze the meaning of being great-grandparents in the family; identify the activities performed by their great-grandparents; identify the legacy that the great-grandparents give forward; and understand intergenerational relations permeated by the presence of great-grandparents among family members. It is a multiple case study with four great-grandparents and their great-grandchildren, totaling eight participants. As a research instrument, a semi-directed interview was used, with a specific script for each generation, as well as a questionnaire with the sociodemographic data of the participants. The data were analyzed through thematic content analysis. The main results pointed out the following: 1) As for the feelings experienced when becoming great-grandparents, they reported joy, satisfaction and gratitude; 2) The support provided by them, most of the time, is of an emotional type; 3) The family relationship appeared as quite significant, being characterized especially in the form of visits; 4) Conflicts exist, but seem to be circumvented with wisdom and much respect; 5) The legacies transmitted by them are related to faith, solidarity, education and order; 6) The meaning of being great-grandmother is intimately linked to the feeling of transcendence, the sense of having fulfilled the purpose of life and also its continuity in grandchildren and great-grandchildren. In the younger generation, the appreciation of the great-grandparents, perceived as wise people, has been observed and can contribute as teachers to the new generations. It is hoped to give visibility to this older generation, and through respect develop intergenerational solidarity in order to construct a society of all ages.
STRATEGIES OF SPEECH INTERACTION BETWEEN ADULTS AND PRESCHOOL CHILDREN WITH TYPICAL AND ATYPICAL DEVELOPMENT

Elena Lyakso
Olga Frolova
Alexey Grigorev
Viktor Gorodnyi
Saint Petersburg State University (Saint Peterburg, Russia)

The goal of research is the study of speech strategy of adult’s interaction with typically and atypically developing 4-7 years old children. The participants were “mother-child” dyads with typically developing children (TD, n=40), children with autism spectrum disorders (ASD, n=20), Down syndrome (DS, n=20); pairs “experimenter-orphan” (n=20). Audio recording of participants’ speech and video recording of child’s behavior were made. Spectrographic, linguistic, phonetic, and perceptual analysis (n=465 listeners) of children’ and mothers’ speech was executed. The analysis of audio records of “mother-child” speech interaction by listeners (n=10) and the elements of nonverbal behavior on the base of video records by expert (n=5) were made. The parents of ASD children filled questionnaires determining the severity of autistic disorders (CARS, WADIC). The parents of DS children answered the questions about the type of genetic disorder and related diseases. The level of anxiety in children and their parents was determined. We found the significant differences between mothers of TD children and mothers of children with atypical development. The specificity of acoustic features of ASD and DS child’s speech in vowel articulation index, pitch values, third formant frequency values, and values of the third formant intensity was revealed. The dialogues of ASD and DS children with the mothers and dialogues of orphans with the experimenter differ from dialogues of TD children with their mothers in number of minimal dialogical units, the child’s ability to support a theme given by adult, the complexity of the response replies. Different communicative strategies of “mother-child” interaction depending on the severity of child’s developmental disorders and child’s age were described. The features of mothers’ speech addressed to TD children with low level of speech development are expressed in mothers’ speech directed to ASD children and used by mothers for child’s verbal activity. The acoustic features of mothers’ speech correlated with high level of TD child speech development don’t lead to similar correlation in dyads with ASD children. The results of the study are considered in the framework of the theoretical construct of L. S. Vygotsky “Zone of proximal development”. The study was financial supported by RFBR-OGN 17-06-00503a, RFBR 18-013-01133.
Specialization helps to delineate fields of psychology practice. When developing professional qualification criteria, associations seek to promote in the members scientific skills and knowledge considered fundamental for the practice of psychology in a given area. On June 5, 2015 the Ordem dos Psicólogos Portugueses created the system for specialization in Psychology. This system delineated three broad areas of specialization — clinical and health psychology, psychology of education and work, social and organizational psychology — and 12 advanced areas —psychological coaching, early intervention, special educational needs, neuropsychology, vocational and developmental psychology, community psychology, justice psychology, occupational health psychology, sports psychology, psychotherapy and sexology. The specialty of Clinical Psychology and Health seeks to be a path for the professional development of psychologists in the different areas of health. In this communication we will discuss the specialties and their access in Portugal and we will reflect on the implications of the specialties for the professional development of psychologists and for the development of the areas of clinical psychology and health.

The research aims are: (1) — to define the connection between the reconstructive imagination and the comprehension of the text; (2) — to diagnose the actual level of development of the reconstructive imagination of schoolchildren. The research sample included 396 schoolchildren of 4th-10th form of schools from Moscow and Moscow region. The Granik & Borisenko technique "Activate your imagination" had been used. The children should have imagined the images and then to describe them verbally and to make a drawing. The fragments of Pushkin’s novel Eugene Onegin describing winter and spring landscapes had been used as the stimulus material. The experiment included three stages. At the first stage the meaning of obsolete words had not been explained to the children as contrasted to the second stage. The results showed that the number of children with a high level of reconstructive imagination increased in 2.3 times (from 12.2% to 22.7%, and the highest increase was in the 4th form: from 4.3% to 15.7%) and the number with a low level decreased in 1.9 times (from 57.5% to 30.5%, in the 4th form: from 82.6% to 39.2%), but still remained considerately high. This group included children who drew inadequate drawings either because of lack of understanding or because of unmotivated fantasizing. This stage shows that understanding meaning of every word of the text is a necessary but not the sufficient condition of comprehension of the whole text and of the work of reconstructive imagination. The reason of inadequate perception is misunderstanding of a fictional text. In the course of the third stage the schoolchildren have been given the information...
about Pushkin’s époque, which included semantization of words. As a result the number of children who drew inadequate drawings was no more than 5% even in the 4th form. The research confirms the hypothesis concerning the connection of reconstructive imagination and comprehension of the text. The proofs of the fact that comprehension and reconstructive imagination is a solid process and a full-fledged work of those processes is based on the historical-cultural experience, without which the perception of a fictional text becomes impossible, have been found.

TRAINING SELF-TALK FOR IMPROVING ACADEMIC PERFORMANCE, USING IT AS A SUPPORT FOR IMPROVEMENT

Julia Sastre
Inés Toro
Flor Sánchez
Autonomous University of Madrid (Madrid, Spain)

Frequently the academic performance of students is below their real capabilities. Among the factors that explain this unbalance we find negative cognitive and emotional self-messages in the students. In this research, to improve the understanding of this gap, we have analyzed the relationship between emotional self-regulation strategies, self-talk style and academic performance, based on a sample of 403 undergraduates enrolled in Business and Administration, Tourism and Psychology Degrees. In the first phase, all participants reported their emotional regulation strategies and academic self-talk (messages they give themselves when they think on the outcome of a difficult subject). Data show a positive relationship between emotional competence and self-talk style. In the second phase, a subsample of the mentioned undergraduates (n=40) were invited to write a self-persuasive WhatsApp message, telling themselves the most effective strategies they could use to be successful in a difficult exam scheduled for six weeks later. These WhatsApp messages were sent to the researcher (first author), who in turn forwarded them to their original sender, 3 to 5 times in the weeks prior to the scheduled exam. Control group (n=40) did not receive any intervention. Results show that students that had written, and later received, their self-persuasive WhatsApp obtained best academic performance than those in the control group. Practical implications for strategies to improve academic performance are addressed.
ANALYSIS OF THE PSYCHOMETRIC PROPERTIES OF THE INTERPERSONAL NEEDS QUESTIONNAIRE (INQ) IN THE ELDERLY ADULTS AND COLLEGE STUDENTS OF CHINA

Yueping Zhu
Mengqi Cao
Kaiyou Fu
Shulin Chen
Zhejiang University (Hangzhou, China)

As the country with the second highest number of suicides in the world, China’s suicide problem is a matter of great concern. In order to improve suicide prevention effort, the tool to assess the risk and affecting factors of suicide is needed. The interpersonal-psychological theory of suicide believed that the perceived burdensomeness (PB) and thwarted belongingness (TB) can predict the desire for death. The Interpersonal Needs Questionnaire (INQ) was developed to evaluate perceived burdensomeness and thwarted belongingness. Our study evaluated the structure and validity of the use of the 15-item INQ in elderly and college students of China. Our study translated and compiled the 15-item INQ into Chinese version. And the psychometric properties of INQ were evaluated in four samples. Sample 1 and 2 were comprised of 150 and 142 elderly adults from the urban and rural areas of Hangzhou, Zhejiang Province. Sample 3 and 4 were comprised of 404 and 149 undergraduates from Zhejiang University. Sample 1 and 3 were used for exploratory factor analysis, and sample 2 and 4 were used for confirmatory factor analysis. INQ demonstrated acceptable internal consistency in all samples. In both sample 1 and 3, exploratory factor analysis indicated that two factors should be retained. Items in the first factor were almost consistent with the concept of TB, whereas items in the second factor were almost in line with the concept of PB. Confirmatory factor analysis demonstrated acceptable fit(elderly: $\chi^2=191.727$, p<0.01, CFI=0.864, RMSEA=0.09, SRMR=0.094; undergraduate: $\chi^2=276.395$, p<0.01, CFI=0.854, RMSEA=0.119, SRMR=0.078) with the two factors model of PB and TB in sample 2 and 4. Moreover, PB and TB had positive correlations with suicide ideation in sample 4(rPB= 0.394, p<0.01; rTB=0.28 , p<0.01). Findings from this study support the use of the INQ-15 among elderly adults and undergraduate students in China. INQ-15 can predict desire for death of undergraduate students.
EXAMINATION OF THE RELATIONSHIP BETWEEN PLACE ATTACHMENT AND PLACE IDENTITY: ISTANBUL EXAMPLE

Ebrar Yenice-Kanik
Cesur Sevim
Istanbul University (Istanbul, Turkey)

Studies on place attachment and place identity indicate that places, which have a specific meaning for individuals provide a sense of continuity related to past, present, and future. They also affect group belonging and intergroup relations. Research on the relationship with place within the Social Identity Theory perspective has investigated the effect of place as a social category on intergroup relations (Arkonaç, 1995; Bernardo and Palma-Oliveira, 2013a; Bernardo ve Palma-Oliveira, 2016a; Puddifoot, 1997). In the case of Istanbul, change of demographic structure along with migration, the intermingling of many different cultures and the economic, cultural and spatial diversity of the inhabitants of the city suggest that Istanbul offers its residents different social categories of identity at different spatial levels. The main aim of this research is to determine the predictors of the place (Istanbul) identity and to examine the mediator roles of district identity, awareness of in-group / out-group and inter-group conflict, between attachment to Istanbul and Istanbul identity. The study was conducted with 242 participants (161 women, 81 men; between 17 to 65 years old) who are living in different districts of Istanbul. Measurement tools were Socio-demographic Information Form, Place Attachment Scale (district and city level), Place Identity Scale (district and city level), and Spatial Intergroup Relationship Scale (district and city level). Results of regression analyses revealed that the model that includes city-level awareness of in-group / out-group, city-level conflict between groups and district identity variables has a positive predictive effect on Istanbul identity ($R^2=.55$, $F(4, 237) = 73.18$, $p<0.001$). A multiple mediation analysis was conducted via Process macro (Hayes, 2013). Results showed that city-level awareness of in-group / out-group has a partial mediator effect ($B=0.017$, LLCI:0.008 ULCI:0.027, $Z = 4.33$, $p =<.001$) between attachment to Istanbul and Istanbul identity, but district identity ($B=0.004$, LLCI:0.000 ULCI:0.01, $Z = 1.99$, $p =.50$) and city-level inter-group conflict ($0.004$, LLCI:0.000 ULCI:0.01, $Z = 1.96$, $p =.50$) have no mediating effect. The findings were discussed within the framework of Social Identity Theory and showed that if awareness of in-group / out-group were defined through place, place identity was strengthened.
READINESS FOR INDEPENDENT LIVING OF ADOLESCENTS: SOCIAL CONTEXT

Tatiana Shinina
Moscow State Psychological and Pedagogical University (Moscow, Russia)

Olga Mitina
Lomonosov Moscow State University (Moscow, Russia)

The modern landscape of life is changing, and it is important for today’s adolescents to be prepared for a new pace of life under the conditions of uncertainty that affect all aspects of the life today of “a changing personality in a changing world” (Asmolov, 2017; Clark, 2016; Griffiths, Hochman, 2015; Hohwy 2013; Malafouris, 2016; Zinchenko, 2007; Belinskaya et al, 2014). Aim The research aims to determine adolescents’ readiness for independent living depending on their educational environment by using a questionnaire developed by the authors. Methods The study uses the Readiness for Independent Living of Adolescents questionnaire (Shinina, Mitina, 2017) based on the adaptation of Ansell-Casey Life Skills Assessment (ACLSA) Youth 4 – Version 4.0 (Nollan, Horn, Downs, Pecora, & Bressani, 2001). The research includes ethical agreements with adolescents. Four groups of adolescents took part in the research: 1) cadets living in their families; 2) adolescents living in Yamal Boarding School and having families; 3) adolescents living in the Girls Boarding School of the Ministry of Defense of the Russian Federation and having a family, and 4) orphaned adolescents graduated from boarding schools. The sample totals 286 respondents including 127 boys and 159 girls of the average age of 15. Two-way ANOVA dispersion analysis was used for further research with two independent dichotomous variables being sex (male/female) and type of residence (family/boarding school) and dependent variables being score on each scale. Results The research revealed correlations between specifics of the family which brought up the person, personal potential, resilience, emotional experiences and individual style of socialization of adolescents in various social situations of development. The comparison of responses giving by adolescents residing in boarding schools with the same ones giving by adolescents living in families showed that girls in these groups demonstrated significantly fewer differences than boys did. A possible reason is that girls, even in boarding schools, are taught to care to others as well as themselves, while live in boarding schools does relatively more harm to the boys in terms of formation of independence and individual styles of socialization.
SOCIAL MEDIA AS A POTENTIAL PREDICTOR OF ANXIETY AMONG CHINESE EMERGING ADULTS: A PRELIMINARY STUDY

Huao Li
University of Pittsburgh (Pittsburgh, USA)

Jiayu Wang
Shulin Chen
Baojin Cui
Zhejiang University (Hangzhou, China)

Anxiety is adverse to individuals' mental health, and anxiety disorders could cause serious impairment of social function and quality of life in individuals, as well as a heavy burden to the society (Whiteford et al., 2013). Given the expanding influence of social media on citizens' daily life, the current study aimed to explore the possibility to predict anxiety status among emerging adults on WeChat, the most widely used social media platform in China. We recruited 192 emerging adults (73 males; 18-28 years-old; mean age = 21.72±1.39) who agreed to disclose their status updates on WeChat Moments. Anxiety status was measured by the 7-item Generalized Anxiety Disorder scale (GAD-7), and participants also reported how much time they spent on WeChat Moments daily. For 147 participants who posted at least 500 words in past 6 months, the word frequency in multiple categories was calculated through the Simplified Chinese Linguistic Inquiry and Word Count (L1WC) dictionary (Gao, Hao, Li, Gao, & Zhu, 2013). Independent samples t-test revealed that compared to participants with low anxiety, those with high anxiety shared more content in updates (p < 0.09), posted fewer words in categories of friends (p < 0.01), emotional tone (p < 0.03), and positive emotion (p < 0.03), and used more words in categories of cause (p < 0.01) and death (p < 0.07). To predict users’ anxiety status, we extracted linguistic and behavior features, and built a classification model based on the Support Vector Machine algorithm, which achieved accuracy of 77%. Our study indicates the possibility to predict users’ anxiety status via WeChat, and our findings may be useful in further work on integrating social media into the mental health service.
PARENTS PERSONALITY, MARRIAGE SATISFACTION, STRESS, AND PUNISHMENT OF CHILDREN IN THE FAMILY

Mikhail Chumakov
Daria Chumakova
Kurgan State University (Kurgan, Russia)

The paper describes relationship between emotional stress, marriage satisfaction, and frequency of punishment in the family. The objective of the research is to ascertain whether emotional and volitional characteristics of the individual affect the frequency of punishments in the family. The research method is M. Perrez's, D. Schoebi's questionnaire on punishing behavior in education. Such parameters as frequency of punishment of children in the family, amount of emotional stress, satisfaction of spouses with family relations, tolerance of parents in relation to behavior of a child, frequency of physical punishments applied to a child were compared. M. Chumakov’s questionnaire on volitional and emotional characteristics of a person (VEC). Results and conclusions. The data were divided in 2 groups (high or low level of development of volitional powers and positive emotions). Analysis of variance (ANOVA) was applied. The dependent variables were Marriage Satisfaction, Emotional Stress, and Frequency of Punishment of children in the family. The gaps between the groups were significant for the Marriage Satisfaction F(1,105)=17.77, p<.0001 and Emotional Stress F(1,105)=23.53, p<.0001 but were not significant for the Frequency of Punishment. For the Depressed Mood parameter, the differences were close to significant F(1,105)=3.90, p=0.51. Marriage Satisfaction in a group with high VEC parameters is higher (M=23.2, SD=4.56) than in a group with the low parameters (M=19.1, SD=5.58). The Stress in a group with high VEC parameters is lower (M=2.9, SD=1.21) than in a group with the low parameters (M=5.6 SD=2.29). There is a correlation between marriage satisfaction and frequency of punishment as well as between stress and frequency of punishment. Thus, the emotional and volitional qualities of the parents’ personality indirectly influence frequency of punishment of children in the family.
WORK AND SUBJECTIVITY: EXPERIENCES AND RESISTANCE STRATEGIES IN THE CURRENT FORMS OF WORK IN MEXICO CITY, A QUALITATIVE STUDY

Adriana Irene Hernández Gómez
National Autonomous University of Mexico (Mexico City, Mexico)

Forms of work organization have changed in last decades; derived from this, there have been changes in discourses, devices and practices within work (Bauman, 2000; Berardi, 2012; Giglia, 2014; Gómez, 2017; Han, 2012; Sennet, 2000; Zangaro, 2011, etc). Thus, employees are confronted with increasingly precarious forms of work, which involve serious psychosocial consequences (Berardi, 2015; de Gaulejac, 2015; Dejours, 2016, 2017, etc). However, most of the psychological research around work focuses on worker’s productivity and how to improve it. This research gives a turn to this perspective. Our purpose is to analyze, by means of professional trajectories, the ways in which workers of big transnational corporations in Mexico City, live and face the working conditions marked by the current neoliberal model. Through in-depth interviews, professional trajectories of ten high-level workers (five men and five women) of big transnational companies in Mexico City are compiled. The interviews are conducted and analyzed under a clinical device, this means that even when there are four axes planned, the questions are opened and structured in each interview in a unique way. The theoretical-interpretative framework for the analysis of the interviews are psychoanalysis and work psychodynamics. The results confirm a growing uncertainty in workplace today, which causes series of emotional effects that mix with life stories of each participant. It has been found that negative emotional effects can be alleviated by defensive (singular and collective) resistance strategies that are carried out in diverse and creative ways. Even though there are some coincidences with what has been found in similar research (Dejours, 2009, 2016; De Gaulejac, 1994, 2005, 2007, 2011 or Zangaro, 2011), the particularities of work in mexican culture -marked by labor reforms that grant privileges for employers and precarize work for employees, added to forms of discrete corruption, with 43% of professional workers with very low salaries and close to 47% without social security (INEGI, 2017), in addition to Mexico occupying the first place in number of hours worked per week (OECD, 2017)- people always create specific ways of living work and coping with the problems that arise.
VOLITION AS A FACTOR OF PROFESSIONAL SUCCESS OF EXTREME PROFILE DOCTORS

Anna Koteneva
Nina Potapova
Valentina Ekimova
Aleksej Kokurin
Anna Litvinova
Moscow State University of Psychology & Education
(Moscow, Russia)

Professional success of doctors is a significant characteristic of the activity efficiency and self-realization. The health and safety of a person in a critical situation depends on the level of professional success of the doctor. Volition is the professionally important quality of extreme profile specialists. The aim of this study was to assess the volitional characteristics of doctors and determine their impact on the professional success. The study involved 70 resuscitators and emergency physicians (38 female and 32 male), 5 expert-head, average work experience — 16.5 years and average age — 48 years. Five psychological methods have been used to diagnose volitional characteristics and self-efficacy in this research. Experts evaluated doctor professional success by the author's questionnaire. Nonparametric Mann-Whitney criterion, correlation and factor analysis were applied to data processing. Doctors were divided into three groups with different levels of volitional self-regulation — high, medium and low. According to the Mann-Whitney criterion, there are significant differences between the indicators of perseverance, self-control, ability to self-government and self-control in all groups (p=0.05; p=0.01). That is, the higher the level of volitional self-regulation, the better were formed and other volitional qualities. High level of volitional self-regulation improves the effectiveness of activities, the formation of professionally important quality, skills, success of medical manipulations (expert evaluation) and the self-efficacy of doctors in the subject area. Also were found significantly differences in satisfaction with functional state in extreme situations between the first and third groups (U = 119.5; p=0.01). Doctors with a higher level of volitional self-regulation had a higher level of adaptability to such situations. All specialists had a high level of self-control in the emotional sphere and self-efficacy in interpersonal relations, as well as well-formed professional skills and abilities. There are significant relationships between indicators of volitional self-regulation and expert evaluations of doctor professional success (r=0.642; p=0.01), well-being in extreme situations (r=0.31; p=0.05), self-efficacy in the subject activity (r=0.389; p=0.01). Volitional self-regulation, perseverance, self-control, professional success and self-efficacy in the activity formed a holistic factor. Training of resuscitators and emergency physicians should include development of psychological, personal, professionally important qualities necessary for work in extreme situations.
Online education requires students to have skills that allow them to organize their time to complete their academic activities, combining study with the responsibilities of adult life, such as work and family responsibilities (Silva, 2016). It is extremely important that students have self-efficacy to facilitate a successful career. Our objective was to analyze the profile of students who attend the last semesters of the Degree in Online Psychology at a Public University in Mexico City, and the academic uses they make of Facebook. 172 students participated in this research, 134 women (77.9%) and 38 men(22.1%), of Psychology degree in its online mode, all students from UNAM, in the last three semesters. An online survey was applied in which demographic, academic, and labor data related to the use of Facebook (time, domain and activities) were obtained. Based on the information provided by the participants, we identify the age range (from 21 to 70 years old with an average age of 40.36 years.) The distribution by semester was as follows: 56 students cursing seventh semester (32.6%), 65 of eighth semester (37.8%) and 51 of ninth (29.7%). In relation to marital status, those who are single (32.6%) and married (40.1%) predominate, and it is also identified that most of the participants combine school with work and family, having to divide their time between these three activities and presenting considerable variation in the time they dedicate to each activity according to each case. From the results we can say that there are two logics related to the use of Facebook, 1) Recreational purposes and 2) Academic purposes. We identify a considerable variability in the number of hours dedicated to their studies, work and home, according to their age, marital status, sex and family structure.
One can predict at least some person’s tax paying behavior based on attitudes toward taxes. Some authors argue, that knowledge about tax system is the basis for attitudes and behavior accordingly. Studies interested in tax attitudes mostly investigate adults; adolescents are usually dismissed. However, if one wants to raise persons who would willingly pay taxes, it is necessary to shape positive attitudes toward tax paying in early age. The goal of this research is to analyze the link between tax knowledge and attitudes toward taxes in adolescents. Total 1268 adolescents (age from 11 to 18 years) of various Lithuanian schools participated in the research (56,9 percent girls; 43,1 percent boys). They had to fill in the questionnaires, which were specially designed for this study: Attitudes Toward Taxes Questionnaire, Knowledge about Taxis Questionnaire, Sociodemographic Questionnaire.

There was a weak, but significant positive correlation between knowledge about taxes and attitudes toward taxes ($r = 0.076, p< 0.001$). There was also a positive correlation between age and knowledge about taxes ($r = 0.399, p<0.001$), but negative correlation between age and attitudes toward taxis (-0.113, $p<0.001$). Analyses based on the sex of the respondents revealed the positive significant correlation between knowledge and attitudes toward taxes only in the group of girls ($r = 0.097, p = 0.011$), but not in the group of boys ($r = 0.065; p = 0.145$), even though boys and girls have the same amount of tax knowledge. The significant positive correlation between attitudes and knowledge was also found in the group of participants who lived in the capital ($r = 0.098, p = 0.011$), but not in the group living in rural areas ($r=0.07, p = 0.113$). Besides, the latter had lower levels of knowledge compared to inhabitants of the capital. Not always the more the better applies speaking about taxes. Even though adolescents get a better understanding about tax system with age, their attitudes towards taxes do not become more positive. Besides, the relationship between knowledge about taxes and attitude towards them depends on other factors, such as gender or living in a city.
LIFE VALUES OF THE YOUNGER GENERATION OF EMPLOYEES IN GLOBAL ECONOMY (THE RESULTS OF THE RUSSIAN — JAPANESE RESEARCH)

Chestyunina Yu.V.
Zabelina E.V.
Chelyabinsk State University (Chelyabinsk, Russia)

Toshihiro Wada
Ehime University (Matsuyama, Japan)

Trushina I.A.
Vedeneeva E.V.
Chelyabinsk State University (Chelyabinsk, Russia)

Employees’ life values play a huge role in company success. Today many organizations focus on management of values – the aspirations, desires and motives that are the most relevant for employees. In global economics, the question of similarities and distinctions of employees’ values in various countries is of a particular practical interest. The purpose of this study is to compare the life values at student’s youth in Russia and Japan, and make some assumptions about future changes of organizational culture. The research is conducted on the selection of students of the regional Russian and Japanese universities (N=400). The method is the survey: PVQ (Sch. Schwartz) is used. Contradictions in the dominant values, both in Russian and in Japanese selection, are revealed that can be a sign of valuable crisis as the consequences of globalization processes. High significance of “Conformity” for the youth in both countries (Japan and Russia) and low significance of “Self-Direction” are revealed. Value “Hedonism” is much more significant for the Japanese young people than for the Russian. Practical implications of the results for the international companies are discussed. The reported study was funded by RFBR according to the research project № 18-013-00201 A.
The BDSx is a brief self-report measure of depressive and hypo/manic symptoms of bipolar disorder (BD). First developed for ecological momentary sampling (EMS) via iPhone, BD symptoms are randomly reported once or twice daily, where they occur (i.e., GPS stamped). Prior research indicates a robust 4-factor model of BDSx responses consisting of two depression factors (cognitive, somatic symptoms) and two hypo/mania factors (affrontive symptoms, elation/loss of insight). For this study, we translated and back-translated a Hebrew version of the BDSx and then recruited 50 BD-I outpatients who completed a battery of questionnaires before their regular psychiatric appointments (Be’er Sheva Mental Health Center). Participants completed the BDSx along with other paper-and-pencil measures of BD symptoms and well-being. We first confirmed the psychometric properties of outpatient responses to the Hebrew BDSx. (i.e., comparable to English version of the scale). And to test concurrent validity, we then compared BDSx responses to established BD self-report measures (e.g., HAMD-6, Altman Self-Rating Mania Scale). Moreover, elevated BDSx depression and hypo/mania scale responses are significantly associated with current BD symptomatology (e.g., major depressive episode) as determined by a clinician blind to questionnaire responses. The results of this study support the psychometric properties of the Hebrew version of the BDSx and suggest that this scale can be used in EMS and clinical research to briefly and effectively measure BD symptoms.
WITHIN-COUPLE ANALYSES OF BIPOLAR DISORDER SYMPTOMS AND PARTNER MOOD OVER TIME

Norm O’rourke
Ben-Gurion University of the Negev (Be’er Sheva, Israel)

David B. King
University of British Columbia (Vancouver, Canada)

For the BADAS (Bipolar Affective Disorder and older Adults) Study, we recruited an international sample of adults with BD and their cohabiting partners where available. A total of 4 couples provided 312 matched BD symptom/partner mood responses over an average of 123 days (range 65 – 221). Both participants and partners downloaded study apps onto their respective smartphones. Within specified ‘windows of general availability’ participants were randomly prompted to briefly report symptoms of depression and hypo/mania (i.e., BDSx; participants), positive and negative mood (i.e., POMS; partners) any important events of the day. The partner app was yoked to participant app so that the former was prompted roughly 30 minutes after the participant with BD, or the next morning if outside the partner’s specified availability. Both were GPS- and time-stamped (M = 3hrs, 11min between questionnaires, SD = 4hr, 51min). As anticipated, positive partner mood was significantly correlated with depressive symptoms (r = -.14, p = .02) but unrelated reported hypo/mania (r = -.01, p = .87), neither affrontive symptoms (r = -.10, p = .07) nor elation/loss of insight (r = -.10, p = .09). Yet only somatic symptoms of depression correlates with positive mood (r = -.20, p < .01), not cognitive symptoms (r = -.05, p = .43). By contrast, partner negative mood was significantly correlated with cognitive (r = .18, p < .01) but not somatic symptoms of depression (r = .03, p = .58). However, symptoms of hypo/mania appear more strongly correlated with partner negative mood (r = .26, p < .01) than depression (r = .15, p = .01); this is attributable just to affrontive symptoms (r = .38, p < .01), not elation/loss of insight (r = .02, p = .71). This association is stronger still when participants are partners are together (i.e., same GPS coordinates, r = .41, p < .01). The results of this study indicate that affect of cohabiting partners is significantly associated with BD symptoms and symptom variability over time. These negative effects appear greater for hypo/mania than depressive symptoms.
PREVENTING SEXUAL AGGRESSION AMONG UNIVERSITY STUDENTS IN GERMANY: FIRST RESULTS OF AN INTERVENTION STUDY

Isabell Schuster
Paulina Tomaszewska
Barbara Krahé
University of Potsdam (Potsdam, Germany)

Although previous research has shown that sexual aggression is widespread among young people, there is little data on effective, evidence-based prevention programs, especially outside the U.S. Therefore, we developed an online-based intervention to prevent sexual aggression perpetration and victimization and conducted a first test of the effects of our intervention program among 324 university students (238 female) in Potsdam, Germany. Since risky sexual scripts and risky sexual behavior are key variables in the prediction of sexual aggression, our intervention aimed at changing them. The intervention also addressed sexuality-related cognitions (sexual self-esteem, acceptance of sexual coercion) and behaviors (risky sexual behavior, sexual assertiveness) as well as the use of pornography. Participants were randomly assigned to the intervention groups (IG1 or IG2), which received three modules designed to change participants’ sexual scripts (IG1) or promote sexual self-esteem and sexual assertiveness, and to reduce pornography use as well as the acceptance of sexual coercion (IG2), or to the control group (CG). Baseline (T1), post-intervention (T4), and follow-up (T5) assessments were taken in all three groups across a seven-week period. At T5, the score of risky scripts was lower in IG1 and IG2 than in CG. Compared to the CG, sexual self-esteem was enhanced in both IGs at T4. Acceptance of sexual coercion was lower in IG2 than in IG1 and CG at both T4 and T5. However, several effects on behavior, especially regarding changing assertive and risky sexual behavior as well as pornography use, did not reach significance. The results are discussed in terms of the potential and challenges of a script-based intervention to reduce sexual aggression.
The first aim of this study was to investigate the impact of parental and personal characteristics on children’s involvement in bullying. The second aim was to examine personal characteristics as moderators in the relationship between parenting and bullying. Additionally, the present study aimed to empirically investigate bullies’, victims’ and bully/victims’ characteristics, their family role and their school processes. In order to address these questions, the present study used a mixed method design which includes two phases: a quantitative and a qualitative phase. The first phase of the study included 535 children and pre-adolescents (12.55 years, SD = 1.11) and their mothers. Children completed the Parental Authority Questionnaire, the Bullying and Victimization Questionnaire, The Callous-Unemotional Inventory, and the Basic Empathy Scale while mothers completed the Parental Knowledge Questionnaire. The second phase of the study included 5 families (i.e. mothers, fathers, and a target child between 11 to 14 years old) that were assessed through semi-structure interviews by the researcher. Results of the first phase of the study showed that authoritarian parental style, parental control and child disclosure were related to bullying and victimization. Also, the relationship between some aspects of parenting and bullying behaviour was moderated by child’s CU traits and empathy. In addition, results of the second phase of the study indicated the profiles of children involved in bullying, their families’ background and specific school processes that were related to bullying incidents. The findings provide support for the importance of taking both personal and contextual variables into account for understanding the development of bullying and victimization. In addition, the findings of the qualitative phase provide support for a more comprehensive story about the dynamics of bullying and victimization during the school years.
SEXUAL SCRIPTS AS PROSPECTIVE PREDICTORS OF SEXUAL VICTIMIZATION: A CROSS-CULTURAL ANALYSIS

Paulina Tomaszewska
Isabell Schuster
Lylla Winzer
Anja Berger
Barbara Krahé
University of Postdam (Potsdam, Germany)

One important key to understanding nonconsensual sexual interactions lies in the mental representations of consensual sexual interactions, described in the literature as sexual scripts. To the extent that individuals’ sexual scripts of consensual sex contain elements associated with a higher risk of sexual aggression (e.g., alcohol use, noncommittal sex, ambiguous communication of sexual intentions), they may be considered risky and are assumed to increase the vulnerability to sexual victimization through corresponding risky sexual behavior. Furthermore, it is expected that the use of pornography may be a source of influence for risky sexual scripts, indirectly increasing the vulnerability to sexual victimization. To study risky sexual scripts and pornography use as predictors of sexual victimization, longitudinal data (2-3 data waves) was collected in five countries (Germany, Poland, Turkey, Brazil, and Chile; N = 6,041) among male and female college students. Our studies revealed substantial prevalence rates of sexual victimization among both women and men in the different countries. In all countries, risky sexual scripts translated into more risky sexual behavior and indirectly increased the vulnerability to sexual victimization, demonstrating the importance of risky sexual scripts for the understanding of sexual victimization across different cultures. In addition, in Brazil and Poland, evidence was found that pornography use informed risky sexual scripts, which indirectly increased the vulnerability to sexual victimization. In terms of applied significance, the findings suggest that addressing risky sexual scripts for consensual sexual interactions and pornography use may be a promising avenue for intervention efforts. Potential problems with cross-cultural data will also be discussed.
THE ASSOCIATIONS AMONG ECONOMIC STRAIN, MOTHER-adolescent RELATIONSHIP AND ADOLESCENTS’ ADJUSTMENT: A FOLLOW UP STUDY

Aysen Gure
Aysun Ergül Topçu
Ankara University (Ankara, Turkey)

The family stress model (FSM) proposed that economic hardship influence children and adolescents’ development indirectly through a series of mediating family processes (Conger and Elder, 1994). FSM predicts that economic hardship conditions affect couples primarily through the economic pressures. When financial pressure is high, couples are at increased risk for emotional distress and behavioral problems. Emotional distress and behavioral problems are directly related to disruptions in parenting behaviour and leads to poor child adjustment. The current study aimed to investigate the mediating role of the mother-adolescent relationship (mother behavior and the quality of mother-adolescent relationship) from an adolescents’ perspective in a longitudinal approach together with adolescent’s psychological well-being (self-esteem and life satisfaction) besides behavioral problems (internalizing and externalizing) under economic strain. Method The data was gathered twice with an interval of one year. The sampling of the study consisted of 832 adolescents (442 females and 390 males). Economic Strain Scale, the Parenting Behavior Questionnaire, the Quality of Parent-Adolescent Relationship Questionnaire, Multidimensional Students’ Life Satisfaction Scale, Self-Perception Profile for Adolescents and Youth Self-Report were used for collecting the data. The findings showed that economic strain was significantly related to a negative mother behavior and quality of mother-adolescent relationship for girls. Mother behavior and the quality of mother-adolescent relationship, in turn, were associated with adolescents’ poor emotional well-being and behavior problems. Results were also similar for boys, apart from non-significant relations between perceived economic strain and the quality of mother-adolescent relationship, as well as the relations between the quality of mother-adolescent relationship and behavior problems. Moreover, structural equation modeling revealed that the effects of economic strain on adolescent emotional well-being and behavior problems were mediated through both mother behavior and the quality of mother-adolescent relationship for girls. For boys, only mother behavior mediated the influence of perceived economic strain on adolescent adjustment. So our findings supported the FSM in a broad extent. It seems that associations between perceived economic strain and adolescent adjustment varied depending on the nature of the mother-adolescent relationship. *Supported by Ankara University, Scientific Research Project Coordination Unit (Grant No: 11B5358001).
RISK OF DEVELOPMENT OF SECONDARY ALEXITHYMIA IN DEPRESSIVE PATIENTS ON HEMODIALYSIS

Liudmila Baranskaya
Ekaterina Uskova
Valeria Gavrilova
Ksenya Obukhova
Ural State Medical University (Yekaterinburg, Russia)

In accordance with the concept of traumatic somatization elaborated by Russian researchers (Nikolaeva V.V., Tkhostov A.Sh., Arina G.A. et al.), secondary alexithymia is seen as the result of negative emotions experienced by an individual caused by a chronic incurable state. Chronic renal failure (CRF) is one of those illnesses. Patients with CRF of the 4-5 stages have to be under hemodialysis for a long period of time. It leads to significant changes in their way of life and perspectives for the future. The purpose of the study was to see how depression and the development of secondary alexithymia interact. The research was undertaken in the "Ural Medical Center" in Yekaterinburg, Russia. The participants were 60 patients (30 males and 30 females), aged from 28 to 70, average age — 50.7 ±13 years, with chronic renal failure for 15.9±9.8 years, under dialysis from 2 to 15 years, on average — 25.6±18.2 months. Statistical analysis was done with the help of the SPSS program, Spearman’s correlation coefficient being used. A test battery was selected to help solve the tasks of the research. The results of the research showed that there was a noticeable correlation between depression and the presence of alexithymia. The patients in the development of secondary alexithymia risk group demonstrated a positive correlation with a moderate depression (r=0.417, with p=0.01) and heavy depression (r=0.325, with p=0.05). At the same time, there was a strong negative correlation between “absence of depression” and “presence of alexithymia” (r=0.516, with p=0.01). A positive correlation, though a strong one, was demonstrated between the alexithymia index and a mild depression (sub depression) (r=0.711, with p=0.01). The absence of alexithymia showed a negative correlation with a mild depression (r=0.328, with p=0.05), which pointed to a lowering of the risk of development of secondary alexithymia with the absence of depression or minimization of its effect on the patient. Thus, we have all the reasons to suppose that there is a correlation between depression and the development of secondary alexithymia in patients undergoing hemodialysis. The results we have received are being used to create a psychological treatment program for such patients.
INSTAGRAM ADDICTION AND SLEEP QUALITY AMONG MEDICAL STUDENTS

Lancy D’souza
University of Mysore (Mysuru, India)

Instagram is a photo sharing social networking app launched in the year 2010 has more than one billion monthly active users worldwide as of June 2018. Instagram is one of the most popular social networking apps in smart phones with high levels of user engagement and one of the fastest growing social networking sites at present. Present study attempted to find out the relationship between Instagram addiction and sleep quality of students pursuing medical education. The sample consisted of 123 students comprising of 71 male and 52 female students aged between 18-28 years. The students completed Test for Instagram addiction (TIA) developed by D’Souza, Samyukta and Bivera (2018) and Pittsburgh Sleep Quality Index (PSQI-1989). Test for Instagram addiction measured addiction in 6 factors– Lack of control, Disengagement, Escapism, Health and interpersonal troubles, Excessive use and Obsession. PSQI measured global sleep quality.

Pearson’s product moment correlations were employed to find out the relationship between factors of Instagram addiction and sleep quality. Stepwise multiple regression was employed to find out the major predictors of sleep quality by factors of Instagram addiction. Results revealed that 5.7% of the students were definitely addicted towards Instagram and 13.0% of them were prone to addiction. Majority of the sample selected (57.7%) had poor sleep quality. As the addiction on Instagram increased, sleep quality of the students decreased linearly and significantly. ‘Health and interpersonal troubles’ and ‘disengagement’ factors of TIA addiction were found to be the major predictors of sleep quality. Both Health and interpersonal troubles and disengagement factors of TIA contributed to 37.1% of the sleep quality among the present sample of students pursuing medical education. Strategies to reduce addiction to Instagram have been delineated.
INDONESIAN BEGINNER VOTERS: WHEN VOTING INTENTION IS SHAPED BY POLITICAL AWARENESS, POLITICAL TRUST, POLITICAL ATTITUDES AND POLITICAL EFFICACY

General election is a political activities which carried out by every democratic country. In Indonesia general election occur every five years. In every democratic party, the votes of the beginning voters are always contested by political parties. Beginning voters have a potential numbers that can make political parties win the election because they have around 20 to 30% of the total number of voters, on the others hand beginner voters have a unique characteristics which are swing voters due to lack of knowledge and lack of political experience, despite having a large number unfortunately phenomenon shown that the beginner voter actually had a tendency not to be involved in voting in general elections. This research is a quantitative correlational study, using linear regression to analysis the hyphotesis which aims to see the voting intention of beginner through the direct or indirect effects of political awareness, political beliefs, political attitudes, and political efficacy variables. Participants of this study were beginner voters as much as 150. Research participants were asked to fill five types of research scales such as political awareness scale, political trust scale, political attitude scale, political efficacy scale and scale of intention to vote. The results of this study indicate that there is a direct role for the variables of political awareness, political beliefs, political attitudes and political efficacy towards voting intentions. While the indirect role of the intention to choose appears in political awareness, political trust and political attitudes. The results of this study shown that the voting intention of beginner voters can be increased through various variables in this study, but from the hole results of this study shown that the basis of all beginner voters’ political behavior is a political awareness because the political awareness variable is the basis of political behavior where these variables can produce direct effects or indirectly effect towards the voting intention, so that efforts are needed to increase awareness of voting through various intervention efforts so that voters have the intention to vote in general elections.
YOU ARE NOT ALONE: A LONGITUDINAL MULTILEVEL STUDY OF PEER INFLUENCES ON THE DEVELOPMENT OF PROSOCIAL BEHAVIOR IN ADOLESCENCE

Robert Busching
Barbara Krahé
University of Potsdam (Potsdam, Germany)

Learning theories predict that people who observe a particular behavior repeatedly will show this behavior themselves. For adolescents, an important social context is their class community, because they spend most of their day in this stable social context. Longitudinal studies have shown that the level of aggression in a class affects adolescent differentially, depending on their own level aggressive behavior. Parallel analyses of class-level effects on prosocial behavior are lacking. They addressed in the current study. Additionally, we hypothesize that individual perspective taking is a moderator, because people with a high ability in perspective taking should be more able to process contextual influences. Therefore, we analyzed the interaction between individual prosocial behavior and individual perspective taking and class levels of prosocial behavior and perspective taking in predicting adolescents’ prosocial behavior over time. A longitudinal dataset with 16,891 participants in 1308 classes was analyzed using multilevel modeling. Prosocial behavior and perspective taking were measured using self-reports twice in 12 months.

School grades, migration background and gender were included as covariates. First, a main effect of class-level of prosocial behavior was found: the higher the class level of prosocial behavior at T1, the more prosocial individual class members were at T2. More importantly, a significant cross-level interaction emerged. In the more prosocial classes, non-prosocial individuals at T1 moved in the direction of the class as a whole, minimizing individual differences. In less prosocial classrooms at T1, individual levels of prosocial behavior predicted individual levels at T2. For perspective taking, only main effects of the individual and class levels emerged. Adolescents showed more prosocial behavior at Time 2 if they were more prosocial at Time 1 and had been in a class with a high average level of prosocial behavior at Time 1. However the class level effect was bigger compared to the individual level effect. Classmates not only create a social context for learning negative social behaviors but may also promote the development of prosocial behavior by moving the initially less prosocial members toward the higher level of prosocial behavior in their class.
THE INFLUENCE OF A PERSONALITY TYPE ON THE PROGRESSION OF CARDIOVASCULAR DISEASES IN THE OLDER AGE

Tatiana Berezina
Moscow State University of Psychology and Education (Moscow, Russia)

Elizaveta Chumakova
State Budgetary Healthcare Institution (Moscow, Russia)

The personality characteristics affecting the development of cardiovascular diseases at the retirement age (496 people) have been studied; It is shown that bad habits and aggressiveness have an effect on diseases. It is noted the professional activities performed earlier, influence as an additional factor. We studied the individual and personality characteristics that affect the development of cardiovascular diseases in different types of elderly people. The analysis of medical documents, expert assessment, questioning the life course and self-assessment of the personality traits. Independent variable — the level of cardiovascular disease; additional variables: gender, age and professional types according to J.Holland. Dependent variables: features of self-esteem of the personality and the life path. Data processing method ANOVA analysis of variance. Empirical base: pensioners attached to the City polyclinic of Moscow — 496 people. The risk of developing cardiovascular diseases among pensioners increase: bad habits (alcoholism (F=12,65, p=0,00), tobacco smoking (F=5,81, p=0,003), overeating F=4,19, p=0,01)), aggressiveness (F=3,14, p=0,05) and professional activities in the field of "Man — Technique" (F=3,44, p=0,05); reduce: the presence of the subject hobbies (F=3,10, p=0,05) and optimism (F=3,23, p=0,05). The types distinguished by sex and age didn’t have a significant additional effect on the severity of the disease. Only professional types additionally influence on the connection between personal characteristics and cardiovascular diseases. Among the realistic-type pensioners (workers and technical specialties) the risk of cardiovascular diseases was further enhanced by sociability (F=3,93, p=0,05), activeness and commitment, career growth (F=3,14, p=0,05) and reduced by the availability of subject hobbies (F=4,36, p=0,01). Pensioners of the social type (professions in the service sector) further reduced the risk by having sports hobbies (F=5,44, p=0,005), while pensioners of the conventional type (office workers) reduced by professional activity and career growth, and increased by the tendency to overeating (F=3,10, p=0,05) and by sports hobbies (F=4,03, p=0,01). along with the general, there are individual and personality prerequisites for the occurrence of cardiovascular diseases, depending on the professional type of a person. To clarify these results, the additional research is needed. This work was supported by Russian Foundation for Basic Research 18-013-00092A.
“INCLUSIVE”: GROUP COUNSELING FOR EMERGING ADULTS IN TRANSITION

Christoph Steinebach
Agnes von Wyl
Filomena Sabatella
ZHAW Zurich University of Applied Sciences (Zurich, Switzerland)

In Switzerland, nearly one out of six persons (16%) has no occupational solution after completing compulsory education. Various transitional options and interim solutions are nowadays available to the young people who are in transition and seeking an apprenticeship. A lot of them suffer from mental disorders (Sabatella & von Wyl, 2014). Usually, the transition options focus on academics and social deficits without offering psychotherapeutic services. However, early intervention is important, as studies have shown that the course of a mental disorder can be positively influenced if the disorder is treated early and immediately (Stein et al., 2003). To enable an early intervention in a non-clinical setting, we started a group psychotherapy program in a transitional option for unemployed people in the agglomeration of Zurich. To underline the low-threshold character we call it group counseling instead of group psychotherapy. Over the next 1 ½ year 60 young people will participate in the program and thus in the intervention. The group size for the group counseling is limited to 8 participants. The program consists of three elements. Based on the concept of Positive Peer Culture (PPC) the focus is set on building resources like self-efficacy, self-worth, and social competence. In addition, the program includes an element of psychoeducation to sensitize and raise awareness on mental disorders. The third element entails mindfulness and relaxation exercises. Using selected indicators, resulting changes will be measured at three measurement time points (entering the program, leaving the program, 6 months after leaving the program). We will present first results of the outcome of those participants who finished the program. Discussion and recommendations will focus on implications for early intervention in emerging adulthood. The research project is funded by the Foundation Gebert Rüf under its BREF program.
The problem of the relationship of psychological well-being and religiosity of the individual over a long period of time in the scientific community cause heated debate and heated debate. Some scientists (in particular Z. Freud) argue that the religiosity of a person negatively affects the subjective well-being and emotional state of a person. However, numerous studies conducted in recent decades, mainly in foreign psychology show that religious activity in General has a positive effect on the psycho-emotional state of a person. The problem of human psychological health and well-being in the context of the Islamic religion has recently become relevant, as well as other psychological aspects. Studies of Islamic-oriented psychologists M. Badri, O. S. Pavlova. K. I. Nasibullova also shows that religious identity has a positive impact on some components of psychological well-being, in particular, psychological stability of a person. Our study in the framework of the RGNF project "Value-semantic sphere and socio — normative behavior of the individual in secular and religious education" (№16-06-01089) on a sample of students of secular and Islamic educational institutions (N-allowed us to conclude that the religiosity of the individual is an important factor of psychological well-being. The data of our study showed that students of Islamic educational institutions are more pronounced such components of psychological well-being as self-acceptance, acceptance of others, emotional comfort (optimism, balance), internal control (I am the master of life and situation), life satisfaction, emotional saturation of life relative to their peers secular educational institutions. Thus, the picture of the world and the person in it set by the religious doctrine, peculiar to people with internal orientation of religion (Mature, internal religiosity) provides meaningfulness of life of believers, gives effective coping strategy of behavior, and finally promotes development of psychological well — being of the person.
MILITARY PSYCHOLOGY IN THE XXI CENTURY: BLOSSOMING OR CRISIS?

Aleksandr Karayani
Military University of the Ministry of Defense of the Russian Federation (Moscow, Russia)

Research objective — estimating current state of military psychology in the world and revealing the main tendencies of its development. Research method: content analysis of scientific publications, documents, literary sources, professional Internet sites. Research course: scientific articles, textbooks, manuals, websites of psychological communities of 22 states (n=212) were studied. It is established that military psychology is a dynamically developing branch of psychological science and practice. Continuously psychological structures in armies of Australia, Israel, Canada, Russia, the USA become stronger. Psychologists in armies of many European countries and China act actively. It is discussed questions of psychological work in armies of many countries. "Center" of activity of military psychology moves to space of the international military-psychological cooperation. Influence of the USA in the theory and methodology of the analysis of military-psychological problems remains considerable. However, the understanding of the question that the regularities of manifestation of mentality of the soldier opened in the USA in fight, can't directly be extrapolated to armies of other countries increases. Scientific researches of military-psychological prospects are actively conducted. The subject field of military psychology extends. Considerable financial means are allocated for functioning of psychological services, training of military psychologists, psychological work with the military personnel. At the same time, expectations of commanders in relation to military psychology in many respects aren't met. The greatest volumes of PTSD, suicides, drug addiction and alcoholism are marked out in armies where number of psychologists highly and above their financing. There are no "breakthrough" psychological technologies in the major branches connected with behavior of the military personnel. The culture of using of psychological knowledge isn't formed among the military personnel. Psychologists pay too much attention to psychodiagnostics and work with documents. Conclusions: the military psychology is in a bifurcation point now. Growth of number of military psychologists isn't followed by decrease of psychological problems. Credibility to military psychology thaws. Cooperation of military psychologists in the field of psychological help, partnership with actively developing branches of science and practice is necessary.
HYPNOSIS AND VIRTUAL REALITY IN PSYCHOTHERAPY: A PROMISING APPROACH

Salvatore Bellissima
CNOP Italy (Catania, Italy)

Dr. Salvatore Bellissima, psychotherapist, Asp Catania, Italy The goal of the work is to reduce the symptomatology, the healing time and to accelerate the process of change through the use of hypnosis associated with an immersive virtual reality. Hypnosis and virtual reality are already used separately in psychotherapy, but the associated effect of both techniques increases the influence of each, as virtual reality favours the narrowing of the field of consciousness induced by hypnosis, amplifying its effects and increasing its effectiveness. It is an all-encompassing experience that all users report as very engaging: it has been observed that the trance sometimes develops even without induction. Is virtual reality associated with hypnosis effective? The work is conducted through the use of a visor and the induction of the trance after the start of various videos, of varying duration. At the setting of hypnosis (armchair and/or bed, twilight, adequate environmental temperature, attenuation of external stimuli) we add the use of the viewer in which first abstract videos such as geometric representations, lights and colors are transmitted to hinder the projections of the subject, and then concrete videos, depicting naturalistic scenarios associated with brief stimulus stories, used as a metaphor to guide the subject towards more appropriate behavioural styles. The therapist observes simultaneously on another screen what is transmitted by the viewer, so as to gradually follow the subject and accompany him with suggestions. The state of trance is maintained and is not interrupted by the visual and auditory stimuli to which he is subjected. The work started a few weeks ago, but the relative effects are encouraging, with the participants who do not develop any idiosyncrasies, but instead they are very satisfied with the experience and motivated. At the moment everyone has experienced a drop in anxiety. Instruments: Oculus go Viewer, Hypnosis 8 partecipants : case of Italian psychooncology, Moroccan DPTS, Polish depressed former drug addicted woman, Italian DAG, mistread woman, man with social anxiety, Italian multiproblematic woman. Therapy: 1 weekly session.
Identity is understood as an organisation of representations of one’s self, serves as a guideline for a person’s evaluations, and allows to take a root into society and oneself. Psychological theories rarely focus on the socio-cultural background of identity formation. By combining the classical conception of identity by Erik Erikson (1968) and socio-cultural theories of Lev Vygotsky (1980), it is argued that identity can be seen from the perspective of the socio-cultural tools, which can be used by a person for representations and manners of how to organise identity. One’s connections with socio-cultural areas (geographical, practical, societal, cultural and institutional) can assessed through 3 dimensions of identity commitment: fidelity, activity, and ideology. A model of perception of developmental threats and opportunities of the modernity was used in this research to understand the links between identity and perception of the world. Three questionnaires were used in this research — questionnaire of Sociocultural Foundations of Identity (3 types of identity commitment and 5 socio-cultural areas), questionnaire of Globalisation opportunities to assess 4 types of opportunities: social, technological, developmental and global) and questionnaire of globalisations threats to assess 4 types of contemporary threats: technology-cultural, existential-identity, social and systemic). Two-hundred participants (66 males, 134 females) of age from 17 to 50 (M=29,08, SD=8,9) took part in the research. Spearman correlation of variables indicated that cultural area of sociocultural foundations of identity was negatively correlated with social opportunities (rho=-0,21, p<0,01) and with global opportunities (rho=-0,2, p<0,01). Existential-identity threats were negatively correlated with geographical (rho=-0,21, p<0,01) and institutional (rho=-0,26, p<0,01) areas of sociocultural foundations of identity. The results provide a good background into future use and development for the model of socio-cultural foundations of identity. It provides an overview of how different sociocultural areas might be linked with an evaluation of the environment. Particularly, the strong correlations between existential-identity threats and socio-cultural foundations shows evidence that it is reasonable in this context, to analyse the background of identity formation.
USING IMPLICIT WORD-OF-MOUTH INFORMATION TO INCREASE ACCEPTANCE OF ONLINE BEHAVIORAL ADVERTISING

Kaibin He  
Shenzhen University (Shenzhen, China)

Online Behavioral Advertising refers to any form of online advertising that is based on information the advertiser has about the advertising recipient, such as demographics, browsing or purchase behavior, information about preference, and geographic information. Because of its positive effect on revenues, online behavioral advertising has emerged as a major marketing trend worldwide. However, researchers have found that consumers remain highly skeptical of online behavioral advertising due to privacy concerns, which leads to a negative impact on users’ acceptance. Two experiments conducted in the scenario of “Wechat moments” show that implicit word-of-mouth information based on Wechat friends help to increase consumers’ acceptance of online behavioral advertising. Specifically, experiment 1 shows that consumers’ psychological reactance decreased significantly if they were told that the advertisement was also viewed by some Wechat friends. Moreover, experiment 2 suggests that such practice was generally more effective for products of high perceived risk than those of low perceived risk. Connecting researches of online behavioral advertising and word-of-mouth, the present research contributes to the literature of consumer psychology by showing how implicit word-of-mouth information will increase acceptance of online behavioral advertising. The results are also helpful to marketing practices in online advertising.
WHO SUPPORTS ME MATTERS: THE MODERATING ROLE OF SUPPORT AND SOCIAL PRESSURE ON THE CAREER ORIENTATION-WORKFORCE TURNOVER INTENTION LINK

Eugene YJ Tee
Rachel Loh
Tee Eugene Yu Jin
Higher Education Learning Philosophy (HELP) (Kuala Lumpur, Malaysia)

Past research has examined how psychological support moderates the relationship between individual employee factors with their turnover intentions. Such studies, however, treat the support mechanism as a unidimensional variable, failing to distinguish between different forms of support. The current study addresses this gap, examining how various forms of support are most effective and influential in influencing the link between career orientation and turnover intentions among women. The present study also examines this link in a multi-ethnic context, expanding on research that has previously sampled American and East Asian university students. It is hypothesized that career orientation will be negatively related to workforce turnover intention (WTI) and turnover intention (TI). It is also hypothesized that this relationship will be moderated by three different forms of support — social, spousal, and organizational. We employed an online survey sampling 145 women working in various organizations. Respondents provided responses to measures of career orientation, WTI and TI, along with scores on perceived social pressure, and three forms of support — social, organizational and spousal. Controlling for age, career orientation significantly and negatively predicted both WTI and TI. Analyses also showed that co-worker social support, a sub-component of social support, moderated the relationship between career orientation and WTI. Findings of this present study highlight the significance of co-worker social support in strengthening the relationship between career orientation and WTI among Malaysian women. Such findings provide imply that co-worker social support may be supportive of creating integrated support systems aim towards retaining women in the workforce. Such retention strategies may then translate to overall increased women workforce participation in Malaysia. References Ng, C., & Chee, H.L (1999). Women in Malaysia: Present struggles and future directions. Positioning women in Malaysia: Class and gender in an industrializing state. London:Macmillan. Phillips, S. D., & Imhoff, A. R. (1997). Women and career development: A decade of research. Annual Review of Psychology, 48(1), 31-59. doi:10.1146/annurev.psych.48.1.31
Accumulating evidence suggests that grit—perseverance and passion for long-term goals—facilitates subjective well-being, yet the underlying mechanism and the time frame along which this effect operates are less known. Drawing from self-determination theory and the fact that grittier people tend to grow towards highest personal potential through meaning and engagement, we assume that at between-person level, need satisfaction acts as a key mediator of the effect of grit on subjective well-being. Besides, since recent evidence has illustrated how daily goal pursuit contributed to happiness experience, we also hypothesize that at within-person level, daily grit enhances need satisfaction and thus is beneficial to daily well-being. Study 1 conducted a cross-sectional survey among 2,963 adolescents and found that students who reported higher trait level of grit experienced higher level of need satisfaction in learning, which in turn predicted better subjective well-being (indicated by higher life satisfaction, more positive affect and less negative affect). Study 2 further uncovered its intra-personal dynamics with daily diary design. Participants reported daily grit, daily need satisfaction and daily subjective well-being once per day for 21 consecutive day (N = 78, observation = 1,475). Multilevel within-subject mediation analysis showed that need satisfaction mediated the relations between daily grit and daily subjective well-being. Moreover, trait level of grit didn’t show moderating effect in the daily intra-personal process as Bayesian analysis suggested. It implied that students experienced higher level of need satisfaction and subjective well-being on days when they exerted grittier goal pursuit, and this effect held independent of participants’ trait-level grit. Collectively, findings highlight the importance of need satisfaction in explaining the association between grit and subjective well-being regarding inter- and intra-personal processes.
A TERROR MANAGEMENT HEALTH MODEL PERSPECTIVE ON TAKING DIET PILLS

Burçin Cihan
Özlem Bozo
Middle East Technical University (Ankara, Turkey)

According to the Terror Management Health Model (TMHM), when mortality concerns are unconsciously activated, we expect health-related decisions to be shaped by individuals’ internalized cultural values. The current research aimed to investigate the reasons behind positive attitudes toward using diet pills using TMHM as a theoretical framework. For this purpose, the effect of the interaction between socio-cultural attitudes toward appearance and mortality awareness on the attitudes towards taking diet pills (i.e., weight management, subjective norms, being reliable) was tested in the sample of 166 women (Mage = 20.70, SD = 1.9). Degree of the influence of the socio-cultural norms stemmed from media, family, and peers was categorized as high and low. Mortality concerns of the participants were made salient through asking them to write their thoughts and emotions about their own death. There were three experimental conditions; unconscious mortality salience (in which participants reported their attitudes toward diet pills after engaging in a delay task following mortality prime), conscious mortality salience (in which participants reported their attitudes toward diet pills right after mortality prime), and control condition (in which participants’ mortality concerns were not primed). Thus, the design of the present research was a 2 (socio-cultural attitudes toward appearance: high-low) X 3 (study conditions: unconscious, conscious, control conditions) between-subjects factorial design, where the participants were assigned to cells via the matched-randomization method. Analyses revealed that after mortality salience was unconsciously primed, women who reported a higher tendency to evaluate their physical appearance using body-relevant social norms also reported more positive attitudes toward using diet pills, compared with women who reported a lower tendency to evaluate their physical appearance using body-relevant social norms. These results provided evidence for health-defeating outcomes as a consequence of the interaction between unconscious mortality awareness and internalized cultural values.
IMPROVING A SAFETY PERFORMANCE IN MIDDLE INDUSTRIES: WHAT IS THE ROLE OF SAFETY LEADERSHIP?

Desak Dewi
Fendy Suhariadi
Seger Handoyo
Airlangga University (Surabaya, Indonesia)

The characteristics of middle industries that have minimal occupational safety management system, make their employees in dangerous situations and have a greater possibility of having an accident at workplace. The results of previous studies indicate that one of the causes of workplace accidents is human factors. The role of human in accidents at workplace can be caused by a lack of work behavior that supports safety as indicated by a lack of compliance behavior and passive participation in matters that support occupational safety. This can be called for lack of safety performance. Safety performance is a form of action or individual behavior shown in work that aims to improve the health and safety of employees and the work environment. Safety performance has an important role for employees who work in industries that have a minimum occupational safety management system. One of the factors that influence safety performance is the leader. Leaders who focus on safety can influence the level of safety in the workplace through improving employee safety behavior and reducing accident and injuries. This study aims to determine the effect of safety leadership in encouraging employee safety performance in middle industries. Participants are workers in chemical and metal middle industries (N = 95). Data were collected using safety performance scale and safety leadership scale. Safety performance scale have cronbach Alpha coefficient of 0.93 and 0.89. Safety leadership scale have cronbach alpha coefficient of 0.92, 0.89, and 0.92. Results show that there is a significant coefficient correlation between safety performance and safety leadership (0.73) and $R = 0.53$, $p < 0.05$. Safety leadership has a significant effect on safety performance of middle industry employees. In line with the concept of leadership theory that through the leader’s personal characteristics and leadership style, leaders are able to influence and change subordinate work behavior. The high power distance culture between leaders and subordinates in Indonesia also influences the ability of leaders to change subordinate work behavior, and shows importance role of leaders in influencing changes in subordinates work behavior.
CAN PLAYING CHESS HELP IMPROVING CHILDREN’S PLANNING AND VISUO-SPATIAL SKILLS?

Hatice Kübra Aydın
Tevfik Aliche
Bursa Uludağ University (Bursa, Turkey)

In relation to the cognitive processes underlying chess playing, the Identical Elements Theory (Thorndike & Woodworth, 1901) emphasize the similarities chess and other fields of expertise and states that the skills acquired in one field may be transferred to the other fields. Chunking Theory (Chase & Simon, 1973) and Template Theory (Gobet & Simon, 1996) suggest that domain-specific patterns are better remembered by experts than non-experts; however, there is no difference between two groups in recognizing random patterns. Therefore transfer of any skill acquired in one domain does not transfer to the other. The aim of this study was to investigate the effects of chess playing on children’s planning and visuo-spatial skills. 90 middle school children aged between 10 to 14 were tested. A quasi-experimental design was used. Participants were divided into three groups in terms of their chess knowledge. First group consisted of 30 children having National Chess Rating (UKD) ratings, namely professional chess players. Second group consisted of 30 novice chess players. Third group was control group including non-chess players. These three groups were equated in terms of age, gender and math scores. Planning skill was assessed using Tower of Hanoi Task. Visual-Spatial skills were assessed using the Line Orientation Test and the Benton Visual Retention Test. MANOVA results showed that children with UKD rating, had better planning skills than both novice players and non-chess players, \( F_{2,87} = 4.33, p<.05, \eta^2=.30 \). Likewise, visual-spatial perception skills (which was measured using Line Orientation Test) were highest in the expert group, \( F_{2,87} = 7.36, p<.01, \eta^2=.41 \). There was no significant difference among the three groups in terms of Benton Visual Retention Test scores. The advantage of playing chess was observed in the ability of planning and visual-spatial perception but was not observed in visual memory skills. Although chess may require visual memory, that skill may have weaker links with chess than other planning and visual-spatial perception for transfer.
AESTHETIC RESPONSIVENESS CORRELATIONS WITH COPING AND COGNITIVE STYLES

Pavel Sabadosh
Russian Academy of Sciences (Moscow, Russia)

Objectives Aesthetic responsiveness is used to be considered as a resource for subjective well-being, and there are even some evidence of its beneficial impact to recovering from depression and anxiety disorders. May it as well be a resource for productive coping strategies or cognitive styles? To tackle the question a correlational study was conducted. Method Russian lyceum students of both sexes 14-17 y.o., N = 176, filled Engagement with Beauty Scale (EBS) measuring aesthetic responsiveness, Personal Views Survey III-R (Hardiness Survey, HS) measuring resilience under stress, Adolescent Coping Scale (ACS) General form, and Cognitive-personality styles questionnaire (CPS-Q) evaluating six traditional bipolar cognitive styles on the level of personality self-report. Results EBS scores correlated at Bonferroni-Holm corrected p < 0.05 with HS Challenge subscale (r = 0.24), ACS’ Seek Social Support (0.30) and Self-Blaming (0.26), CPS-Q’s Rigidity (-0.29) and Tolerance to Unrealistic Experience (0.37). Conclusion The mentioned HS and CPS-Q subscales obviously relate to openness to experience as the general trait comprising aesthetic responsiveness. Besides, Tolerance to Unrealistic Experience may be consistent with aesthetic experience’s transcendent aspect as well, while the two ACS subscales are presumably related with its empathic and introspective aspects respectively.
ONLINE THERAPIES AND PSYCHOTHERAPISTS’ ETHICAL CONCERNS

Burcu Korkmaz
Bursa Uludağ University (Bursa, Turkey)

Gamze Sen
Necmettin Erbakan University (Konya, Turkey)

Many factors can play a role in therapists’ decision to use the psychotherapy process with the client, including experience, online psychotherapy experience, orientation, and ethical concerns. Especially in online therapies, the therapist has relatively less control comparing face-to-face therapies, and this situation can cause therapists to worry about how they can apply certain ethical rules. Ethical rules for online psychotherapies are not fully clear in this area, which may be an obstacle for people with no experience of online therapy. Although some researchers have published some views on this issue, research on psychotherapists’ concerns about ethical issues is limited. Therefore, the aim of this study is to examine the psychotherapists’ thoughts on ethical issues in online therapies. Our study was carried out with a total of 45 therapists ranging between 24 and 44 (M = 26.07, S = 2.31), 39 female (86.66%) and 6 male (13.33%). Data from the participants were analyzed according to the inductive thematic analysis method (Braun and Clarke, 2006). According to the results, the most frequently cited ethics issues are protection of privacy and confidentiality, beneficence and nonmaleficence, responsibility, being competent about using online psychotherapy context and honesty. Another finding of our study is that psychotherapists’ concerns about ethical issues are thought to negatively affect the therapeutic alliance, which is one of the best predictors of therapeutic change. Our study shows that therapists tend to be flexible using online therapies but are based on some conditions. At the very beginning, the emphasis is on the technical-hardware knowledge deficiencies that will ensure the protection of therapy confidentiality. Finally, it is noteworthy that concerns and negative perceptions of the use of online psychotherapies in the field of mental health stem from the fact that the majority of the participants do not experience the online psychotherapy process. The anxiety of unknown may be causing thoughts such as ’it is difficult to apply ethics code in online therapies’; and this thought may cause the anxiety. The results will be presented as themes and will be discussed in the direction of literature.
IMPACT OF EQUINE ASSISTED GROWTH/LEARNING PROGRAM ON STUDENTS’ PSYCHOLOGICAL WELL-BEING

Olga Lopukhova
Kazan (Volga Region) Federal University (Kazan, Russia)

Kajum Gazizov
International equestrian complex "Kazan" (Kazan, Russia)

The study presented experimental verification of the Equine assisted growth / learning (EAG/L) program created to enhance the psychological well-being among students. The conceptual basis of the EAG/L program is ecopsychological approach to personal development. It is based on the principles of ecological holism, equality of person and nature. The sample includes 90 students of Kazan Federal University aged 19-22: 30 students based on voluntary participation in EAG/L program was "experimental group", and 60 students was "control group". The EAG/L program consisted of six two-hour sessions on Weekends. Quantitative data is received with questionnaires: 1) "Subjectification of a horse" (in S.D. Derjabo & V.A. Yasvin concept); 2) Russian version of Ryf’s "Psychological well-being Scale". Statistical data analysis of control and experimental groups before and after the program is performed using Student’s T-test to related and unrelated samples and the method of linear correlation. Qualitative analysis is based on their oral reflection and writing self-reports. The results showed that the EAG/L program participants significantly increased all measured parameters of psychological well-being (positive relations, autonomy, environmental mastery, personal growth, self-acceptance, purpose in life). The increase in psychological well-being in most scales appeared directly linked to increased general subjectification of a horse during the program. Qualitative analysis of reports on experiences and psychological changes received from EAG/L program participants specified the quantitative analysis results. Students have indicated the following changes: the removal of the state of distress, increase of self-confidence, increase in sense of energy and purpose to gain significant activity. Moreover, about half of the students emphasized that an important step in personal changes was removal of fear in tactile contact with the horse and the acquisition of trust. It is important that students mentioned the spread of the therapeutic effect during communication with horses for different areas of their daily lives and relationships. Thus, approbation of EAG/L program showed that subjectification of a horse contributes to psychological well-being of personality in communication with horses.
Spearmen’s law of diminishing returns (SLODR) is the hypothesis formulated at 1927 by Ch. Spearmen. It states that intercorrelation between intellectual tests are higher when dataset contains subjects with less intellectual abilities (factor g score) and vice versa. After almost hundred years of researches only the trend in average was detected and in many cases the tendency. It was shown also that test distribution asymmetry may lead to the artifactual appearance of SLODR effect but systematic analysis of different sources of asymmetry was not provided. We used three methods of SLODR detection to test real data and two sets of simulated data with different sources of distribution asymmetry and having no any SLODR effect. The first one simulated the asymmetrical choice of respondents having different ability test results. The second one simulated the case of different density of the differently difficult tasks. We selected the simulation parameters so that the simulated data correlation matrix to be similar to one of the real data, and at the same time all distributions to have similar asymmetry parameters. The SLODR testing methods use the dividing a data sample into two subsamples by g factor median. Then we used so called traditional method comparing the g deviation in subsamples, the structural models comparing, the invariance testing in nested structural models, and the original method of ‘Running Variance Estimate’. The results showed that all used methods can’t differ real and artificial SLODR effect. The summary of all methods gives better result but it is also not complete, and that this non-completeness is indispensable until sufficient psychometric properties (interval scales in terms of Stevens’ typology) be provided.
DOES FUTURE TIME PERSPECTIVE AFFECT BEDTIME PROCRASTINATION? THE MEDIATOR ROLE OF MEANING IN LIFE

Kutlu Turkarslan
Deniz Okay
Mustafa Çevrim
Özlem Bozo
Middle East Technical University (Ankara, Turkey)

Being irreplaceable activity in terms of physical and psychological health, night sleep is also the event ending the day. Yet, average sleep length and quality has been significantly decreased since 20th century (Van Cauter, Knutson, Leproult, & Spiegel, 2005). Many sociological, psychological and cultural reasons for this change has been proposed. In this respect, a recent topic of interest is procrastinating bedtime without any mandatory reasons (Kroese, De Ridder, Evers, & Adriaanse, 2014). Since procrastination behaviors are in general associated with aversive activities, procrastination of sleep, which is actually a regenerative and refreshing activity, has been baffling researchers. The present study hypothesized that people try to extend their lifetime by procrastinating sleeping and end of the day. Therefore, higher future time perspective, believing there is enough time left ahead of one’s life, would predict lower bedtime procrastination; and this association would be mediated by meaning in life To test the proposed hypotheses, data were collected from 238 participants (160 female, 78 male). They were administered measures of future time perspective, bedtime procrastination, meaning in life, self-regulation and circadian energy levels. The mediation analysis revealed that the association between future time perspective and bedtime procrastination is significantly mediated by meaning in life. However, after controlling for the effects of self-regulation and circadian energy levels, previously significant mediation became insignificant. The results of this study were discussed along with the information in the existing literature. Limitations and suggestions for further studies were also provided. Kroese, F. M., De Ridder, D. T., Evers, C., & Adriaanse, M. A. (2014). Bedtime procrastination: introducing a new area of procrastination. Frontiers in Psychology, 5, 611-?. Van Cauter, E., Knutson, K., Leproult, R., & Spiegel, K. (2005). The impact of sleep deprivation on hormones and metabolism. Medscape Neurol Neurosurg, 7(1), x-y.
DIFFERENCE IN PSYCHOTHERAPY: CLIENT AND THERAPIST PERSPECTIVES

Carol Long
University of the Witwatersrand (Johannesburg, South Africa)

Clinicians find themselves working with increasingly diverse populations, raising the importance of issues of diversity and cultural competence in psychotherapy. Few studies have undertaken a qualitative investigation of client experiences of diversity in psychotherapy, and psychotherapy research more generally seldom considers both client and therapist perspectives. This qualitative interview-based study aimed to explore client and therapist experiences of difference and similarity in social identity and implications for the psychotherapeutic relationship. A qualitative study employing semi-structured interviews was conducted with 11 South African client-therapist pairs about their experience of psychotherapy and about similarity and difference in social identity. South Africa is characterized by diversity across different social identities for both clients and therapists and the free clinic chosen as the sampling site is particularly diverse. Given both the storied nature of psychotherapy and the relational context of the therapeutic relationship, a narrative analysis was conducted to explore how clients and therapists storied their psychotherapy experience with one another. Both therapists and clients held similar views of the therapeutic relationship but there were some key divergences concerning the valence of social identity in the therapeutic relationship. While therapists linked issues of social identity to the therapeutic process, clients often picked up on key moments, often idiosyncratic and not mentioned by therapists, as helpful in navigating social similarity and difference. Both therapists and, to a greater extent, clients, found it difficult to reflect on social similarity and difference in interviews, and the process of narrating their experience holds implications for addressing identity issues in psychotherapy. Theories of cultural competence often focus on the therapist’s knowledge, or ability to be curious about, difference between clients and therapists. This study suggests that the navigation of social difference is a process which unfolds in unpredictable ways. The findings also suggest that similarity is as complex to navigate as is difference. Key divergences in understanding between therapists and clients suggest implications for therapists’ understandings of client experiences of psychotherapy.
THE RELATION OF ADOLESCENTS’ SEXUALIZED INSTAGRAM CONSUMPTION WITH BODY IMAGE CONCERNS: CORRELATIONAL AND LONGITUDINAL EVIDENCE

Marika Skowronski
Robert Busching
Barbara Krahé
University of Potsdam (Potsdam, Germany)

Media scholars have studied sexualized media consumption and its negative effects on body image concerns. Most research has focused on the use of traditional media and its effects on young women. Furthermore, longitudinal data is scarce. Limited research has addressed the links between sexualized Instagram consumption and body image concerns among adolescents. Two studies were conducted to examine links between adolescents’ sexualized Instagram use and internalization of media ideals, self-objectification and body surveillance. Study 1 (N=300) was conducted online. To further study the relations in a larger sample using a longitudinal two-wave design, Study 2 (N=600) is currently conducted at German public schools. In both studies, correlational data will be presented using structural equation modeling. Extended analyses examining longitudinal paths from T2 data will also be presented. Study 1 revealed that for girls, sexualized Instagram use was associated with body surveillance, mediated through both internalization and self-objectification. For boys, no relation between sexualized Instagram use and body image variables was found. Cross-sectional analyses with the data of Study 2 at Time 1 indicate that sexualized Instagram use is associated with body surveillance, mediated through internalization and self-objectification. No gender differences have been found in this sample. Longitudinal data will be presented that test the directions of the relation between sexualized Instagram use and body image concerns. Findings suggest that sexualization on Instagram can play an important role in increasing body image concerns among adolescents.
Testimonial messages are frequently used in public information campaigns to cope with health and social problems. In the present research a narrative strategy is proposed aiming to reduce perceived threat toward immigrants in the context of the European Union (Schmuck & Matthes, 2017). Narrative persuasion models suggest that transportation and identification with the protagonist are two relevant mechanisms through which narratives produce their impact because both processes reduce counterarguing (Green & Brock, 2000; Moyer-Gusé, 2008). However, previous empirical evidence on the mediating role of counterarguing is not conclusive. Because transportation and identification facilitate persuasion, it is important to know how to increase both processes (Tal-Or & Cohen, 2016). The present study focuses on two factors: similarity between the protagonist of the message and the recipient, and empathy. It is hypothesized that the joint effect of “training” empathy before reading a high-similarity narrative will increase identification and narrative transportation (as compared to the control condition). Secondly, this research tests the indirect effect of the experimental condition that combines empathy with exposure to a high-similarity narrative on the reduction of perceived threat toward immigrants, through identification and transportation (primary mediators) and counterarguing (secondary mediator). In order to contrast our predictions, two experiments were carried out via Qualtrics opt-in on line panels in Spain (N = 383) and the Netherlands (N = 416). We employed a two (empathy versus no empathy instructions) by two (low versus high similarity) factorial design. Both experiments used as stimuli short testimonial messages delivered by a stigmatized immigrant of different origins (a Moroccan immigrant in Spain and a Turkish one in the Netherlands). The results showed that the condition that combined empathy with reading a high-similarity narrative induced the highest levels of identification and narrative transportation. In the mediation analysis, a significant indirect effect was observed on perceived threat toward immigrants through identification and counter-argumentation. However, transportation did not act as a significant mediator. Our work improves our understanding of the mechanisms that explains the impact of testimonial messages. Ultimately, both studies suggest that testimonial messages can be effective narrative tools to reduce perceived threat toward stigmatized immigrants.
INVESTIGATION OF THE ROLE OF EXECUTIVE FUNCTIONS ON EPISODIC FUTURE THINKING AND PAST REMEMBERING

Hasan Gündüz
Zeynel Baran
Hacettepe University (Ankara, Turkey)
Yağmur Kır
Bora Baskak
Ankara University School of Medicine (Ankara, Turkey)
Nilay Sedes-Baskak
Yıldırım Beyazıt University (Ankara, Turkey)

The ability to mentally simulate future events, or episodic future thinking (EFT) can be conceptualized as projection of the self into future. Although, both EFT and past remembering largely depend on episodic memory (EM), due to their different demands on the recombination process, re-integration of details brought back from memory, their need for executive functions (EF) which are thought to be important for this process may also differ from each other. We aimed to examine the role of executive functions on different conditions with different recombination demands independently of the possible contaminative effect of EM. We compared healthy control subjects (N=23) with intact EM and EF to an index group of schizophrenia patients (N=20) with intact EM but impaired EF in a EFT task. The outcome variables were EFT performance as well as frontal cortical activity during the EFT task. The EFT task consisted of three conditions; (i) past remembering using one cue word (PR-1C; lowest demand), (ii) future imagination using one cue word (Fi-1C) and, (iii) future imagination using three cue words (Fi-3C; highest demand). Frontal activity was measured by 52 channel Functional Near Infrared Spectroscopy (FNIRS; Hitachi ETG 4000). We found that the index group compared to the control group displayed worse performance in all conditions. Past remembering performance was better than future imagining performance among the index group. We also found that the activity in the right middle and superior temporal areas in the Fi-1C condition was significantly higher than in the PR-1C condition in the control group. Behavioral results clearly point out to a greater utility of EF resources in EFT than in past remembering. Lack of disseverance between the two future imaging conditions suggest that the recombination may be necessary for construction rather than elaboration of stories created by the participants. This conclusion, also partly explains why the differences found between conditions on the basis of physiological data were temporal rather than frontal-focused. Pattern of temporal activity may be related to the contextual characteristics of conditions and the amount of specific detail brought back during these conditions.
EVENT-RELATED HOUSEHOLD DISCUSSIONS AND PSYCHOLOGICAL ADJUSTMENT IN CHILDREN AND ADOLESCENTS AFTER COMMUNITY VIOLENCE

Ilgin Gökler Danisman
TED university (Ankara, Turkey)

Elif Tekin
Madalyon Psychiatry Center (Ankara, Turkey)

Ibrahim Yigit
Baskent University (Ankara, Turkey)

Family factors affect psychological outcomes of children and adolescents in the aftermath of human-caused traumas. Following huge-scale traumatic events, families are generally provided with guidelines about how to provide developmentally appropriate information to their children and about the effective ways of discussing the event. However, relatively few research have investigated the benefits of such household discussions after incidents of terrorism and community violence. Terrorism and community violence experienced one after another in about past 1.5 years in Ankara provided a context to investigate this issue. The main objective of the current study was to test the mediating role of event-related household discussions in the relationship between family factors (family functioning and parental mental health) and internalizing/externalizing problems in children and adolescents. A total of 129 children and adolescents aged between 11-18 years and their parents who were exposed to incidents of community violence took place in Ankara participated in the study. Exposure Checklist, Event Related Household Discussions Checklist, Brief Symptom Inventory and Youth Self Report and Inventory of Family Protective Factors were administered to collect data. The results showed that event-related household discussions mediated the relationship between parental mental health and internalizing behavioral problems but did not mediate the relationship between parental mental health and externalizing behavioral problems. The study also indicated that family functioning predicts the quality of household discussion but was not a significant mediator. The findings suggested that children who have mentally healthy parents with whom they discuss the traumatic event exhibit less internalizing behavior problems whereas children who have mentally disturbed parents with unhealthy discussion patterns are more prone to internalized behavior problems. In the case of externalized behavior problems, on the other hand, regardless of the effects of event-related household discussions, parental mental health became a more important determinant of adjustment after controlling for trauma exposure. The main findings of the study indicated the preventive role of event-related household discussion hold after traumatic exposure in the development of internalized behavior problems, such as anxiety, depression and social introversion, in children and adolescents.
In line with the developments in medicine, the survival of children with chronic illnesses has increased progressively and been extended beyond childhood. However, chronic illnesses still have many consequences in terms of the psychosocial well-being. Family Systems Perspective, brought about the realization that a chronic illness does not only impact the individual child, but also transmit its effects to the entire family system. Living with a chronic illness can be considered as an ongoing trauma both for the child and for his/her parents as the primary caregivers. The present study aims to evaluate the psychological adjustment of families of children and adolescents with chronic illnesses by investigating the emergence of depression and posttraumatic stress symptoms in children and their parents by utilizing a conceptual model. Assuming that the factors influencing families’ responses to illness-related trauma are multiple, the model incorporates demographics, illness characteristics (both objective and appraised) and social-ecological variables as primary predictors of psychological adjustment. The sample consists of 125 children and adolescents living with a chronic illness and their parents. The data has been gathered through the use of self-report questionnaires. Hierarchical Regression Technique was used to analyze the data. The results constitute an initial support for the validity of the proposed conceptual model in predicting depressive and posttraumatic stress symptomatology in children and adolescents with chronic illness and their families. The results are believed to provide a useful framework to organize researchers’ and clinicians’ thinking about the psychological responses of the families living with chronic illnesses and the factors that influence them. An improved understanding of the role of different predictive variables, functioning either as risk or protective factors, is expected to be helpful in designing psychosocial interventions for the families.
THE CURRENT INTERNET-BASED MENTAL HEALTH SERVICES IN CHINA

Ziwei Wan
Shulin Chen
Zhejiang University (Hangzhou, China)

Internet has been considered as a cost-effective and convenient supporter for mental health services. Since the release of the "Internet Plus" strategy in 2015, Internet-based mental health services (IMHSs) have been developing gradually along with the rapid development of internet in China. A very interesting theme right now is coming out: what are the effects of these IMHSs in China? So, the aim of this systematic review is to clarify: 1) the contents of IMHSs in China, 2) the evaluation system for effects of IMHSs, and 3) what we learn from the current IMHSs in China. We completed a preliminary review on the current IMHSs in China, evaluation of these services and public perceptions about IMHSs. According to the results, we found that: 1) IMHSs in China were carried out mainly in the forms of psychometrics, psychology education and counseling presently. 2) There hasn’t been any complete evaluation system for IMHSs in China, despite the fact that lots of methods could be adopted for assessment (qualitatively and quantitatively). And 3) some problems still existed in the delivery of IMHSs, including unstandardized entry requirement for service providers, inadequate evaluation, limited forms of services and ethical issues. Considering the current IMHSs in China, we thought future efforts should focus on the relationship between people’s mental health demands and service providers’ demands for increasing profitability, in order to ensure the sustainability of mental health services. And we proposed several suggestions and future trends for the development of mental health services: 1) setting up an Internet-based mental health services ecosystem, consisting of normal people, patients with mental illness and their caregivers, psychiatrists, psychology consultants and volunteers; and services should be provided respectively, including counseling, psycho-education, psychotherapy and so on; 2) establishing a whole set of evaluation standards to assess efficacy of services, competence of service providers and public attitudes toward IMHSs; 3) combining other technology to improve IMHSs’ functionality, for example, physiological graphers can be used as emotion monitors, AI can be an auxiliary access to professional help, and VR may play an important role in relaxation trainings.
SPILLOVER OF INCIVILITY FROM WORK TO HOME DOMAIN: THE MEDIATING ROLE OF EMOTIONAL EXHAUSTION AND WORK FAMILY CONFLICT

Derya Karanfil
Ankara Yıldırım Beyazıt University (Ankara, Turkey)

H. Canan Sümer
Middle East Technical University (Ankara, Turkey)

In workplace incivility literature, it was empirically supported that being targeted with uncivil treatment was a unique predictor of whether someone displays such uncivil behaviors towards coworkers. However, it is not known whether when someone is targeted with uncivil behaviors in the workplace, she/he will show such behaviors in another domain like home toward his/her partner. In this regard, we aim to examine the mechanisms underlying work-home spillover of uncivil behaviors. As experienced workplace incivility might be a resource draining experience, it was hypothesized that experienced workplace incivility is positively related to emotional exhaustion, which in turn might be positively related to work family conflict. As increased emotional exhaustion and work family conflict might be related to withdrawal behavior and avoidance from partner interaction, we hypothesized emotional exhaustion and work family conflict as serial mediators in the relationship between experienced workplace incivility and instigating family incivility. 150 heterosexual couples (300 partners) participated to our two-wave survey with two weeks interval. At time one, participants filled out workplace experienced incivility and emotional exhaustion scales. At time two, scales of work family conflict and experienced family incivility were administered. Each partner’s experienced family incivility score was used as his/her partner instigating family incivility score. Separate analyses for husband and wife samples were conducted with PROCESS macro developed by Hayes (2013). For husband sample, after controlling experienced family incivility, experienced workplace incivility positively predicted emotional exhaustion (B=.50, p<.001), then emotional exhaustion increased work family conflict (B=.57, p<.001) and later work family conflict was negatively related to instigating family incivility (B=-.13, p<.05). The proposed serial mediation was supported as the confidence interval for indirect effect (B=-.04) did not include zero. For wife sample, experienced workplace incivility was positively related to emotional exhaustion (B=.40, p<.001) and emotional exhaustion increased work family conflict (B=.36, p<.001); however, work family conflict did not predict instigating family incivility (B=.04, p=.14) and the proposed serial mediation was not supported as the confidence interval for indirect effect (B=.00) included zero. Our findings will be discussed based on social gender roles and work-home resource model.
THE BULGARIAN VERSION OF THE MULTIDIMENSIONAL DRIVING STYLE INVENTORY: PSYCHOMETRIC PROPERTIES

Zornitsa Totkova
Rositsa Racheva
Bulgarian Academy of Sciences (Sofia — City, Bulgaria)

Road safety is one of the main priorities of the European Union. Different strategies and politics strive to increase the level of road safety across Europe and although this level have indeed increased in the last couple of years the number of injured and killed in traffic accidents is still very high. The Multidimensional driving style inventory (MDSI) is a self-reported instrument for assessment of person’s habitual driving style as a factor which can explain risky driving behaviour and involvement in different traffic accident. The instrument is originally developed in Israel and there are several previous adaptations in different countries such as Argentina and Romania (Taubman-Ben-Ari, Mikulincer and Gillath, 2004; Poó et al., 2013; Holman and Havârneanu, 2015). The main objective of this study is to develop a valid and reliable version of the MDSI in Bulgaria. A study is conducted in order to evaluate the construct validity of the instrument and to test the validity of the factors in Bulgarian sample (n = 456, male = 204; female = 252; average age = 37). With respect to the driving experience the sample is with relatively balanced distribution, i.e. 284 people have driving experience up to 15 years, and 172 have more than 15 years of driving experience. Nine factors representing a specific driving style — dissociative, anxious, risky, angry, high-velocity, distress reduction, patient, careful, and irrational, identified by previous versions of the MDSI are included in this study. The overall number of items in the inventory is 61 with Cronbach’s alpha = 0.78. The current study in Bulgaria confirm the structural organization of the initial version of the inventory. The predominant styles for the Bulgarian sample are patient and careful driving style. The results of the conducted study supported the reliability and validity of the Bulgarian version of the MDSI. The possible implementation of the instrument for the development of different programs for prevention and interventions is discussed.
INTERCONNECTION BETWEEN DRIVING STYLE, TRAFFIC LOCUS OF CONTROL AND IMPULSIVITY IN BULGARIAN DRIVERS

Zornitsa Totkova  
Bulgarian Academy of Sciences (Sofia — City, Bulgaria)

The need for researches in the field of transport psychology in Bulgaria has become more tangible in recent years both due to increased public intolerance to aggressive driving and the very high number of injured and killed in road accidents in the country. In addition one of the main priorities of the European Union is the road safety. The main objective of this study is to assess the interconnection between Driving style, Traffic locus of control and Impulsivity in Bulgarian drivers. These constructs are assessed with The Multidimensional driving style inventory (Taubman-Ben-Ari, Mikulincer and Gillath, 2004) and questionnaires evaluating the traffic locus of control and functional and dysfunctional Impulsivity (Dickman, S., 1990). A study is conducted in order to evaluate the construct validity of the instrument and to test the validity of the factors in Bulgarian sample (n = 456, male = 204; female = 252; average age = 37). Electronic versions of the questionnaires are used. The results imply that external locus of control has an influence on the driving style as well as the impulsivity as a personality trait. The highest correlation between the External Locos of control is with the dysfunctional impulsivity (Pearson correlation equals to 0.345) but also it correlates with the patient style which is a surprising result. All the styles correlate significantly with the impulsivity and also with the locus of control however the interconnection with the locus of control has lower results. When it comes to gender differences women have significantly higher results on the anxious and dysfunctional driving style when compared to men. Men show higher results on the risky driving style compared to women. This research is one of the few studies in the field of transport psychology in Bulgaria concerning the Bulgarian driver’s behaviour. Such studies are important in order to increase the level of road safety in the country through policies based on scientific evidences.
Organizational culture is considered as one of the most important topics for organizational performance that provides competitive advantage in today’s social and business environment. Culture defines the manifestations of strategic orientations (Wronka-Pośpiech & Frączkiewicz-Wronka, 2016; Baird, Harrison, Reeve, 2007) and influences teams (Cameron and Quinn, 2011; Kotter, 2012; Moonaisur & Parumasur, 2012; Serrate-Alfonso et al., 2014).

However, an interesting issue from theoretical and practical point of view is to study the dynamics and interconnections between the three aspects (culture, strategic orientations and team effectiveness) in a specific industry such as Software industry. In this regard, the current paper explores the impact of both different types of culture and different strategic orientations on team effectiveness. Four types of culture are measured (market, clan, adhocracy and hierarchy which are based on the Competing Values Framework), as well as four types of strategic orientations (customer, technology, entrepreneurial and learning) and four factors for team effectiveness (team results, team processes, team commitment and shared mental models). Quantitative research method is applied with regression analysis in SPSS of three methodologies. The results from the study conducted amongst 494 participants from 35 software companies in Bulgaria confirm the leading influence of culture on team effectiveness (R=0.453). Meanwhile, industry specifics can be found. Clan and market culture and learning orientation have the strongest effect of team effectiveness, i.e. if software companies want to improve effectiveness they should encourage learning programs, improve communication, foster the management skills and implement common standards for project management. Directions for future research and application are also discussed in the article. The outcomes from the research are valuable for managers and team leaders when trying to improve organizational performance. HR professionals and consultants also can take into consideration the results from the study when planning recruitment strategies and training programs for employees at all levels.
Migration may result various levels of adaptation. Research has focused on stressors with a negative impact on adaptation; thus group of migrants that maintain their new lives with good psychological functioning have been dismissed. It is obvious that, certain protective factors do facilitate positive adaptation and functioning in the face of acculturation process. The purpose of this study is to expand understanding of the protective factors of migrant women’s positive psychological adaptation to the host environment. In order to reach that goal we tested a hybrid model that is a combination of Acculturation (Berry, 1987) and Resilience (Ungar, 2011) Theories. The current study offers a hypothesized model that proposes direct effects between individual protective factors and migrant women’s psychological functioning as well as indirect effects through contextual protective factors. This two-level protective factor model includes; women’s education level, socioeconomic status, immigration decision, perceived cultural distance, and psychological resilience as individual level variables; and the perceived social support and psychological functioning of the family as contextual variables. The participants are 215 women (ages ranging from 20-60) who migrated to three metropolitans of Turkey. Testing our hypotheses through Structural Equation Modeling (SEM) showed an acceptable fit for the theoretical model ($\chi^2/df=1.59$, $p<.000$, GFI=.92, CFI=.94, RMSEA=.05). The results demonstrated that socioeconomic status ($\beta=.17$, $p<.05$), immigration decision ($\beta=.17$, $p<.05$) psychological resilience ($\beta=.22$, $p<.005$), social support ($\beta =.35$, $p<.005$) and psychological functioning of the family ($\beta=.15$, $p<.05$) directly predicted psychological functioning of migrant women. Moreover, women’s education level ($\beta=.07$, $p<.05$) and psychological resilience ($\beta=.02$, $p<.05$) contributed to psychological adaptation through psychological functioning of the family indirectly. Additionally, women’s socioeconomic status ($\beta=.10$, $p<.005$) and psychological resilience ($\beta=.10$, $p<.005$) also contributed to the psychological adaptation through social support indirectly. Findings indicate that personal factors do enhance psychological adaptation of migrant women through contextual pathways. Interventions that facilitate protective factors within family and the neighborhood may support positive adaptation of migrant women.
THE RELATIONSHIP BETWEEN VIOLENCE EXPERIENCE BEFORE THE AGE OF 18 YEARS AND PHYSICAL VIOLENCE RECIDIVISM

Hüseyin Nergiz
Sedat Işıklı
Hacettepe University (Ankara, Turkey)

Determining the causes of the crime is important for both rehabilitation and preventive/protective studies. Individuals who reported being violated by their parents during childhood were more likely to commit violent crime than others (Fowler, Cantos, & Miller, 2016). In this study, the relationship between physical and verbal violence exposure before age of 18 years and physical violent crime (wounding or murder) recidivism were examined. The study sample consisted of 228 convicts (age mean=36.74, SD=9.85) who were sentenced to wounding or murder in the open and closed prisons in 4 different cities (Turkey). A self-report form was used to investigate various personal information and exposure to physical and verbal violence before the age of 18 years. The chi-square test was applied to test the relationship between the pre-18 years old violence history and the situation of repetitive punishment for the physical violence act. A significant relationship was found between exposure and/or witness to physical and/or verbal violence from a familiar and/or stranger person and a repetitive punishment for the physical violence. Having experienced any of these conditions increases the likelihood of an individual being punished more than 2.26 for physical violence. Especially witnessing a physical violence before the age of 18 increases the likelihood of physical violence recidivism more than 4.76 times. When the findings are evaluated, it is expected that prevention of physical and/or verbal violence in childhood will prevent the crime of physical violence; In addition, psychological treatment of individuals convicted of physical violence for those who have experienced such experience before the age of 18 years is thought to reduce the repetition of the crime.

THE DARK SIDE OF SUBJECTIVE WELL-BEING

Lucia Monacis
University of Foggia (Foggia, Italy)

Maria Sinatra
University of Bari (Bari, Italy)

Silvana Miceli
University of Palermo (Palermo, Italy)

Valeria de Palo
University of Foggia (Giovinazzo, Italy)

Although emotion regulation is one of the areas of high interest within psychology, there remains considerable uncertainty as to what is behind this process, i.e., which constructs can account for it. In light of the scarce research on the relationship between the dark personality features and emotion regulation, this study examined the influence of narcissism, machiavellianism, and psychopathy on emotion regulation strategies of reappraisal and suppression. Moreover, as the defining feature of emotion regulation is the activation of a goal to influence the emotion trajectory, the behavioral activation and inhibition systems were considered as potential mediators of such relationship. 471 university students (Mage = 23.24; 58.2% males) filled out the Dark Triad Questionnaire, the BIS/BAS scales, and the Emotion Regulation Questionnaire. Results from structural equation modeling showed that cognitive reappraisal was indirectly affected by
machiavellianism via the activation system and by narcissism via the two behavioral systems, whereas expressive suppression was indirectly affected by psychopathy via the inhibition system. These findings confirmed the expected relationships, thus supporting the emotional correlates of each dark personality trait.

DIFFERENCES BETWEEN MEN AND WOMEN IN ROMANTIC RELATIONSHIPS ACCORDING TO ACTUAL CAPABILITIES OF POSITIVE PSYCHOTHERAPY

Çiğdem Yavuz Guler
Ilgın Çakmak
Üskudar University (Istanbul, Turkey)

The aim of this study is to examine the differences between men and women in romantic relationships in the context of primary and secondary abilities of Positive Psychotherapy. The other aims of this study investigate meeting with partner, definition of relationship, topics they chat with, activities they enjoy doing together, time allocation, physical attractiveness, sexuality, doing separate activities and alternative relational reaction.

Research was conducted quantitative research method relational screening model. In the research, were used to “Primary and Secondary Abilities in the Romantic Relationships Questionnaire Form” created by researchers and "Personal Information Form" to obtain demographic data using online questionnaire. The sampling consists of 330 people, aged 18 and over, 197 women, 133 men.

Participants defined their relationships with their partner, 20% trust / 13.9% love/ passion, 7.9% excellent / extraordinary, 7.9% compliance / complementarity, and 6.7% love. Women commitment (34%) and passion (33%); while males passion (39.8%) and commitment (36.1%) specified what they needed to have in their romantic relationships. 22.8% of the women and 30.8% of the men stated that they did not welcome the separate activity of the partner. The findings on to what extend important for participants to value equally their primary and secondary capabilities in romantic relationships are evaluated according to gender. Females significantly care more than males about having similarities with their partners in primary capabilities: love and patience, and in secondary capabilities: cleanliness and sincerity.

It is thought that the other findings of the study on female-male differences will shed light on the differences in the possible perspectives, attitudes and experiences in romantic relationships.
PROFILES OF TYPICAL COPING STRATEGIES IN FEMALE DOG TRAINERS AND VETS

Lisa Emmett
Birgit U. Stetina
Sigmund Freud University Vienna (Vienna, Austria)

Even though until today research in the field of human-animal-interactions (HAI) shows a high prevalence of studies addressing animal-assisted-interventions (AAI) (Ng et al., 2018) it is highly relevant especially in the field of psychology to focus on the inner experience and behavior of professionals, working in the field of HAI and acting as an interface between humans and animals. For example in view of dog trainers and veterinarians it is noteworthy that although their occupation concentrates on the support and the communication with the handler essential skills are hardly taught in their training (e.g. Kleen & Rehage, 2008). Based on the hypothesis that these professions are confronted with various stressors in their professional activity because they have to handle the animal and the human side, as well as females are more prone to somatic stress reactions (e.g. Matud, 2004) the goal of the presented study was to identify a profile of typical coping strategies of female dog trainers and veterinarians. Using a cross-sectional design an online study was conducted to survey 316 female dog trainers and veterinarians including a self-report test battery to measure twenty different coping styles (SVF-120 Stressverarbeitungsfragebogen (Erdmann & Janke, 2008). Statistical analysis included t-test and cohn’s d as concurrent effect size measure.

Regarding to the subscale NEG, which summarizes all negative coping strategies (e.g. aggression) dog trainers and veterinarians show significantly more negative coping strategies when compared to the general population (t(319)=19.469, p=<.001, d=1.19). Additionally, also in comparison with a control group these professionals tend to ruminate (t(342)=15.290, p=<.001, d=.84), encapsulate socially (t(341)=11.998, p=<.001, d=.67), resignate (t(343)=10.504, p=<.001, d=.58) and even take medication (t(337)=19.366, p=<.001, d=1.07) when they are confronted with stressful situations. Professionals in the field of HAI have rarely been researched in the past although they play an important role for the safety in HAI and for the public health system. The results show that these female professions use a lot of negative coping strategies, which obviously can cause several health problems (e.g. use of medication as coping strategy). Therefore it seems to be substantial to give them the opportunity to improve these skills within their education and training.
PROVIDING VULNERABLE WITNESSES WITH A VOICE: THE USE OF REGISTERED INTERMEDIARIES IN UK

Amuda Agneswaran
Manchester Metropolitan University (Manchester, India)

In England and Wales, the Youth Justice and Criminal Evidence Act (1999) introduced a range of Special Measures to assist vulnerable witnesses whilst giving testimony. One of these was the use of Registered Intermediaries (RIs), experts who facilitate a two-way communication between the vulnerable witness and the practitioners of the Criminal Justice System (CJS). As the RI scheme was introduced nationally only in 2008, there is little knowledge on the operation of this scheme, or the characteristics and motivations of people who elect to become intermediaries. To explore the experiences of RIs of working with the CJS and adult vulnerable witnesses, semi-structured interviews were conducted with 12 RIs. Interpretative Phenomenological Analysis (IPA) revealed that while they are being gradually accepted by the CJS, they face several challenges such as lack of awareness about their role among the police and legal professionals. However, their biggest contribution has been in making a difference and giving the vulnerable witnesses a voice. This study makes a significant contribution to knowledge as it one of the first empirical pieces of work that has explored the experiences of RIs, while providing recommendations for future research and practice, such as training police on the role of RIs. The RI scheme is an important step in the inclusion of vulnerable people into the society and providing them with an opportunity to access justice. It also illustrates the importance of involving experts from the fields of psychology and speech and language therapy in developing a system that adapts to the needs of vulnerable people.
UNDERSTANDING THE ‘FITRAH’ OF HUMAN BEING FROM THE QUR’AN AND THE NEW SCIENCE OF PSYCHOLOGY

Bagus Riyono
Universitas Gajah Mada (Yogyakarta, Indonesia)

‘Fitrah’ is a term in Arabic that has the meaning as the origin, the true nature, and also the purpose of human existence. The knowledge of ‘fitrah’ is the foundation of all human affairs. The World Social Science Report 2010 by UNESCO concluded that the fundamental problem of social science today is the absence of "generally accepted model of humanity". This study explains how the new science of psychology found the proof of human ‘fitrah’ that is in accordance with the message from the Qur’an. The method used in this study is meta-ethnography. The study conducted by deep understanding on the existing reports and theories to find the themes emerge from the theses. There are three themes that emerge as a result of a meta-ethnographical study on the works of Riyono (2012), Barlette (2016), Brown (2015), and Yuniardi (2018). These three themes are freedom-responsibility, uncertainty, and vulnerability. Human freedom is found to be supported not only philosophically, but also by the study of the brain activity. Uncertainty is found to be the reality of life that denying it will be the beginning of all psychological problems. Vulnerability is found to be the key to happiness. The three themes found in this study create a foundation to build the new science of psychology that integrate knowledge from various sources including holy book, phenomenological science, positivism science and neuro-science. This study proposes a new hope in the field of psychology in order to become a comprehensive human science.
EXPERIMENTAL STUDY OF INTERACTION BETWEEN HUMAN AND ROBOT: CONTRIBUTION OF ORIENTED GESTURES IN COMMUNICATION

Artemy Kotov
Anna Zinina
Ludmila Zaidelman
Nikita Arinkin
National Research Center «Kurchatov Institute» (Moscow, Russia)

We develop a computer implementation of a cognitive architecture to simulate emotions, text comprehension and natural communication. We design F-2 robot as sample robot companion to support communication with a human, while operated by the suggested architecture. The architecture is based on the concept of proto-specialists [1] and CogAff model [2]. It consists of (a) linguistic processor (parser), (b) model of scripts for the simulation of emotions and natural language inferences and (c) robot software manager, executing behavioral scripts in BML format [3] on F-2 robot [4]. An important part of our work is the study of human communicative behavior in the situations of natural emotional interaction in REC — Russian Emotional Corpus. We select behavioral patterns — emotional facial expressions, head movements and gestures — and transfer them to the robot. In the experimental studies on robot-to-human interaction we evaluate the contribution of these movements to the positive impression of the robot on a human. Our report describes new experimental studies on the effect of oriented (pointing) gestures on the attractiveness of the robot to the user. In an experimental setup robot can detect user’s location and the position of his eyes. Further, in a dialogue the robot can direct its gaze sidewise, use random gestures (condition 1) or direct it’s gaze at the human, executing oriented gestures (condition 2). Experimental study involved 21 participants (7 female, 14 male), at mean age 33.1. According to the results of the experiment the participants significantly (p = 0.04) more often prefer a robot that looks at the user (condition 2). However, such estimates are implicit, because respondents do not always consciously note the difference between the two experimental conditions. 1. Minsky M.L. The Society of Mind. ONLINE GAMES AS A MEANS OF SOCIAL CONTACT: AN INVESTIGATION OF STUDIES IN TERMS OF INTERGROUP OUTCOMES

Özlem İskender
Kastamonu University (Kastamonu, Turkey)

This study aimed to interpret how useful online games, in general, as a means to draw successful results from social contact. Social contact (Allport, 1954) through the internet has been told to yield more successful results due to several mechanisms it has, to overcome obstacles that might be encountered in an offline setting (Hamburger & McKenna, 2006). The internet has been told to have several advantages for social contacts, such as affordability, accessibility, suitability, flexibility, repeatability, easily manipulating group saliency, etc. Online games are one internet means through which social contact between members of different social groups can occur. Online games could be even more advantageous, in that playing is a desired positive experience, participation (i.e., playing online games) is very voluntarily, and the likelihood of going back for fun is high (i.e., playing regularly or repeatedly). Moreover, online games usually have a social nature which requires players to cooperate to reach game objectives or goals. Players can communicate outside of games as well through several platforms which would extend their contact. Several studies examined upon a literature review revealed positive outcomes regarding improving intergroup attitudes. For instance, playing cooperatively with a real-life outgroup member (for example, in shooter games) can reduce bias against them (e.g., Adachi, Hodson, Willoughby & Zanette, 2015). It also increases helping behavior and reduces aggression (e.g., Velez, Mahood, Ewoldsen & Mayor-Guse, 2014). Further, players can learn about the lives of and empathize with real-life outgroup members, through simulated characters (e.g., Bachen, Hernandez-Ramos, Raphael & Waldron, 2016). Finally, players identify with other players sharing this common interest, i.e., their game community (e.g., Guegan, Moliner & Buisine, 2015; Kim, Lee & Kang, 2012; Van Looy, Courtois, De Vocht & De Marez, 2012). Overall, it was concluded that online games are a favorable means of social contact and a natural lab to study it. However, it is needed to pay attention to what predicts positive results of social contact and if the impact is sustained and transferred. Findings will be discussed based upon social contact hypothesis, social identity approach, and relevant computer-mediated communication theories.
INVESTIGATING THE ROLE OF VIRTUAL REALITY AS AN ANXIETY AND DISGUST PROVOKING TOOL IN CONTAMINATION SENSITIVITY

Mujgan Inozu
Ufuk Celikcan
Elif Uzumcu
Huseyin Nergiz
Ezgi Trak
Hacettepe University (Ankara, Turkey)

Virtual reality (VR) is a computer-generated simulation in which the user can interact with a lifelike environment in seemingly realistic means. VR-based exposure has so far been effectively utilized in the treatment of anxiety disorders, post-traumatic stress disorders and eating disorders. While VR technology in the evaluation and treatment of obsessive compulsive disorders (OCD) has a recent history of use, there has been studies that provide promising results on the effectiveness of VR in OCD treatment. The present study aimed to investigate whether VR scenarios developed for contamination concerns evoke anxiety, disgust and a need for hand washing in high and low contamination sensitivity groups. Based on Belloch et al. (2014)’s study, four different virtual scenarios, compromising of 12 tasks in total, have been developed. The scenarios take place in a home kitchen setting where the overall dirtiness is increased gradually throughout the scenarios. VR tasks were administered to high (N=33, M=28.28, SD=3.53) and low contamination sensitivity groups (N=33, M=2.88, SD=1.36). Before and after VR tasks, participants completed State-Trait Anxiety Inventory, The Disgust Scale-Revised, The Immersive Tendency Questionnaire and Presence Questionnaire; and during VR tasks participants rated their anxiety, disgust and need for hand washing between 0-100 points after they completed each task. Results revealed that high sensitivity group had higher anxiety, disgust and need for hand washing in the virtual environment than did low sensitivity group. A series of two-way mixed ANOVA revealed that the levels of anxiety, disgust and the need for hand washing of the high sensitivity group increased systematically as the level of triggering the sense of contamination of the tasks in the virtual environment increased. These results suggest that VR technology provides a realistic environment which can provoke anxiety and disgust sensations in people with high contamination sensitivity. As a result, applications based on virtual reality are thought to be a powerful anxiety-provoking and exposure tool in the treatment of OCD.
THE RELATIONSHIP BETWEEN SENSE OF HUMOR AND COGNITIVE STYLES AMONG UNIVERSITY STUDENTS

Asil Özdoğan
Üsküdar University (Üsküdar, Turkey)

Sense of humor is individuals’ tendency to appreciate, produce, and use humor in a variety of situations. Humor perception and generation involves a set of underlying cognitive processes such as working memory, verbal and visual reasoning, cognitive flexibility, and cognitive styles. Cognitive style refers to the preferred way individuals think, perceive, and process information. For example, individuals with knowing cognitive style prefer objectivity, logic, and precision, whereas those with planning style emphasize structure, control, and routines and, on the other hand, subjectivity, impulsivity, and openness are favored in creating cognitive style.

This correlational study explored the relationship between sense of humor and cognitive style among Turkish university students. A group of 224 students (63% female) at a foundation university in Istanbul who had a mean age of 22.66 (SD=5.96) had completed demographic questions and two self-report measures. Sense of humor was measured through Multidimensional Sense of Humor Scale (MSHS), which is a 24-item five-point Likert scale that has a total score as well as four subscales for humor production and social uses of humor, coping or adaptive humor, appreciation of humor, and attitudes toward humor. Cognitive style was measured via Cognitive Style Indicator (CoSI), which is an 18-item five-point Likert scale with three subscales of knowing, planning, and creating. Correlation analyses showed that participants’ age was not related to sense of humor but slightly correlated with the creating cognitive style (r=.15, p<.05, n=204). There was no gender difference in MSHS scores, but females had slightly higher scores in planning cognitive style (M=28.8, SD=4.25) than males (M=27.5, SD=4.38; t(202)=1.97, p<.05). A multiple linear regression to predict MSHS total score based on three CoSI scores yielded a significant equation [F(3, 213)=9.08, p<.001, R^2=.11] where the creating style was the only significant predictor (B=1.13, t=4.84, p<.001). Results show that the university students with higher levels of creating cognitive style also have higher levels of sense of humor. These results add support to earlier findings on the relationship between humor and creativity and offer new questions for future studies on cognitive processes and individual differences.
Studies have shown that individuals’ relations with their own living environment (e.g., Junot, Paquet, & Fenouillet, 2017) and their contact with natural places (e.g., Herzog, Chen, & Primeau, 2002) can improve well-being. In this study, it was aimed to test the associations between urban identity, contact with nature and well-being in a city located in the western part of Turkey. It was assumed that the stronger individuals’ identity derived from the city they live in, the better well-being they should report. Moreover, levels of their contact with nature should be associated with a better well-being as well. The study consisted of 213 Turkish participants (Female = 130; Male = 83). Participants’ age ranged from 17 to 73 years (M = 39.70; SD = 12.33). The participants were asked to complete the scales of Urban Identity (Lalli, 1992), The Positive and Negative Affect Schedule (Watson, Clark, & Tellegen, 1988), Life Satisfaction (Diener, Emmons, Larsen, & Griffin, 1985), and Contact with Nature (Herzog et al., 2002). For the Urban Identity Scale, the PCA identified three eigenvalue > 1.0 (λ = 11.01; λ = 2.19; λ = 1.24). The three-factor solution (external evaluation, commitment and attachment) explained 72.18% of the variance. MANOVA results showed that age had effect on external evaluation and attachment, Wilks’ Λ = .92, F(6, 414) = 2.72, p = .013, η² = .04. The highest scores were obtained by the participants over 45 years. In order to clarify the associations between variables multiple regression analyses were run. Each dimension of well-being were regressed on contact with nature and the subscales of urban identity by controlling sociodemographics. Results indicated that whereas economic status (β = .38, p < .001) and commitment (β = .26, p < .05) explained 19% of the variance in life satisfaction, contact with nature (β = .28, p < .001) was a unique predictor of positive affect by explaining 12% of the variance. Overall, the pattern of results is consistent with the literature suggesting that physical environment is a key issue for human well-being.
INDEPENDENCE AS A FACTOR OF PERSONAL AND CIVIL IDENTITY DEVELOPMENT

Larisa Maksimova
Moscow cadet’s school “Boarding school of Ministry of Defense of Russian Federation” (MCS) (Moscow, Russia)

Oksana Popova
Republican Institute for Vocational Education (Minsk, Belarus)

Lyubov Grigorovich
Moscow Institute of psychoanalysis (Moscow, Russia)

Marina Kurenkova
Moscow cadet’s school “Boarding school of Ministry of Defense of Russian Federation” (MCS) (Moscow, Russia)

Modern psychological researchers encounter the problem what personal characteristics help adolescents to adapt to the social environment and cope with life difficulties. Modern psychology presents the concept of personal potential as an integral characteristic of personal maturity level. The main phenomenon of personal maturity and the form of manifestation of personal potential is the phenomenon of self-determination of personality with the opportunity to experience personal emotions in the process of personal development on a life path (Chiksentmikhai M., 2011).

A teenager’s readiness for independent living cannot be viewed outside the family, peer environment, or an analysis of the adolescent’s development situation (OA Karabanova, 2018). The ability to change the environment and personality is based on a personal system of values. The way of own activity representation is associated with responsibility of consequences of the choice (Grigorovich L.A., Popova O.S., 2018). In our study we discuss the correlation of characteristics of the social situation of development, vitality, emotional experience and independence of adolescents. We used the Theory of life position of the personality (Leontiev D.A., 1993, 2019) and the Differential questionnaire of experience of loneliness (Leontiev D.A., Osin E.N., 2013).

The study involved 404 people from 13 to 18. The respondents were students of the Boarding School located in Moscow. Teenagers arrived for training from isolated areas of Russia.

The aim of the research is to define whether teenage girls are ready to live independently according to the education environment.

The study has revealed the tendencies defining the connection of the relationship of personal development and individual style of socialization in adolescence with such aspects of social space as “autonomy - dependence” and “activity - passivity”. The main trends of the formation of readiness for independent life and their connection with age and individual characteristics, development tasks and the influence of macro- and micro-social space factors have been demonstrated.

It is revealed that an important indicator of successful socialization (along with social norms and values assimilation) is a positive emotional attitude to these norms, especially of a particular group with which a teenager identifies himself, and has a strong position in society.
THE RELATIONSHIP BETWEEN WELL-BEING, STRESS, AND POSITIVE EXPERIENCES IN MOTHERS OF CHILDREN WITH DEVELOPMENTAL DISABILITIES

Panayiota Stavroussi
University of Thessaly (Volos, Greece)

Joanna Bismpiki
University of Thessaly (Volos, Greece)

Parents raising children with developmental disabilities face great challenges which can result in increased levels of stress, yet the positive outcomes of parenting a child with disabilities cannot be ignored. In the context of developing adequate family-centered supports and services, well-being in parents caring for children with disabilities has become an area of increasing research interest. Moreover, the identification of factors that influence parental well-being has received special attention. The main purpose of this study was to examine the relationship between parental stress, positive experiences of raising a child with disability, and spiritual well-being in mothers having children with a diagnosis of Autism Spectrum Disorder (ASD) or Intellectual Disability (ID). The potential predictive role of parental stress and positive experiences in the overall level of spiritual well-being was examined. A total of sixty-nine mothers (mean age 45.52 years) of 37 children with ASD and 32 children with ID (mean age 13.2 years) participated in the study. All mothers completed a demographic information form and three questionnaires, the "Spiritual Well-being Scale", the "Parental Stress Scale", and the "Positive Gain Scale". According to the results of hierarchical regression analysis, maternal positive experiences significantly contributed to the prediction of the overall level of spiritual well-being in the total group of mothers. Specifically, lower scores on the positive gain scale (which indicate greater levels of positive experiences) predicted higher spiritual well-being. The diagnostic group also predicted maternal well-being. Mothers of children with ID reported higher levels of well-being than did mothers of children with ASD. Finally, the interaction between maternal stress and positive experiences did not contribute to the prediction of spiritual well-being. The results are discussed in relation to the development of meaningful evidence-based strategies for supporting families of children with disabilities by taking into account the complex and potentially dynamic role of child- and parent-related strengths and challenges.
The concept of zero in quality improvement has been around for more than 50 years, with James Halpin introducing the zero defects movement in 1966. By 1976, the concept of “target zero” had moved to reducing accidents in Japan. In the 1980s, Dr Don Berwick and the Institute for Healthcare Improvement reached out to NASA for a dialogue about applying quality improvement to health care, ie, one small step for quality and one giant leap for health care safety. More recently, “Innovating to Zero” has been called one of the 10 megatrends for innovation. Health care in the United States has focused on quality improvement since the 1960s, but it has only introduced the concepts of high-reliability science in the past 20 years. High-reliability organizations aggressively pursue perfection, an approach, for example, that has driven commercial aviation in the US to achieve remarkable levels of safety in air travel. This approach is characterized by a deference to front-line expertise, a preoccupation with learning about failures and “near misses” and a relentless focus on the target of zero defects. The Henry Ford Health System (HFHS) in Detroit was the first to apply these concepts in behavioral health care, focusing on the relentless assessment of suicidality across their continuum of psychiatric care. The result was an audacious goal to achieve zero suicides in their mental health programs. The effort was labelled “perfect depression care.” In a 2015 National Public Radio story, the author wrote: “The story of the health system’s success is a story of persistence, confidence, hope, and a strict adherence to a very specific approach.” In 2011, the National Action Alliance for Suicide Prevention in the United States published “Suicide Care in Systems Framework,” and organizations around the world began to adopt and implement the Henry Ford Health System Zero Suicide in Healthcare model, including in Australia, Canada, the Netherlands, New Zealand and the United Kingdom. In 2015, leaders from 13 countries crafted “Zero Suicide: An International Declaration for Better Healthcare.” In 2018, more than 90 healthcare organizations in the UK forged the Zero Suicide Alliance.
NEUROCOGNITIVE ABILITIES IN PREMATURE CHILDREN AT 14 MONTHS OF AGE

Sergey Kiselev
Ekaterina Suleymanova
Nadia Bakushkina
Inna Tuktareva
Ural Federal University (Ekaterinburg, Russia)

It is known that premature children have a risk for neurodevelopmental disorders [Anderson & Doyle, 2008]. There is not enough data about the impact of prematurity on neurocognitive development in young children. We have shown that prematurity has negative effect on cognitive scale, receptive language and gross motor from the Bayley Scales (3rd Edition) in infants at 5 months of age (Kiselev et al, 2017). The aim of this study was to study the neurocognitive abilities in premature children at 14 months of age. The participants were 23 premature infants at 14 months of corrected age and 23 age-matched healthy full-term infants. The gestational age of preterm infants was between 29 and 35 weeks. The Bayley Scales (3rd Edition) were used to evaluate the neurocognitive abilities using 5 scales (cognitive scale, gross and fine motor, receptive and expressive language). One-way ANOVA was used to reveal group differences in performing tasks from the Bayley Scales. We have revealed the significant differences (p<.05) between groups only in expressive language. Premature children performed significantly (p<.05) more poorly than the full-term infants on this scale. However, we did not find group differences in gross and fine motor, cognitive scale and receptive language. It can be assumed that prematurity has a specific negative effect on neurocognitive abilities of children in different stage of development. Particularly, the prematurity has a more negative effect on neurocognitive abilities at 5 months of age in comparison to 14 months of age. We are going to study neurocognitive abilities in premature children in the framework of longitudinal approach to reveal effect of prematurity on neurocognitive development of children at 24 and 36 months of age. This work was supported by grant Russian Science Foundation № 16-18-10371.
Suicide and self-harm are major public health concerns with complex aetiologies which encompass a multifaceted array of risk and protective factors. There is growing recognition that we need to move beyond psychiatric categories to further our understanding of the pathways to both. Although there have been many advances in our understanding of suicide risk, our ability to predict suicidal behaviour remains no better than chance. New approaches to predicting suicidal behaviour focus on distinguishing between those who think about suicide and those who attempt suicide. Although a comprehensive understanding of these determinants of suicidality requires an appreciation of biological, psychological and social perspectives, the focus in this presentation is primarily on the psychological determinants of self-harm and suicide. The Integrated Motivational–Volitional (IMV) Model of Suicidal Behaviour (O’Connor, 2011; O’Connor & Kirtley, 2018) provides a framework in which to understand suicide and self-harm. This tripartite model maps the relationship between background factors and trigger events, and the development of suicidal ideation/intent through to suicidal behaviour. We propose that defeat and entrapment drive the emergence of suicidal ideation and that a group of factors, entitled volitional moderators, govern the transition from suicidal ideation to suicidal behaviour. According to the IMV model, volitional moderators include access to the means of suicide, exposure to suicidal behaviour, capability for suicide (fearlessness about death and increased physical pain tolerance), planning, impulsivity, mental imagery and past suicidal behaviour. I will present a selection of empirical studies derived from the IMV model to illustrate how psychological factors increase suicide risk and what can be done to ameliorate such risk. The IMV model identifies 8 key pillars that govern the transition from suicidal thoughts to suicide attempts. Clinical interventions need to target the volitional phase factors to reduce the likelihood that suicidal thoughts are acted upon. The implications for the prevention of self-harm and suicide will also be discussed.
COMPARISON OF METACOGNITIVE BELIEFS IN PATIENTS DIAGNOSED WITH ANXIETY DISORDER AND NON-CLINICAL SAMPLE

Serap Görgü Akçay
Oya Sorias
Şebnem Pırıldar
Ege University (Izmir, Turkey)

The point at which the metacognitive approach differentiates from the cognitive approach is that it’s not only focusing on the content of thought, but also focusing on how one thinks and controls his/her thought. Because, according to the most fundamental hypothesis of this approach, what causes the occurrence and continuation of Anxiety Disorders are the ways in which one’s thoughts or beliefs about the negative thoughts passing through the mind of the person are applied to deal with these thoughts (Wells, 2009). The aim of the study was to determine whether patients diagnosed with Anxiety Disorders differed from healthy subjects in terms of metacognitions. Therefore, patients with anxiety disorders who commonly had worry and obsession were compared with control group in terms of metacognitive beliefs. Patient Group Diagnosed with Anxiety Disorder (Obsessive Compulsive Disorder, Panic Disorder, Generalized Anxiety Disorder) (n=86) and a Control Group (n=88) were included in this study. Demographic Form, Metacognitions Questionnaire-30 (MCQ-30; Wells & Cartwright-Hatton, 2004), A Brief Measure of Worry Severity (Gladstone et al., 2005), Padua Inventory of Obsessive Compulsive Symptoms (Burns, Keortge, Formea & Sternberger, 1996) were the materials used in this study. Analysis of variance results showed that total scores and all dimensions of metacognitions of patients with Anxiety Disorders were clinically significant and higher than control group’s scores. In this study, it was found that patients with anxiety disorders had more negative and positive beliefs about anxiety, more need to control their thoughts, more cognitive self-consciousness and cognitive confidence. The results of the analysis confirmed the fundamental hypothesis of Wells’ theory. According to the metacognitive model of psychological disorders, the occurrence of anxiety and obsessive thoughts is closely related to the activation of a special poisoning thinking style, called Cognitive Attentional Syndrome (CAS). CAS is triggered by metacognitive beliefs and thoughts (Wells, 2000,2009). It has been suggested that patients with anxiety disorders have metacognitive beliefs (e.g. positive and negative beliefs about worry) (Wells, 2009). These results are supported with earlier literature (Cartwright-Hatton & Wells, 1997; Cucchi et al., 2012; Sica, Steketee, Ghisi, Chiri & Franceschini, 2007; Pazvatoğlu ve ark., 2013).
THE CONGRUENCE BETWEEN SIBLING RELATIONSHIP AND PARENT-CHILD RELATIONSHIP: A FAMILY SYSTEM MODELLING

Arife Berna Aytac
Hacettepe University (Ankara, Turkey)

Dilek Demirtepe Saygılı
Atılım University (Ankara, Turkey)

According to Family System Theory, the family is a complex system composing of different interdependent subsystems such as sibling, and parent-child subsystems; and, there is a mutual relationship among these subsystems. Available research exploring the relation between parenting and sibling relationship quality suggests that parenting practices are related to sibling relationship quality. Congruence hypothesis suggests a positive relationship or spillover between the quality of parent-child relationship and sibling relationship. Overall, findings imply that both positive and negative practices of parents spill over into sibling relationship. The aim of the current study was to investigate whether parenting practices in terms of warmth and discipline reflect on sibling relationship quality. We examined the influences of parenting on children’s relationships with their siblings in a socioeconomically diverse sample of 122 families. The mean age of children is 6.55 (SD=1.43, 70 girls and 52 boys). The mean age of their siblings is 8.52 (SD=2.96, 61 girls and 60 boys). Mothers completed questionnaires about relationships with their children, and children were interviewed using the Berkeley Puppet Interview, in order to gain their perceptions about the positive and negative aspects of their relationships. According to the hierarchical regression analyses, if the child perceived warmth from his/her mother and father, s/he builds a more positive relationship with his/her sibling. Similar effects were also found when the relationships were perceived negatively. When the mothers’ reports were analyzed, similar findings were observed. One interesting finding is that, even after controlling perceived mothers’ warmth, perceived fathers’ warmth significantly predict positive sibling relationship, suggesting the importance of the roles of the fathers. The current study adds to the literature by supporting the congruence hypothesis. The findings highlight the importance of exploring family relationships in the operation of family systems. The findings also show that the quality of the father-child relationship also plays a key role in child development. Limitations and future directions will also be considered.
EXTRAPOLATION OF MISSING INFORMATION IN FACE IMAGES

Olesya Blazhenkova
Sabanci University (Istanbul, Russia)

Boundary extension (BE) a common memory error that involves extrapolation of missing visual information just beyond the edges of a view. The limited view of a scene may activate a perceptual representation of the expected layout beyond the visible boundaries. This subsequently manifests as a false memory error, in which people confidently remember seeing a wider-angle view of the scene than was viewed. The present research explored boundary extension in upright or inverted images. During the encoding, participants observed photographs of faces, cropped either in a forehead or in a chin area. Subsequently, they performed face recognition through a forced choice selection. The recognition options represented different degrees of boundary extension and boundary restriction errors. Eye-tracking and performance data were collected. The present work demonstrated BE in cropped upright and inverted faces. Moreover, it revealed the asymmetry of BE at different sides of an image. More pronounced BE errors were observed for forehead-cropped than for chin-cropped upright faces. In contrast, BE errors were more pronounced for chin-cropped than for forehead-cropped inverted faces. Thus, BE was greater for images cropped in the upper part than for those cropped in the lower part, independent of whether the face was inverted or normally oriented. The examination of oculomotor behaviour during the encoding showed that for both, upright and inverted, faces, a greater attention was paid to the upper part of the face. While both ‘eyes’ and ‘mouth’ were the most salient regions, for the upright faces, ‘eyes’ attracted more attention than ‘mouth’; however, for the inverted faces, ‘mouth’ attracted more attention than ‘eyes’. These results suggest that BE could be affected by attention.
FROM THE NORTH CAUCASUS TO MOSCOW: MULTIPLE IDENTITIES, ACCULTURATION, AND ADJUSTMENT OF INGUSH MIGRANTS IN MOSCOW. A NETWORK ANALYSIS

Zarina Lepshokova
Dmitry Grigoryev
National Research University Higher School of Economics (Moscow, Russia)

The number of migrants from North Caucasus in Moscow has risen steadily, while the intercultural relations between migrants from the North Caucasus and the host population of Moscow are rather complex (Zayonchkovskaya et al., 2014). Since Ingush, as all of the migrants from North Caucasus, have a high cultural distance to the Russian host population of Moscow. The difference in traditions, values, and religion is a serious challenge for their mutual adaptation (van Osch, Breugelmans, 2012). Studies point here to the importance of investigating the structure as well as consequences of migrants’ multiple identities (Martiny et al., 2017). In our study, we focused on multiple identities, acculturation, and adjustment of the Ingush who moved to live in Moscow from the Republic of Ingushetia. We explored the relationship between five different identities: ethnic identity (i.e., Ingush identity), national identity (i.e., Russian citizen identity), religious identity (i.e., Muslim identity), ethnolinguistic identity (i.e., Vainakh identity), and regional identity (i.e., Caucasian identity). The Ingush-origin migrants in Moscow (N = 201, men = 50%; age: M = 23.0, SD = 4.8) completed the questionnaire with measures of the multiple identities, acculturation strategies, and psychological and sociocultural adaptation. Network analysis was used to determine the structure of the Ingush’s multiple identities. Path analysis was used for testing the specific predictions. Ethnolinguistic (Vainakh) identity, which is closely related to ethnic (Ingush), regional (Caucasian), and religious (Muslim) identities, was a central node in the network structure of the multiple identities of the Ingush living in Moscow. National (Russian) identity was not directly associated with Vainakh identity. Regional (Caucasian) identity was a bridge between Vainakh and national (Russian) identities. Integration, which is closely related to separation, was a central node in the network structure of the acculturation orientations. The results of path analysis showed that Vainakh and Russian identity positively related to integration, which in turn is positively associated with life satisfaction. It was also found that ethnic Ingush identity is positively associated with a separation and self-esteem, but negatively associated with assimilation. Results are discussed in terms of the role that identity construction plays in the integration of migrants into host societies.
PREDICTING FAKING IN PERSONALITY ASSESSMENT FOR PERSONNEL SELECTION PURPOSES

Mehmet Gültaş
H. Canan Sümer
Middle East Technical University (Ankara, Turkey)

Although, personality inventories in personnel selection is used widely, their susceptibility to faking is still considered an important issue. Social desirability scales (SDS) are the most widely used method to prevent faking in personality assessment but their utility has been questioned in the literature. To evaluate predictive validity of SDSs in discriminating honest responding and faking and to compare their performance with one of the recently developed machine learning methods (i.e., random forests; RF) an experiment was conducted using a computer program. Participants (N = 182) completed a SDS and then the BFI-2 twice (i.e., Condition 1 [C1] and Condition 2 [C2]). In C1 participants were instructed to respond as honestly as possible, and in C2 they were instructed to distort their responses to appear as positive as possible for a sales job. The order of the conditions was randomized. Between conditions, participants completed the Raven’s Advanced Progressive Matrices as a distractor task. To evaluate how good SDS in discriminating between the conditions, logistic regression (LR) models using SDS score as the predictor were used. To achieve this, 2000 bootstrap samples were created from the original data and using each of the bootstrap samples a LR model was estimated. In each iteration of the bootstrap sample creation process, on average, approximately .368 of the original data which are called out-of-bag were not selected and used as a test sample to evaluate the performance of the fitted LR model. As classification performance measures, each LR model’s classification accuracy (CA), area under the curve (AUC), positive predictive value (PPV), and negative predictive value (NPV) were averaged on the test samples. Similarly, RF models using the BFI-2 items as predictors were created on bootstrap samples and their performance were tested on the OOB data. Averaged bootstrap results showed that using SDS scores LR had 70.5% CA, 77% AUC, 71% PPV, and 70% NPV. Average of the bootstrapped RF results showed that RF had 72.4% CA, 74.5% AUC, 76.5% PPV, and 69.6% NPV. These results indicate that the information already in the personality inventories can be used to detect faking in personnel selection contexts.

STIGMA TOWARD PEOPLE WITH MENTAL ILLNESS

Nurul Hartini
Nur Ainy
Atika Dian
Nido Dipo
Universitas Airlangga (Surabaya, Indonesia)

Mental illness is a serious issue in Indonesia, including in East Java, a province in the Java Island. According to the national survey or Riset Kesehatan Dasar, the prevalence of severe mental illnesses such as schizophrenia and other psychotic disorders in East Java is 2.2 per mil. People with mental illness had experience discrimination from those around them. This research conducted a survey study on 1,269 respondents in East Java. The instruments used were Mental Health Knowledge Schedule (MAKS), and a sociodemographic questionnaire. This research found significant score differences in level of stigma toward people with mental illness based on contact experience (t = −4.271, P < 0.01) and history of mental disorder within family (t = −2.919, P < 0.01). Familiarity with mental illness was found to have notable contribution to the shaping of attitude toward mental health patients.
The aim of this study was to examine risk perception and worry, being involved in an accident, harassment, theft or terror, as a pedestrian, and to examine the association between worry and walking frequency during night-time and daytime. Active travel modes like walking and cycling are more pro-environmental than motorised travel modes. Hence, the Norwegian transport policy and the Norwegian authorities give high priority to increase the number of active travellers. Pedestrians' perceived risk and worry are important for transport planners and in the work of increasing the number of active travellers. The study was based on a telephone questionnaire survey carried out among a representative sample (n = 2000) of the Norwegian population aged 15 years or older. The data collection was carried out distributed in collaboration with The Norwegian Public Roads Administration during spring 2017. The response rate was 27%. The respondents were asked to evaluate their perception of risk, risk tolerance, risk protection, their previous accident and assault experiences, worry being a pedestrian and walking frequency during night-time and daytime. In addition, the study contained questions about age, gender and level of education. The results showed differences in how people perceive the risk and how worried they are being exposed to different hazards (accident, harassment, theft and terror) as a pedestrian during night- and daytime. As expected, pedestrians perceived the risk to be higher and were more worried being exposed to hazards during night-time compared with daytime. SEM showed that risk perception was a significant predictor variable of worry during both night-time and daytime. Additionally, worry was found to influence pedestrian behaviour. Worry was moderately associated with walking frequency during night-time, and how often individuals walk alone outside during night-time. These associations was stronger for people without access to a private car. There were not found to be an association between worry and walking frequency during daytime. The importance of risk perception, risk protection, risk tolerance and previous experiences for worry being a pedestrian will be discussed.
Fear of missing out (FoMO) is a form of anxiety that results from not being able to follow information provided by others (Beyens et al., 2016). FoMO is significantly associated with an increase in the level of general anxiety (Przybylski et al., 2013), which leads directly to the experience of negative feelings. Researchers emphasize that following information about friends can be reduced by social support, especially among adolescents (Xie et al., 2018). The aim of this study is to find the complex role of perceived support from friends, family and a significant other through the influence of FoMO on experiencing negative feelings in individual’s life. Participants aged between 14-52 (N = 752, M = 24.73, SD = 6.18, 62.6% women) filled out an online survey consisting of Fear of Missing Out scale (FoMOs; Przybylski, et al., 2013), The Multidimensional Scale of Perceived Social Support (MSPSS; adap. Buszman, Przybyła-Basista, 2017) and the Scale of Positive and Negative Experience (SPANE; Diener, Biswas-Diener, 2009). The results obtained by mediation analysis with multiple mediators through bootstrap sampling showed a significant role of (1) perceived family support, (2) perceived significant other support and (3) both as mediators between influence FoMO on experiencing negative feelings in double-mediation model with significant total indirect effect (Indirect = 0.035, SE 0.01, 95% CI[0.018,0.056]). After adding a perceived friends support as a mediator in the obtained model, significant mediation models included perceived support of: (1) family, (2) family and friends, (3) significant other and friends and (4) all three components of social support in a multiple mediation model with significant total indirect effect (Indirect = 0.031, SE = 0.01, 95% CI[0.012,0.052]). Implications from these findings may include emphasizing specific types of social support resources and social-based activity in psychological treatment of FoMO. The highest meaning of social support while experiencing negative feelings from FoMO comes from the family, and the smallest from friends. This may be related to the belief that friends are the main cause of the FoMO, especially among adolescents; therefore, their role as a source of social support is negligible.
Dravet syndrome (DS) is a rare disease (the incidence is 1 in 15,700 or 40,900, Wirrell et al., 2017), of genetic origin, in which epilepsy, cognitive disorders, behavioral disorders and motor disorders are associated. The autism spectrum disorder (ASD) is a disorder with incidence 82.6 / 10,000 boys and 23.6 / 10,000 girls (Hinkka-Yli-Salomaki et al., 2014). Rare disease in the case of DS or the relatively common disorder in the case of ASD, disability of the child is the common point of these two chronic conditions. The goal of our research To explore life experiences, as well as parental stress and the psychological well-being of parents of children with severe disabilities. Methods: 48 parents of children with severe disabilities vs 57 controls participated in the study. Families with Dravet Syndrome (n = 29) were recruited in France, Switzerland, Canada, and Belgium. Families with autism spectrum disorders (n = 19) were recruited with the help of the French association of parents. The mixed method was used. Questionnaire-based data allowed analysis of different dimensions of parents’ psychological well-being. The interviews aimed to understand how the parents lived this unique experience, what adaptation to the chronic disease strategies they used to ensure the good development of the siblings, medical and educational support for the sick child, effective interactions with health and education professionals. Interviews with parents of children with severe disabilities were analyzed using the Interpretive Phenomenological Analysis (Smith, 1996), a method designed for the collection of qualitative data in the case of serious disorders. The findings suggest that parents of children with severe disabilities experience higher level of stress than parents of children without disability. The chronic illness would have a significant impact on parental stress. Parents of children with DS experience higher level of parental stress compared to parents of children with ASD. This result suggests that the intractable epilepsy greatly increases parental stress. The results indicate that the level of behavioral disorders in children with severe disabilities is the reliable predictor of parental stress. The behavioral problems do not predict different dimensions of parents’ mental health.
THE SUCCESSFUL OF EMOTIONS RECOGNITION BY PRESCHOOLERS DEPENDING ON THE PERSON’S AGE IN THE PHOTO

Evgeniya Lebedeva  
Institute of Psychology RAS (Moscow, Russia)

Evgeniya Butolina  
The State Academic University for the Humanities (GAUGN) (Moscow, Russia)

The research was carried out within the theory of mind (ToM) approach, which suggests that the recognition of emotions is one of the important aspects of the development of understanding of the mental world. The influence of both the cultural context and the interaction experience (van der Meulen et al., 2017; Sternglanz, DePaulo, 2004). However, there is a gap in studies of the recognition of emotions by children of different ages. Research Questions: Will children of preschool age be better able to recognize emotions by the facial expression of their peers than by the facial expressions of adolescents and adults? Will the successful recognition of emotions in preschoolers be associated with the success of theory of mind? The sample consisted of 60 children at the age of 3 years old (Me=41 m.) and 5 years old (Me=65 m.). To study the possible role of the person’s age in the successful of recognition of basic emotions 32 photos of faces of different age persons of both sexes were selected, expressing basic emotions: happiness, sadness, anger and fear. The tasks to understand the visual perspective of first and second levels, to understand the desires, source of knowledge and the false beliefs were used to assess ToM. The results showed that the success of preschool-age children in recognizing basic emotions is related to the age of the recognizable face: three-year-old children more easily recognize emotions from their peers, while five-year-olds—from peers and adolescents. Recognition of basic emotions and understanding of the mental world in preschool children are connected—the better children recognize emotions from photographs of people of different ages, the better they understand various aspects of ToM—differences in visual perspective, a source of knowledge, differences in desires and understanding of false beliefs (rs = 0.514, p = 0.004; rs = 0.588, p = 0.006). The results obtained and their significance for the understanding of the theory of mind’s development in early age is discussed.
Portugal has been facing a change of Paradigm on Education that goes far away beyond a legislative or theoretical change of framework and expresses an important change on processes and practices towards new law and policies on Inclusion, schools’ Flexibility and Autonomy, Pedagogical Differentiation, Significant Learnings and a Competencies Profile for the 21st Century Student, where Educational and School Psychologists have a significant role and opportunity to support, operationalize, reinforce and experiment new psychological evaluation and intervention proposals, simultaneously contributing to the continuous improvement of the quality of psychological practices and services, schools, education, life and of democratic participation in society. These educational challenges have been in the daily agenda of the Portuguese Psychologists’ Professional Association, concerning and intervening in this political moment, with formal positions and recommendations for the new legislative documents, the creation of a Profile for the Educational and School Psychologist and of Technical Guidelines for the Educational Psychologists Interventions, built in an intense dialogue and advocacy with the Portuguese Ministry of Education, standing for a promotional and preventive multilevel model of intervention that aims the educational success and mental health for all students and for the school as a whole organization. Educational Psychologists can indeed support reflections and foster the cultural, political, organizational, structural dimensions of the school by providing data that facilitate informed decision making, introducing programs and practices based on scientific evidences, promoting cognitive and behavioral modifications, training and empowering educators and supporting a systemic, comprehensive and functional evaluation and intervention model, which facilitates the development and use of learning and socioemotional competencies and skills in projects, procedures and methodologies of teaching and learning, in an emotionally healthy and supportive educational environment, leading future civic commitments. The Psychologists’ Professional Association addresses the continuous professional development implications for educational psychologists to respond to the actual political and professional demands towards a collaborative consultation model to support organizational leaderships in the development and implementation of innovative and educative actions, projects and policies around strategic goals and sustainability.
BOOSTING UPDATING IN WORKING MEMORY BY POST-HYPNOTIC SUGGESTIONS AND ITS ERP CORRELATES

Anoushiravan Zahedi
Werner Sommer
Humboldt University of Berlin (Berlin, Germany)

Working memory (WM) or updating, one of the most pivotal executive functions, is responsible for refreshing short-term memory to keep its content relevant for the task at hand. Most of the numerous studies assessing neural underpinnings of updating function were confined to the n-back task. In order to generalize these findings, we utilized a tone-tracking task where different syllables were presented consecutively, requiring a button press after a fixed number of each syllable. In Experiment 1, we applied three levels of load (syllables) while recording event-related brain potentials (ERPs). Increasing task load caused longer reaction times (RTs), a decrease in accuracy rates, and a reduction in N1, N2, and P3 amplitudes. These results were closely comparable with typical results observed in the n-back task. In Experiment 2, we explored the malleability of WM in tone-tracking by applying post-hypnotic suggestions (PHSs), which have been successfully applied to improve inhibition but never for updating. For scrutinizing effects of PHSs, a counter-balanced design with two sessions, one without hypnosis and the other including hypnosis and relevant PHS, was utilized. Our results indicate that PHSs successfully enhanced accuracy and RTs in the two and three syllables conditions, whereas in the one syllable condition performance was not boosted. The impermeability of one syllable condition to enhancement of PHSs can be interpreted as either (1) due to selectivity of PHSs, in other words, the one syllable condition require normal counting and any enhancement in updating function will not affect counting or degree of arousal; (2) or the performance in one syllable condition was already at ceiling, therefore no enhancement was possible. Further, PHSs decreased task load effects on the P3 component, which corroborates that the enhancement caused by PHSs are due to the alterations in the same brain network which reacts to the task load. Together, the results of these two studies indicate that, first, the neural concomitants of WM (updating) generalize over tasks and, second, PHSs are applicable also for improving the updating dimension of executive functions; further, these improvements were achieved by alterations in the brain network responsible for WM.
Reduced access to formal education and the precarious working conditions of young people generates a kind of disenchantment and hopelessness in their desire for social ascent. In this sense, it is not strange that this population section is constantly criminalized. A questionnaire was specifically developed and designed for this population, evaluating sociodemographic factors and Likert scales of substance consumption, domestic violence and depressive symptoms. Validity and reliability (Cronbach’s Alpha=.703) of the instrument showed appropriate relations between the reagents of the scales; results showed -through Chi Square analysis- statistically significant differences in the correlations between factors. The cross-sectional, descriptive and correlational research has a universe constituted by inmates of sixteen federal reclusion centers of Mexican Republic with two subgroups of population: the total of female, and a representative sample of the masculine residents. The results show that most of the imprisoned male were detained before 30th birthday and come from sectors socially disadvantaged. This condition aggravates the social impact: low educational levels (39% elementary and 44% middle), main economic providers in young families and the most frequent crime of incarceration were drug trafficking (35.7%). This condition is related to drug or weapons possession; in addition, 46% have not received the court decision. The woman situation should be highlighted in order to understand their vulnerability conditions. Here 51% of the woman were incarcerated before age of 30, 73% had children (64% between 1 and 3) and only 17.4% lived with a partner or husband. The educational level is low (24% elementary and 52% middle completed) despite the fact that 69% had not been sentenced for the crime committed, 40% and 41% reported 1 to 3 or 4 to 6 years in prison. Moreover, 44.5% of the women detained before the age of 30, pointed the economical problems as the main one in home, and 14.4% remarked the addictions as the family problem. The objective is to establish indicators in order to design policies for prevention, treatment and social reintegration, understanding psychosocial problems associated with delinquency, generating a better quality of life.
MOVING FORWARD HEALTH PSYCHOLOGY PRACTICE: AIMS AND WORK OF A EUROPEAN HEALTH SOCIETY (EHPS) TASK FORCE

Sven Ingmar Andersson  
Lund University (Lund, Sweden)

Angelos Kassianos  
University College London (UCL) (London, United Kingdom)

Antonia Paschali  
National & Kapodistrian University of Athens (Athens, Greece)

Wim Nieuwenboom  
University of Applied Sciences (Berne, Switzerland)

Anne Marie Plass  
Institute for Medical Psychology and Medical Sociology (Göttingen, Germany)

Moving forward Health Psychology Practice: Aims and work of a European Health Psychology Society (EHPS) Task Force Sven Ingmar Andersson1, Angelos Kassianos2, Antonia Paschali3, Wim Nieuwenboom4 & Anne Marie Plass5 on behalf of the EHPS Task Force to Moving Forward Health Psychology 1Department of Psychology, Lund University, Lund, Sweden 2Department of Applied Health Research, University College London (UCL), London, UK 3National & Kapodistrian University of Athens, Greece 4University of Applied Sciences, Northwestern Switzerland, Switzerland 5Institute for Medical Psychology and Medical Sociology, University Medical Center (UMG) Göttingen, Germany

Background The aim of the Task Force is to stimulate further discussion of the development and application of Health Psychology practice into the society and to stimulate the process of moving towards a more globally recognized definition of Health Psychology through mapping and listing core competencies and skills. In a series of four articles presented by members of the Task Force in the European Health Psychologist (2017) on Health Psychology education, legislation, employability and cooperation with other disciplines in various countries represented in EHPS, multiple barriers were identified when applying Health Psychology into practice. These include language barriers, cooperation with other professionals, lack of funding, as well as variability in training, education and legislation between different countries. The Task Force continues its work to propose a global consensus in how Health Psychology is applied and what Health Psychologists do, through identifying (unique) core competencies and skills. These could support the development of international standards for Health Psychology education, and to legally regulate and standardize Health Psychology practice within the health care systems. Hence, the Task Force relies on National Delegates of the EHPS and other international experts. The ongoing work involves a broad exploration of core skills and compiling a list of competencies through investigating national documents, categorizing these as general, core and unique, and recruiting an Advisory Panel of experts reviewing the list and the suggested categorization. International psychological associations have an important role to ensure that Health Psychology practice is better globally defined, in order to increase visibility of Health Psychologists in the society.
VALIDATION OF THE CENTRE FOR EPIDEMIOLOGIC STUDIES DEPRESSION SCALE-REVISED (CESD-R) FOR USE IN A SOUTH AFRICAN NON-CLINICAL SAMPLE OF WORKING PEOPLE

Carolina Maria Henn
Michelle Michas
University of Johannesburg (Johannesburg, South Africa)

Depression is increasingly becoming a major contributor to workplace disability worldwide. Research on depression in the South African workplace, however, is scarce and more is required as a matter of urgency. To be able to do the rigorous research required, it is important to have psychometrically sound research instruments available. The objective of this study was to validate the Centre for Epidemiologic Studies Depression Scale — Revised (CESD-R) for use in the South African working population. The CESD-R is an instrument used for measuring symptoms of major depression in non-clinical and clinical samples. The main research question was: Is the CESD-R a valid and reliable instrument to measure depression in a non-clinical sample of working people? A quantitative, cross-sectional design was followed. Participants (N=316) were obtained through convenience sampling. The CESD-R scale, the DASS-21 (Depression, Anxiety and Stress Scales) and the GAD-7 (Generalised Anxiety Disorder Scale) were employed. Confirmatory factor analysis (CFA) was done to examine factor structure. Correlations were done to investigate convergent validity between the CESD-R and the DASS-21’s depression scale. To investigate discriminant validity, the CESD-R was compared to the GAD-7 by means of the DIFFtest in Mplus. A constrained model (latent variable correlations constrained to 1.0) and an unconstrained model (latent variable correlation unconstrained) were compared. Good fit was obtained for a unidimensional model for the CESD-R. Fit indices were .05 (RMSEA), .97 (TLI) and .97 (CFI). In terms of discriminant validity, a significant \( \chi^2 = 173.90 \) provided evidence of discriminant validity. The correlation between the CESD-R and the depression scale of the DASS-21 was .81 and this provided evidence of convergent validity. The alpha coefficient for the CESD-R was .95. The CESD-R shows promise as a valid and reliable instrument for measuring depression in non-clinical samples such as working people. Employers can use the instrument to help determine the pervasiveness of depression in an organisation. This information, in turn, can inform intervention and support programmes.
THE EFFECT OF TAIL-SHOCK STRESS ON EEG AND DENDRITIC SPINE DENSITY IN FEMALE RATS

Müge Aslankara  
Süleyman Demirel University (Ankara, Turkey)

Aslı Zengin Türkmen  
Asiye Nurten  
Istanbul Yeni Yüzyıl University (Istanbul, Turkey)

Can Kayacılar  
Istanbul University Aziz Sancar DETAE (Istanbul, Turkey)

It’s shown that the stress and estral cycle cause changing in physiological properties of the brain. In these studies, the stress and estral cycle examined separately. So, there’s no study examining the effects of stress applied on estral cycle from electrophysiological and histological perspectives within the same sample. This study aims to analyze the effects of acute and chronic tail-shock stress applied during estral phases on the theta rhythms and dendritic spines. Bilaterally frontal and hippocampal electrodes were implanted to rats (N=60) under anesthesia. Rats which were classified according to estral phases, were separated into eight groups for acute stress and two groups for chronic stress, as control and experiment (n=6). Basal EEG recordings were taken from all rats for 15 minutes. For acute stress 1 mA, 60 Hz tail-shock was applied for one minute. This application was repeated during a whole estral cycle for chronic stress. EEG recordings were taken again. The animals were decapitated and the brain slices were stained with Rapid Golgi-Stain kit. Independent-Samples t-test and ANOVA were used for the statistical analysis. While there was no difference on theta rhythms that were taken from the control group (CG) animals which were in estrus, metestrus and diestrus phases, it’s shown that acute stress caused significant differences in the experiment groups (p<0.05). It’s also observed that the dendritic spine density on hippocampal regions of the proestrus CG was higher than the metestrus and diestrus CGs (p<0.001) and acute stress applied in proestrus caused a decrease on the hippocampal dendritic spines according to the CG (p<0.001, ~37%). It’s found that chronic stress caused a decrease on the theta rhythms (p<0.05) and the frontal dendritic spines (p<0.05, ~23%) according to the CG. Exposure to the acute and chronic stress cause different effects on the theta rhythms. The result also confirms the finding regarding the increase that occurs normally on dendritic spines in proestrus female is prevented by the stress. This decrease on hippocampal dendritic spines of acute stressed females in proestrus may suggest that females are especially sensitive to stressful experience when estrogen levels are high.
THE MODERATING EFFECTS OF ORGANIZATIONAL CULTURE AND MOTIVATION ON THE RELATIONSHIP BETWEEN WORKAHOLISM AND WORK-LIFE OUTCOME

Alethea Xhuan Jing Wong
Eugene Y.J. Tee
Higher Education Learning Philosophy (HELP) University (Kuala Lumpur, Malaysia)

Previous research has suggested that workaholism — the irresistible inner drive to work very hard, is associated with negative work-life outcomes such as psychological well-being, job satisfaction, and organizational commitment. No study, however, examines the delineation and mitigation of workaholism outcomes by socio-environmental context. We propose that organizational culture and motivation explains how workaholism can lead to positive work-life outcomes. We hypothesized that: (1) Workaholism will be negatively associated with work-life outcomes, (2) The relationship between workaholism and work-life outcomes is moderated by organizational culture, such that the relationship is stronger under different dominating culture profile type, and (3) The relationship between workaholism and work-life outcomes is moderated by motivation, such that the relationship is stronger when motivation is high. We employed a non-experimental correlational design with a total of 125 working professionals, who provided responses to their work addiction, organizational culture, motivation, psychological well-being, job satisfaction, and organizational commitment. We also measured and controlled for demographic profiles in this study. Results provided support for three of the hypotheses. Workaholism was negatively correlated with job satisfaction and was positively associated with organizational commitment. Motivation moderated the relationship between workaholism and psychological well-being. Subfactors also revealed that supportive and innovative culture moderated the relationship between workaholism and job satisfaction. Findings of this present study highlight the significance of understanding workaholism, and how it can function under different socio-environmental context. Such findings shed lights upon potential implications and interventions for understanding how organizations can engineer an optimal working condition and talent development programs in the workplace to increase desirable work outcomes in organizations with a high prevalence of workaholics.
CRIME AND ADDICTIONS: THE CASE OF YOUNG INMATE POPULATION ON MEXICAN FEDERAL PRISONS

Patricia Martínez Lanz
Alejandro Sánchez Guerrero
Patricia Hernández Valdez
Universidad Anáhuac México (Mexico City, Mexico)

According to the National Survey of Inmate Population 2016 (ENPOL) conducted by the National Institute of Statistics and Geography (INEGI), 12.9% of the imprisoned population with criminal record was sentenced for drug trafficking the last time of incarceration. In consequence, a questionnaire was developed and designed, in order to evaluate sociodemographic factors and Likert scales including substance consumption. Validity and reliability (Cronbach’s Alpha=.703) of the instrument showed appropriate relations between the reagents of the scales; results showed -through Chi Square analysis- statistically significant differences in the correlations between factors. The cross-sectional, descriptive and correlational research has a universe constituted by inmates of federal reclusion centers of Mexican Republic, in pursuance to obtain the criminal profile of inmate population. The results show, in the case of men sentenced by drug trafficking: 44% were imprisoned before 30 years, 38.6% had elementary and middle school, 49% reported the economic problems as the main family complication and 72% reported a negative use of illegal drugs during the last year before the incarceration. In the case of women, 48% were imprisoned before 30 years, 81.6% had elementary and middle school, 63% reported the economic problems as the main family complication and 91% reported a negative use of illegal drugs during the last year before the incarceration. Therefore, people incarcerated by drug trafficking are in vulnerable situation, particularly in the case of women. It is important to review this situation to guarantee the reconciliation of our country in justice topic, encouraging social reintegration and prevention of drug abuse.
WHAT CHARACTERIZES PROFESSIONAL SELF-REALIZATION OF RUSSIAN UNIVERSITY STUDENTS AND WORKING YOUNG ADULTS

Yulia Obukhova
South Federal University (Rostov-on-Don, Russia)

Self-realization is both, the process and the result of personal development that stems from and manifests itself in various aspects of life. Successful social functioning implies self-realization in different domains, including professional career, and psychological research cogently targets factors that determine effectiveness of self-realization forming at work places and through educational experiences. Conceptually and methodologically the study is based on the systemic approach to self-realization (Kudinov, 2013) and the ideas of the ‘meaning-forming’ motives (Kokurina, 2011). The main research question: Do predominant and undervalued components of self-realization and ‘meaning-forming’ motives differ in university students and working professionals? Young adults (age 18-35, N=105) from Rostov region of Russian Federation (42 students and 63 employees) participated in the study. They completed “The multidimensional questionnaire on personality self-realization” (Kudinov, 2013) and “Meaning-forming motives for self-realization” test-profile (Obukhova, 2015). Data analyses included Friedman’s and Mann-Whitney’s non-parametric criteria, Spearman’s rank correlation and were implemented in Statistica 10.0. Findings indicate that the leading component of professional self-realization in students is goal-oriented, followed by the self-motivation, whereas working youth showed predominance of the organizational and prognostic motives. There are also undervalued motives. In students they are represented by the emotional ones. Working youth tend to overlook the competency and person-oriented components of self-realization. The leading ‘meaning-forming’ motive for students’ professional self-realization is the competitive result-oriented one. Professionals are more achievement-driven and process-oriented. Two groups differ in their respective undervalued motives. Students typically do not take into account the cooperative motive as a result to strive for, and professionals tend to ignore the pragmatic process-guiding motive. Students equate professional self-realization with academic achievements and primarily consider it the means for a scholarship. Professionals consider self-realization to be the drive for self-improvement. These group differences are age-independent: the measures of professional self-realization and respondents’ age were not significantly correlated (r=.202, p=.09). Also, students reported the overall higher levels of professional self-realization (U=103.00, p=.04).

Conclusions: 1. Dominant motives for professional self-realization in students and young professionals are substantially different. 2. So are different their respective predominant and undervalued meaning-forming motives. 3. Students are characterized by higher levels of professional self-realization.
CHILDREN’S RIGHTS SOCIAL AND CULTURAL CONTEXTS IN THE SUBJECT FIELD OF DEVELOPMENTAL PSYCHOLOGY

Anna Chernaya
South Federal University (Rostov-on-Don, Russia)

The formation of the cultural policy of childhood and the institution of children's rights had a significant impact on the enrichment of the subject field of developmental psychology. The inclusion of children's rights in the field of scientific knowledge has expanded the possibilities of understanding and describing childhood and their categories: Child as ontological other; children as sovereign individuals. Emergent Child-Adult Reconstruction) in the 20-century science due to the introduction of children's rights promoted the elimination of the tough binary opposition child-adult in social concepts of Reconstructing Childhood. The social and cultural phenomenon of lengthening the duration of childhood— the emerging adulthood of children's rights reinforced two trends. On the one hand, in economically developed countries the duration of childhood has increased. At the same time, in countries with a transitional economy and an unstable political system, as well as in poor and dysfunctional families, where the total non-observance of children’s rights, separation from adults, reduction of childhood and rapid maturity still occur. The potential of the rights of the child created the conditions for the study of children’s well-being; ideas about their rights and the rights of others, assessing yourself, your capabilities. In a scientific discourse in connection with the rights of children, the possibility of differentiation and categorization of certain groups of children also arose. The psychology of development is included in the field of view of the category "Excluded and invisible children" -- mentally or physically disabled children; children deprived of liberty, children being at a difficult life situation, the most vulnerable categories of children, ones being discriminated; those at risk of violence (physical, sexual, psychological), and various forms of exploitation (labor and sexual slavery, prostitution). The global United Nations initiative for human rights education contributed to educational programs and the study of a sense of personal autonomy, tolerance for the rights of others. Conceptualization and identification of key research areas on the child’s rights in the developmental psychology are importance for the actualization of modern strategies for researching children’s rights as well as for analyzing international and national experience in this area.
PRELIMINARY STUDY: THE EFFECT OF A TRAINING PROGRAM IN A UNIVERSITY CLINIC ON THERAPEUTIC SUCCESS

Alba Luque González
Miriam Romero
Cristina Casadevante de la Fuente
Applied Psychology Clinic of the Autonomous University of Madrid (CPA-UAM) (Madrid, Spain)

The objective of this research is to study the effect of the training program taught at the University Clinic of Psychology of the Autónomus University of Madrid (CPA-UAM). The aim is to study the effect of clinical experience on therapeutic success. Traditionally, in the scientific literature, the experience has been understood as the number of years of professional practice, however, some studies find that it is not so much the accumulation of practice as the effect of supervision on practice (Burlingame, Paul, Fuhriman & Ogles, 1989). There is a difference between experience and expertise. In the CPA-UAM there is a four-year training program in which the therapists perform clinical practice under the supervision of therapists with more experience and expertise.

Each year, there are approximately ten therapists in the clinic, and more than 120 patients. Each therapist carries, at least, twelve cases per year. This research has studied the influence of the year of training on the therapeutic success. For this we use the following data: (1) the pre-post results of the questionnaires battery that patients complete (BDI-II, STAI, SCL-90-R and WHOQOL-BREF), (2) the number of sessions performed until discharge, (3) the number of objectives proposed and achieved and (4) the number of dropouts per therapist. The preliminary results of this research will bring clarity to the effect of experience and supervision on therapeutic success. This field of research for clinical psychology is relevant to carry out quality and validated empirically training programs.
PSYCHOLOGICAL VIOLENCE AGAINST WOMEN, ATTITUDES, AND SYSTEM JUSTIFICATION: A RESEARCH ON UNIVERSITY STUDENTS

Taner Görüryılmaz
Selva Ülbe
İnci Boyacioğlu
Dokuz Eylül University (İzmir, Turkey)

**Background:** Unlike physical violence, psychological violence cannot be easily recognizable, but it deeply affects the victims and leaves devastating "invisible scars" on them (Asensi, 2008). Unfortunately, it is frequently reported that the proportion of being victimized by psychological violence is considerably high among university students (Harned, 2002). Therefore, the main objective of present study was to reveal the social mechanisms and processes underlying psychological violence, on a sample of university students who are considered to be at high risk both as perpetrator and victim of psychological violence.

**Method:** The data collected from 343 university students (183 female and 160 male). Demographic Information Form, Ambivalent Sexism Inventory, Attitudes Toward Physical Wife Abuse Scale, and System Justification Scale were administred to all participants. Besides, female participants completed Psychological Abuse Profile Scale regarding the exposure to psychological violence, male participants filled out the psychological violence perpetrator form of the Conflict Tactics Scale. **Results:** Separate multiple hierarchical regression analyses were performed to examine whether sexism, system justification, and attitude against physical violence predicted both the exposure to psychological violence and the perpetration of psychological violence. According to results, as the level of benevolent sexism (β=.19, p<.05) and positive attitude towards physical violence (β=.18, p<.05) increased, the possibility of being a victim of psychological violence increased. As for male participants, as the positive attitude towards physical violence against women (β=.32, p<.001) was found to be significantly associated with the tendency to commit psychological violence against women.

**Discussion:** The present study, which focuses on the underlying social mechanism rather than the consequences of psychological violence, is thought to provide significant implications in terms of understanding psychological violence and developing preventive policies in the future. The results will be discussed in the context of honour cultures.
PSYCHOLOGICAL MEDIATION IN HYPERFUNCTIONAL AND DYSFUNCTIONAL RESPIRATION REGULATION

Juliia Koniukhovskaia
Elena Pervichko
Lomonosov Moscow State University (Moscow, Russia)

Cultural-Historical Approach and Clinical Psychology of Corporeality (1) suggest viewing the body not exclusively as a natural biological function, but also as a culturally mediated and regulated process similar to higher mental functions. The regulation of breathing is both an autonomous and a voluntary function. The research investigates the continuum between the dysfunction and the hyperfunction of breath regulation and presents psychological factors that support or disrupt the regulation. The study involved 20 patients with hyperventilation syndrome (HVS) as an example of dysfunctional breath regulation, 20 freedivers as a sample of hyper-functional breath regulation, and also 20 healthy participants as the control group. The capability of voluntary respiration regulation was examined through breath holding involving easy-going and struggling phases. Psychological mediation was assessed through: a) respiratory experience interviews, b) anxiety level, c) psychosemantic and projection techniques. Statistical data processing was carried out through descriptive, correlational and variance (ANOVA) analysis. The study revealed, that freedivers had a longer total breath holding ability and also a struggling phase, which was perceived by other participants as agonizing. Moreover, freedivers had a lower level of anxiety and a more positive breath vocabulary, which consisted of colloquial and emotional-somatic words. The patients, on the contrary, were unable to hold breath. Their short breath holding correlated with a higher anxiety level, a larger vocabulary of negative breathing experience and the fixation on current unpleasant sensations, described by emotional, but not bodily linked words. Therefore, freedivers have a bigger volume of positive breathing vocabulary and can withstand longer the conflict between the physiological need to inhale and the voluntary motivation to hold their breath. The connection of breathing with negative sensations in patients, who have HVS, leads to less breathing control. Conclusion Psychological mediation of breath may become the goal for psychotherapy within HVS treatment and for improving freedivers’ sport results.

THE PREDICTOR ROLE OF PSYCHOLOGICAL ABUSE ON THE CHARACTERISTICS OF AUTOBIOGRAPHICAL MEMORIES

Selva Ülbe
İnci Boyacıoğlu
PSİKARE Group
Dokuz Eylül University (İzmir, Turkey)

Background: Self-defining memories (SDMs) are a specific type of autobiographical memory which arouse strong emotions, and focus on life goals and unresolved conflicts (Singer & Salovey, 1993). Thus, the SDMs play a crucial role in the formation of the self. However, some undesirable life events, such as women’s exposure to psychological abuse in a romantic relationship, may damage one’s self-coherence and memory processes such as accessibility of the SDMs. The previous research has indicated that psychological abuse toward women is negatively associated with positive self-perceptions and self-esteem. In the present study, being exposed to psychological abuse is expected to influence the recollection of the SDMs. In this regard, two studies were conducted in order to examine the predictor role of the exposure to psychological abuse on the phenomenological characteristics of both negative (Study 1) and positive (Study 2) SDMs.

Method: The sample consisted of 167 (Study 1) and 205 (Study 2) female participants aged between 19-60 who have experienced a romantic relationship at least once. In Study 1, the participants were asked to write about an important negatively-valenced memory causing them to experience intense negative emotions about themselves such as guilty, and unconfident while in Study 2 the participants were asked to report an important positively-valenced memory making them be proud of themselves. Then, the Autobiographical Memory Characteristics Questionnaire and the Profile of Psychological Abuse Scale were given to the participants in both studies.

Results: Separate multiple regression analyses were performed. The results of Study 1 indicated that women whose behaviors are highly criticized by their partner were prone to recollect highly negative SDMs. In Study 2, women who were ridiculed and exposed to jealous control in their romantic relationships recalled low levels of sensory details of positive SDMs. However, women tended to report higher levels of emotional distance from the positive SDMs and more sensory details of positive SDMs, if they frequently experienced being ignored in their romantic relationships.

Discussion: The implications of findings will be discussed in the light of the literature.
INVESTIGATING THE RECIPROCAL RELATIONSHIP BETWEEN DYADIC ADJUSTMENT AND SOMATIZATION IN NEWLYWED COUPLES: A LONGITUDINAL STUDY

Selin Karakose
Berna Akcinar
Isik University (Istanbul, Turkey)

Nilufer Kafescioglu
Ozyegin University (Istanbul, Turkey)

H.Ozlem Sertel-Berk
Istanbul University (Istanbul, Turkey)

Gül Sendil
29 Mayis University (Istanbul, Turkey)

Dyadic adjustment is a term that affects the physical and mental health of people, in which the changes in dyadic adjustment are also known to have an impact on individual’s general well-being. Somatization is the tendency to express the distress and discomfort with bodily symptoms. It is a good opportunity to study the somatization in Turkey where in such a culture most people tend to express their distress with somatic symptoms. It gains more importance to investigate the association of dyadic adjustment and somatization during the first years of marriages, because most of the marital disparities occur during these years. The aim of the study is to explain the longitudinal and reciprocal association of the dyadic adjustment and somatization. Participants consisted of 96 newly-wed couples (192 people). Sociodemographic Form, Dyadic Adjustment Scale (DAS) and Somatization (SOMA) subscale of Symptom Check List were given the participants via online survey platform. To understand the changes over time, the same online instruments were sent the participants after 2.5 years and cross-lagged panel design was applied for dyadic adjustment and somatization association. The results demonstrate that for both women and men, dyadic adjustment in the first year of marriages predicted the subsequent somatization level. In contrast, the somatization level in the first years of marriage did not predict the subsequent marital adjustment for both gender. Furthermore, dyadic adjustment of the first year of marriage, only predicted later dyadic adjustment in women and the level of somatization on the first year of marriage did not predict the later somatization level for both gender. In respect to literature and current results of our study, level of dyadic adjustment is the most powerful variable in the reciprocal relationship between marriage and health. The implications of the results for future results are discussed.
EXTRAFOVEAL PERCEPTION OF THREE-DIMENSIONAL SHAPES

Anna Dreneva
Dmitry Chumachenko
Anatoly Krichevets
Lomonosov Moscow State University (Moscow, Russia)

Anna Shvarts
Utrecht University (Utrecht, Netherlands)

The possibilities and limitations of extrafoveal processing remain insufficiently studied, though it plays a great role in visual search. It has been shown that in the case of widely diverging targets and distractors, the very first saccade is headed towards the target, suggesting it is determined extrafoveally. We aimed to investigate extrafoveal analysis of visualized mathematical concepts while saccades planning. We performed two experiments: 12 students with normal or corrected-to-normal vision participated in Experiment 1 and 18 students in Experiment 2. In the first trial, we used 2x2 design: the targets were either prisms or pyramids with 3 to 6 base angles among either prisms or pyramids as distractors. The second experiment included the most challenging condition with a target pyramid among distractor pyramids. Notably, Experiment 2 involved the probes with the eye movements prohibited. We received dramatically different results for each of four types of the task in Experiment 1. Searching for the target prism among pyramids was the easiest task, as a single saccade or even no saccades were performed by most of the participants. The condition with target pyramid among prisms was a bit harder. Then, a target prism among other prisms was a difficult but still solvable task due to visible base angles. At last, the condition with target pyramid among distractor pyramids was revealed to be so challenging that most participants made a large amount of saccades suggesting random search for the target. The results of Experiment 2 have shown similar tendencies as in the first trial and the absence of any performance improving during the whole experiment. Nevertheless, in the last probes when participants were required to avoid eye movements, most of them gave a larger amount of right answers comparatively to random search, prompting suggestions that they used extrafoveal analysis. The findings of our investigations allow us to assume extrafoveal processing to be one of many possible behavioral acts in the complex system of perceptual action. The decision whether to use extrafoveal analysis depends on current energy resources, necessity of foveal confirmation and subjective cost of mistake.
IMPLEMENTING PRINCIPLES FOR EXTRANEOUS COGNITIVE LOAD REDUCTION IMPROVES LEARNING OUTCOMES: RESEARCH EVIDENCE FROM A META-ANALYSIS

Eugene Borokhovski
Robert Bernard
Centre for the Study of Learning and Performance (CSLP) Concordia University (Montreal, Canada)

Jase Moussa-Inaty
Rana Tamim
Lina El Saadi
Zayed University (Dubai, United Arab Emirates)

Cognitive load theory (CLT, Sweller, 1991, 2011) postulates that, due to limited working memory capacity, instructional design for learning should strive to minimize, as counterproductive, so-called extraneous cognitive load. Research within the CLT framework distinguishes between cognitive activities relevant for learning, also called germane, and irrelevant/redundant, also called extraneous. The former is content and concept-driven and results in meaningful knowledge acquisition, whereas the latter distracts learners and undermines both learning process and results. Hence, extraneous cognitive load should be counteracted, for which goal Sweller and followers (e.g., Mayer, 2010) suggested several principles for effective instructional design in education. These include (though are not limited to): split attention, dual-mode information processing, worked examples, etc. The current meta-analysis addresses the following set of research questions: (1) Does reduction in extraneous cognitive load helps learning? (2) To what extent? (3) What factors (including individual principles) contribute to the overall effect? The study followed the standard procedures for meta-analyses (Cooper, 2017). Systematic literature searches were conducted in multiple electronic databases (e.g., ERIC, PsycINFO, Education Source, Academic Search Complete). In addition, we performed ‘grey literature’ searches and branching from the major reviews and conceptual publications on the topic. These revealed over six hundred potentially relevant primary empirical studies, dated between 2006 (the date of the most recent related meta-analysis by Ginns) and 2017. Abstract screening and subsequent full-text review according to a set of pre-established inclusion criteria, performed by two trained independent coders with inter-rater agreement rates of $\kappa=0.73$ and $\kappa=0.78$, reduced this number to 102. At the moment, over twenty primary studies are fully processed (i.e., effect sizes extracted and moderator variables coded). Preliminary analyses (random effects model) yielded the overall weighted average effect size of $g+=0.46$, highly heterogeneous in favour of the treatment condition. These findings are indicative of the moderate positive effect of various means for extraneous cognitive load reduction on learning outcomes, with various factors potentially enhancing or depriving this effect. The project now progresses toward extraction and aggregation of all available independent effect sizes with the subsequent moderator variable analyses to explore and explain sources of systematic variability in findings.
The main purpose of the current study is to determine the mediating roles of happiness, sadness and anger expression styles and friendship quality in the relationship between parental acceptance-rejection and loneliness. The predictor variables of the study are maternal acceptance-rejection and paternal acceptance-rejection. Loneliness is predicted variable; emotional expression styles (for happiness, sadness and anger) and friendship quality are the mediator variables of the research. The study was conducted in Turkey with 876 participants of 541 (62 %) women and 335 (38 %) men whose ranged in age from 18 to 66 years. Participants were reached by accidental sampling method. Participants completed a survey containing the following scales, namely, Parental Acceptance-Rejection Questionnaire PARQ Mother, Acceptance-Rejection Questionnaire PARQ Father (Rohner, Saavedra and Granum (1978), Emotional Expression Styles Inventory (Araz and Erkus, 2014), McGill Friendship Scale-Friendship Functions (Mendelson and Aboud (1999) The Loneliness Scale (UCLA) (Russel, Peplau and Cutrona, 1980) and a personal information form prepared by researchers. As a result of testing seven different serial multiple mediation models, the partial mediator roles of (a) the self-focused expression of happiness, (b) the verbal expression of both sadness and anger, and (c) friendship quality were found to be significant in the relationship between both maternal and paternal acceptance and loneliness. As the participant’s remembered parental acceptance increases, their self-focused expression of happiness and their verbal expression of sadness and anger increases. Thus, these increases decreased loneliness by increasing their friendship quality. In the relationship between remembered maternal acceptance and loneliness, the other-focused expression of happiness and friendship relationship also have partial mediating effects. In other words, as participant’s remembered maternal acceptance increases, their other-focused expression of happiness increases and this in turn, decreases loneliness by increasing their friendship quality. The results of the study can shed light on the mechanisms through which interpersonal and emotional factors eliminates loneliness. Araz, A., & Erkus, A. (2014). Conceptualizing and Measurement of Emotional Expression Styles: An Inventory Development Study (Duygu Disavurum Tarzların Kavramsallastirilmasi ve Ölçümü: Bir Envanter Geliştirme Çalışması). Türk Psikoloji Dergisi, 29(74), 50-65.
RESPONSE INHIBITION IN MENTAL NUMBER LINE: A FUNCTIONAL NEAR INFRARED SPECTROSCOPY STUDY

Buşra Yelbuz
Oxford University (Oxford, United Kingdom)

İlgım Hepdarcan-Sezen
Seda Dural
Seda Can

Mehmet Türkan
Izmir University of Economics (Izmir, Turkey)

The aim of the present study is to investigate asymmetries in inhibition of responses relative to magnitude of numbers, through go/no-go task. Mentally, numbers are represented along a continuous representational field, oriented from left to right with small/large (size) numbers positioned on the left/right side (space) of this continuum, respectively (Dehaene et al., 1993). In the literature, studies focused on behavioral asymmetry in size-space association on excitation of responses. In this study, inhibition of responses and whether this behavioral asymmetry also occurs in brain are investigated.

Go/No-Go task is a commonly used paradigm in brain imaging studies to measure response inhibition (Heilbronner & Münte, 2013; Verbruggen & Logan, 2008). In a standard Go/No-Go task, participants were required to press a specified button whenever they see a Go stimulus, and inhibit their responses whenever they see a No-Go stimulus. Thus, two different cognitive efforts (giving and inhibiting response) lead different activations in brain (Fallgatter, Brandeis, & Pascual-Marqui, 1998). Because prefrontal cortex has a primary role in inhibition, hemodynamic measures obtained through functional near infrared spectroscopy (fNIRS), which is used in specification of the executive functions related to the hemodynamic activity of the prefrontal cortex. A total of 40 right-handed healthy participants (between the age of 19 to 29) took part. Go/No-Go task was presented via MATLAB. Hemodynamic measurements were obtained via 16-channeled fNIR system. In Go trials, participants were required to press "Space" for every number. In Go/No-Go trials, there were four different task-instructions: in group 1, participants were required to press "Space" for the numbers higher than 5; in group 2, required to press "Space" for the numbers lower than 5, in group 3, required to not press for the numbers higher than 5; in group 4, required not to press for the numbers lower than 5. There are 6 Go/No-Go blocks in total. Results indicated that when participants inhibited their responses, their behavioral responses worsen, regardless of the stimulus magnitude. Hemodynamic activity in response inhibition with respect to stimulus magnitude discussed within the frame of differences in hemispheric asymmetry.
Learner identities, defined as the way a learner sees his position towards the subject-matter that he has to learn, is depended on the field of study but also on his global identity (Norton & Toohey, 2011). We consider that each field of study is an activity in which the learner has to take part. In our conception, each activity, and thus each field of study, has its own epistemology and balance of psychological tools that allow for the elaboration of knowledge (van der Veer, 1998). Learners develop peculiar ways to treat the information, reason, take into account information and emotions, that are compatible with this activity (Buysse, 2012). They develop corresponding learner identities that try to be coherent with the learner’s activity in a specific field of study, but that also the reflection of their subject position. In a systemic view, we consider that global identity consists of the harmonic (or not) balance of divergent or convergent subsystems of identity. Each learner identity is in that respect linked to and in interaction with other learner identities and the systems of activity to which they are related. Therefore, we can consider that any system tends to influence the others in order to keep a global balance or identity. However, students face a multiplicity of activities during their studies (Rahm, 2008). This leads to tensions that can unfortunately develop into a situation of crisis, contribute to sometimes unresolvable tensions, sometimes even potentially leading to mental health disorders or disinvestment from school activity (see for instance Charlot, 1997). This is even more complex in an environment where classes are composed of students of different cultures. Our research provided students with reflexive workshops enabling them to reflect on their different activities and their identities. During the workshops, the researchers interact with the students to simulate their writing and deepen their reflection (Buysse, 2010; Vanhulle, 2009). We present this method and the preliminary results of analysis of their written productions. This analysis is based on a structural discourse analysis (Vanhulle, Balslev, & Buysse, 2012). We conclude with different suggestions to minimize identity problems during school.
MY ACHIEVEMENTS ARE NOT MINE: THE IMPOSTER PHENOMENON FROM AN INTERGROUP PERSPECTIVE

Gamze Özdemir
Çanakkale Onsekiz Mart University (Çanakkale, Turkey)

M. Ersin Kuşdil
Bursa Uludag University (Bursa, Turkey)

The Imposter Phenomenon (IP) is a psychological concept that describes a pattern in which individuals feel like a fraud when they are successful and tend to attribute their achievements to external causes (Clance & Imes, 1978). Unlike the most part of the IP literature, we suggest that IP should be examined in relation to intra- and intergroup processes. In line with this aim, IP was investigated in the present study by using the theoretical frameworks of Social Identity (SIT), Social Dominance (SDT) and System Justification (SJT) Theories. 148 research assistants (75 female, 73 male), who were working at a state university in Bursa, one of the metropolitan cities of Turkey, participated in the study. The age of the participants ranged from 23 to 46 (M=29.01, SD=3.82). They completed the IP Scale (Clance, 1985), the Group Identification Scale (Kirchler, et al., 1994), the Gender Specific Justification Scale (Jost & Kay, 2005), the Social Dominance Orientation Scale (SDO; Pratto et al., 1994), the Gender-Related Stereotype Scale (Kandiyoti, 1982), and a Self-Debilitating Behaviors Scale that was developed for the present study. Also, the implicit attitudes toward the self and genders were measured by Implicit Association Test. The hypotheses derived from the above-mentioned theories were tested by hierarchical regression analyses. Results of the analysis of the model based on SIT (intragroup processes) showed that women’s IP scores were predicted by the increasing differences between the participant’s self-definition and the academic prototype that was measured in the forms of occupational and masculine stereotypes. Men’s IP scores were predicted by the increasing divergence from the academic prototype in terms of occupational stereotypes as well as with the length of work. Results from the model based on SDT (intergroup processes) revealed that, for both sexes, high self-debilitation and SDO scores were the most significant predictors of IP. Finally, results from the model for SJT (social processes) showed that having an explicit out-group bias for men increased IP scores for women, whereas having a low level of implicit self-esteem increased IP scores for men. Findings will be discussed in relation to the relative powers of the theories in predicting the IP.
Ensuring the economic security of the personality is to create a mechanism of protection against internal and external threats in modern Russia. In this connection, the role of the policy of insurance of citizens as the most effective institution of risk management and security of health, personal property of citizens. The article presents the results of an empirical study of the attitude of Russian citizens to insurance policy of insurance and investment. The study consisted of three stages: at the preparatory stage — a longitudinal study of Russian clients of insurance companies was conducted, at the pilot study — a survey of policyholders on two developed scale multifactorial questionnaires investigating insurance preferences and financial anxiety. In the main study, which was presented by a heterogeneous sample, an Arsenal of techniques was used, which included a basic survey, a TAS questionnaire (in Soldatova's approbation), a questionnaire of economic attitudes (Deineka, Zabelin) and a Dinner satisfaction scale. A total of 1409 people took part in the study. The article presents the results of theoretical understanding of the factors of economic security of the individual, which affect the insurance behavior of citizens. The questions of scientific development of insurance research in politics and Economics, the problem of psychology of personal security in the economy, the phenomenon of insurance in the economic life of the citizen and the phenomenon of trust as an indicator of political and economic reality. The problem of insurance culture and financial planning as a measure to reduce economic risks at the level of the state and the individual is raised. The theoretical model of insurance behavior is developed. The Institute of insurance in our work is considered in the framework of psychological science as a category of risk avoidance, danger, threat, overcoming fear, as a system of economic security, creating a mechanism to protect the individual from internal and external fears and threats. The complex of diagnostic techniques allows to reveal and predict psychological and typological features of insurance behavior of citizens that can be used by experts in the field of insurance policy.
THE BLOCKING EFFECT IN OBSERVATIONAL LEARNING OF FEAR

Ezgi Palaz
Seda Dural
Izmir University of Economics (Izmir, Turkey)

Hakan Çetinkaya
Ankara University (Ankara, Turkey)

Blocking effect (Kamin, 1968, 1969) represents the disruption of association between a novel stimulus that is added next to a conditioned stimulus (CS) which already predicts an unconditioned stimulus (US), and it is especially remarkable due to its relation to prefrontal cortex. In recent years, the approaches attempting to explain the mechanisms of fear learning, emphasize on the similarity of the direct and observational fear learning mechanisms and the involvement of prefrontal cortex in both (Olsson and Phelps, 2007). Present study assumes these two types of learning share a neural pathway; therefore, aims to show the blocking effect, which is a direct learning phenomenon, in observational fear learning. In total, valid data from 33 participants were collected. A model was exposed to acquisition and blocking procedures which were administered in a discriminative classical conditioning paradigm. During this procedure, acquisition phase consisted of 3 arbitrary stimuli and in the blocking phase, these stimuli were shown next to 3 novel stimuli simultaneously, while the stimuli presentations and the responses of the model were being recorded on a video. The video of the model was presented to the participants. Afterwards, in the test phase, the single stimuli were presented directly to the participants and the responses were used in the investigation of the blocking effect. Skin conductance responses and US expectancy levels were analyzed by comparing responses towards single stimuli. Although blocking effect was not observed in skin conductance responses, analyses on US expectancy levels revealed blocking effect. Results were discussed in the scope of dual process theories, which explains the discrepancy between implicit and explicit level of conditioning.
POSTTRAUMATIC GROWTH IN WOMEN VICTIMS OF IMITATE PARTNER VIOLENCE. THE IMPORTANCE OF SPECIALIZED COMPLEX HELP PROVISION

Zuzana Vasiliauskaite
Vilnius Women’s House (Vilnius, Lithuania)

Domestic violence/intimate partner violence (DV/IPV) is a traumatic experience that can result in serious distress and bodily injuries leading to detrimental consequences for survivors’ health and well-being in general. Research reveals that at the same time even those who have experienced severe complex trauma have the potential to experience post-traumatic growth (PTG). PTG reflects the transformation of traumatic experience that gives a positive boost for a change in various domains of survivor’s life. Even though the body of research on PTG in female victims of IPV is limited, the existing research has consistently found that in comparison to other traumas IPV victims experience lower PTG. Seeking understand this phenomena we conducted the research. The quantitative study involved 261 women aged 18-69 years old (M=36.9, SD=10.64) who had experienced male partner violence. The Composite abuse (Cronbach α=.96, \( \chi^2(131)= 185.70, \) CFI=.94, RMSEA=.06) and the Economic abuse (Cronbach α=.92, \( \chi^2(50)= 82.35, \) CFI=.93, RMSEA=.07) scales were utilized to evaluate IPV women suffered, PTG was measured by the Posttraumatic growth inventory (Cronbach α=.96). Along with social-demographic questions, a list of individuals, professionals and organizations were provided in order to understand women’s help-seeking behaviour. Analysis revealed that even though participants reported relatively low levels of PTG (M=42.98, SD=29.94), 71% of the women experience at least some PTG. Significant differences were found between women who had sought help from Specialized help centres (SCH) that provide help and assistance for DV/IPV victims and those who did not. Greater PTG was more common among women seeking help from SCH than among those who did not (U = 3025, p < .001). Moreover, contrary to previous research the association between greater physical and sexual violence suffered and PTG was not significate for SCH group (rs(103) =.21, p > .01). The results shows the importance of specialized complex help provision for women survivors of male partner violence, as this best predicts a higher PTG, therefore higher IPV victims’ psychological functioning. This supports the importance of specialized client friendly help and accessibility. These and other implications for policy makers and specialists will be discussed at the conference.
PREVENTION OF OFFENSES AMONG POLICE OFFICERS

Mikhail Marin
Moscow State University of Psychology and Education (Moscow, Russia)

Maryin M. I. Prevention of offenses among police officers. Effective prevention of offenses among police officers is impossible without the research of the personality that committed the act. It is caused by the fact that the personality is the carrier of the reasons for committing crimes. It is obvious that no external circumstances can be the defining reasons for an illegal act if they aren't put at the same time on the internal determinants of human activity. Therefore, it is possible to speak about certain internal determinants of the personality of the employee committing illegal actions, that is, about a set of significant specific properties of such personality. Relevance of the work is proved by the need of development of a technique of psychological studying of the personality of employees for the purpose of early identification among them of the persons inclined to commit a crime, development of more perfect measures for the prevention of crimes. In the research we used an integrated interdisciplinary approach which united legal, social psychology, psychology of the personality and allowed to establish the informal statuses on the tendency to illegal behavior in the office staff. There was developed a modified option of the expert-sociometric procedure implemented in the program of computer Monitoring, which is based on the activity determined by interpersonal elections on the basis of business and emotional preferences and allows to reveal indicators of individual statuses of employees in relation to the rules of law, observance of the rules of law within the implementation of office activity. The confirmation results of the conducted research were found in the objective indicators of professional activity surveyed, in particular, in disciplinary practice. Data on service by employees in five years after the conducted research indicate essential distinctions in their office career. Thus, the offered procedure gives additional opportunities for timely diagnostics and effective prevention of illegal behavior among police officers.
COGNITIVE CONTROL AND SOCIAL COGNITION ABILITIES IN COGNITIVELY PATHOLOGICAL AGING

Despoina Moraitou
Aristotle University of Thessaloniki (Thessaloniki, Greece)

Georgia Papantoniou
University of Ioannina (Ioannina, Greece)

Based on the existing research on cognitively pathological aging, the extent to which cognitive control processes (Cc) and social cognition abilities (SC) are interconnected is not clear. The aim of the three empirical studies to be presented was to examine whether and to what extent this relationship exists, as well as whether it is differentiated in vascular aging, Mild Cognitive Impairment (MCI), Vascular Dementia (VaD), frontal variant Fronto-temporal Dementia (fvFTD), and Alzheimer’s Disease (AD). Participants (n=15 for each pathological group which was matched in age, gender, and educational level with the other experimental and control groups in its study) were given tests assessing inhibitory control, task/rule switching, and long-term planning for the measurement of Cc. A test developed to assess the ability to distinguish between sincerity, simple and paradoxical sarcasm was given to measure SC. Emotion recognition was also assessed. The results indicated that both the level of Cc and SC as well as their interrelationships are significantly differentiated depending on the type of the pathology. Long-term planning decline was found to be the major index of cognitive decline in incipient VaD. Social cognition abilities were found to be severely reduced in early-stage fvFTD. Path analyses revealed more relationships between Cc and SC in MCI, compared to vascular aging. No relationships were found between the two constructs in VaD and AD. Hence, based on the differential pattern of decline in the different types of cognitively pathological aging, new diagnostic batteries that can cover all types of decline should be developed at the neuropsychological as well as the neurophysiological level.
STUDY OF PRESCHOOLERS’ AND PRIMARY SCHOOL STUDENTS’ PREFERENCES AS THE FIRST STAGE OF CO-DESIGN OF PUBLIC SPACES FOR KIDS

Tatiana Le-Van
Anna Iakshina
Moscow City University (MCU) (Moscow, Russia)

Engaging children into various democratic practices is an important mechanism for their personality development in modern society. Based on the principle of participation, social experience of children is expanding. However, due to age, it is difficult for preschoolers and primary school students to express their opinions: their speech, imagination and reflection are not sufficiently developed, the choice is more often based on spontaneous reactions. Therefore, traditionally it is difficult to engage children into the process of decision-making. This is one of the reasons why Moscow playgrounds do not meet children’s needs (Kotlyar, Sokolova, 2014; Iakshina et al., 2018). The aim of the study is to develop the model of co-design of playgrounds. The first stage helps to answer the question: how to study children’s preferences according to their individual and age characteristics. The theoretical framework is cultural-historical approach (Vygotsky), dialectical psychology (Veraksa), participative approach (Bertram, Pascal, Fthenakis). The study is based on the Convention on the Rights of the Child and the ethical code of the Russian Psychological Society. Participants are from 6 Moscow schools: 80 preschoolers (4-7 years old) and 200 primary schoolchildren (7-10). The study is conducted by 17 trained teachers. Respondents are divided into contrast groups in terms of the level of dialectical thinking and typical gross motor experience. The methods of collective semi-structured interview, priority selection, commented drawing are used. To identify the level of dialectical thinking, the diagnostic technique “Unusual Tree” (Veraksa) is used. The data confirm that the methods of study are appropriate: the majority of preschoolers and students are able to express their preferences. However, the second drawing of the children with low level of dialectical thinking and poor gross motor experience doesn’t principally differ from the first (playground: “unattractive” -> “attractive”), which indicates an undeveloped ability to transform objects to achieve their goals. Consequently, for these children, additional methods of enhancing imagination and the ability for creative transformation are required to help them express their preferences. The results of the study can be applied by social services, architects and designers of urban spaces to organize sessions of co-design with children.
Decision on the treatment pathways related to mental health is influenced by many factors. People who have high mental health literacy tend to visit professional helper, such as medical doctor, psychiatrist, or psychologist when experiencing mental health problems. On the contrary, those who have low mental health literacy prefer other treatments provided by traditional healer, religious leader, or relatives that have distinct competencies on mental health treatment. Impact that need to be taken into account is that improper treatment not only worsening the prognosis of the mental health condition but also developing other health problems. Therefore, understanding treatment pathways and its determinant is important to promote community mental health. This research aims to investigate whether mental health literacy predicts the decision on the treatment pathways followed by people with mental health issues in Indonesia. A total number of 803 people, aged from 12 to 70 years old, participated in this study. The survey was conducted from July to September 2018. The Help-Seeking Questionnaire and Mental Health Knowledge Schedule were used to measure treatment pathways and mental health literacy respectively. A multiple regression was run to predict treatment pathways based on gender, age, and mental health literacy. A significant regression equation was found (F(3, 95) = 6.097, p = .000), with an R2 of .022. Both mental health literacy (B = .030, SE = .009, p = .002) and age (B = .008, SE = .003, p = .008) were significant predictors of treatment pathways, where sex (B = .046, SE = .065, p = .474) was not significant. In conclusion, mental health literacy was found to be an important determinant of treatment pathways followed by people with mental health issues in Indonesia. There was not a significant difference between male and female in term of decision on the treatment pathways related to mental health problem. Mental health literacy should be promoted in society, especially in younger age group, hopefully leading to increased help-seeking behaviour.
PERCEIVED INNOVATIVE BEHAVIOR DETERMINANTS IN TOURISM INDUSTRY IN WEST NUSA TENGGARA, INDONESIA

Dewi Syarifah
Seger Handoyo
Samian Samian
Rahkman Ardi
Universitas Airlangga (Surabaya, Indonesia)

Tourism industry is necessary to be innovative to survive, grow, and sustain in the competitive market. However, only few studies have examined the innovative behavior in tourism. Innovative Behavior defined as the intentional creation, introduction and application of new ideas within a work role, group or organization, in order to benefit role performance, the group or the organization (Janssen, 2000:288). The purpose of this research is to investigate the determinants of innovative behavior in tourism industry in West Nusa Tenggara. West Nusa Tenggara is chosen by the government of Indonesia as one of top ten tourism destinations in Indonesia. For data collection, we recruited 10 participants representing the actors in tourism industry, such as tourism businesspersons (e.g. hotels, souvenirs, culinary) and government. We conducted phenomenological data collection procedure (Englander, 2012). Thematic analysis (Braun & Clarke, 2006) was performed to find determinants of innovative behavior. It is found certain common themes i.e. (1) participants have taken innovation initiatives; (2) innovation initiatives are driven by awareness of innovation importance; (3) The government and organizational supports are important to sustain benefits of innovation initiatives; (4) human resources and team work are significant factors to drive successful innovation behavior; (5) technology is necessary to obtain better innovation products; and (6) positive reinforcement is important to maintain innovative behavior in organization. Based on those findings, a hypothetical model is developed to exhibit necessary and sufficient conditions for improving innovative behavior.

EFFECTS OF PSYCHOLOGICAL CAPITAL ON THE INNOVATIVE BEHAVIOR IN THE TOURISM INDUSTRY

Samian Samian
Seger Handoyo
Rahkman Ardi
Dewi Syarifah
Universitas Airlangga (Surabaya, Indonesia)

The innovative behavior study has received enormous attention in the tourism industry. Previous empirical studies and official statistics indicated a rather modest level of innovation in tourism sectors. Many researches concerned about barriers to innovation in tourism industry, but little empirical study using positive organizational behavior approach has been conducted on the topic of innovation. This study aims to examine the relationship between psychological capital and innovative behavior. The subjects of this study were 91 tourism industry players in Bara Nusa Tenggara, Indonesia. The results indicate that the overall psychological capital (self-efficacy, hope, resilience and optimism) is related significantly to the innovate behaviour i.e. \( r = 0.46 \) with a value of \( p < .001 \). Self-efficacy is the strongest significant predictor for innovative behaviour \( (= 1.1678, p = 0.002) \). Meanwhile hope \( (= 0.3777, p = 0.328) \), resilience \( (= -0.1230, p = 0.688) \), and optimism \( (= 0.0353, p = 0.927) \) are not significant predictors for innovative behaviour.
VALUES IN PARENTING PRACTICES OF INDONESIAN PARENTS: A CONTENT ANALYSIS STUDY

Wiwin Hendriani
Universitas Airlangga (Surabaya, Indonesia)

The patterns of human behavior differ from era to era, making the social world very complex and dynamic. A number of scientific investigations revealed that phenomenon from many countries, as well as Indonesia. The ways in which people develop are shaped by social experience and circumstances. According to the perspective of developmental psychology, human behavior is formed through a long time learning process, since the early life. Parenting takes a leading role in developing individual behavior. Parenting affect how individual learns to think and behave, by means of instruction, rewards and punishment, and example given by the parent. Values that are believed by the parents have deeply influence to all behaviors and their attitudes and effect parent’s relationship and decisions in parenting practices that furthermore define the behavior pattern of the children. The question then, what values are commonly believed by parents today regarding the child’s future, and how do they affect their parenting practices?

This is a content analysis study with qualitative approach. Data were collected through online survey that used open questions. The three main survey questions include: (1) Parents’ expectations for the child’s future; (2) Abilities that are considered important for children to grow and develop according to the expectations; (3) Efforts that need to be done in parenting practices. There were 265 respondents participated in this study, consists of parents who filled out the online survey during the period between 21-30 October 2018. Data were analyzed in five steps, namely: (1) Identifying concepts; (2) Defining relationship types; (3) Coding the texts; (4) Coding the statements; and (5) Displaying the result.

This study has strengthened the results of previous studies that individual focus values now have more influence on parenting practices carried out by parents. This finding confirms that the change in character of the generation is inseparable from the shift in parental values and the practice of parenting. The value that is considered more important is repeatedly emphasized in various moments of interaction with the child, both through direct stimulation, discussion, and indirect messages when communicating other topics. Greater attention from parents to individual values makes parenting practices that aimed at fostering sensitivity and various social skills less emphasis. This can be seen from the data about efforts to instill it in children that is far less than the effort to instill individual focus values.
A QUALITATIVE ANALYSIS FOR THE EFFECTS OF DIFFERENT MOTIVATION STYLES FOR EATING REGULATION

Gaye Zeynep Çenesiz  
Van Yuzuncu Yil University (Van, Turkey)

Faruk Gençöz  
Middle East Technical University (Ankara, Turkey)

The increase in unhealthy eating habits causes weight problems. Factors contributing to the weight issues are important points that need to be assessed in order to understand the problem and to intervene properly. Self Determination Theory (SDT) addresses people's motivational styles and proposes that motivations may differ when people want to change a specific behavior. The purpose of the present study was to provide a deeper understanding of the individuals with different motivational styles for regulating their eating behaviors. Semi-structured interviews were done with eight female participants with an age range between 24 and 34. Purposive sampling method was used for selecting the participants. Participants were falling into one of the four motivational styles category — namely autonomously-engaged regulator, obliged regulator, preoccupied regulator, and indifferent regulator — based on their scores on Regulation of Eating Behavior Scale (Pelletier, Dion, Slovinec-D’Angelo & Reid, 2004). For each motivational style, one participant with a normal body mass index (BMI) and one with an overweight BMI were selected. The semi-structured interviews lasted approximately 20 to 30 minutes. Interpretative phenomenological analysis (IPA) was used as the qualitative analysis method for understanding the individuals’ personal involvement in eating regulation behaviors. After the interviews, the transcriptions were evaluated, the recurrent themes were noted, and superordinate and subordinate themes were generated. The results showed themes of “self-evaluation of physical appearance”, “others’ evaluations of physical appearance”, “eating habits”, “eating regulations”, “physical activity”, and “emotions associated with weight issues”. The differences and similarities of the themes for different motivational styles and BMI scores were compared. The results of interviews showed that there were negative feelings accompanying the weight issue. If the individual felt under pressure of others, try to regulate the eating behaviors for others, this pressure increased. Most of the results were independent from the BMI scores. They were rather related to the motivational styles. It can be said that autonomously engaged regulators had a healthier perception of the issues about weight; and indifferent regulators seemed not to carry the negative emotion and self-criticism burdens which can be a sign of learned helplessness.
USING IMPLICIT WORD-OF-MOUTH INFORMATION TO INCREASE ACCEPTANCE OF ONLINE BEHAVIORAL ADVERTISING

Kaibin He
Shenzhen University (Shenzhen, China)

Online Behavioral Advertising refers to any form of online advertising that is based on information the advertiser has about the advertising recipient, such as demographics, browsing or purchase behavior, information about preference, and geographic information. Because of its positive effect on revenues, online behavioral advertising has emerged as a major marketing trend worldwide. However, researchers have found that consumers remain highly skeptical of online behavioral advertising due to privacy concerns, which leads to a negative impact on users’ acceptance. Two experiments conducted in the scenario of “Wechat moments” show that implicit word-of-mouth information based on Wechat friends help to increase consumers’ acceptance of online behavioral advertising. Specifically, experiment 1 shows that consumers’ psychological reactance decreased significantly if they were told that the advertisement was also viewed by some Wechat friends. Moreover, experiment 2 suggests that such practice was generally more effective for products of high perceived risk than those of low perceived risk.

Connecting researches of online behavioral advertising and word-of-mouth, the present research contributes to the literature of consumer psychology by showing how implicit word-of-mouth information will increase acceptance of online behavioral advertising. The results are also helpful to marketing practices in online advertising.
THE MEDIATOR ROLE OF AVOIDANCE COPING MECHANISM BETWEEN MALADAPTIVE PARENT MODES AND PSYCHOLOGICAL SYMPTOMS

Bahar Köse Karaca
İstanbul Arel University (İstanbul, Turkey)

Mert Aytaç
Ministry of education (İstanbul, Turkey)

Alp Karaosmanoğlu
Private practise Psychiatrist (İstanbul, Turkey)

In the literature, schema modes and maladaptive coping mechanisms in schema theory are remarkable concepts due to their relationship with psychopathology. Especially, avoidance coping style draws attention with its relation with dissociation, somatization, and personality disorders. However, further research is needed to examine the relationship among these concepts.

In the present study, the aim is to determine mediator role of avoidance coping mechanism between maladaptive parent modes and psychological symptoms. The sample of the study included 539 (371 females and 168 males) people between 20 and 68 years old who applied to an office of psychiatrist due to psychological complaints. An informed consent was given to the participants. Schema Mode Inventory, Symptom Check List 90, and Young-Rygh Coping Inventory were used as the assessment tool. Analyses of the data were conducted via SPSS and LISREL. After analyzing descriptive statistics, correlation analyses were utilized to determine relationship between variables. To analyze mediator role of avoidance coping mechanism, structural equation model (SEM) was used and findings were examined considering fitness of indeces (Kline, 2005). Descriptive statistics indicated that variables had normal distribution.

The results of correlation analyses showed that there was a significant relationship between avoidance coping mechanism and psychological symptoms. According to SEM results, the overall goodness of fit indices from the analyses suggested that the proposed model provided a reasonably good fit to the data. ($\chi^2 = 3.27$, df = 1, $p = .07$, NFI = .99, CFI = .1.00, RMESA = .065).

Results of analyses indicated that maladaptive parent modes significantly predicted avoidance coping mechanism ($\beta = .26$, $p < .001$) and psychological symptoms ($\beta = .64$, $p < .001$). Moreover, maladaptive parent modes significantly predicted psychological symptoms ($\beta = .20$, $p < .001$) via mediator role of avoidance. Maladaptive parent modes explained %7 of the variance related to avoidance coping style while explaining %.51 of the variance related to avoidance coping mechanism and psychological symptoms. In conclusion, a partial mediator role of avoidance coping mechanism was determined and this showed that dealing with avoidance initially could be important to cope with psychological disorders related to maladaptive parenting in psychotherapy settings.
THRIVE: HOW PSYCHOLOGICAL THERAPIES TRANSFORM LIVES AND SAVE MONEY

David Clark
Experimental Psychology University of Oxford (London, United Kingdom)

Empirically supported psychological therapies have been developed for many mental health conditions. However, in most countries only a small proportion of the public benefit from these advances. The English Improving Access to Psychological Therapies (IAPT) program aims to bridge the gap between research and practice by training over 10,500 new psychological therapists in empirically supported treatments and deploying them in new services for the treatment of depression and anxiety disorders. Currently IAPT treats over 560,000 patients per year, obtains clinical outcome data on 98.5% of these individuals, and places this information in the public domain. Around 50% of patients treated in IAPT services recover, and two-thirds show worthwhile benefits. The clinical and economic arguments on which IAPT is based are presented, along with details of the service model, how the program was implemented, and recent findings about service organization. Limitations and future directions are outlined.

SOLUTION-FOCUSED BRIEF THERAPY WITH SUBSTANCE-USING INDIVIDUAL: A SINGLE-CASE STUDY

Siti Raudhoh
Ema Krisnawati
Telkom University (Bandung, Indonesia)

The majorities of the drug users are more likely to do self-intervention for their addiction rather than get proper help from professional, and turn out failed. Most rehabilitation centers in Indonesia use Therapeutic communities (TCs) as the main intervention. TCs are a common long-term—six to nine months—residential treatment for substances use disorders (SUDs). What about a patient who wants to get outpatient rehabilitation program? Solution-Focused Brief Therapy (SFBT) is one of the recommended therapies by clinicians working with SUDs. SFBT is a short-term, strength-based intervention which helps the client finding their own solutions to problems. This research was aimed to find the effect of SFBT on one person with SUDs. This research a single-case design where there were four sessions, each session lasted between 45 and 60 minutes. The pre and post test conducted were BAUM Test and “Draw a Person” Test. The tests were interpreted by an expert of those tests. In addition, subjects self-report was included in the data analysis. In the first session, the subjects test results showed low self-esteem and social interest. It was supported by result of anamneses where he talked more about his flaws, his opinions that social group was not important to him, and his doubts that he could change to be a better person. After three sessions using some main techniques of SFBT,—scale questions, finding exceptions, and compliments—he showed some behavior changing in line with behavioral changes plan he composed in the sessions. Discussing about his changing behavior reinforced his behavior and enhanced his confidence to succeed. The post test results also showed the increase of self-esteem and social interest. SFBT is effective for increasing self-esteem and social interest of this substance-using individual. Further research with more subject and less limitation design is needed.
PSYCHOSOCIAL DIFFICULTIES AND STRENGTHS OF FATHERS OF CHILDREN WITH AUTISM SPECTRUM DISORDER

Nuray Mustafaoğlu Çiçek
Hacettepe University/ Bursa Teknik University (Ankara, Turkey)

Müjgan Inozu
Hacettepe University (Ankara, Turkey)

In studies conducted with families with children with autism spectrum disorder (ASD), caregiving mothers reported more stress, anxiety, and depression (Bitsika, Sharpley and Bell, 2013). On the other hand, those families have individual strength to overcome continuous stress and anxiety of the situation (McCubbin and McCubbin, 1999). In the studies conducted with the parents of children with ASD focus on maternal experiences since the main caregiver has been mothers generally. In this study, it is aimed to investigate psycho-social difficulties and strengths of fathers with ASD children. The study group consisted of 61 fathers who have children with ASD (M=42.21, S=6.58). Fathers were asked to fill the scale set for their socio-demographic information form and open-ended two questions about being a father of ASD child. One of the questions is about difficulties in their life and the other one is about strengths that help them to overcome these difficulties. Answers of the fathers to open-ended questions were investigated by qualitative analysis. As a result of analyses, main teams for difficulties and strengths of being a father of a child with ASD were stated. Main teams for difficulties were economic difficulties, difficulties on communicating with the ASD child, negative reactions from society, ignorance of teachers about autism, insufficient special education hours, inadequacy and commercial nature of training programs, low psychosocial support for the families, and limited interest to the other child in the family. Main teams for strength of the fathers were patience, parental consistency, education (special education, sports, music education, etc.), psychological support, family support to main caregiver, and religious-spiritual feelings. It has been stated that families with the child with ASD have some difficulties. However, these results both based on quantitative and maternal report mostly. In this study, it has been focused on father’s reports by open-ended questions that can give qualitative information. Some main teams for difficulties can be influenced by socio-cultural (i.e., negative reactions from society) and socio-political (i.e., such as limitation of education hours supported by the government) focus on autism in Turkey. Moreover, the results will be discussed in the light of literature.
MOTHERS’ DESCRIPTIONS OF CHILDREN WITH A DEVELOPMENTAL DISORDER AND THEIR SIBLINGS WITH TYPICAL DEVELOPMENT

Dilek Demirtepe-Saygili
Atilim University (Ankara, Turkey)

Berna Aytac
Hacettepe University (Ankara, Turkey)

Growing up in the same family does not necessarily mean being treated very similarly by the same mother. This differential treatment contributes to a non-shared environment for the siblings. When one of the children has a developmental disorder, this gap is prone to be even larger. A possible mechanism of this difference can be the mother’s perception of her children. The aim of the current research is to evaluate the similarities and differences between a mother’s descriptions of her two children, one with a developmental disorder and the other with typical development. 40 mothers were interviewed about their relationships with each child and their children’s temperament. The children’s age ranged between 4 and 10. The diagnosis of the child included learning disabilities, attention deficit hyperactivity disorder, and mild cognitive deficits. 20 children with disability were the older child and the other 20 were younger. The interview scripts were content analyzed. The mothers reported a priority for the child with a developmental disorder. They paid more attention to and spent more time with the child’s problems, and defined them as difficult. They also reported anxiety about the child’s future. The descriptions of the child with developmental disability included being emotional, sensitive, aggressive, stubborn and selfish. However, the child with typical development was described as either agreeable (easy, mature) or irritable (ambitious, jealous, and fond of the mother). Therefore, although the descriptions of children with developmental disorders were similar, the descriptions of the siblings have diverged in 2 directions. Studies show that mothers report behaving equally toward each child when they are asked directly and quantitatively. However, their children perceive being treated more negatively as compared to their siblings. With the help of qualitative approach, the current study has the advantage of comparing mothers’ descriptions of each child. Moreover, mother’s different perception of each child can be a possible underlying mechanism of treating them differently. Especially the siblings with typical development seemed to be perceived as either easy or uneasy. Temperament and developmental disorders should be investigated in relation to mother’s parenting with an emphasis on siblings.
Language and writing systems are important social practices associated with the development of specific features in cognitive activity. Preferences in cognitive patterns are associated with the language systems mastered previously. Thus, the grammar of Indo-European languages contributes to the idea of a world built of atomic blocks while Asian language systems tend to focus on the continuous nature of the world (Hansen, 1983). East Asian languages are characterized by high contextuality (Freeman & Habermann, 1996), whereas English-speakers teach their child to understand speech without context (Heath, 1982). There are several solid reasons to believe social and cognitive practices are mutually supportive (Nisbett, 2011). Plenty of research demonstrating that the use of two mental lexicons leads to the development of special cognitive skills appeared (Hermandes et al., 2001). It showed that writing system (alphabetic or hieroglyphic) and reading direction influenced cognitive processing strategies (Hoosain, 1991, Reilly, Radach, 2012). We assume that the users of hieroglyphic writing systems can demonstrate holistic patterns of semantic stimuli perception and show better results in reading vertically-oriented targets. In the current study, we compare performance and eye-movement patterns of Russian, Japanese and Chinese students in a visual semantic search task which involved looking for English words among chaotically arranged letters of Latin alphabet. Number, spatial orientation of found words and oculomotor activity parametres (fixations, saccades and blinking) were registered with SMIRED eye-tracker. Data (analyzed with IBM SPSS Statistics) show that different search strategies are reflected in the proportions of fixation and saccade times. Mean saccadic amplitude for the group results of East Asian students grows twice as compared to that of the group of Russian students (11,5 vs 5,5;F(1;394)=58,9;p<0,01). The Kotval index comparison confirms the trend (ratio of fixation and saccade duration is 4,63 vs 10,17;p<0,001). As the task presupposed letter-by-letter analysis of the stimuli, East Asian students who chose the holistic strategy were less successful. Though, the percentage of successful identifications for vertically-oriented words was significantly higher among them as compared to Russian participants. Thus, the core hypotheses of the study were confirmed, suggesting further research into the influence of language system on cognitive processing.
EFFECT OF SOCIAL MEDIA INFORMATION ON RECRUITERS’ HIRING DECISION MAKING PROCESSES: A POLICY CAPTURING APPROACH

Seren Burak Ozkum
The University of Tulsa (Tulsa, Turkey)

Hayriye Canan Sumer
Middle East Technical University (Ankara, Turkey)

Organizations use social media information for various business purposes including personnel recruitment and selection. The literature on social media usage in the process of recruitment and selection is relatively new and controversial as the findings are inconsistent and mostly negative in terms of psychometric properties of this application. Regardless, research shows that practitioners’ use of social media for screening purposes has been increasing constantly. Present study aimed to investigate how different information on candidates’ social media profiles influences hiring decisions of recruiters and whether negative and positive information has differential weights on those decisions by using policy capturing method. Policy capturing method is used to assess decision makers’ evaluative judgements in the light of available information (Zedeck, 1977). In the present study, initially, two focus groups were conducted with eight selection professionals in an attempt to identify the social media themes that would influence their judgements. Then, 64 summary social media reports were created, and they were divided into four different blocks. Following the creation of the reports, 82 HR professional, who were actively engaged in personnel selection in their jobs, were given summary social media reports of 16 hypothetical candidates and they were asked to rate their likelihood to invite each candidate for an interview. Three negative (sharing confidential information about former organization, having conflicting information with resume, and making offensive sharings about different groups) and three positive information (having a profile which is congruent with organizational culture, being actively engaged in extracurricular activities, and sharing job related information and getting positive comments on them), that were rated as potentially most important in focus groups, were manipulated in a dichotomous way indicating whether that information could be inferred from the candidate’s profile or not. Results showed that all six information significantly affected recruiters’ hiring decisions while negative information being more influential, suggesting that social media information is more influential in screening out the candidates. The findings demonstrated that human resources professionals’ decisions are affected by social media information even in the absence of scientific evidence supporting the effectiveness of social media as a selection tool.
DANCE THERAPY IN THE CONTEXT OF POSITIVE SOCIALIZATION OF MIDDLE AGED PEOPLE

Kristina Kharlova
Russian State Social University (Moscow, Russia)

The primary form of communication is not verbal, but motory. Newborn children immediately move synchronously to the sounds they hear. Although many people will admit that they like to dance, their dance is just a reflex, incapacity to remain in place. Movement is our mother tongue, and dance, as a form of communication is more direct than speech. Dance allows us to understand movements and gestures that would otherwise go unnoticed, overwhelmed by verbal expression. The goal of the study was to examine empirical evidence of the effects of a comprehensive psychocorrectional dance programme on psychophysical and emotional well-being of healthy people as well as impact on their socialisation in the social context. The psychocorrectional programme lasted for a month and included a set of breathing exercises, pilates, melodance and some elements of melolistics. There was a quasi-experimental design with pre-test and post-test control. The sample included 40 people (average age — 34) with no health issues. The following toolkit was used: a biographical questionnaire, a test of differentiated self-assessment of functional state, the Big Five personality test and an original test using projective methods. The results showed that such psychocorrectional intervention tools like melodance and melolistics arouse interest in developing proper personality and stimulate increased professional activity. After undergoing the programme, the participants have a high degree of focus in their actions, quickly react to a changing situation, they have a higher level of intellectual potential and a higher degree of openness to new experience. The hypothesis was confirmed about the increase in the differentiated self-assessment of functional state of the participants, statistically significant differences were obtained between the self-assessment of well-being, activity and mood before and after the dance class. Therefore, it can be concluded that participants who have higher rates on the “personal resources” scale, i.e. having a higher ability to work with new information, openness to new experience, had a higher self-assessment of activity before participation and more attentive to their own bodily sensations. This suggests that differentiated self-assessment of functional state increases with repeated classes, which certainly contributes to further positive socialization of the person.
We aimed at studying brain electrical activity underlying implicit and explicit social cognition in healthy adults. In our study, gender differences in ERP components and behavioral measures were analyzed while our participants performed recognition of social negative, positive, or neutral situations. Our participants were healthy volunteers (26 females and 26 males), all performed two tasks with the same set of photographs. The stimuli were monochrome photographs showing pairs of humans or animals of the same species: they were neutral, positive or negative. The instruction for the Implicit Social Recognition (ISR) task was to press button 1 for a human and button 2 for an animal image. The instruction for the Explicit Social Recognition (ESR) task was to evaluate the kind of interaction between two subjects on the photograph — neutral, negative, or positive. ESR task always followed ISR task. 128-channel EEG was recorded with sampling rate of 500 Hz and segmented -100 ms + 1000 ms from the picture onset. The evoked activity and behavioral parameters were analyzed for six categories: human negative, neutral, and positive, and animal negative, neutral, and positive. The error rate was 1-3% in ISR and 3-17% in ESR. The inter-category differences were significant in males for both human and animal images ($p<0.001$), but in females for human images only ($p<0.001$). Motor reaction times (RT) were longer for males compared to females in all categories in ISR ($p<0.05$) and ESR ($p<0.01$) tasks. The inter-category differences were not found in ISR task, but they were significant in ESR task for human ($p<0.001$) and animal images ($p<0.02$) in both groups. The ERP differences between male and female groups were in the following windows: 1) early differences during the first 90 ms from picture onset; 2) 80-170 ms, including P120 component; 3) 170-400 ms, including N170/VPP and N250; 4) 400-1000 ms, corresponding to LPP. The differences in LPP were observed mostly in ESR task, and in ISR task they were seen for positive animal images. The topography of gender differences in ERPs and in RT measures depended on the task and the stimuli category.
EMOTIONAL MODULATION OF BRAIN ACTIVITY ELICITED BY ANGRY FACES IN PATIENTS WITH SCHIZOTYPAL DISORDER AND SCHIZOPHRENIA

Elena Mnatsakanian
Institute of Higher Nervous Activity and Neurophysiology RAS (Moscow, Russia)

Vadim Krjukov
Valery Krasnov
Moscow Research Institute of Psychiatry (Moscow, Russia)

Facial expression recognition is distorted in schizophrenia. The schizotypal disorder can be considered a mild form of schizophrenia, sharing some features but showing better preservation of prefrontal brain regions. We investigated the differences in visual brain evoked responses to neutral and angry faces in patients with schizophrenia and schizotypal disorder. Only male participants took part in our study: 18 patients with paranoid schizophrenia, 17 patients with schizotypal disorder, and 55 healthy volunteers. Participants had to give a differential motor response to photographs of neutral and angry/aggressive people (total of 80). We recorded 128-channel EEG and analyzed the evoked brain activity elicited by neutral faces and angry facial expressions. The differences between the neutral and emotional conditions (p<0.05) represented the emotional modulation (EM) of evoked brain activity in each group. The difference waves for neutral-emotional conditions were statistically compared between the patient groups. The EM was observed at early latencies in all groups: location corresponding O2 in controls, locations corresponding to O1 and F4-F8 in both patient groups, with additional spot in F3-Fz-Fp1 in schizophrenia. EM in P100 component was found only in schizophrenia patients in the left central area. The EM in components N170, N250, and P280 was quite similar in scalp topography for controls and schizotypal disorder, while it was not observed in schizophrenia for N170 and N250. The central distribution of EM was found for N450 in all groups, and for the later latencies (Positive Complex), was found only in controls and in schizotypal disorder. The comparison of difference waves between the patient groups showed clear distinction in N170 in occipital areas with the left hemisphere preponderance. For the later latencies, the between group distinctions were located mostly in the left central and parietal areas. Our results indicate that EM in schizotypal disorder exhibits a general resemblance with EM in healthy controls at the latencies longer than 130 ms. We can suggest that certain steps of facial expression processing are preserved in schizotypal disorder. However, at the earlier latencies, the EM in schizotypal disorder has more in common with schizophrenia than with healthy controls.
ABSTRACT VERSUS CONCRETE NOUN ENCODING AND MAINTENANCE: HIGH-DENSITY ERP STUDY

Elena Mnatsakanian
Institute of Higher Nervous Activity and Neurophysiology RAS (Moscow, Russia)

The metabolic studies provide evidence that the processing of abstract and concrete words may differ, e.g. the concrete nouns may elicit additional activation due to the mental imagery related to the word meaning. We aimed at studying brain electrical activity underlying short-term memory for different kinds of visual verbal stimuli. Our participants were healthy adult volunteers (17 female and 12 male), aged 24.8 ± 5.5 years. All participants performed delayed match-to-sample visual tasks. The stimuli were 5-letter Russian nouns. Participants had to memorize the first stimulus in a pair and compare it to the second stimulus presented with 2000 ms delay. The first stimulus was an abstract noun in one task (AW) and a concrete noun in the second task (CW). 128-channel EEG was recorded with 500 Hz digitization rate. We analyzed the visual response elicited by the first stimulus in a pair and the following slow potential (CNV). The inter-task differences (p<.05) were found in 60-650 ms time window from the first stimulus onset but not on the later latencies. The earliest observed distinction between the tasks was in 60-90 ms in the central area where the negative component was larger in AW task. The component peaking around 160 ms and negative in posterior area (N170) was also larger in AW than in CW task. Components peaking around 250 ms and 320 ms and both positive in posterior area, both had larger amplitudes in CW task. The differences in components peaking around 160 ms, 250 ms, and 320 ms showed bipolar pattern on the scalp, i.e., larger positivity and corresponding larger negativity in anterior and posterior scalp depending on the polarity of the component. The positivity in the fronto-central area around 550 ms was larger in AW task, and the positivity in the occipital area around 600 ms was larger in CW task. Our results indicate that the encoding of concrete versus abstract nouns differs at several stages of visual verbal information processing in the brain. The maintenance of encoded information in short-term memory is not affected by the concreteness of the word.
DOES THE MOOD AT THE TRAFFIC HAS AN EFFECT ON THE JOB PERFORMANCE?

Tolga Büküük
Aygen Beste Öziç
Ece Özkaya
Gizem Serin
TOBB University of Economics and Technology, (Ankara, Turkey)

Özge Kantaş Yorulmazlar
University of Rochester (Rochester, USA)

In this study, the relationship between traffic mood, depression, anxiety, and job performance was examined. As the literature states, negative mood is positively correlated to depression and anxiety (Watson et al., 1995). Literature also suggested that depression symptoms were related to reduction in job performance (Adler et al., 2006). The scale used for mood is a pure measure of mood such as The Profile of Mood Scales (McNair, Lorr & Droppleman, 1971). Therefore, it could be a better predictor for depression and anxiety instead of direct effect on job performance. Anxiety Items and Depression Items of Patient Health Questionnaire (Kroenke, Spitzer, Williams, & Löwe, 2010), mood scale (Stokols, Novaco, Stokols, Campbell, 1978), and Individual Work Performance Questionnaire 1.0 were used (Koopmans, Bernards, Hildebrandt, de Vet, & van der Beek, 2014). A total of 200 individuals participated in the present study. A hierarchical regression was performed to assess the relationship between traffic mood, depression, anxiety, and job performance. The model included commute time at the first step as control variable. In the second step, mood was included into the model. At the last step, depression and anxiety included into the model. After controlling the effects of commute time, mood explained nine percent of the variance. Negative mood was negatively related to task performance. This indicates that individuals who experienced negative mood at the traffic reported reduced task performance. In the second step, anxiety and depression explained seventeen percent of the variance, depression was also negatively related to task performance. Including the counterproductive behavior subscale as dependent variable, mood explained ten percent of the variance. Negative mood was found positively related to counterproductive behavior. Lastly, depression and anxiety explained twenty eight percent of the variance. Anxiety was found positively related to counterproductive behavior. However, when the contextual performance is dependent variable, results were insignificant. Results indicated that individuals who reported higher negative mood and depressive and anxious symptoms might have reduced job performance. Therefore, learning coping ways with negative moods on traffic can help preventing depression and anxiety related symptoms, thus could increase job performance.
THE METHODOLOGICAL BASIS OF PSYCHOLOGY ORIENTED TO RELIGIOUS CONFESSIONS

Anatoly Krichevets
Lomonosov Moscow State University (Moscow, Russia)

The psychology of the personal existence cannot be developed outside of any value systems. The fact that human development can take place in different cultural environments with different outcomes does not mean that psychology can focus only on the common part of these development variations, even if one can be found. The situation is not better with so-called universal human values, which may be criticized as being not common to all people. As an example, we can consider the psychology of education, which primarily discusses the definite forms of education and training of children — the West World forms of education. Although the generalizability of these forms can be questioned in the reflection or in the comparison with other traditions of education, nevertheless that does not negate its value in a certain (West) culture. Similarly, the psychology of spiritual development, although it cannot be based on any universal system of reference points, can propose the variants based on sustainable systems of spiritual development — religious confessions — which can and should generate corresponding to them forms of psychological knowledge. The question of how "universal" the resulting systems will be, how they can support each other, and what such confessional-oriented psychological enterprises can give the main "trunk" of the psychological "tree", which they are branches of, cannot be solved without trying to develop all these confessional forms, such as Christian, Muslim, Buddhist, and any other ones.
THE PROGRAM "REFLECTION 1" — THE CONDITION OF INTENSIVE FORMATION OF METACOGNITIVE SKILLS IN ELEMENTARY SCHOOL

Anatoly Zak
Russian Academy of Education (Moscow, Russia)

The aim of the study was to determine the conditions for increasing the intensity of the formation of metacognitive skills associated with reflection on ways to solve problems in children 9 years of age. The study was based on the statements of the theory of A.N. Leontyev on the development of mental formations in activity and the statements of the theory of V.V. Davydov on two types of thinking (theoretical and empirical) and reflection (substantive) and (formal) in solving problems. It was assumed that the original program "Reflection 1" creates conditions for the formation of substantive reflection. The program includes 32 types of non-standard problems with non-curricular content: 9 narrative-logical problems, 6 comparative problems (comparisons of schematic object representations), 8 spatial problems, 9 route problems (that involve movement of imaginary characters according to specific rules). Each problem type had three structural versions of tasks: find an answer, find the question, find a part of the initial conditions. The control group consisted of 127 children, the experimental group contained 131 children. These children participated in 32 group lessons (weekly, September through May). Initial (September) and final (May) diagnostics of the above-mentioned skills were held in the experimental and control groups on the basis of special problems to determine the type of reflection. Comparison of the results of the initial and final diagnostics showed that in September, substantive reflection was carried out when solving diagnostic problems in the experimental group of 29.8% of children, in the control group — 31.5%, in May, respectively, 58.8% and 41.7% (statistically significant differences, p<0.01, — used criterion * Fisher). The study creates conditions for improving the "Reflection 1" program: it is planned to include in the program tasks for self-compiling problems (similar to those solved) and tasks for checking ready-made solutions of problems, where it was necessary to choose from several options the missing part of the condition or the missing question. The research results show that the program "Reflection 1" contributes to more intensive (than usual) formation of metacognitive skills associated with reflection on ways to solve problems in children 9 years of age.
SOCIO-EMOTIONAL CHARACTERISTICS OF GIFTED ADOLESCENTS: SELF-CONCEPT, PERSONALITY, COGNITIVE COPING, AND PERFECTIONISM

Mojca Jurišević  
University of Ljubljana (Ljubljana, Slovenia)

Frank C. Worrell  
University of California (Berkeley, USA)

In this presentation, we examined the harmony hypothesis about gifted adolescents. Specifically, we report on characteristics of selected personality constructs among adolescent students identified as gifted in Slovenia, and we compare them with their peers who have not been identified as gifted. 804 students aged 14 to 18 years (59% females) composed the purposive sample of this study (ngifted = 307 and npeers = 497). Academic self-concept was measured with the SDQII (10 items), personality dimensions with the NEO-FFI-3 (60 items), coping strategies with the CERQ (36 items), and perfectionism dimensions with the LPM (30 items). All instruments were administered during regular class after obtaining parental consent. Preliminary analyses indicated adequate fit of the proposed models and acceptable internal consistency of scores (.68 ≤ α ≤ .91). Gifted students showed significantly and meaningfully higher academic self-concept than their peers did (d = 0.69). Gifted students had significantly higher scores on Openness and Conscientiousness, but only the difference on Openness had a medium effect size (d = 0.49); no statistically or practically significant differences were found on Neuroticism, Extraversion, and Agreeableness (d ≤ 0.27). With regard to coping strategies, peers of gifted students reported significantly higher levels of Catastrophizing, Blaming Others, and Positive Refocusing. On the other hand, gifted students reported higher Self-Blame, Acceptance, and Refocus on Planning. Effect sizes for these differences were in the small range (d ≤ 0.28), but in keeping with what theory would suggest. Regarding perfectionism, gifted students showed significantly higher perfectionistic thoughts than their peers did on three dimensions, that is, Striving for Excellence, Order, and Sensitivity to Criticism, but only the difference on Striving for Excellence had a medium effect size (d = 0.41). The findings indicate that there are personality constructs that are more closely with gifted adolescents, but that gifted are not any more vulnerable and are not more likely to be prone to maladaptive functioning than their non-gifted peers.
The other-race and other-species effect refers to a specific cognitive bias where the faces of other-races and other-species processed less efficiently compared to own-race and own-species faces (O’toole et al., 1994). Previous research showed during a face recognition task humans tend to process faces from their own-race more holistically than faces from other-races and other-species (Michel et al., 2006). Current study aimed to examine the gaze patterns of Caucasian participants while they were performing a sex categorization task with own-race (Caucasian), other-race (Asian) and other-species (Chimpanzee) faces. During the sex categorization task participants were required to respond as male or female to faces which were appeared in one of four quadrants of the screen. Behavioral results revealed that participants could successfully categorized the sex of Caucasian, Asian and Chimpanzee faces (better than chance level), yet a strong other-race and other-species effect were observed in both accuracy and reaction time measurements. For the eye-tracking results, area of interest (AOI) analysis for five facial regions (eyes, nose, mouth, cheeks and jaw) revealed that, the eye region was the most informative area during sex categorization. The results in general showed that observers attended to the eye region more than other regions for all face categories (Caucasian, Asian, Chimpanzee). However, the eye was more dominantly fixated in own-species faces compared to other-species. Furthermore, the nose was more attended in other-race and other-species faces compared to own-race and own-species faces. Findings of the current study are consistent with the literature and suggest that other-race and other-species faces elicit different gaze pattern in sex categorization task.
STUDENTS’ CHARACTEROLOGICAL PERSONALITY INTERNALS AS A FACTOR OF PSYCHOLOGICAL RISK AT PROFESSIONAL ACTIVITY IN FUTURE

Olga Kovaleva
Shvetsova Vitalina
Alexey Sharapov
Vladislav Tsurkin
Elena Filatova
Belgorod National Research University (Belgorod, Russia)

This research is devoted to the problem of training optimizing for future journalists, paying attention to their important professional qualities. E. Klimov, E. Pyr’ev, I. Solomin and others mean professionally important qualities as socio-psychological, psycho-physiological and psychophysical variables ensuring personal success in a particular profession. E. Klimov shows the profession of a journalist as a Person-to-Person activity by the criteria of the activity object, J. Holland relates it to the entrepreneurial personality type, I. Solomin, V. Oleshko, A. Shesterina and others note the creative labor type as the main. The purpose of this research is to study students’ characterological personality properties as a factor determining the psychological risks for their professional activity in future. The hypothesis is: if a future journalist shows accentuated character traits, those traits will act as the psychological risks in their profession. They may not only lead to professional mistakes, but decrease the overall professional productivity, entail faster emotional burnout, and early professional deformations. This research is performed using the method of determining the character accentuations by K. Leonard — G. Shmishek. The result is that only one fifth of the students may be marked as a harmonious personality type. The majority of respondents characterized by the presence of accentuation, manifested as maladaptive behavior tendency. Two dominant types of accentuation revealed: hyperthymic type and exalted type. In a harmonious form, they fully possess a range of professional qualities of journalists: hyperthymic, showing energy and adventurousness, tendency to social and organizational activities; and exalted, with its high susceptibility and aesthetic skills — to the creative activity. Nevertheless, the presence of character accentuation complicates students’ personal and professional implementation.
TREATMENT OF CHILDHOOD ANXIETY DISORDERS

Silvia Schneider
Ruhr University (Bochum, Germany)

Separation anxiety disorder (SAD) is one of the earliest and most common mental disorders in childhood, and a strong predictor of adult psychopathology. Despite significant progress in psychotherapy research on childhood anxiety disorders, no randomized controlled trial has been conducted with a disorder-specific treatment program for young children suffering from SAD. Forty-three children (ages 5-7) with SAD and their parents were assigned to either a 16-session disorder-specific SAD treatment program including parent training and classical cognitive-behavioral therapy (CBT) components, or to a 12-week waiting list group. Categorical and/or continuous data for anxiety, impairment/distress and quality of life were collected at baseline, after treatment/waiting list condition, and at a 4-week follow-up. Intention-to-treat analyses indicate that 76.19% of children allocated to the treatment group definitively no longer fulfilled DSM-IV criteria for SAD at follow-up, compared to 13.64% in the waiting list group. Between 91 and 100% of children rated themselves or were rated by their father, mother or therapist as very much or much improved on the global success rating immediately after treatment. Results indicated large time by treatment condition interaction effect sizes (d = 0.98-1.41) across informants for reduction of distress/avoidance in separation situations after the test for the treatment condition. Further, parents reported significant improvements in impairment/distress in the child’s major life domains and the child’s quality of life. Treatment gains were maintained at the 4-week follow-up assessment. Results indicate the short-term efficacy of a disorder-specific treatment approach for SAD, and are among the first to indicate that CBT programs work with young children.

HEARINGS HAVE COLORS: A MIXED DESIGN STUDY OF SYNESTHESIA

Leyla Alma-Uzuntuna
Sami Çoksan
Middle East Technical University (Ankara, Turkey)

Synesthesia is a rare perceptual condition which a certain stimuli is experienced by at least more than one sensation (Beeli, Esslen and Jancke, 2008). Current study aims to understand the experience of synesthesia by the aid of individuals declaring to have synesthesia. In order to accomplish this aim, the research was planned to be twofolded. A mixed (QUAL-quan) design study was applied in order to understand how synesthesia is experienced by people having synesthesia. In orders words, while quantitative part is necessary to confirm the self-report synesthetes (quan), qualitatative design, Interpretative Phenomenological Analysis (IPA), addresses the main aim the research (QUAL). Firstly, self-report synesthetes was confirmed by collecting data from both synesthetes (N = 6) and non-synesthetes (N =22). Eagleman Synesthesia Test Battery (Eagleman et all., 2007) word and color lists was conducted to the both samples. Secondly, a semi-structured question list was applied to the synesthetes to give meaning to their experience by using the methodology IPA. Initially, results of quantitative study revealed that synesthetes stated consistently associated color with chosen words compared to non-synesthetes. Furthermore, four main themes were emerged from IPA which are (1) not being aware of rareness of experience, (2) denying of the rareness of experience, (3) determinants of associated colors and (4) stability of associated colors. The study is unique for using both

A HIGHLY NEEDED RESEARCH PROJECT ABOUT BEREAVED AFTER DRUG-RELATED DEATH (THE END PROJECT). BACKGROUND AND RESEARCH DESIGN

Kari Dyregrov
Kristine Berg Titlestad
Western Norway University of Applied Sciences (Bergen, Norway)

Every year 250-300 people die in Norway because of drug use. Still there is little focus on the bereaved, what relief measures they need, and how they are met in society. Worldwide, there is also very little research on this socially marginalized group’s situation. A major research project "Drug death related bereavement and recovery" (END), led by Professor Kari Dyregrov, started in 2017 at Western Norway University of Applied Sciences. The project team consist of drug death bereaved, user organizations (NGO’s), the municipality of Bergen, professionals representing health and welfare services, and national and international experts on substance abuse, stigma, trauma and grief. An overall goal is to generate knowledge for targeted and adequate relief measures from the health and welfare services and contribute to a new discourse in drug policy on how society meets and protects this marginalized group of bereaved. Four studies are included (with these main research focuses): Study 1. What are the consequences and strains of drug death bereavement and how do the bereaved manage everyday life? Study 2. What assistance and support do drug death bereaved receive, compared to their perceived needs? Study 3. How is the function of the bereaved reflected in the context of register data (e.g. sick leave, use of medication)? Study 4. How do the health- and welfare services handle drug deaths and what relief measures should be provided? 260 bereaved family members and close friends over 18 years from Norway participate in a large survey. From this sample, 35 parents, siblings and close friends participate in individual interviews. Study 4 examines data from a strategic sample consisting of six "case municipalities"; i.e. with highest rates of drug deaths in Norway. Data will consist of relevant national steering guidelines and documents, and data form focus group interviews with 120 health and social workers. This conference presentation will briefly describe how we study complicated and traumatic grief accompanied by stigma, guilt, relief, shame, and self-stigma after a drug-related death. Challenges regarding ethics, recruitment, response rate and generalization when studying this marginalized, invisible and vulnerable group of bereaved will be outlined.
THE ROLE OF SELF-COMPASSION, MINDFULNESS AND AUTHENTICITY IN THE RELATIONSHIP BETWEEN BODY IMAGE AND PSYCHOLOGICAL WELL-BEING OF WOMEN: A MODEL TESTING

Burcu Korkmaz  
Hayriye Güleç Pap  
Bursa Uludağ University (Bursa, Turkey)

Many studies have shown that there is a significant relationship between the negative body image of women and their psychological well-being (Cash & Pruzinsky, 2002; Noles, Cash & Winstead, 1985). However, it is also important to examine whether some protective factors may play a role in this relationship. In recent years, few variables such as self-compassion, mindfulness and authenticity are found to have high and positive correlations with psychological well-being. Self-compassion is “being open to one’s own suffering, feeling cared and kind toward oneself, behaving nonjudgmental to failures and accepting these failures and inadequacies as a human experience” (Neff, 2003). Mindfulness is “bringing one’s complete attention to the present experience on a moment-to-moment basis” (Marlatt & Kristeller, 1999) purposefully and nonjudgmentally (Kabat-Zinn, 1994). And authenticity is defined as “the unobstructed operation of one’s true or core self in daily enterprise” (Kernis & Goldman, 2006). Although the relationship between some of these variables and body image was investigated, the evidence remains limited to determine the direction of this relationship due to the correlational study designs. Furthermore, to our knowledge, no study investigated the role of authenticity, mindfulness and self-compassion in the relationship between body image and psychological well-being. Therefore, we hypothesized that people’s dissatisfaction with their body may not have a negative impact on psychological well-being due to the self-compassion, mindfulness and authenticity levels. Or, vice versa, psychological well-being levels may reduce if individuals with body dissatisfaction have not enough experience with these protective variables. In order to test these hypotheses, a model testing will be conducted with 300 female participants. The data will be collected online and analyzed using the Structural Equation Modelling. The results will be discussed within the scope of the literature.
SOCIO-PSYCHOLOGICAL APPROACH TO A KINSHIP DEVELOPMENT IN A YOUNG FAMILY

Ekaterina Yumkina
Saint-Petersburg State University (Saint-Petersburg, Russia)

The crisis phenomena in the modern family can be viewed as a search for new forms of kinship relationships that would be more responsive to the changing social reality. In this reality a person, being included in many interactions, suffers an acute shortage of trusting, spiritually filled and emotionally mature relationships. In this regard, the actual question is to define the criteria for kinship. On the one hand, among the blood relatives (biological kinship), sometimes there is such strong hostility that people from the same family are perceived as strangers to each other. On the other hand, such close ties (social kinship) are formed between completely non-native people, that they do not hesitate to call each other relatives. In both of these phenomena, from a socio-psychological point of view, it is interesting to search for the border beyond which the factors of interpersonal and intergroup interaction of people come into play over the biological foundation of the unity of the human race. One of the starting points in this search may be a young family, in which two non-native people (spouses) form a social development environment for the future kinship community. In addition to the pronounced interpersonal component in the communication of spouses, a young family is also the interaction of their parents, i.e. fully intergroup interaction. Analysis of the literature about satisfaction with relationships in a young family and our own research show that similarity of the conditions that the parents of the spouses created during childhood and adolescence is one of the key factors of young family stability. In the first approximation, we can talk about the following socio-psychological criteria of the kinship formation in a young family: 1) acceptance of the partner image; 2) similarities in the perception of the family structure of the parent family (the system of family lifestyle — Kunitsyna, Yumkina 2015); 3) similarity in fundamental values. Further research is aimed at deepening a number of aspects in the family structure and searching for structural relationships in the analysis of already established families of parents and the emerging families of their children.
Self-presentation tactics scale (SPT) is a measurement which was developed to assess self-presentation which is defined as the process of controlling how people are perceived by others. Self-presentation allows people to represent themselves in certain situations in certain way. A 64 item scale was originally developed by Lee, Quigley, Nesler, Corbett and Tedeschi (1999) to measure 12 different self-presentation tactics which are merged into two categories: self-assertive and self-defensive. The aim of the present study was to measure the psychometric properties of the Turkish version of SPT. The data was collected from adult population via online and paper-pencil forms. The participants were 346 (F: 228, M: 116, 2 not specified) adults with a mean age of 30.33 (SD: 10.97) ranging between 18-63. An explanatory factor analysis with Direct Oblimin Rotation was conducted. 13 items which were loaded more than one factor or not loaded any of factors excluded from the scale. 9 factors were extracted with Eigen values higher than one at the final analyses. 58.13% of the variance was explained by 9 factors. Internal consistency of the subscales varied between .67 and .90. The Cronbach Alpha of the total scale was .93, which indicates high internal consistency. Results of the study showed that apology, exemplification, intimidation and self-handicapping items are grouped in separate factors same as original scale. However, other subscales merged with another subscale in one factor. These combinations may result from the different perceptions about tactics in Turkish sample. Confirmatory factor analysis will be carried out in order to test two models (12 factors vs. 9 factors).
BRIEF PREVENTIVE INTERVENTION EFFICACY STUDY

Tatiana Balachova
Oklahoma University Health Sciences Center (Oklahoma, USA)

Ekaterina Burina
Galina Isurina
Irina Grandilevskaya
Saint-Petersburg State University (Saint-Petersburg, Russia)

Preventive brief interventions are becoming important in clinical practice. This research is devoted to the study of the psychological effects of brief intervention aimed at Fetal Alcohol Syndrome (FAS) prevention. The intervention design is based on the health belief model and the model of stages of change. Beliefs about personal risk and expected consequences were considered as a behavior change mechanism. Previous results indicate that women are ready to change their convictions under the influence of information from significant sources, which determined the main elements of the program: information brochures and brief intervention carried out by an OB/GYN physician. Brief intervention is a psychological counseling method, based on motivational interviewing principles, focused on client’s problems and aimed at motivating positive lifestyle changes. Research into the effectiveness of brief health interventions requires equability in their implementation. Therefore, in the current study special attention was paid to training physicians the standard intervention procedure and the implementation of reliability criteria in the process of its realization by specific specialists. Study sample consisted of 280 childbearing age women: 140 made up the experimental group (brief intervention) and 140 — control (passive informing — brochures). The study used methods developed by the FAS Prevention Research Group and was conducted in women's clinics in St. Petersburg, Russia. The study results before the intervention showed that the majority of women (77%) did not have knowledge of FAS and were characterized by a fairly high level of alcohol use: 100% of the sample at least once in the last 90 days consumed alcohol at risk (4+ doses at one time). Women planning a pregnancy did not differ from the total sample by their drinking style. The results of the study, 12 months after, showed that the level of FAS knowledge in women increased in both groups, however, participants from experimental group significantly more often had more accurate knowledge. The attitudes towards alcohol use during pregnancy also changed in both groups, but in the experimental one, these changes occurred much faster. The same trend was observed in relation to real alcohol use. Thus, the study results indicate the brief intervention efficacy.
A PROTOTYPE SCALE FOR THE VALIDATION OF THE NEO-FUNCTIONALISM THEORETICAL CONSTRUCT

Filippo Dipasquale  
University Hospital “Policlinico-Vittorio Emanuele” (Catania, Italy)

Paola Magnano  
KORE University (Enna, Italy)

Marta Blandini  
Raffaele Gueli  
Paola Fecarotta  
European School in Functional Psychotherapy (Catania, Italy)

The Neo-functionalism theory in psychology asserts the complex and integrated psycho-bodied functioning of human being depending on the multidimensional integration of four levels of functioning: cognitive-symbolic; emotive; motor-postural; physiologic. During Neurodevelopment, the complex and congruent embodiment of the human functioning is achieved through the “Basic Experiences of Self” (BEsS), that represent the functional way the child skills daily activity along his/her development from the beginning of life. The BEsS are organized in a typical “Configuration of Functions”. The Functions already exist when the child is in the womb and, congruently to life situations occurred during child development, assume different nuances along the gamma of values between opposite polarities (i.e., trust-distrust, happiness-unhappiness, mobility-immobility, etc.). Being interconnected and normally adequately variable from one polarity to the other, the Functions will be typically organised in a configuration that is specific for the BES. This study is the first attempt to validate the theoretical construct of Neo-Functionalism, building a psychometric diagnostic scale. We chose three Basic Experiences of the Self (BEsS) among the twenty-two ones recognized: “Vitality”, “Letting go” and “Contact”. An evaluation form for each BES reports thirty Functions drawn in their dyadic polarity with points from 7 to 1 to quote the gamma polarity of the Function, according the Osgood Semantic Differential Scale. Twenty-four videos of newborns and infants up to 3 years of age, showing the studying BEsS in their spontaneous activity, were collected and submitted to thirty-three experts in Functional Psychotherapy. N. 840 evaluation forms were admitted to the study; SPSS 20.0 software was used for data analysis. Means and Standard Deviations for thirty Functions were calculated for every BES. ANOVA showed significant differences among almost all the Functions of the three BEsS, according the congruent meaning reported in the Neo-Functionalism’s Theory. A good scale’s internal consistency and reliability was confirmed by a Cronbach’s Alpha Index (Vitality=.87; Contact=.80; Letting Go=.79). The validation of the construct will be useful to confirm theoretical framework of Neo-Functionalism and offer a basis to the construction of a scale to be used in clinics.
AN UNDERESTIMATED CONCEPT: INDIVIDUAL DIFFERENCES IN ONLINE DISINHIBITION EFFECT

Selin Misir
Yeşim Çapa-Aydın
Middle East Technical University (Ankara, Turkey)

Introduction Research show that individuals behave differently in online and face to face contexts. Online disinhibition effect covers a situation in which social restrictions are loosened online and allowing individuals to behave in a relatively free manner. Although disinhibition effect mostly studied in relation to problematic behaviors the concept by itself is not positive or negative; rather, its effect depends on individual differences. Although it is not a new concept, it is rarely measured and therefore correlates of online disinhibition affect rarely mentioned. To this aim, based on Social Identity Model of Deindividuation (SIDE) a measurement tool has been developed and its communicational and personality correlates was examined. 517 university students (F: 266, M: 251) participated in the study (M = 21.18, SD = 2.47). Ten item personality scale and communication skills scale were applied. Online disinhibition scale (OSD) was developed by researchers. Results of CFA showed a moderate fit (2: 248.010, 2/df: 3.397, P: .00, CFI: .93, GFI: .94, RMSEA: .06, SRMR: .05). Result Hierarchical regression analysis was conducted for both factors (facilitated communication and reduced responsibility of negative consequences) of OSD. Gender entered at the first step, followed by personality factors and communication skills. Gender (B= -1.07), extraversion (B= -.60), neuroticism (B= -.60) and self-expression (B= -.54) significantly predicted facilitated communication. For reduced responsibility of negative consequences, gender (B= .99), conscientiousness (B= .11), openness to experience (B= -.50) and self-expression (B= -.26) are significant predictors. Discussion Findings suggest two factors of OSD is associated with different individual characteristics. Being a woman, scoring low on extraversion and neuroticism as well as self-expression skills are positive predictors of facilitated communication effect whereas for reduced responsibility factor; being a man, scoring low on conscientiousness and openness as well as self-expression skills are significant positive predictors. Results aim to provide a new measurement tool to the literature and further information on correlates of online disinhibition effect as a psychological state. Findings can help researchers integrate online disinhibition as a moderator variable in their research and help to extend the interpretations being made in terms of psychosocial effects of online communication. EVIDENCE-BASED PSYCHOLOGICAL AND EDUCATIONAL INTERVENTIONS FOR CHILDREN WITH AUTISM SPECTRUM DISORDER

Evgeniya Lebedeva  
Russian Academy of Sciences (Moscow, Russia)

Elena Grigorenko  
Saint Petersburg State University (Saint-Petersburg, Russia)

Yevgeniy A. Bondar  
Association of Non-profit Organizations Created by Parents of Children with Autism Spectrum Disorders “Autism Regions” (Novosibirsk, Russia)

Autism spectrum disorder (ASD) is a lifespan developmental disorder that manifests within the first years of life primarily through difficulties in social communication and social interaction, and the presence of focused repetitive, restrictive or stereotyped behaviors, interests, and activities. This disorder is characterized by striking heterogeneity both in its presentation and etiology. The estimated world prevalence of ASD is close to one percent. Given the explosion in published psychological and educational interventions for ASD over the past several years, this review talk highlights the latest trends in interventions for children with complex learning and developmental needs. Recent efforts in intervention research focus on meeting standards of scientific evidence and emphasize the importance of strict adherence to the principles of high quality research and evidence-based practice. According to recent systematic reviews, all evidence-based comprehensive intensive intervention programs for children with ASD are based to some extent on the scientific discipline of Applied Behavior Analysis (ABA). Such intensive behavioral interventions have the power to improve the trajectory of development of a child with ASD. In particular, meta-analytical studies have demonstrated substantial improvement in IQ scores and adaptive behavior in children receiving early intensive ABA-based comprehensive interventions. Moreover, the majority of evidence-based focused interventions (designed to address a specific set of skills/goals) for ASD are either ABA-based or are included in ABA-based comprehensive intervention programs. The majority of adults with ASD do not live independently, although outcomes are much better for those adults who received early diagnoses and appropriate treatment as children. Thus, early diagnosis and comprehensive behavioral intervention starting as early as possible, within the first years of life, are imperative. Importantly, there is a growing interest in modular interventions, which allow a high-degree of individualization for each child with ASD, while meeting the standards of evidence-based practice. An increase in the number of rigorous evaluations of different interventions conducted in real-world settings with outcomes focused on core deficits in ASD augurs well for wide dissemination and implementation by qualified nonspecialists in the community.
PARENTAL POSITION AS A FACTOR OF SELF-ESTEEM DEVELOPMENT IN ADOLESCENCE

Olga Karabanova
Lomonosov Moscow State University (Moscow, Russia)

The development of self-esteem of adolescents is largely due to the parental position. The research was aimed to study the relationship between the characteristics of the parent position and the characteristics of adolescent self-esteem. The parent position is a complex structure that includes the following components: value (motives and values of education), cognitive, emotional (acceptance/rejection of the child) and behavioral. The cognitive component could be defined as 1. mental representation of the child’s age and individual personality traits; 2. parent’s self-image as a) the “ideal” parent, b) real I – “I’m like a parent what I am” and c) what I would like to be, d) how the child perceive me; 3. mental representations of the goals and methods of education. The features of the parent position are stability/inconsistency, flexibility/rigidity, reflexivity, criticalness, predictability, satisfaction with parenthood and readiness for self-development. In adolescence separation of maturing children from parents leads to the increasing of ambivalence and emotional coldness, detachment in parent-child relationships. The techniques ADOR (S. Shaffer) and “Parent-child interaction” (I. Markovskaya) were used, 470 adolescents aged 14 to 17 years participated in our research. The ratio of the perception of parent-child relations among adolescents and parents revealed a discrepancy in some parameters. Adolescents rate emotional acceptance, intimacy, cooperation lower than parents; but demanding, rigor, the level of control higher than their parents. The study of the role of parent-child relationships in the formation of adolescent self-esteem revealed the significant influence of the parent position on the self-esteem. The empirical data allowed us to highlight harmonious parent position, distant parents, accepting inconsistent parents, accepting mother/authoritarian rejecting father, and accepting father/authoritarian rejecting mother. It was cleared that parent’s acceptance is a key variable determining the adolescent’s self-esteem. The inconsistency of controls, requirements and prohibitions influence on the self-esteem of adolescents in accordance to the level of parent’s acceptance. The disharmony of the parental position as the discrepancy between the acceptance and adequacy of the methods of education adversely affects the adolescent self-esteem, leads to ambivalence and disharmony of self-esteem. The study was supported by the Russian Foundation for Basic Research under the project 18-013-01213.
Most Australian university students also work part-time jobs to support themselves, a trend seen across many countries. We examined the relationship between proactive personality and perceptions of both current and future (graduate) employability among these working students. Proactive personality has been identified as one of the most important personal resources in career success (Fuller & Marler, 2009), but few studies have examined its relationship with perceived employability, especially among those who are still studying towards their future careers. According to general models of proactivity (Seibert, Kramer, & Crant, 2001), proactive people seek out opportunities to initiate changes in their environments to better suit their needs. Thus, we examined whether the mechanism by which proactivity was related to perceived employability was through engaging in crafting of their dual study and work roles. Role crafting has been associated previously with higher perceived employability (Akkermans & Tims, 2017). We expected that higher proactivity would relate to greater crafting behaviours and via that to greater perceived employability. A cross-sectional survey-based design was used. Participants comprised 400 Australian university students (mean age 23.5 years; 80% female). We administered measures of proactive personality (Bateman & Crant, 1993), crafting of job and study roles (Slemp & Vella-Boderick, 2013), and perceived current and graduate employability (De Witte, 1992). SEM (via AMOS 25) was used to test the hypothesized mediation model. We found good fit for the indirect effects model, $\chi^2(73)=131.81, p<.001, \chi^2/df=1.81, CFI=.98, TLI=.98, RMSEA=.05$, although fit was improved by adding direct paths from proactivity to employability. 95% bootstrapped confidence intervals were generated to test the indirect effects. Job crafting completely mediated the relationship between proactivity and perceived current employability, while study crafting partially mediated the relationship with perceived future employability. We concluded that the capacity to craft their study role, which is generally their main role, rather than their secondary part-time job role is what is important in fostering students’ perceptions of future graduate employability. However, job crafting fosters current employability. There was evidence of different mediated paths depending on which role was crafted and whether current or future employability was measured.
DANCE FOR A BETTER LIFE: EXAMINING THE IMPACT OF DANCE ON WELLBEING

Papri Nath
Indian Institute of Management Tiruchirappalli
(Tiruchirappalli, India)

Present study attempts to understand the intervening mechanism, which transforms the impact of dance on wellbeing. The underlying idea is to explore the applicability of an existing framework of positive emotions and wellbeing (Nath & Pradhan, 2012). Data is collected using standardized measures on a sample of 240 students and working professionals. The age range of the participants is 15-35 years. Analysis of variance is conducted to assess the difference in reported wellbeing among dancers and non-dancers group. Results indicate that dancers group reported experiencing significant amount of greater positive emotions and well being as compared to non-dancer group. Further mediation analysis is done to examine the underlying mechanism between dance and wellbeing. Providing support to the adopted framework (Nath & Pradhan, 2012), the findings show that the act of dancing induces positive emotions and eventually builds psychological resilience. Psychological resilience functions as a buffer to deal with adversity resulting in greater experience of well being in the long run. The study has major implications in theoretical advancement of positive emotions, designing of training programs on enhancing well being through dance, and development of positive therapeutic techniques.

PREDICTORS OF COMPULSIVE ONLINE BUYING BEHAVIOR AND POSSIBLE ROLE OF MEDIATOR VARIABLES: IMPULSIVITY, INTERNET ADDICTION, MATERIALISM AND PSYCHOLOGICAL DISTRESS

Özden Yalçınkaya-Alkar
Yıldırım Beyazıt University (Ankara, Turkey)

Yasemin Türker
Gazi university hospital (Ankara, Turkey)

With the rapid increase in technological developments, psychological problems related to these developments have started to increase as well. For example online shopping makes life easier for people, however, sometimes starts to create problems as an addictive behavior too (Faber & O’Guinn (1992). It is important to examine the variables associated with online shopping addiction in the Internet. Thus, in this study, the relationship of internet addiction (Manchiraju, Sadachar, & Ridgway, 2016), impulsivity, materialism, loneliness, life satisfaction (Manchiraju, Sadachar, & Ridgway, 2016), depression-anxiety-stress variables with compulsive online buying behavior was investigated. Totaly 578 volunteers from different cities of Turkey participated in this research. Firstly predictors of online compulsive buying behavior were identified. Then possible mediator model was tested to determine their roles between the compulsive online buying behavior and other variables of the study. The findings have shown that; internet addiction, impulsivity, depression-anxiety-stress and materialism predicts compulsive online buying behavior. In addition, the indirect effect of internet addiction on compulsive online buying behavior through materialism; the indirect effect of depression-anxiety-stress on compulsive online buying behavior was found to be mediated by the role of internet addiction. Lastly, ur study pointed out that variables of our study important interns of both understanding of mechanism of compulsive online buying behavior and developing possible interventions methods.
DISORDER OR DISABILITY OF A FAMILY MEMBER AS COPING PROCESSES IN FAMILIES PREDICTOR AND MODERATOR.

Nadezhda Mikhailova  
Saint-Petersburg State University (Saint-Petersburg, Russia)

Amount of studies, using observational model and allowing to estimate the impact of disease or disability of one family member to the family system is limited. As a model of studying of family adaptation to chronical stress, mechanisms of its contagion and transmission and coping we used families with a patient. We studied 156 family with adolescents (412 individuals), including 34 families with blind, 28 with deaf, 69 families with healthy adolescents. To estimate effects of child’s as well as parent’s disorder on impact on family system, additional group of 25 families with mothers suffering from neurosis was studied. Using 9324 event sampling, we examined their stress and coping experiences (Perrez, Schoebi, Wilhelm, 2000). Family members were instructed to daily report everyday stressful events, stress emotions, causal attribution, coping and coping outcomes. The nature of stressful emotions and the choice of coping behavior were most influenced by causal attribution and the controllability of a stressor. These processes of cognitive evaluation of a stressor were most affected by moderation (strengthening or weakening) as a result of influence of family member’s illness. Regression analysis proved that sensor defect of a child can predict both child’s own stress characteristics and the same parameters of his parents. In our research blindness of a child was a moderator that increased the impact of mother’s internal control over stressor on father’s internal control over stressful situation. The blindness of a child became a moderator that strengthens the father’s internality in controlling the stressor, especially when they considered themselves as the culprits of stress. We found that blindness has the most destructive effect on coping-competence of a family. Mother’s neurosis was one of the predictors of father’s causal attributions, his inadequate coping and mental health. Mother’s neurosis was a moderator, decreasing positive impact of mother’s adequate coping on father’s adequate coping. In families with a patient or a teenager with disability specifics of father’s causal attributions was in ignorance that neurotic wife or a child with disability can be a source or subject able to control stressor or solve the problem. Supported by RFH project 16-06-00228
EARLY-LIFE ECONOMIC DISADVANTAGE AS AN ANTECEDENT OF MASTERY BELIEFS IN ADULT AGE

Olga Poluektova
Bremen International Graduate School of Social Sciences, Jacobs University Bremen (Bremen, Germany)

Early-life experiences of economic disadvantage may have long-lasting consequences for individuals’ wealth, health, and well-being. To explain these effects, past research has linked child poverty with greater family stress (for a review, see Duncan, Ziol-Guest, & Kalil, 2010) and also with impaired executive function (e.g., Kim et al., 2013). Few studies, however, have focused on the role of poverty in the development of social cognitive phenomena, such as personal beliefs. Beliefs are likely to develop through children’s interactions with their environment, remain relatively stable over time, and may guide judgements, feelings and behaviors. In an attempt to broaden our understanding of the mechanism underlying child poverty effects on later life psychological and behavioral outcomes, I present a study that focuses on the impact of early-life poverty on mastery beliefs in adult age. I hypothesize that children growing up in poverty develop lower mastery beliefs as a function of unfavourable family environment and lack of successful mastery experiences. To test the proposed hypothesis, I combine two datasets from the Longitudinal Surveys of Youth that followed 6,283 women (NLSY79) and their children (NLSY79 Child and Young Adult) from 1979 to 2014. To assess children’s economic disadvantage and family environment in childhood, I use the data provided by their mothers. To assess children’s mastery levels, I use their responses to the Pearlin Mastery Scale at ages 15 (first assessment), 23, and 31 (last assessment). The results will add to the existing literature on the mechanism underlying child poverty effects and inform policies aimed at alleviating those effects. In particular, those who grew up in poverty might benefit from mastery-based interventions aimed at developing a positive sense of mastery and improving individuals’ emotional and behavioral outcomes.
YOUR HELPING DOESN’T HELP AT ALL: REPRODUCING GENDER INEQUALITIES IN DOMESTIC LABOUR

Hilal Peker-Dural
Gülgün Meşe
Ege University (Izmir, Turkey)

Although women’s appearance in paid employment and public life increases, men’s appearance in home increases as well. These New Men, who engage in domestic realm of home, differ from husbands of traditional housewife (Pink, 2004). Despite the fact that women’s participation in paid employment and adoption of egalitarian values are increased day by day, women are still responsible primarily for household chores (Dixon & Wetherell, 2004; Singleton & Maher, 2004). However, even the contributions of men in household realm are limited, it is important to investigate that how men interpret these contributions, which subject positions they take, how they negotiate their identities and which strategies they use while they speaking about division of labour. Analysis of everyday discursive practices in the home via how men define their contributions to household labour and negotiate ideological dilemmas about gender is important for investigating gender inequalities in domestic labour. For this purpose, we conducted a one-to-one semi-structured interview with 19 heterosexual men, who ages 28-40, full time employee, and who were married with working women. The interviews were audio-recorded and later transcribed for the analysis. The data was analyzed by endorsing critical discursive psychological approach. The results of the study revealed that men used “helping” repertoire while explaining their contributions in household labour. Men positioned their wife as primary responsible for domestic labour and constructed their identities in the home as “helpers”. Moreover, they legitimated their limited contributions to household labour with various discourses such as exaggerating public responsibilities, indicating being tired because of the work, and being untalented about housework, and not being talented as much as their wives. Additionally, it was revealed that men were engaged in household work which was traditionally masculine, such as repairing or fixing, and they positioned themselves as primary responsible for these works. These discourses contribute for maintaining gender inequalities in the household and women’s subordinated position in gender relations. Revealing these discourses is important for changing the gender ideology while changing the everyday discursive practices, since discourse and ideology produce each other.
FORGIVENESS AS A BASIS FOR CONCILIATION IN THE SCHOOL MEDIATION PROCESS

Natalya Bolshunova
Novosibirsk State Pedagogical University (Novosibirsk, Russia)

Olga Ustinova
Novokuznetsk Institute of the Kemerovo State University (Novokuznetsk, Russia)

School interpersonal conflicts are specific in terms of resolution, results, and the underlying values. This is not a conflict of interests, but a meaning associated with self-incomprehension and incomprehension the others generating acute emotions. The values of friendship, love, trust, human dignity become «profaned», which is manifested in extremely pronounced violence against yourself and the others. The ways of the result of working with school conflicts differ from those in legal practice. The result is self-comprehension and comprehension the others, overcoming negative experiences, restoring of confidence and forgiveness, ensuring the continuation of the relationship. The most acceptable means of mediation is a dialogue and narrative practices. The narrative interview reflects the narrator’s emotions in accordance with his values, ideas about himself, other people, the world, which allows the mediator to understand the «semantic core» of the conflict, to work further in the context of the dialogue, actualizing mutual understanding and mutual acceptance of the participants in the conflict, accompanied by experiencing forgiveness and repentance. The basis of forgiveness is the acceptance of the other as a different one, an awareness of the other’s right to be different. The mutation of the participants of the conflict is due to the reflection of the interaction situation, the content and motives of the conflict. Forgiveness is of particular importance in Russian culture, along with the concepts of “conscience”, “truth”, “soul”, “fate”, as forming the national mentality (Mayorov, Brileva, Verzhbitskaya). The discovery of the «otherness» of the other and the actualization of reflection occurs in the dialogue. We understand the dialogue as the process of actualization of the «spiritual self», from the point of view of conscience (Florenskaya) in ourselves and in the interlocutor. Self-comprehension and comprehension the others occurs when a person has a relation with himself and the situation of communication «being outside», revealing himself through the eyes of another person. The task of the mediator is to help the interlocutor to discover his «spiritual self», actualize the «dominant on the other» and the voice of conscience.
THE GROUP DYNAMIC DURING IN ONE-YEAR-LONG EXPOSITION TO ICE CONDITIONS IN POLISH POLAR STATION ON SPITSBERGEN

Agnieszka Skorupa
Bartosz Boniecki
University of Silesia in Katowice (Katowice, Poland)

Each year a small group of Polish researchers and technicians is staying on Spitsbergen to work in the Polish Polar Station. Their work conditions are characterised as: Isolated-Confined-Extreme (ICE; Sandal, Leon, Palinkas, 2006). The unique combination of social and environmental factors poses many challenges for human physical and psychological functioning (comp. Palinkas, 2003; Leon, Sandal, Larsen, 2011). We have conducted the one-year-long study measuring changes of individual characteristics and the whole group dynamic and their origins—social or environmental. Data were collected in three ways: (1) before the expedition leave and after return; (2) for a whole-year by sending each month questionnaires through the internet; (3) directly in the Polish Polar Station. The social network analysis (prepared in SocNetV-2.4.) of monthly changes in the group closeness will be presented. Data will be compared with changes in individual psychological states (stress level, positive and negative emotions, perception of positive and negative events, depressiveness and anxiety level) and changes in environment (polar day and night, temperature). Main conclusions are that: the individual characteristics have minor impact on the adaptation to ICE; the surrounding factors do not have such a big impact on one’s adaptation as they use to have; the group dynamic depends more from situational factors than from environmental one, however there is partial support for winter-over syndrome existence.
THE RELATIONSHIP BETWEEN PSYCHOLOGICAL TIME AND ROLE-PLAYING REPERTOIRE OF MANAGERIAL IDENTITY

Alexander Paramuzov
Takhir Bazarov
Lomonosov Moscow State University (Moscow, Russia)

The relationship between time and identity has been intensively discussed by philosophers. They tried to figure out how identity related to time. An American psychiatrist Frederick T. Melges examined some cases in which the sense of time and of identity was impaired. His core thesis is that "the sense of identity is related to the continuity of temporal perspective, especially future time perspective" (Block, 1990, p. 256).

Time and identity have many aspects and dimensions. For instance, there are personal identity, social identity, group identity, leader identity, organizational identity. Researchers have studied many aspects of identity. Nevertheless, many questions are still not answered. In the current work, we conduct an empirical research to clarify how role-playing repertoire of managerial identity related to psychological time. The question is what is my role as a manager and how it is related to psychological time. We have chosen managerial roles developed by Bazarov (2011). According to his concept, there are four primary roles for managers which are a commander, an organizer, an administrator and a supervisor. Participants will choose one of four roles themselves. There will be a description of each role so they make a choice according to their managerial identity. They also will fill other questionnaires such as Zimbardo Time Perspective Inventory (Zimbardo, Boyd, 1999) and Occupational Future Time Perspective of Zacher and Frese (2009). Some extra questionnaires will be added. We are planning to collect data from 120 managers and 120 non-managers. In the analysis will be used MANOVA, t-test, Kruskal-Wallis Test and Mann-Whitney U test. We will compare the role-playing repertoire of managerial identity with their psychological time and also compare the results of managers with non-managers. In the process, not finished yet.
This study explores the possibility to capture the Big Five Model of Personality with ten non-verbal characters; i.e. open-minded, conscientious, extravert, agreeable, and neurotic; versus close-minded, impulsive, introvert, antagonistic, and emotionally stable. The ambition was to design unisexual and multicultural characters, free from physical objects such as clothes and hairstyles. In the development process, we have combined personality theories with research on body languages and facial expressions. Different versions of the characters have been tested in several pilot studies and continuously improved by graphic designers at an international top-ranking design and innovation agency, Veryday. The aim of the present study was to validate the ten non-verbal characters through experts in the field of personality psychology. One hundred twenty experts at six international conferences (ECPA 2015; ICP 2016, World Conference on Personality 2016: ECPA 2017, AICP 2018 and European Conference on Personality 2018) evaluated to what degree (on a 5-point Likert scale) each non-verbal character corresponded to the Big Five Model of Personality. Three of the Big Five personality factors seem to be possible to capture with non-verbal characters. However, Openness and especially Conscientiousness, remain challenging. The non-verbal characters need to be further validated and discussed with experts in the field of personality psychology.
THE EFFECTS OF DEMOGRAPHY, GEOGRAPHY AND PERSONALITY ON CAR DRIVING AND USE OF PUBLIC TRANSPORTATION: INSIGHTS FROM A NATIONALLY REPRESENTATIVE SWEDISH STUDY

Roos John Magnus
Frances Sprei
Chalmers University of Technology (Gothenburg, Sweden)

Ulrika Holmberg
University of Gothenburg (Gothenburg, Sweden)

To address the challenges related to travel behavior, technological innovations seem not to be sufficient. Behavioral changes are also called for. The objective of the present study is to examine the influence of demography, geography and personality on travel behavior, i.e. car driving and use of public transportation. Demography is defined by age, gender, income and education. Geography is defined by the population density of the living area. Personality is defined as the Big Five personality factors (i.e. Openness, Conscientiousness, Extraversion, Agreeableness and Neuroticism). In autumn 2017, a postal questionnaire was randomly sent out to 3,400 Swedish citizens in the age range 16 to 85. Given attrition and missing values, the final sample size was 1,812. (852 males, 960 females, M = 51.7 years of age). Personality was assessed using the Big Five Inventory, BFI-10 (Rammstedt & John, 2007). Transport behavior was measured through frequencies of mode use, ranging from 1 (“never”) to 7 (“daily”). For each transportation mode, a regression analysis was conducted with transportation mode as dependent variables, and demography, geography and personality as independent variables. Our result shows that car driving is predicted by male (β = .15, p = .000), age (β = .11, p = .002), income (β = .22, p = .000), education (β = .07, p = .004), population density (β = -.26, p = .000), Openness (β = -.06, p = .012), Extraversion (β = .06, p = .015) and Conscientiousness (β = .10, p=.00). Our result shows that use of public transportation is predicted by age (β = -.22, p = .000), education (β = .16, p = .000), population density (β = .35, p=.000), Openness (β = .08, p = .001), Extraversion (β = -.06, p = .015), Agreeableness (β = .06, p = .013). It seems as driving car is related to conservation — and self-enhancement values, while use of public transportation is related to self-transcendence- and openness to change values (Schwartz, 2012). Our result should provide useful information to psychologists, policy-makers and transportation planners developing sustainable transportation systems.
HOW CORTISOL REACTIVITY INFLUENCES PROSOCIAL BEHAVIOR: MODERATION OF GENDER AND EMPATHIC CONCERN

Jianhong Ma
Qionghan Zhang
Zhejiang University (Hangzhou, China)

Urs Nater
University of Vienna (Vienna, Austria)

It has been assumed that individual’s stress responses is irrational with panic and self-protective. A theory of tend-and-befriend proposed by Taylor suggested otherwise. It posits from the perspective of evolutionary psychology that stressed women have a desire to tend to children, affiliate with others and engage in prosocial behaviors. The current study began with a question that whether prosocial behaviors in stress varied between man and woman. Experiments were designed to investigate the effect of stress-related cortisol reactivity on subsequent prosocial behaviors, and the moderating role of gender and empathic concern in the process. Sixty-one healthy students (34 women, 27 men), aged 18-32 years, took the Trier Social Stress Test for Groups (TSST-G) or the control version of the TSST-G. Subsequently, participants completed three economic tasks — the dictator game, the ultimatum game, and the third-party compensation game — via computers. Subjective ratings of stress and salivary cortisol samples were collected throughout the whole procedure, and salivary cortisol was later analyzed as a biological stress marker of HPA axis activity. Statistical analyses revealed a significant main effect of cortisol reactivity on individuals’ third-party compensation behaviors, and a gender-specific effect that men in the stress group were more willing to compensate victims who suffered from unfair treatment, compared to men in the control group. A gender-specific effect of stress-related cortisol change on prosocial behaviors was found, with men exhibited more generous in the dictator game as stress-related cortisol reactivity increased. Furthermore, empathic concern level as a dispositional variable was found to moderate the association between stress-related cortisol change and prosocial behaviors, that individuals with low level of empathic concern reported more generosity and third-party compensation behaviors. Overall, the present study contributes to a better understanding of the behavioral stress responses, that individuals whose HPA axis are highly activated in response to stress would exhibit tend-and-befriend responses, but only among men and those with a low level of empathic concern.
Relationships between subjective well-being (SWB) and personality have been shown in many studies (DeNeve and Cooper, 1998; Steel, Schmidt and Shultz, 2008). Moreover, it is reported that occupational groups are important for studying relationships between personality, job performance and job satisfaction, because personality factors are reported to have different effects in different occupational groups (Rothmann and Coetzer, 2003). In this study, it is aimed to investigate the relationships between subjective well-being and personality traits in the service and production sectors. It has been investigated that whether subjective well-being is predicted by different personality traits or not. To this end, a total of 515 people (296 women, 219 men) have participated to the study, 339 of them (65.8%) from service sector and 176 of them (34.2%) from production sector. Subjective Well-Being Index (International Well-Being Group, 2006; Meral, 2014) and Big Five Personality Questionnaire (Goldberg, 1992; Tatar, 2017) have been applied to the participants. Subjective well-being scores for employees in service and manufacturing sectors have been predicted by five factor personality scores. The predicted variance in subjective well-being is 0.26% for service sector employees and 0.22% for production sector workers. Subjective well-being was predicted by Neuroticism, Conscientiousness, Agreeableness, and Openness factors for service sector employees and by Neuroticism, Extraversion, Agreeableness, and Conscientiousness for production sector employees. While Extraversion factor didn’t enter to the regression model for service sector employees, Openness factor didn’t enter to the regression model for production sector employees. The importance of personality for subjective well-being in different occupational groups, how personality affects subjective well-being and the limitations of the study have been discussed.
THE SOCIAL MEANING OF PSYCHOLOGICAL METHODOLOGIES

Gordana Jovanovic
University of Belgrade (Belgrade, Serbia)

This historical and theoretical paper reflects on the social meaning of different psychological methodologies. The general theoretical and methodological frameworks refer to social studies of science, social constructionism and Foucauldian discourse analysis. By social meaning, I mean both social presuppositions as well as social implications of psychological methodologies. I start with a general contextualization of modern science as a framework to analyse psychological methodologies. Methods of observation and experimentation became a trademark of empirical scientific knowledge. Tasks of reorganization of social life under modern conditions, with rising mobility and interdependence of members, required new social moralities based upon objectivity, which had to be secured by quantification. In the mid-19th century, with the support of positivist philosophy, scientific knowledge gained an even stronger affirmation as a superior mode of knowledge that would induce social progress (Harding). Wundt founded psychology as a new science of consciousness, with self-observation and experimentation as its methods. It is, however, hardly known that Wundt introduced methods of interpretation and even critique as necessary methods of psychology as Geisteswissenschaft, to deal with meaningful processes and their outcomes. For more than a half-century psychology was dominated by American behaviorism which continued to shape psychology in its objectivist methodology. With the changes in philosophies of science (Kuhn) that pointed out the social situatedness of science, and due to progressive social movements gaining momentum in 1970s, the role of science in sustaining the oppressive status-quo was put on the agenda. A "quiet methodological revolution" under the name of qualitative inquiry was inaugurated, giving voice to those who remain invisible in the dominant quantitative paradigm and instigating hopes that this can contribute to social justice and democracy. The newest methodological developments (post-qualitative turn) question the traditional humanistic qualitative inquiry and require as a unit of analysis conglomerates of humans and things, advocating a new materialism instead of a discursive focus. In conclusion, I argue that any scientific methodology is both shaped by and gives shape to the social world. Such insights can contribute to a more critical attitude toward knowledge, which has practical consequences for modern societies understood as knowledge societies.
ACCEPTANCE OF AUTOMATED DRIVING AMONG TURKISH DRIVERS: TRAFFIC LOCUS OF CONTROL AND GENERAL CAUSALITY ORIENTATIONS

Pınar Bıçaksız
Selin Şermet
Çağla Giriş
Çankaya University (Ankara, Turkey)

The present study investigates Turkish drivers’ accepted level of automated driving. The definitions of the six levels of automated driving determined by the Society of Automotive Engineers (SAE International Standard J3016, 2014) were presented to the participants and they were asked to indicate which level is the most acceptable for them. Although the data collection process is still in progress, the preliminary analyses with the existing data (n = 135) show a trend toward lower acceptance among Turkish drivers. That is, among the 135 participants, 51 indicated that the level 0 (meaning no automation) and 45 indicated that the level 1 (only one type of driver assistance system of either steering or acceleration/deceleration with the expectation that the human driver perform all remaining aspects of the driving task) as the most acceptable option for them. But, only three participants indicated level 4 (an automated driving system of all aspects of the dynamic driving task, even if a human driver does not respond appropriately to a request to intervene) and five participants indicated level 5 (the full-time performance by an automated driving system of all aspects of the dynamic driving task under all roadway and environmental conditions that can be managed by a human driver”) as the most acceptable option. In addition, Traffic locus of control scale (T-LOC; Özkan & Lajunen, 2005) was used to measure the attributions of the drivers about the causes of traffic crashes on four dimensions, namely self, other drivers, fate, and vehicle-environment. Among these four factors, fate dimension yielded a significant positive correlation with the accepted automated driving level (r = .20, p=.018). Finally, although nonsignificant, accepted level of automated driving was positively associated with impersonal orientation referring to the experience of behavior as being beyond intentional control (Deci & Ryan, 1985), while negatively associated with autonomy orientation involving “a high degree of choice with respect to the initiation and regulation of one’s on behavior” (Deci & Ryan, 1985, p. 111). The revised results of the analyses conducted after completing the data collection process and the discussion of these results will be presented.
RECEPTION OF CONCEPTS FROM PERSONALITY AND ORGANIZATIONAL PSYCHOLOGY IN FACULTY DEVELOPMENT PROGRAMS IN GERMANY

Moerth Martina
Berlin Center for Teaching and Learning in Higher Education (Germany, Berlin)

The Bologna reform in higher education has led to the „shift from teaching to learning“ as main paradigm in academic development. Centers for teaching and learning all over Germany have developed faculty development programs, supported by a large federal initiative for many years. On the basis of psychological learning theories and motivation theories from pedagogic psychology universities teachers learn to understand their teaching from the side of students learning and to develop appropriate didactic approaches. Sanford & Kinch (2018) explored the key competences of faculty in the USA to address the challenges of the next 10 years. Dealing with work-life balance / well-being of teachers and students is ranked 3rd after dealing with diversity, inclusion, multiculturalism (1st) and effective and meaningful use of technologies (2nd). With concepts from well-being, positive psychology, psychology of values, stress research etc. we can support teachers to reflect on themselves as a whole person and to promote the development of a reflected positive identity of the students. Are concepts of personality development expressively addressed in faculty development programs of German universities? Under which key words are they found? An analysis of the descriptions of faculty development programs from 13 centers for teaching and learning representing most of the programs at German universities was done. The key words of 500 workshop descriptions were extracted. Our results show that concepts of personality development are hardly in focus. In the Berlin center we have already gained experience with workshop concepts concerning self coaching, work-life balance, mindfulness, happiness research in teaching etc. They are summarized under the umbrella term of individual teaching style and have become the most popular workshops of our program with very positive evaluation results. Our conclusion is that concepts of personality and organizational psychology have not found their appropriate way into academic development, yet. The reflection and development of oneself meets a demand of teaching staff and is worth to be addressed in faculty development programs based on a solid psychological conceptional basis. It is a prerequisite for understanding others, especially in our global world.
THE IMPACTS OF PSYCHOLOGICAL VIOLENCE ON TURKISH WOMEN’S DEPRESSIVE SYMPTOMS

Cennet Yastıbaş
Mete Sefa Uysal
Duygu Güngör Culha
Dokuz Eylül University (Izmir, Turkey)

Psychological violence that is generally characterized as verbal aggression, threatening to give harm, destroying private properties is one of the most prevalent type of violence among Turkish women. It basically targets women’s emotional well being and it can result in short and long term mental and physical health problems. One of the major mental health consequences is depression for women who exposed psychological violence. Little is known about psychological violence and depression and their relations. Violence may be conceptualised as distressing emotional event and have not been properly emotional processed and they may be unable to absorb emotional disturbances so that it might be result in experiencing more negative emotions. Besides, experiencing psychological violence may give harm to women’s self-esteem. Thus, this study focuses on the potential meditor roles of emotional processing and self-esteem in relationship between psychological violence and depression. 346 women were participated and mean of age was found 26.78(SD=7.26). They completed an instrument set of self-report questionnaire consisting depression, emotional processing, self-esteem and psychological violence. Mediational analysis with PROCESS macro for SPSS were administrated to test the research aim. Preliminary results indicated that psychological violence was a significant predictor of emotional processing and self-esteem and that emotional processing and self-esteem were predictors of depression. Thus, these results support the mediational relation i.e. emotional processing and self-esteem mediated the relationship between psychological violence and depression. Approximately 58% of the variance in depression was accounted for by the predictors. Experiencing psychological violence may decrease self-esteem and may have emotional processing difficulties which, in turn, suffers from depressive symptomps. These results may have significant clinical implementations.
Most challenges and problems in society, organizations and groups (like climate change, urban development, corporate innovation or intergroup conflicts — to name a few) appear to be ‘fuzzy’, not well defined and ambiguous. The reason lies in growing complexities and fast changing environments of today; a systems dynamic which will be intensified in the future. That is why pure technological and disciplinary scientific approaches often fail to find real effective and sustainable solutions. Thomas Kuhn (1962) already, in his seminal book ‘The structure of scientific revolutions’, highlighted the need for transdisciplinary approaches to real world problems both on the individual, group or structural level. This early insight since then has been seconded in psychology (and many other disciplines) by G.A. Miller (1969), D. Kahnemann (2011) and D. Stokols (2006). Nevertheless, psychology as a field (like many other science areas) is structured in disciplines and lives in science silos which primarily slows down cooperation. This paper deals with the challenge of psychology to intensify or unleash disciplinary boundaries and to promote human welfare. Successful solutions for societal challenges manage to link scientific results ‘of the few’ with the implicit knowledge ‘of the many’ and to cooperate between various disciplinary and transdisciplinary knowledge domains. This collaborative approach is needed to address real world problems. Although disciplinary approaches are important to deepen our understanding of the world, only transformative and transdisciplinary approaches are able to promote human welfare. That is why each scientific discipline needs to have both: sound disciplinary-based ‘deep knowledge’ and ‘linking’ sub- or metadisciplines to detect, set up, design and evaluate helpful links to address and solve real world problems. The paper will ask, how psychology will be able to promote human welfare through balancing both needs.
Humor is a complex phenomenon that includes many psychological functions: cognitive processes, emotions, and communication, which manifest themselves in various social and cultural contexts. Comic texts are intellectual tasks of a special kind. The function of the comic component is not only entertainment and the creation of a favorable emotional background, but also the creation of a kind of an obstacle that violates the logic of the task. The content analysis of funny stories composed by preschool age children allowed us to highlight the actions involved in the creation of comic content and develop a methodology “Funny stories” for diagnosing humor in children. We carried out an empirical study using this technique and the “Dialectic Actions” technique (Shiyan I.B.) and revealed the interrelations between the action of transformation and closure \( (r = .46) \); alternative change \( (r = .39) \) \( (p = 0.01) \), however, no relationship was found between the indicator according to the “Coloured Raven Progressive Matrices” method and the actions involved in creating humor. Was used to study dialectical actions (Bayanova L.F.); “Dialectical stories” (Shiyan I.B.); sensitivity to contradictions was studied using the scale of coping with humor and the subtest “Sequential pictures” by D. Wexler. Correlational research has confirmed our assumption that the actions of dialectical thinking are involved in the understanding of comic, contradictory situations. We found significant direct correlations \( (p = 0.01) \) between humor and the dialectic action of association \( (r = .82) \), the dialectical action of the content seriation \( (r = .70) \), and the dialectical action of the alternative \( (r = .53) \). The carried out studies indicate the involvement of the dialectical thinking actions in the understanding of the comic text contradictions. The importance of the study lies in the fact that by offering children different versions of conflicting tasks, it is possible to develop children’s curiosity, the desire to solve mental tasks that require the reflection of complex hidden links and relations between objects, to teach how to find creative solutions.
WHY SHARE? PREDICTORS OF INFORMATION SHARING DURING DISASTER SITUATIONS

Stefanie Wahl
Lars Gerhold
Freie Universität Berlin (Berlin, Germany)

Warning and informing the public during disasters is a central component of disaster management. Not only public authorities, but also the public itself share valuable information and thereby contribute to crisis communication efforts. Therefore, social media is increasingly used to communicate about the ongoing situation (Lopatovska, & Smiley, 2014). Nevertheless not much is known about what factors explain peoples' information sharing behavior (Chen, Liang, & Cai, 2018). We thus ask: Why do people share information with others during disaster situations? As a theoretical framework, we adopted the research design of a recent Chinese study (Chen, Liang, & Cai, 2018), that combines the theory of planned behavior (Ajzen, 1991) with the uses-and-gratifications approach (Katz, Blumler, & Gurevitch, 1974) and the social exchange theory (Blau, 1964) to explain what influences people to share information during disaster situations. We conducted a representative online survey in eight European countries (Austria, Denmark, France, Germany, Italy, Netherlands, Poland and United Kingdom) as well as the United States (total n = 9.126). Multiple linear regression models show for the total and all country samples, that subjective norms (β = .382, p < .001) are the strongest predictors for intention to share information (R2 = .37, p < .001, n = 8.705) compared to attitudes (β = .135, p < .001) and self-efficacy (β = .178, p < .001) as a measure for perceived behavioral control. Subjective norms are significantly influenced (R2 = .52, p < .001, n = 8.698) by the norm of reciprocity (β = .460, p < .001) as well as socializing (β = .163, p < .001), information seeking (β = .074, p < .001), status seeking (β = .062, p < .001) and entertainment (β = .047, p < .01) as gratifications of sharing information through social media. According to our findings, information sharing during disaster situations is highly driven by social pressure and people's need to affiliate with others. Emergency management agencies can address this in their crisis communication strategies by emphasizing social aspects of sharing information and integrate the public as valuable resource to spread reliable information.
The development and increase of the use of technology and the internet has led to the development of a new and increasingly popular field outside the traditional contexts of psychotherapy practices and mental health interventions. In this context, together with the spread of online psychotherapy worldwide arises the therapeutic process debate on the execution of the virtual environment. One of the important focuses of the discussions is how an important variable such as the therapeutic alliance, which is one of the most important predictors of the therapy results, is affected from the virtual contexts. The aim of this study is to evaluate the perceptions and thoughts of psychotherapists about breakage moments in therapeutic alliance in online psychotherapy processes, which are still limited in the frequency of use and literature in our country. Our study was carried out with a total of 45 therapists ranging between 24 and 44 (M = 26.07, S = 2.31), 39 female (86.66%) and 6 male (13.33%). Data from the participants were analyzed according to the inductive thematic analysis method. The findings of our study suggest that psychotherapists use online psychotherapies to indicate that they can think about the use of online psychotherapies in face-to-face sessions after the establishment of a therapeutic alliance. Another important finding of the study, compared to face-to-face traditional interview, online psychotherapy more ‘on causing trouble’ as a context. In this case it is widespread opinion that could lead to rupture in alliance on psychotherapeutic frame. The majority of participants preferred the ‘retreat’ approach to ‘confrontation’ if they experienced a rupture in the therapeutic alliance; it is seen that they want to rationalize this opinion by referring to the ‘unnatural’ environment of online psychotherapy. When the data are examined, it is seen that online psychotherapies are considered as a concern for the therapists. It is thought that anxiety and negative perceptions experienced by the majority of the participants are due to the fact that most of the participants did not state the process of online psychotherapy.
MEETING OTHERS WITH DIGITAL TOOLS

Jennifer Kerzil
UCO (Université Catholique de l’Ouest) (Angers, France)

In French schools, welcoming children from elsewhere is a well-established reality. For several years now, the Ministry of Education has implemented a plan to promote the use of digital tools in classrooms. Devices are also developed for this audience and in particular broadcast through the Canopé network. According to Abdallah-Pretceille, “the recognition of others involves self-recognition and reciprocally” (1997, p. 125). For example, the use of documentary-type video resources based on the testimony of non-Western children regarding food or cultural practices, for example, provides teachers with materials from which to promote exchanges and discussions on other topics. Several studies have shown that using the web can foster understanding between students from different countries (Li and Zhang, 2015) and help to improve learning through the exchange of ideas (Tutty and Klein, 2008; Wade, Fauske and Thompson, 2008). The use of social networks in a free exchange between students from different cultures plays on the similarities (“I recognize myself in the practice of the other”). What are the pedagogical intentions of teachers using these devices? Do they correspond to the goals of education for otherness? How are they perceived? How do children, with the help of their teacher, get hold of these supports? For what purpose do they use them? Our team is interested in the way in which the questions related to the encounter of the other are staged and presented through digital educational devices, created or not by teachers, and intended for primary school students. Our goal is to highlight “the moral and imaginary representations” of otherness (Pignier, Drouillat, 2008, p.50) transmitted by digital devices and to question how they are perceived, understood and used by the target audience. What values and imaginations of the relation to the other are staged in these devices? How are they understood, perceived and used in class? Our on going research is focusing on the issue of otherness in children via digital devices. Taking into account the contents, the experiences and the interpretations, it will aim to consider the reception and the interpretation of the multiple experiences of intercultural communication in educational situation.
THE RISING IMPORTANCE OF TECHNOLOGY IN INDUSTRIAL AND ORGANIZATIONAL PSYCHOLOGY — A SYSTEMATIC OVERVIEW BASED ON HR STARTUPS

Simon Werther
Stuttgart Media University (Stuttgart, Germany)

During the last years, technology has an increasing importance in recruiting and development approaches. Industrial and organizational psychologists must consider these technological change in order to create additional value for innovative companies. This systematic overview examines the importance of technology and the activity of psychologists based on HR startups in Germany. The main research question are the following: Is the number of HR startups in Germany increasing between 2015 and 2018? How many HR startups are developing solutions for recruiting and development? Are psychologists frequently founders of these technology-driven startups? The methodical procedure starts with the identification of current HR startups in Germany based on the most important key words. The identification of these startups both uses search engines and important events or trade fairs. The data collection period is October to December 2018. The data set is compared with the results of a first HR startup survey from 2015. The analysis works with several descriptive and statistical methods based on this data set in order to answer the main research questions. First results indicate that there is a rapid increase of HR startups developing digital solution between 2015 and 2018. Furthermore, psychologists aren’t the most important influencers in HR startups. Further results are currently analyzed. The study illustrates that industrial and organizational psychologists could be much more active in the area of technological recruiting and development solutions. One main limitation of the study is the sample based on Germany which limits the transfer of the results. Further limitations and implications for theory and practice are discussed in the presentation.
MENTAL REPRESENTATIONS OF AN OPTIMAL FUNCTIONAL STATE IN NEGOTIATION PROCESS

Alla Kuznetsova
Alexandra Lobanova
Lomonosov Moscow State University (Moscow, Russia)

Analysis of positive functional states (FS) acquires the character of a dynamically developing field of research, which relevance is determined by the need to identify and describe targets for optimal FS when performing educational and professional tasks (A.B. Leonova, 2009; G.R.J. Hockey, 1993). Problem areas for studying positive FS are associated with limitations caused by: (1) the difficulty of understanding such FS by a person: an optimal FS is usually not recognized, and its qualities are unrealized; (2) lack of reliable scientific data on the specificity of such FS syndromes; (3) lack of tools for assessment of positive FS manifestations. The problem of optimal FS research acquires particular urgency in situations, where the temporal boundaries are clearly outlined and substantive requirements are defined. Such situations are typical for negotiation process (D.G. Pruitt, 2013). The formation of an optimal FS is based on the ability of a person to build a clear mental representation of a required FS (L.G. Dikaya, V.V. Semikin, 1991; A.S. Kuznetsova, 2009). The goal of the presented research: to analysis the mental representations of an optimal FS in negotiation process. In the study psychological Russian native speaking students from Russian, Uzbek and Azerbaijan universities and professional negotiators participated (n=140). They were offered a questionnaire consisting of 37 qualities of the optimal FS for negotiation process. The qualities are grouped in the questionnaire by 5 blocks of FS manifestation: physiological, cognitive, emotional, behavioral and reflexive signs. The participants were offered to rank the qualities inside each block according to the degree of decreasing significance. Rank comparison of functional state’s manifestations showed a lack of cultural specificity of optimal state’s mental representations. Slight differences were found in students’ mental representations of “reaching compromise” as the aim of negotiations; for the representatives of education program “Psychology of negotiations and resolution of conflicts” compromise is viewed as one among many possible outcomes of negotiation, while for other students compromise — is the one and only outcome. The differences relating to some cognitive and emotional manifestations were found in students’ and professionals’ optimal FS representations.
THE LEVEL OF TOLERANCE AND ETHNIC IDENTITY OF THE RUSSIAN SOUTH’ CITIZENS WITH DIFFERENT GENOTYPES OF THE VAL158MET COMT GENE

Elena Vorobyeva
Don State Technical University (Rostov-on-Don, Russia)
Ekaterina Kovsh
Pavel Ermakov
Oksana Saakyan
Marija Bunyaeva
Southern Federal University (Rostov-on-Don, Russia)

The problems of ethnic identity and tolerance are very important in modern society. Difficult socio-economic situation is largely due to broken values, distorted ethnic identity and the intolerance of the population. The psychobiological approach to the nature of these phenomena is practically not developed. In the same time, tolerance may be associated with functions of prefrontal brain cortex areas, which controlling, among others, by gene COMT, calling "warrior or worrier strategy" (D.J. Stein et al., 2006, A.A. Palmer, C.C. Dulava, 2010). There are three obtainable genotypes of gene COMT: low-active Met/Met, associated with a high level of dopamine in prefrontal cortex, Val/Met, Val/Val, associated with a low level of dopamine in prefrontal cortex. The study involved 137 men and women 18 to 30 years old (Kabardians, Balkars, Karachais). The psychodiagnostic methods: 1) The Express Questionnaire "Index of Tolerance" (G.U. Soldatova, O.A. Kravtsova, O.Ye. Khukhlaev, L.A. Shaigerova), 2) The "Types of ethnic identity" questionnaire (G.U. Soldatova, S.V. Ryzhova). Procedure of polymorphic locus Val158Met of the COMT gene genotyping: PCR. Statistical data processing: the factorial ANOVA method, Fisher LSD-test, p<0.05. We investigated the influence of factors "genotype", "sex", "nationality" combination on the level of tolerance and ethnic self-awareness of the subjects. Results and conclusion. According to our data, the factor "nationality" exerts more influence on the investigated phenomena, than "the COMT gene" and "sex", which may indicate the greater contribution of environmental influences (enculturation, assimilation of experience, etc.) in the formation of ethnic identity and tolerance. A higher level of ethnic tolerance was demonstrated by Balkarians, in comparison with Kabardians and Karachais. The latter, in turn, have a higher conviction of ethnic superiority. According to the results of this study, low-active COMT genotype Met/Met, affecting high level of dopamine in prefrontal cortex, is associated with low level of the tolerance in representatives of different nationalities. Our findings are consistent with other studies, suggesting a negative correlation between the genotype Met/Met and altruism (M. Reuter et al., 2010) and positive correlation with high level of aggression (P.N. Ermakov et al., 2016). This investigation has been carried out with financial support from RSF (16-18-10222).
BULLYING AT WORK: CONSEQUENCES ON SOCIAL AND PERSONAL LIFE AND COPING STRATEGIES. A QUALITATIVE APPROACH

Angelique Beaulieux
Université de Picardie Jules Verne (Amiens, France)

The study aimed to extend knowledge regarding bullying at work (BAW; Leymann, 1984, 1996; Hirigoyen, 2017) and its consequences on the personal and social life of harassed people as well as the strategies they use to cope with these consequences. This choice was made since most of the literature on BAW relates on its consequences at work rather than on personal life; coping strategies relative to these personal consequences are also under-analyzed. Firstly, we focused on the consequences of BAW on social and personal life (impact on relationships, isolation...) of harassed people. Secondly, we investigated how harassed people dealt with social and personal consequences of BAW. A qualitative approach was selected in order to proceed to an in-depth exploration of these two highly emotionally charged research questions. Eight people who experienced BAW accepted to discuss these difficult issues in semi-directive interviews. Qualitative data were content-analyzed and the frequency of occurrence of each theme and its constituent units was noted.

6 people in 8 reported serious consequences of BAW on their personal and social life such as isolation or deterioration of family, friendly and couples relationships. 7 people in 8 developed coping strategies, from speaking to close relatives to, on the contrary, voluntary isolation in order to avoid conflicts. Some people also mentioned help-seeking behaviors toward the authorities or a specific member of their close circle. The study contributes to a detailed description and analysis of the personal and social consequences of BAW and the coping strategies used to deal with them, an area little explored by academics in work and organizational psychology. This qualitative investigation also draws conclusions regarding to the position to hold as psychologists and researchers in contact with people in great suffering who sometimes present a generalized anxiety and deny of the situation.
THE RELATIONSHIP BETWEEN SPLITTING DEFENSE MECHANISM AND SCHEMA MODE CONCEPT IN SCHEMA THEORY

Mert Aytaç  
Republic of Turkey Ministry of Education (Elazığ, Turkey)

Bahar Köse Karaca  
Arel University (Istanbul, Turkey)

Splitting, a defense mechanism, is based on difficulty in bringing together good and bad, white and black and results in polarization of beliefs related to people, objects, and situations. Moreover, schema modes including early maladaptive schemas, coping mechanisms, and emotional responses are triggered immediately and result in behaving towards dominant emotion. According to the literature, both these mechanisms cause loss of objectivity and are intensely appeared in borderline personality disorder. Therefore, in the current study, it was aimed to determine whether there was a relationship between splitting and schema modes. The sample consisted of 537 (364 females and 173 males) university students from different universities in Elazığ and Ankara cities in Turkey. Age of the sample changed between 18 and 34 (M = 20.37). As the assessments, schema mode inventory and splitting scale were used and the results were analyzed with regression and correlation analyses via SPSS. According to the results, it was found that there were significant positive relationship between splitting and bully and attack (r = .33, p < .001), punitive parent (r = .35, p < .001), vulnerable child (r = .33, p < .001), demanding parent (r = .32, p < .001), compliant surrenderer (r = .26, p < .001), self-aggrandiser (r = .37, p < .001), impulsive child (r = .43, p < .001), undisciplined child (r = .29, p < .001), enraged child (r = .38, p < .001), angry child (r = .48, p < .001), detached-protector (r = .34, p < .001), and detached self-soother modes (r = .31, p < .001). There was significant negative relationship between splitting and happy child mode (r = -.14, p < .001). According to regression analyses, child modes explained %31 of the variance, maladaptive schema modes explained %25 of the variance, maladaptive parent modes explained %16 of the variance. Apart from impulsive and angry child modes, all schema modes significantly predicted splitting. In conclusion, significant relationship was found between splitting and happy child mode. The results, strengths and limitations of the study discussed in line with literature.

MILLENNIALS IN WORKPLACE: WHAT MAKES THEM STAY IN ORGANIZATION?

Reza Lidia Sari  
Cholichul Hadi  
Airlangga University (Surabaya, Indonesia)

Millennial is often stereotyped as a generation with lower loyalty because they easily move from one organization to another. Thus, identification of factors influencing their decision to stay in organization is important. This study aims to see whether there is influence of career growth and team support on their turnover intention. 132 millennials were asked to fill out instruments consisting of the Career Growth Scale, Team Support Scale, and Turnover Intention Scale. The analysis methods used were Pearson’s Product Moment Correlation and Multiple Regression. The results showed that there were significant negative correlations of career growth and team support with millennials’ turnover intention. However, after multiple regression tests, it was
found that career growth was the most influential factor for their turnover intention. Therefore, career growth is of a great importance to be considered by HR managements in order to maintain the millennial generation in their company.

EFFECTS OF CHILDHOOD TRAUMA, DAILY STRESS AND EMOTIONS ON DIURNAL CORTISOL LEVELS IN INDIVIDUALS VULNERABLE TO SUICIDE

Daryl O'Connor  
University of Leeds (Leeds, Ireland)

Dawn Branley  
Northumbria University (Newcastle, United Kingdom)

Eamonn Ferguson  
University of Nottingham (Nottingham, United Kingdom)

Suicide is a global health issue. Dysregulated hypothalamic-pituitary-adrenal (HPA) axis activity, as measured by cortisol levels, has been identified as one potential risk factor for suicide. Recent evidence has indicated that blunted cortisol reactivity to stress is associated with childhood trauma. The current study investigated whether childhood trauma and daily stressors and emotions were associated with diurnal cortisol levels over a 7-day study. 154 participants were recruited and grouped according to history of previous suicidal attempt, suicidal ideation or as control participants. Participants completed background questionnaires including the Childhood Trauma Questionnaire before commencing at 7-day daily diary study. Cortisol samples were provided immediately upon waking, +15 mins after waking, +30 mins, +45 mins, +3 hours, +6 hours, + 9 hours and +12 hours on 7 consecutive days. Measures of daily stressors, mood and defeat and entrapment were completed at the end of each day. Diurnal cortisol slope was calculated as the change in cortisol from the peak following waking to late evening. Data were analyzed using multi-level modelling. Participants who had made a previous suicide attempt exhibited significantly flatter diurnal cortisol slopes across the 7 days compared to participants in the control group; suicide ideators were intermediate to both groups. Childhood trauma was found to be associated with flatter diurnal cortisol slopes, such that individuals who had experienced higher levels of trauma exhibited flatter cortisol slopes across the day. In particular, physical abuse was identified as being the most important subscale. Higher levels of daily defeat/entrapment were found also to be associated with a flatter diurnal cortisol slope. These results extend other findings from the laboratory into naturalistic settings and indicate that dysregulated hypothalamic-pituitary-adrenal (HPA) axis activity is associated with suicidal behavior. Childhood trauma and perceptions of defeat/entrapment may be important proximal and distal factors associated with the development of HPA axis dysregulation. The challenge for researchers is to elucidate the precise causal mechanisms linking trauma, cortisol and suicide risk in order to develop interventions to help build resilience in vulnerable populations.
SEXUAL RISK BEHAVIOR, SELF-ESTEEM, AND SELF-STIGMA OF MEN WHO HAVE SEX WITH MEN (MSM)

Hector Perez  
St. Scholastica’s College (Manila, Philippines)  
Mike Jerome Iglesias  
Niza Irish Astrolabio  
Kevin Astronomo  
Emmanuel Santos  
Far Eastern University (Manila, Philippines)

This research undertaking could be one of the pioneers in the study of Men having Sex with Men (MSM) in the Philippine setting in these three contexts: their sexual risk behavior, self-esteem and self-stigma. What is Filipino MSM? Are there significant differences between sexual risk behavior, self-esteem and self-stigma in terms of the demographics? Do significant relationships exist among these variables? Hence, this research aims to understand the different dimensions of MSM, sexual risk behavior, self-stigma and self-esteem. The term MSM has been introduced in the Philippines nonetheless it is not well-known yet, and it is an umbrella term that covers all males who have sex with males. The study used explanatory sequential mixed methods design. For the quantitative part, researchers gathered 64 respondents from urban Manila with experience in MSM regardless of their age. Results showed that most of the respondents are versatile, and those who engaged in casual sex and have multiple partners are more likely to have higher risk of sexual behavior and lower self-esteem. Moreover, significant relationships with sexual-risk behavior and self-esteem and self-esteem and stigma were noted with inverse relationships however sexual-risk behavior and stigma was not significantly correlated. In order to understand the quantitative results, a focus group discussion with 5 respondents from the quantitative phase was conducted. Results indicate that the awareness of the risks in MSM served as precaution to practicing safe sex albeit these precautions were present, it was not sufficient in reducing the risky sexual behavior of the respondents. Respondents showed low self-stigma with high self-esteem indicative that they were happy about their sexuality, not blaming themselves being gays and bisexuals, seeing themselves as happy MSM. Further, respondents, being part of MSM did not imply that their behaviors were moral or immoral nonetheless, accordingly it was not to be bragged about nor to be ashamed of.
PERSONAL POSITIVE PHENOMENA AND PSYCHOLOGICAL REGULATION OF ONCOLOGIC PATIENTS

Kseniia Evnina
Diana Tsiring
Chelyabinsk State University (Chelyabinsk, Russia)

We assume that successful psychological regulation in a difficult life situation is enhanced by personal positive phenomena. 68 patients of the oncology department took part in the empirical study. The following diagnostic tools were used to diagnose positive phenomena in the system of psychological regulation of oncologic patients: authenticity test; self-confidence test; hardiness test; test of life orientation; existence scale; questionnaire for a subjective assessment of the situation; questionnaire “Adaptability”, “Type of attitude to the disease” method. In order to assess the significance of the severity of indicators of positive psychological phenomena, a cluster analysis of data was used on the methods of diagnosing authenticity, self-confidence, optimism, viability and responsibility. Based on cluster analysis, the subjects in study were divided into two significant subgroups: The first subgroup included respondents with sufficient and high indicators by methods (28 people). The second subgroup consisted of subjects with low and medium with a tendency to underestimate the indicators by methods (31 people). Analysis of differences in performance across all methods was carried out using the U-Mann-Whitney. Indicators of the subjective assessment of the life situation vary considerably depending on the severity of positive phenomena (U = 21, p = 0.001). Patients of the first subgroup subjectively assess their own life situation as not difficult or inclined to it. Patients from the second group tend to assess the situation as difficult, uncertain, poorly predictable. Significant differences of subgroups in some indicators on the method of diagnosis of adaptability were noted. The adaptation abilities are different (U = 38.5, p = 0.014). Differences on the scale of “behavioral regulation” (U = 32, p = 0.006) were revealed. An analysis of differences in the indicators of the diagnosis of the type of attitude towards the disease showed significant differences in the five test scales. Subjects in subgroups differ in the severity of indicators for harmonious (U = 18, p = 0.001), disturbing (U = 31, p = 0.005), neuroasthenic (U = 44, p = 0.03), melancholic (U = 33, p = 0.007) and dysphoric (U = 36, p = 0.01) types.
RESEARCH OF SOCIAL AND PSYCHOLOGICAL ASPECTS OF FORGIVENESS

Nadezhda Blinova
Olga Vasilyeva
Tatyana Kondratieva
Southern Federal University (Rostov-on-Don, Russia)

The phenomenon of forgiveness raises a number of issues affecting a wide range of scientific fields. Despite the widespread occurrence of the concept of forgiveness in everyday life, literature, religious and philosophical texts, its definition is often ambiguous. As a result, when conducting psychological studies of this phenomenon terminological difficulties arise, which can hinder the development of methods and the interpretation of data. A questionnaire has been developed to study the phenomenon of forgiveness. This study involved 770 respondents and resulted in the cognitive, emotional and behavioral aspects of forgiveness being identified. For example, the question “What does ‘forgiveness’ mean to you?” divided the interviewed group into four subgroups: 1. To forgive means not to think — to forget; 2. To forgive means to understand and accept the offender; 3. To forgive means to understand and accept the situation; 4. To forgive means to come to terms with oneself. 80% of respondents clearly defined the line between what can be forgiven and what cannot: one can forgive deception, a rude joke, unfaithfulness, “what one repents of”, “not done consciously/out of malice”. One cannot forgive murder, betrayal, humiliation. A similar trend is observed in the categories “who can be forgiven” and “whom is it impossible to forgive”. Respondents demonstrated the following range of feelings arising from forgiveness: relief, satisfaction, peace, relaxation, joy, and amiability. To the questions “Do we need to learn to forgive? If not, why? If yes, how can we learn to do this?” many respondents gave voluminous “recipes”. To the question “Is it necessary to learn to forgive?” 99% of respondents answered in the affirmative, 3% of respondents defined the direction of learning to be within the development of religious consciousness, particularly the study of the Bible. Thus, the formation of deeper adequate ideas about forgiveness is a crucial area of research, especially in the field of personality psychology. A deeper understanding of forgiveness can contribute to the harmonization of both intrapersonal and interpersonal space and can be considered an enormous impact on clearing negative experiences and promoting spiritual and personal growth. Therefore, it is important for psychologists to understand the structure of the forgiveness process, as well as the factors that help to optimize this process.
This study was carried out with the people who were found to provide security at the scene after the bomb attack in a crowded square. The relationship of this group with the traumatic experience and the world assumptions was examined. Participants were reached by snowball sampling method. The sample consisted of 32 male participants. Demographic Information Form, Post Traumatic Stress Diagnosis Scale and World Assumptions Scale were applied. As a result of the analyzes, it was observed that the event severity predicted PTSD and at the same time the randomness assumption was a partial mediator effect (z = 2.06; p < .05). The benevolence assumption of those with at least one traumatic experience (X = 22.20) was significantly higher than the participants who had no traumatic experience (X = 17.14). In addition, it was reported that the self-worth of the participants with traumatic experience (X = 19.00) were significantly lower than the scores of the participants without traumatic experience (X = 19.57). Participants can often experience traumatic events due to their jobs. Therefore the idea that life may be full of randomness is clear according to these people. It’s thought that when the intensity of the traumatic event is too much, the randomness may be breaking the defense. It’s also thought that participants with past traumatic experiences are believed the world is actually a good place and they tend to attribute bad events to themselves.
TRAUMA SYMPTOMS, RISK FACTORS AND LIFE SATISFACTION OF SUICIDAL ADOLESCENTS

This study ascertained the risk factors and trauma symptoms of adolescents with suicidal tendencies and how these factors influence their life satisfaction. Using the descriptive research method specifically correlational and comparative, the study answered the postulated hypotheses of the study with 65 sampled college students from 3 universities. Suicide Probability Scale was used to determine the suicidal tendencies of the respondents. Other outcome measures were used such as Trauma Symptoms Checklist for Children, Risk Factors Questionnaire and Multidimensional Students’ Life Satisfaction Scale. Results proved that female adolescents with suicidal tendencies have lower anger symptom as compared to male adolescents. Notwithstanding, both genders have average trauma symptoms of anxiety, depression, post-traumatic stress and dissociation. With regard to sexual concerns, both have non-clinically significant symptoms indicating that sexual assaults or sexual abuse had been evident among adolescents with suicidal tendencies. Further, both genders have relatively similar experiences of risk factors such as childhood experiences, social support, coping, physical activities and injurious behavior. Albeit, suicidal adolescents who were non-Catholics have high experience social support as compared with Catholic respondents. Gender difference exists on sexual concerns of trauma symptoms, social support on risk factors and satisfaction with school and friend on life satisfaction, and coping for risk factors when religion was compared. Correlation between trauma symptoms of anger and sexual concerns in life satisfaction in the area of family whereas post-traumatic stress, dissociation and sexual concerns with the respondents’ life satisfaction in school. In addition, correlations were observed with post-traumatic stress and sexual concerns on the life adjustment related to living environment. Lastly, risk factors on physical activities relate significantly with dissociation whereas social support and coping as risk factors relate significantly with sexual concerns. Results of the study implied that male suicidal adolescents have sexual concerns whereas female received more social support and have higher life satisfaction with friends and school. Physical activities are dissociative mechanisms to surmount the suicidal tendencies of adolescents.

FACE-NAMESPACE ASSOCIATIVE ENCODING AND RECOGNITION DEFICITS IN MILD COGNITIVE IMPAIRMENT: EVIDENCE FROM BRAIN ACTIVATION AND BRAIN NETWORKS

Mild Cognitive Impairment (MCI) is often seen as a prodromal stage of Alzheimer disease. Persons with MCI generally have learning and memory problems, especially in associative memory at...
earlier stages. This is attributed to deficits in memory related areas like hippocampus and medial temporal lobe. Because MCI patients are at risk for converting to Alzheimer disease, MCI should be understood better for early diagnosis. Thus, the current study focuses specifically on associative memory functioning of patients with MCI and aims to compare memory performance of patients and health elderly controls. We used functional magnetic resonance imaging (fMRI) to test whether there were disease-specific changes in memory related areas. The study included 15 healthy elderly controls and 15 patients with MCI. All participants underwent fMRI scanning as they encoded (block-design) and recognized (event-related design) 60 face-name associations. T2-EPI functional images were preprocessed and BOLD signals were analyzed by MATLAB-SPM 12 toolbox. Separate independent samples t-test for both encoding and recognition tasks were performed. Preliminary results showed that MCI patients had reduced activation in FFA, hippocampus, and medial temporal regions during both encoding and recognition, relative to healthy controls. Functional connectivity analysis using Graph theory also revealed reduced connectivity within memory network. Familiarity-repetition effect was measured by repeating the task after one-month. Participant recruitment is still continuing and further analysis will be conducted to present final results.

DIFFERENCES IN TEST ANXIETY FACING COMPUTER-BASED TESTS BASED ON GENDER AND REGIONAL ORIGIN: CASE STUDY OF HIGH SCHOOL STUDENTS IN EAST JAVA, INDONESIA

Endah Endah Mastuti
Seger Handoyo
Airlangga University (Surabaya, Indonesia)

When computer-based tests are applied, it is necessary to look at the digital divide aspects. In Indonesia with a socio-economic background and regional factors, the emergence of inequalities in access to students is very likely to occur. When computer-based exams are applied for national examinations, students in cities and villages will give various reactions. This is because not all students have experience to use computers. One form of reaction that appears is test anxiety in the face of computer-based tests. This test anxiety becoming important things because in some studies test anxiety affect student’s performance. In addition, in several studies, there were gender differences in test anxiety. This study aims to determine differences in test anxiety in students who use computer-based tests based on regional origin and gender. The research subjects were 210 high school students from villages and cities. Scale using Test Anxiety Inventory (TAI). Data analysis using two-way ANOVA. The results of data analysis obtained F values 17.163, sig 0.00 so that there were differences in anxiety tests based on regional origin and gender. Furthermore, the results showed that students in the village had lower test anxiety than students in cities. This is different from the hypothesis proposed. The methodological issue might be one of the causes. In addition, male had lower test anxiety than female. This finding supports the results of previous studies.
STUDENT’S ATTITUDES TOWARD SEEKING MENTAL HEALTH SERVICES

Natalia Antonova
Larisa Tsvetkova
Ksenia Eritsyan
Ekaterina Rushchak
Herzen State Pedagogical University of Russia (Saint-Petersburg, Russia)

Mental health problems in the student population are relatively widespread and considered to be an important public health concern. Negative attitudes towards seeking professional psychological help are important barriers for establishing effective system of prevention and treatment of mental health problems among this population. Data from 882 university students (2017) and 960 university students (2018) were collected using Internet surveys. The survey questionnaires include measures of recent life experiences and Russian version of Mackenzie’s et. al. (2004) Inventory of Attitudes Toward Seeking Mental Health Services (IASMHS). This data analysis was supported by a grant from the Russian Foundation for Basic Research (RFBR), project no. 19-013-00903/19. About half of all students (45.5%) reported having problems that they find difficult to solve, and in 42% of cases those problems are seen as chronic ones. Positive attitudes towards seeking professional psychological help was negatively associated with self-reported presence of problems in the emotional and personal spheres (p≤0.01) and positively associated with studying at psychology department (p≤0.05). The relationship between seeking professional psychological help and contacting to alternative medicine specialists was evaluated. There is need for interventions focused on psychological support for the students population and on improving students’ willingness to seek specialty mental health services.
ADOLESCENTS’ ATTACHMENT TO PEERS AND ADOLESCENTS’ SELF-ESTEEM

Tatiana Sadovnikova
Lomonosov Moscow State University (Moscow, Russia)

Attachment to peers (AP) is a part of the teenagers’ attachment system (Cassidy, 2001; Mikulincer et al., 2001; Burmenskaya, 2012). Relationship with peers is the context of teenagers’ self-esteem formation that reflects the well-being of personality. 252 students aged from 18 to 23 years from Moscow High Schools participated in the research. Inventory of Parent Peer Attachment (IPPA) (Armsden, Greenberg, 1987) in author’s adaptation (Dzukaeva, Sadovnikova, 2017); Self-Esteem Scale Dembo-Rubinstein (Prikhozhan, 1991) in the author’s modification and Differential Questionnaire of Loneliness (Osin, Leontiev, 2011) were used. The method of classify analyses was used to divide sample into two groups: the adolescents with secure AP, and the adolescents with insecure AP. The self-esteem comparative analyses of adolescents’ with different types of AP showed that there are significant differences in two scales of their self-esteem: «number of friends» (p = 0.035) and «experience of loneliness» (p = 0.019). The aim of the 2-nd step of study was to explore the features of the adolescents’ loneliness depending on different types of AP. The received results demonstrate a variety in 1). The level of the relevant experience of loneliness (REL) in teenagers. 2). The relation to loneliness (RL). Four groups of teenagers differing on these two indicators were allocated: 1. REL high level and the positive relation to privacy situations; 2. REL low level and undifferentiated RL; 3. Respondents don’t feel loneliness at present, and situations of a privacy are a value and a resource for self-development; 4. REL low level and prevalence of negative installations on RL. Gender distinctions of extent of REL are revealed: girls, in average, feel lonely, than young men. Teenagers of group 1 are characterized by the lowest general indicator of AP and the highest extent of alienation in relationship with them. The study showed that adolescents with different types of AP had specific features of self-esteem and specifics in their experience of loneliness. The research concludes that the AP is the important factor of personality well-being in adolescence.
Worldwide significant efforts are invested in building biobanks—specialized facilities for storing biological materials for research and medical purposes. The successful functioning of biobanks directly depends on people’s willingness to donate their biological materials. The motivation for participation in biobank in the form of providing blood or tissue is an interesting new topic for the health psychology since psychological context of biobank donation is not entirely clear. So far only vary limited evidence exist regarding the biobank donation in Russia. This qualitative study aimed to evaluate decision making experience of the clinical biobank donors as well as psychological and social motivators and deterrents of this decision. This data analysis was supported by a grant from the Russian Foundation for Basic Research (RFBR), project no. 18-013-01131. Data from 13 donors of clinical biobank and 3 coordinators of biobank recruitment were collected using semi-structured interviews in 2016-2017. Analysis of interview data was based on the constant comparative method. This involved iteration between the developing analysis and data, supported by regular team discussions and sensitizing constructs derived from the literature. The emerging categories were organized into a framework and used to code and index the transcripts. The study results indicated that donors of a clinical biobank do not express negative attitudes towards biobanking and genetic research. The main motivators for donating to the biobank were: prosocial motivation, indirect reciprocity, intrinsic motivation (to enhance their self-esteem and satisfying their curiosity about the donation process) and personal values. A high level of trust in biomedical research, medicine and the concrete physician can contribute to the positive decision. Lifestyle and psychological barriers such as health status and personality traits have been detected as potential barriers to donating to the biobank. The phenomenon of “therapeutic misconception” (insufficient differentiation by patients of the actual clinical and research goals of donation) as well as unrealistic hope that donation could provide direct benefit for concrete person was discovered. It is necessary to continue the study of psychological factors and donation phenomena for the development of the biobanking system in Russia.
THE EFFECT OF COGNITIVE STYLES ON EFFECTIVE MEDIA AND TECHNOLOGY USAGE AND ATTITUDE

Dilem Dinc  
Cag University (Mersin, Turkey)

Hurol Aslan  
Mersin University (Mersin, Turkey)

With the developments in recent years, technology is finding increasingly more place in people’s lives. As technology-related improvements proliferate, the use of media and technology is also becoming more prevalent. Now, we see smart devices in everyone’s hands. The way people use technology is affected by the differences between people in terms of information processing abilities. One of these differences is analytical holistic versus visual verbal cognitive styles, which the CSA test attempts to measure. The aim of this study is to evaluate the differences between individuals favoring either one of those two cognitive styles in terms of the subject area of their studies and their preferences and attitudes in the uses of media and technology. 171-undergraduate students between the ages 19-27 years (Mean=21.08; sd=1.35), 98-from a social-science-department and 74-from a computer-technology-department participated. Participants were given the CSA Test and were asked to evaluate the scale of media and technology usage and attitudes. According to the results of the analysis, students studying in social sciences leaned towards the verbal cognitive style and the students studying Computer Technology were inclined to the visual cognitive style. There was no significant difference between Analytic and Holistic styles. In relation to social media and technology attitudes, social science students did more phone calling, text messaging, and TV viewing than Computer Technology students. In comparison, students of Computer Technology were more into communicating by e-mail, playing video games and online friendships. In addition, the participants with Analytical cognitive style tendency had more social media friendships than those with Holistic cognitive style tendency. Based on these results, it is possible to claim that the participants with Analytic tendency have more social aptitude in media and technology use, whereas those who are Holistic tendency are more individualistic. This conclusion implies that those who with the Analytic tendency favor virtual friendships, while those who with the Holistic tendency prefer actual friendships. Indeed, the participants who were found to be Analytic had more social media connections. In addition, social science students were more likely to use media and technology to socialize than the Computer Technology students.
In recent decades, empirical studies of individual legal consciousness have become increasingly important. However, psychologists still have no a valid and reliable instrument that would allow assessing the extent to which the initial legal principles of law are reflected in the personality’s legal consciousness, which can serve as a guideline for lawful behavior in a legally significant situation when the subject is not aware of special legal regulations. Legal axioms acquired socially fixed values expressed by the world community in the Universal Declaration of Human Rights, which reinforces the legal dogmas that form the basis of the constitutions and national legal systems of the developed countries of the world. We have taken this Declaration as a basis for the development of a questionnaire aimed at measurement of the level of awareness and his /her evaluative attitude to the basic initial legal provisions that determine the basic principles of legitimate interaction in modern society. The structure of the questionnaire is represented by two scales — “awareness” (cognitive component of legal consciousness) and “significance” (emotional and evaluative component of legal consciousness). The following second order scales are substantiated: the legal status of the individual, personal rights, political rights, social rights, cultural rights. The factor structure of the questionnaire was confirmed on a representative sample of adults (N = 100) using the principal component method (54% of the variance explained). Further steps needed to support the validation of the new survey are discussed.
ATTACHMENT AND INTIMATE PARTNER VIOLENCE IN EMERGING ADULTS: EMPATHY AND EMOTION REGULATION DIFFICULTIES AS MEDIATORS

Monica Guzmán-González
Jimena Silva
Universidad Catolica del Norte (Antofagasta, Chile)
Christine Levesque
Marie-France Lafontaine
Ricardo Espinoza-Tapia
University of Ottawa (Ottawa, Canada)

Despite the prevalence of intimate partner violence in emerging adulthood, past research has mainly focused on later life stages (Grest, Amaro, & Unger, 2017). Intimate partner violence occurred in this stage is an issue of critical concern because it is associated to several negative consequences on mental health, and it can shape future romantic relationships. The attachment theory (Bowlby 1969/1982, 1973, 1980) has proven to be a fruitful avenue to understand romantic relationships, including violence, but the identification of mechanisms underlying this link needs further exploration. The goal of this study was to evaluate the mediating role of empathy and emotion regulation difficulties in the association between romantic attachment and the perpetration of intimate partner violence in emerging adults. To this end, 951 students recruited from Chilean universities completed the Experiences in Close Relationships questionnaire (Brannan, Clark, & Shaver, 1998), the Interpersonal Reactivity Index for Couples (Péloquin & Lafontaine, 2011), the Difficulties Emotion Regulation Scale (Gratz & Roemer, 2004), and the Revised Conflict Tactics Scales (Straus, Hamby, Boney-McCoy, & Sugarman, 1996). Results obtained through structural equation modeling revealed no significant direct effects of romantic attachment on violence. However, results show that romantic attachment (attachment anxiety and attachment avoidance) were associated to less perspective taking and more difficulties in emotion regulation. In addition, attachment anxiety leads to more empathic concern while attachment avoidance leads to less empathic concern. Moreover, results indicate that perspective taking leads to less violence, while empathic concern leads to more violence. No significant effect was found for difficulties in emotion regulation on violence. The indirect effect of the relationship between attachment anxiety and violence through the mediators (empathic concern, perspective taking, emotion regulation difficulties) as a set was significant. However, the indirect effect of the relationship between attachment avoidance and violence through the proposed mediators did not reach significance. Implications or future research and clinical practice are discussed.
PREDICTIVE VARIABLES OF ATTITUDES TOWARDS PHYSICAL WIFE ABUSE

Ilgin Gökler Danisman
TED University (Ankara, Turkey)
Derya Hasta
Aysun Yigit
Zeynep Hakan
Ankara University (Ankara, Turkey)

Previous research documented a positive relationship between attitudes towards physical wife abuse, authoritarianism and gender-related system justification. The current study examines whether and to what extent these two variables and attributional complexity predict supportive attitudes towards physical wife abuse. A total of 236 university students (48.3% female, 51.7% male) participated in the study. The data was collected via sociodemographic form, Attitudes Towards Physical Wife Abuse Scale, Right Wing Authoritarianism Scale, Gender-Related System Justification Scale and Attributional Complexity Scale. According to the results of the regression analysis, gender (0=female, 1=male), right wing authoritarianism and gender-related system justification positively; and attributional complexity negatively predict supportive attitudes towards physical wife abuse. The results contribute to the understanding of contextual factors related to domestic violence.

EMOTIONAL COMPETENCE OF PRESCHOOL CHILDREN AND PARENTAL ATTITUDES

Svetlana Savenysheva
Natalya Smirnova
Saint-Petersburg State University (Saint-Petersburg, Russia)

Analysis of studies of emotional competence shows that this phenomenon is studied to a greater extent in adults than in children, although its active formation begins in childhood. In preschool children, separate components are studied, but there is small amount of comprehensive research of emotional competence, including the influence of family factors. The aim of the study was to investigate the features and structure of emotional competence of preschool children and influence parent-to-child relationships on emotional competence. «Emotional identification» by Izotova, Projective technique «Emotional regulation strategies» (by Smirnova, Savenysheva), Projective technique «Study of empathy» by Avdulova, Projective technique «Drawing the family», Parent-child emotional relationship questionnaire by Zakharova. Sample: 93 children (47 boys and 46 girls) aged 5-7 years and 165 parents (93 mothers and 72 fathers) lived in Saint-Petersburg, Russia. The study of gender differences in the level of components of emotional competence revealed a higher level of empathy and a smaller number of non-constructive coping strategies in girls than in boys. Study of the relationship between the components of emotional competence in preschoolers showed that empathy is associated with all components of emotional competence, emotional identification is related with all components except reflection, emotional expression is associated with all components, except emotional self-regulation; reflection is related only with expression and empathy, and self-regulation is associated with emotional
identification and empathy. Correlational analysis of the components of emotional competence and parent-child relationships showed that the emotional sensitivity of the mother is associated with a higher level of emotional identification in preschool children. Higher rates of emotional interaction of mothers and fathers with their children are associated with higher levels of emotional self-regulation. Analysis of the relations between the components of emotional competence has shown that the components are more related to empathy, as well as emotional identification and expression. The study of the relations of emotional competence and parent-child relationships has shown that emotional identification and self-regulation is most closely related to the indicators of emotional parent-child interaction. Research is supported by RFBR №18-013-00990.

ETHNIC AND GENETIC FACTORS ASSOCIATED WITH ADOLESCENT AND YOUTH HOSTILITY

Ekaterina Denisova
Anastasia Kolenova
Kryuchkova Anna
Don State Technical University (Rostov-On-Don, Russia)

Increased tension, hostility and conflict in the behavior of adolescents and young men in modern society in recent times makes the study of hostile strategies among young people particularly relevant. In this regard, the purpose of the study was to study the biological component of the predisposition to hostile behavior in adolescents of different ethnicity. The study involved 285 participants — adolescents and young men of different ethnicity (Russians, Armenians, Kabardians, Dagestanis) aged 12 to 19 years. Buss-Durkee Hostility inventory (in the adaptation of Osnitsky A.K., 1998); isolation genomic DNA from buccal epithelial cells. Statistical analysis and data processing was performed using the PSPP 0.8 5 and the STATISTICA6.1.478. 18% of subjects had low-active variant of the MAOA gene, 63% — highly active. 98% of young people with low enzyme activity show a high level of hostility. Univariate ANOVA indicate a significant correlation (F = 24,30; p <0,05) between the propensity to hostile behavior with low activity for this gene enzyme A MAOA (LPR). Distributions analysis of MAOA polymorphic variants in different ethnic groups showed that in the Russian and Armenian populations the low-active version of the gene corresponds to 9.09% and 8.82%, highly active — 78.41% and 76.47%, the presence of both alleles occurs in 12.50% and 14.71% of sample. In Dagestanis and Kabardin populations, the distribution of the low-active gene variant is 33.33% and 29.48%, highly active in 42.22% and 43.5%, and both alleles simultaneously in 24.44% and 26.92% of subjects. The chi-square test showed that the distribution of the low-active variant of the MAOA gene in the populations of Russians, Dagestanis, and Kabardians significantly differs (p <0.006). Ethnicity affects the polymorphic variants of the MAOA gene. The distribution of low-level MAOA variants in the populations of Russians, Dagestanis, and Kabardians significantly differs (p <0.006). Ethnicity affects the polymorphic variants of the MAOA gene. The distribution of low-level MAOA variants in the populations of Russians and Dagestanis, as well as Kabardians, has statistically significant differences. One third of the population of Kabardians and Dagestanis have this polymorphism, in contrast to Russians and Armenians, where it is only in 8-9%. There is a significant correlation between the propensity to hostile behavior with low activity for this gene enzyme A MAOA (LPR).
CONCEPTS OF HUMANNESS AND DEHUMANIZATION IN SURVIVORS OF VIOLENCE

Tamara Leonova
Jodie Andre
University of Lorraine (Nancy, France)

Sexual violence, intimate partner violence and childhood maltreatment — the most common forms of interpersonal violence — have been shown to leave a large number of long-term and debilitating effects on the lives of survivors. On top of post-traumatic symptoms, anxiety, depression, substance abuse, suicidality, somatic complaints, personality disorders and disruptions in neurobiological development, such traumatic interactions may also lead to disturbances in the victim's sense of self. Given the scarcity of studies which have focused on the dehumanization experienced by survivors of sexual violence, intimate partner violence and childhood maltreatment following abuse, our exploratory study has two objectives. First, it aims to investigate how survivors of such forms of interpersonal violence give meaning to the concepts of humanness and dehumanization. Second, it seeks to explore the psychological processes which lead from experiencing those forms of violence to self-dehumanization. Semi-structured interviews were administered to five adult survivors of sexual violence, IPV and childhood maltreatment. Transcripts were qualitatively analyzed using Interpretative Phenomenological Analysis (Smith, 1996). Results show that all participants experienced self-dehumanization as a result of the violence they went through, which appears mainly as a reaction to PTSD symptoms affecting their capacity to feel and to think. Self-dehumanization also seems to be linked to major interpersonal difficulties. Finally, rehumanization is discussed, with implications for psychological practice and future research.
FALSE MEMORIES IN EYEWITNESS TESTIMONIES, THE EFFECT OF DELAY- REDUCING THE IMPACT AND IMPROVING RELIABILITY OF TESTIMONIES

Veronika Leja
University of Latvia (Riga, Latvia)

A fair trial is considered to be one of the most fundamental human rights and it should be protected at the highest level, but it has been recognized that mistakes made by witnesses are a significant factor of wrongful court judgements. These mistakes can occur because of false memories, a phenomena in which a person recalls a memory that did not actually occur. The aim of this research is to discover a new way of reducing the influence of false memories in eyewitness testimonies and to test the effect or delay. Specific materials–video, questionnaire and misinformation question—were designed in an experiment to produce false memories and discover their influence. Research participants-128 students. The participants were randomly divided into two groups with a 2 x 2 design with factors: warned / not warned, misinformed / not misinformed. Qualitative analysis was used to verify whereas a simple warning about the false memories phenomenon can decrease false memories and increase the reliability of testimony. For False memories’ totals statistically significant difference for warning, interaction and misinformation has been revealed: warning F (1,124)= 20,02, p<0,01; misinformation F (1,124)= 29,94, p<0,01; warning * misinformation F (1,124)= 14,99, p<0,01. The testimony accuracy, statistically significant difference between warning and misinformation was revealed: warning F (1,124)= 38,02, p<0,01; misinformation F (1,124)= 5,22, p<0,05; warning * misinformation F (1,124)= 5,22, p<0,05. But testimony carefulness no statistically significant difference has been revealed: warning F (1,124)= 2,62, p>0,05; misinformation F (1,124)= 5,22, p<0,05; warning * misinformation F (1,124)=2,18, p>0,05. Results showed that the memory of eyewitnesses can be damaged by leading questions, and false memories can arise, but pre-warning can reduce the influence of false memories and increase the reliability of eyewitness testimony. The findings of this research show that state institutions like the police or court, have to take the false memories phenomenon into account. Results suggests that using pre-warning procedure in court and by the police would improve the reliability of testimony. This pre-warning method used in the research is simple, and can be used in any legal systems and institutions.
PSYCHOPHYSIOLOGICAL INDICES OF VECTIO IN ILLUSION

Artem Kovalev
Lomonosov Moscow State University (Moscow, Russia)

Vection describes the sensation of ego-motion induced by moving visual stimuli that cover a large part of the visual field. The research was aimed to study: 1) whether perception of visually induced circular vection is changed if rotational velocities of 30, 45 or 60 o/s of stimuli are used, and 2) what is the psychophysiological mechanisms of vection perception. In the experiments we used the eye tracking to examine parameters of optokinetic nystagmus to identify vection perception periods and to analyze the brain activity during these periods. Vection was provoked by the rotating optokinetic drum with black and white stripes in CAVE virtual reality system. 17 volunteers with healthy vestibular systems took part in this study. Subjects passively observed rotating stimulation and pressed the button to indicate the vection onset. 18 trials (3 velocities x 2 directions (left and right) x 3 repetitions were presented in pseudorandom order. The duration of each trial was 2 min. Several dependent variables were obtained: vection onset latencies, vection intensity, Simulator Sickness Questionnaire (SSQ) scores to evaluate motion sickness strength, EEG parameters. It was found that for all stimuli rotation velocities slow phases of nystagmus were significantly longer compared to non-vection periods (F = 44.5, p < 0.01). During 60 o/s rotations SSQ scores and vection intensity rates were the highest, and vection onset times were significantly shorter. Although during vection perception periods we found the decrease in alfa-band activity in parietal and central areas of left hemisphere. Thus we revealed the temporal relationship between optokinetic nystagmus dynamic, brain activity and vection perception. It is suggested that the increase in slow phases of nystagmus and decrease in alfa band because of revealed to increase the sensory conflict between visual and vestibular sensory channels. The research was supported by the grant from Russian Foundation of Basic Research, project # 17-36-01101.
CHILD ABUSE REPORTED BY ADULTS WHO EXPERIENCED SEPARATION OR DIVORCE FROM THEIR PARENTS

María Cristina Pérez-Agüero
Diana Betancourt
Alejandro González
Universidad Nacional Autónoma de México (Mexico City, Mexico)

When parents divorce and there are children, few people are prepared and often travel with difficulty to this new state, sometimes leading to situations of conflict that are detrimental to the emotional health of children. The objective of this study was to have a first approach to the experiences and reports of any form of abuse, referred by adults who had experienced the divorce of their parents in their childhood and adolescence, from physical abuse to negligence, as well as reports of manipulation of one of the parents (mom or dad) to say negative things about the other or reject it. It should be clarified that the moment in which the abuse was presented was not explored, however, this study seeks to envisage two things: first, the everyday that may be child maltreatment, given the alarming figures that exist, for example, Unicef estimates that in Mexico, 62% of children have suffered some form of violence at some point in their lives. Secondly, make a contribution regarding the psychological well-being that young people and adults who have passed their parents’ divorce and how related the abuse can be. A total of 485 respondents were obtained to the demographic background questionnaire, as well as the questionnaire for the reporting of experiences of child abuse, based on Baker & Ben-Ami (2011). 63.3% were from Mexico City, 29.7%, 82% were women and with an average age of 29.09 years. The third part of the sample reported that the separation occurred when they were between 6 and 7 years. Among relevant results, it was found that 57% reported having lived one of the most obvious forms of abuse that is the physical, 28% reported having experienced some situation of Child Sexual Abuse. Alarming figures that largely represent the condition of the population in Mexico, because although there were some respondents from other countries, it was decided to leave them because it would be important to analyze the results finely and see if the situation changes if the experience of abuse is compared in Mexico with that of other Spanish-speaking countries. Some other issues are reported.
DIALOGICAL PSYCHOLOGY AND ITS APPLICATIONS

Natalia Burlakova  
Lomonosov Moscow State University (Moscow, Russia)

Valeriy Oleshkevich  
Applied Research Center for Child and Adolescent Mental Health named after G.E. Sukhareva (Moscow, Russia)

The research discussed is aimed at examination of the nature of psychological knowledge and psychological experience. Sociological and phenomenological analysis of psychological intellection and of structures of psychological knowledge demonstrates that psychological knowledge is determined by culture and history. Psychological knowledge when analyzed historically is a cultural construct based on psychological “perception” that in its turn is constructed by certain cultural experience, i.e. experience of self-awareness within certain society. We conducted multiple research projects devoted to the history of psychology and psychotherapy, fundamental conceptions of personality theory, psychotherapeutical process and personality of psychotherapist, etc. The projects were based on objective sociological, hermeneutical and phenomenological analysis. As it was demonstrated, psychological knowledge is principally dialogical and is rationalized during practical elaboration and implementation. Thus, it proves the importance of dialogical analysis and significance of understanding every psychological knowledge or experience within the historical context it first appeared in. It brings us to conclusion that every psychological knowledge is based on psychological experience constructed by social relations a person was involved in and their interiorization. Thus, psychological experience is to be understood as an experience of self-awareness and as a dialogical experience. It is elaborated and differentiated in activities, only then it can be transformed into rational experience that can serve a basis for life psychology of a person and psychotechniques. It means that every psychological conception can be reconstructed in the terms of dialogue and psychotechnical organization. Such an understanding of psychological experience leads us to the following objectives dialogically perceived psychology could achieve: 1) explication of this experience, as a result we deconstruct knowledge as a number of social and psychological dialogues and psychotechniques developed; 2) synthesis and optimization of these dialogues and as a result, elaboration of life experiments aimed at mental development; 3) elaboration of new psychotechniques, psychotechnical cultures; 4) psychological methods for organization of the dialogue between cultures and civilizations on the new scientifically proved level.
Shame is described as an overwhelming emotion which may direct individuals adaptive or maladaptive behaviors depending on the ways it is regulated. According to Compass of Shame Model, there are four maladaptive ways of coping with shame, namely Withdrawal, Attack Self, Attack Other, and Avoidance. Maladaptive coping with shame may make individuals vulnerable to depression through the paths of emotion regulation difficulties. Thus, current study aimed to investigate the mediating roles of areas that individuals have difficulties in regulating their emotions between shame coping ways and depressive symptoms. With this purpose Demographic Form, Compass of Shame Scale, Difficulties in Emotion Regulation Scale-Brief Form, and Beck Depression Inventory were used. A path analysis was conducted with 483 adult participants. Results indicated that The relation between Attack Self and Withdrawal with Depressive Symptoms was mediated through emotion regulation difficulties in finding strategies, clarity, and acceptance domains. Attack Other, on the other hand, related with depression only through difficulty in finding strategies domains. Individuals using different coping strategies of shame are vulnerable to depression through different domains of emotion regulation difficulties. These findings, clinical implications, and suggestions were discussed in the light of current literature.
POSSIBLE ORGANIZATIONAL EFFECTS OF OXYTOCIN: EMOTION RECOGNITION DIFFERENCES BETWEEN CAESAREAN- AND NATURAL-BORN ADULTS

Turan Gündüz
Hakan Çetinkaya
Ankara University (Ankara, Turkey)

First recognized as a regulator of parturition and lactation, the neuropeptide oxytocin has recently gained attention for its ability to modulate social behaviors. Its multifaceted effects are ranged from facilitation of labor to enhancement of romantic attachment. Although the acute effects of oxytocin on the brain and behavior have been extensively studied in many species, its organizational effects remained to be explored. Based on the recent findings concerning its long-term effects and given the amount of oxytocin released during vaginal delivery is substantially larger than caesarean delivery, we predict that the differences in perinatal levels of oxytocin between natural-born and caesarean-born individuals might produce long-term differentiations in their emotion recognition performances. We tested this hypothesis in two studies. First, we aimed to obtain best representing pictures of seven facial expressions (Angry, happy, disgusted, surprised, sad, scared, and neutral). The participants (N=50) evaluated 126 facial pictures obtained from stage actors and actresses (N=18) for the extent to which each picture represented the given emotion. Based on the evaluations, best representing 9 pictures for each emotion category were selected. In the second study, the pictures were presented to 82 college students (45 females, 22 were caesarean-born; 37 males 18 were caesarean-born) for 30, 40, and 50ms durations using SuperLab 4.5 system. The participants responded as accurately and quickly as possible by response keys assigned to each facial emotion. Results showed that the vaginal-born participants recognized emotions better than their c-sectioned peers F (1, 78) = 54.32; p < .01. Sex by Type of Delivery (F (1, 78) = 8.86; p < .01), Sex by Exposure Duration (F (2, 156) =10.82; p < .01), and Exposure Duration by Type of Delivery (F (2, 156) = 7.05; p < .01) interactions were also found to be significant. The findings suggest that the effects of birth-type may be mediated by the levels of oxytocin exposed during peri/post-natal developmental stages. Human females may be more sensitive to the oxytocin levels also they may be better at utilizing the oxytocin, than their male peers.
USING NETWORK THEORY TO UNDERSTAND HOW ENVIRONMENTAL FACTORS SHAPE PRESCHOOL SYMPTOMS OF PSYCHOPATHOLOGY

David Gosar
University Children's Hospital (Ljubljana, Slovenia)

Rok Hointhaler
University Children's Hospital (Maribor, Slovenia)

Network theory can provide new insight into symptoms of psychopathology and their interaction with risk-factors. Greater emphasis on context and the reciprocal interaction of variables in a network offers a more intricate understanding of the role individual risk-factors. In our study we leveraged concepts from network theory to better understand data on risk-factors associated with preschool psychopathology. We analyzed data on the psychopathological symptoms and risk-factors (biological and family risk-factors, parenting styles) from 17,189 children who participated in the Systematic Screening Survey of Three-year-olds. We focused on the analysis of global connectivity of the combined network, as well as the role of individual risk-factors in connecting environmental influences with behavioral outcomes (i.e. bridge connectivity) by using network bootstrap methods. Using network simulation we also examined the impact of interventions aimed at reducing either more central or more peripheral risk factors. Among the examined risk-factors parenting practices, specific biological risk factors and cultural differences between the family and wider cultural proved to have the greatest connectivity with our combined network of risk-factors and symptoms. Parenting practices had especially high bridge connectivity (bridge closeness and expected bridge influence), indicating they represent a vital link between environmental risk-factors and behavioral symptoms. This was further confirmed by our network simulations showing that interventions focusing on parenting practices had the greatest impact on psychopathological symptoms. Specifically, reducing indulgent and inconsistent parenting was predicted to have a moderate effect on externalizing (95% CI for Cohen d=0.43-0.47), and smaller effect on internalizing symptoms (95% CI for Cohen d=0.15-0.19). This effect was more pronounced when the environment included multiple risk-factors (95% CI for Cohen d=0.60-0.64). At high levels of expression externalizing symptoms showed a high degree of connectivity with each other, making them less sensitive to the potential modulation of parenting practices (95% CI for Cohen d=0.10-0.14). Our results show the potential network theory has to advance insight into the etiology of psychopathology and offer psychologist with an opportunity to tailor and combine mental health interventions more specifically for different groups.
PREVENTION OF RADICALISATION, THE NEEDS OF FAMILIES

Magda Rooze
Convenor Standing Committee Crisis, Disaster and Trauma Psychology EFPA (Diemen, Netherlands)

Radicalisation that leads to terrorism is one of the phenomenon that has dominated both national and international agenda in the recent decades; it also has its disturbing impact on families and societies. Our interviews with several families, who were dealing with the process of radicalisation of their children, confirm this. The devastating effects of radicalisation was observable. There are several reasons why radicalisation occurs. Sageman (2004) argues that social bonds (friendship, kinship and discipleship) have forced many individuals to radicalise and to participate in terrorist activities. Similarly, Bakker (2006) after analysing 242 individuals concludes that there are many socio-economic factors like unemployment, injustice, kinship, criminal record behind radicalisation and terrorist activities. Bloom (2005), Ganor (2009), Hundley (2011) and Walker (2007) discuss the same motives but from different perspectives. Finally, Arian (2012) former Deputy Director of the Department of Human Rights at the Ministry of Foreign Affairs in Afghanistan admits that the process of radicalisation which finally leads to terrorism is a highly complex phenomenon in terms of its concept and motivations. He adds that despite scholarly efforts to address the root causes of radicalisation and terrorism there are still significant uncertainties. There are also several reasons why families fail to deal with the process of radicalisation of their children. Lack of knowledge around the topic, taboo, inability to recognise its signs and unawareness where to ask for help are some reasons why parents fail / failed to prevent their children from radicalisation. This research explores the role of families in the process of radicalisation leading to violent extremism. Results of interviews with families of radicalised youngsters are being presented and first conclusions are presented on the impact of these insights.
IDEA OF PROJECTIVE EXPERIMENT AND ITS ELABORATION ON THE BORDER OF EXPERIMENTAL AND PRACTICAL PSYCHOLOGY

Natalya Burlakova
Lomonosov Moscow State University (Moscow, Russia)

The idea of this research originates from two sources. First one is a projective methods. As known, they undergo a crisis now and are reduced to problems of scaling, simple cognitive self-descriptions, etc. Second one is the development of a child and attempts to describe and to analyze psychotherapeutical process. Systematical research of such complex psychological phenomena culminated in perception that the ontology of self-awareness needs to be introduced to psychology. On the one hand, this ontology opens up new opportunities in analysis and description of communication happening during psychological assessment including organization of psychological experiment. On the other hand, it breaks new ground in phenomenological and dialectical analysis of the collected material. Thus, we receive descriptions both of organization of the experiment and of analysis of its results (i.e. of the psychological phenomena and their organization) in the same language — in the language of dialogue. This double description allows to distinguish between different layers of self-awareness, its projection and exteriorization. Moreover, it provides us with accurate description of how these processes are organized. So, the communication stimulated by a researcher and built on the principle of reflection, on the one hand and phenomenological analysis of inner dialogues within the self-awareness of a patient, on the other hand open up new horizons in the development of projective experiment. It is demonstrated that experimental research organized in such a way may become not only the initial stage of psychotherapy, but also a way to organize psychotherapeutical process. Furthermore, it could be used in rehabilitation, organization of psychological help and development. In rehabilitation, this approach allows to include patient’s inner motivation in rehabilitation process. If integrated with techniques of formation experiment developed within the activity theory, it allows to elaborate methods not only of an formation experiment, but also of a developing experiment that could potentially transform into interiorized self-experiment, i.e. become similar to psychotherapy, but in this case, it would be something (skill, quality, etc.) shaped in concrete and controlled conditions. Systematical elaboration of these ideas could lead to convergence and even integration of experimental and practical psychology.
VIRTUAL REALITY EXPOSURE THERAPY FOR PUBLIC SPEAKING ANXIETY CORRECTION

Artem Kovalev
Stepan Strelnikov
Lomonosov Moscow State University (Moscow, Russia)

It is well known that virtual reality exposure (VRET) is may be effectively applied in the treatment of phobias. The present study devoted to investigation the virtual reality application to decrease the level of anxiety during public speaking (PSA). The hypothesis was that PSA level will decrease in the real life after systematic desensitization in the virtual environment. 23 subjects suffering from PSA fulfilled an adopted State-Trait Anxiety Inventory (STAI). After this, the level of anxiety was fixed using biofeedback test. As a managed parameter during biofeedback test we used the galvanic skin response. Then subjects were invited to prepare a short public speech in the virtual environment, where the virtual audience was disinterest (someone was talking, someone was asleep) and where different distracting factors appeared (light flashes in the audience). After such presentation the level of anxiety was fixed by biofeedback method again.

The HTC Vive virtual reality system was used. The virtual environments for this experiment were developed by Modum Lab. Each participant carried out 7 training of public speaking. Results showed that according to STAI and neurofeedback three groups of subjects took part in the experiment — 8 people with a high level of anxiety, 10 people with a moderate level of anxiety and 5 people with a low level of anxiety. The significant differences in VRET decrease were revealed between groups (p<0.01). The group with high anxiety values found the greatest decrease in anxiety in comparison to other groups which did not differ in this parameter. However all participants decreased the level of anxiety and improved their skills in public speaking. Thus we concluded that using VRET is relevant for the correction of such social phobias as PSA. This work was supported by grant RFBR # 17-29-02169.

CAN THE DESTIGMATIZATION OF SEXUAL VIOLENCE REDUCE THE TRAUMATIC SYMPTOMS‘SEVERITY?

Natalia Khodyreva
Arina Diespirova
Saint-Petersburg State University (Saint-Petersburg, Russia)

The high latency of the rape and the low appeal of rape survivors for psychological help in the Russia make the study of the rape stigma urgent. A three-dimensional model of the rape stigma includes elements of victim’s devaluation, social disintegration, and the secrecy of the rape (Levett, 1989; Smith, 2001). How much the stigmatization of rape survivors is associated with their traumatic symptoms? Fifty women — survivors of the sexual violence with the different levels of the severity, participated in the anonymous online study. Life Experience Questionnaire (Norbeck, 1984; Sarason et al., 1978), Sexual Experiences Survey (Koss M. P., 2006), Stigma Scale (Gibson, Leitenberg, 2001), Rape Stigma Scale (modification of Khodyreva N., 2016), Blame Attribution Scale (Meyer C. B., Taylor S. E., 1986), SCL-90-R (Derogatis et al., 1973) in the adaptation of Tarabrina N. (2007) were used. The results showed direct correlations between the level of rape stigma, the level of self-blame and the traumatic symptoms. A positive relationship was found between the variable “severity of sexual violence” and the level of the Rape Stigma Scale (r = 0.482, p<0.05). The correlations indicate that the more rape stigma is expressed among survivors of sexual violence, the more they experience traumatic symptoms. With a high level of stigmatization, women who have experienced
sexual violence were more likely to blame themselves for their own personality traits or behavior ($r = 561, p \leq 0.01$). It can be recommended that it is necessary to support the disclosure of information on the sexual violence among survivors in the safe interpersonal and therapeutic relationships. Also, the experience of anonymous or open disclosure of sexual violence through flash-mobs in the Internet works to reduce the rape stigma by the disclosure of secrets and mass social integration.

### IMPLICIT FACTORS AFFECTING OCCUPATIONAL SAFETY: A CASE STUDY IN THE AUTOMOTIVE INDUSTRY

Marina Zavartseva
Olga Chernysheva
Lomonosov Moscow State University (Moscow, Russia)

The present study covers the initial diagnostic stage of complex ergonomic project on optimization of working conditions at the automobile plant producing stamped car body parts. The research aim of the discussed stage was to identify key factors among working conditions and work tasks affecting occupational safety of plant employees. The design of the study included two directions. The first direction concerned analysis of occupational injuries/errors and their time dynamics during shifts for the previous 5 years as integral indicators of occupational safety and its disruptions. The second direction included a comparison of data gathered from previously performed legal audit of working conditions with data of real-time observations of work process, in order to identify possible gaps in the normative assessment of working conditions. The sample included two professional groups of workers – operators of stamping automatic/semi-automatic lines and drivers of forklifts. In total, 209 incidents were analyzed: 108 cases of injuries of operators and 101 cases of errors of drivers, for whom injuries are not typical. The results indicated that: 1. The maximum frequency of both injury and errors surprisingly takes place during the first shift (6:00 a.m. – 14:30 p.m.), which is most similar to regular office regime: the ratio of % injuries (from the total number) during the first shift to second to third is 56%: 22%: 13% for operators, and 50%: 33%: 16% for drivers. 2. The maximum frequency of injury in operators’ group happens in the period between 3rd and 4th working hours, in all three shifts. Intra-shift time dynamics of drivers’ errors is more blurred due to the lack of strict, externally regulated time work mode. 3. The key specificity of the operators’ work activity was allocated: in addition to receiving and moving parts from the stamp, they are constantly carrying out tactile quality control on a production line. This work task is not regarded in normative documents and, thus, in normative assessment, but is the key psychological factor of work intensity for this professional group. The results are discussed taking into account the existing normative documentation and current ergonomic concepts of occupational safety.
Contemporary rehabilitational practices even if numerous are only partly productive because of absence of general concept of rehabilitation. Widespread rehabilitational practices and practices of psychological help served as a material for our analysis. Based on structural and phenomenological analysis, we conclude that efficiency and intenseness of these practices are based on their psychological fundament, because psychological organization of rehabilitation designates motivation that in its turn defines its results. It brings us to the conclusion that just as pathopsychological research reopen a new, deeper essence of psyche, so deeper understanding of mechanisms used in rehabilitation opens more fundamental basis of developmental psychology. The essence of rehabilitation can be understood as development of a patient’s self-awareness, i.e. we are speaking not only about recovery, but about development as well. Rehabilitation proves to be effective only when it affects deepest layers of self-awareness within the psychological domain of progression and regression. Furthermore, the depth of regression determines energetic structure and recovering potential. Analysis of effective rehabilitational practices demonstrates that their efficiency is designated by controlled systematic regression to basic and stable personality organization. Such an analytical regression could not only fill the gaps of development, but also define a new line of development. It means that only development of self-awareness is possible, and we understand self-awareness in the style of Hegel as an essence of awareness determining inner structure of selfhood. Such concept of self-awareness is different from the concept of perception that includes only certain cognitive moment of it. This concept grasps the very essence of rehabilitation in general, beginning from rehabilitation of disabled people and psychiatric patients to rehabilitation of persons deprived of liberty and the whole nations. Such understanding of rehabilitation opens up new perspectives in developmental psychology and new perception of psychology as a whole, where psyche becomes not an abstract essence, but a functioning psychotechnical structure whose development is organized by self-awareness. Methodology of rehabilitation understood in such a way includes understanding psychology, psychology of dialogue, psychotechnics aimed at organization of controlled regression as well as psychotechnics of self-awareness’s actualization and its development.
INHIBITORY SPILLOVER EFFECT ON INHIBITION OF UNWANTED THOUGHTS

Hakan Cetinkaya
Turan Gündüz
Ankara University (Ankara, Turkey)

Hasan Gündüz
Hacettepe University (Ankara, Turkey)

Hilal Kaya
Gökçe Baykuzu Gündüz
Institute of Forensic Sciences, Ankara University (Ankara, Turkey)

Inhibitory spillover effect (ISE) refers to diffusion of inhibitory effects from one brain region to another. This effect manifests itself by enhancing performances on simultaneously performing tasks which require different types of inhibition. We designed a study to test whether or not the ISE facilitates inhibition of unwanted memories. By addressing this issue, the effect of such diffusion on the inhibition of stimulus’ long-term representations in brain has also been examined for the first time. We sampled 30 of psychologically healthy people and created intentional physiological inhibition (urination urgency) through a bogus water taste task. Totally 50ml and 1000ml of water was consumed in low (LUU, n=15) and high urination urgency (HUU, n=15) condition, respectively. Participants were then given a set of questionnaire in order to both measure study related features and to spend the time necessary for urination urgency. After completion of forms, participants performed Think/No-Think (T/NT) task. During the task, participants were asked to learn 30 object(cue)-scene pairs first, then cues were presented alone with either green or red frame and according to the frame, participants were asked to either recall(green) or suppress(red) the associated scene. Finally, cues were presented without colored frames, and asked participants to remember the associated scene as many detailed as possible. Stimulus presented in T/NT task divided into 3 sets and two of them were used for think or no think condition and remaining set was used for baseline condition. Assignment of the sets to the conditions was counterbalanced across participants. Inhibition performances were calculated by subtracting the mean number of details remembered in the no-think condition from the baseline condition. After we verified that our manipulation was worked well, we compared the inhibition performances of two groups and revealed that the HUU group showed greater inhibition performances than the LUU group (p<.05; Cohen’s d=0.76). We concluded that facilitating effect of ISE is not specific only to inhibition of external sensory stimulus itself, but also inhibition of their long-term memory representation. We believed that our findings have also important clinical and cognitive implications for people suffered from inhibition related problems.
THE RELATIONSHIP BETWEEN MOTHER’S ATTACHMENT STYLE AND
CHILD’S PROBLEM SYMPTOMS: THE ROLE OF CHILD’S EMOTION
REGULATION SKILLS

Burcu Altin
Cansu Alsancak Akbulut
Aysegul Durak Batigun
Ankara University (Ankara, Turkey)

Decrement in children’s emotion regulation abilities were shown to be related with their emotional and behavioral problem symptoms. The aim of this study was to investigate whether children’s emotion regulation abilities mediate the relationship between mother’s attachment domains (anxious and avoidance) and children’s emotional and behavioral problem symptoms. Participants consisted of 157 mothers living in Turkey, who have children between the ages of 47-73 months. Participants filled a self-report measure form; which includes Experiences in Close Relationships-Revised (Fraley, Waller, & Brennan, 2000), Emotion Regulation Checklist (Shields & Cicchetti, 1997), and Social Competence and Behavior Evaluation Scale (Fabes, Eisenberg, & Berntzwig, 1990). Indirect macro analysis showed that the relationship between mother’s attachment domain (both anxious and avoidance) and child’s anxiety-internalizing problem symptoms was mediated by children’s emotion regulation abilities. Furthermore, there was a mediating role of child’s emotion regulation abilities in the relationship between mother’s avoidant attachment domain (but not anxious attachment domain) and child’s aggression-externalizing problem symptoms. Both mother’s self-reported attachment and child’s emotion regulation abilities contribute to the problem symptoms of children. Findings were discussed in accordance with cultural issues and relevant literature.
SOCIAL MEDIA TOOLS: ARE THEY EFFECTIVE FOR HEALTH BEHAVIOR CHANGE?

Adriana Băban
Taut Diana
Babeș-Bolyai University (Cluj-Napoca, Romania)

Social media tools (SMTs) are becoming a popular vehicle of health behavior change interventions. Despite their rapid growth in notoriety, little is known about the effectiveness, mechanisms of actions and the pitfalls of using SMTs in such interventions. The current study aimed to conduct a meta-analysis with a systematic review, and pitted together RCTS of SMTs interventions on health behavior change (physical activity, weight loss, smoking and alcohol intake), in the general population, alone or as part of larger interventions, in order to assess the magnitude of effects on: a) actual behavior, b) participants’ knowledge and skills, and c) participants’ satisfaction with the intervention. We investigated potential moderators of these effects, by taking into consideration the length of interventions, other program components, the type of SMTs (commercial and non-commercial), the type of target behavior, and the quality of the RCTs. We excluded correlation studies and research carried with children populations or those having medical conditions.

Our analyses on 34 studies showed that overall, the quality of RCTs was satisfactory, with some underpowered studies. The overall effect size on behavioral outcomes in lifestyle interventions was small, $d= 0.195$, CI95% $= [0.110, 0.280]$ though significant ($Z=4.49, p< 0.001$). There were no differences in effectiveness between types of interventions using SMTs, such as for physical activity, weight loss, quitting smoking, or alcohol intake, $Q(2)= 1.823, p=.402$. Commercial SMTs, such as Facebook had medium to large effects in interventions, $d= 0.410$, CI95% $= [0.198, 0.622]$, while non-commercial ones such as blogs, internet discussion forums or message boards had small to moderate effect sizes, $d= 0.199$, CI95% $= [0.018, 0.381]$. Introducing SMTs in behavior change interventions is a promising approach. However, well conducted RCTs that incorporate SMTs in theory-driven, well designed and adequately powered interventions should be prioritized before integrating SMTs in actual health promotion interventions.

VALIDATION OF THE RUSSIAN VERSION OF "ATTACHMENT STYLE QUESTIONNAIRE" (ASQ, J.A. FEENEY, P. NOLLER, M. HANRAHAN, 1994)

Natalia Sabelnikova
Altai State Pedagogical University (Barnaul, Russia)

Dmitry Kashirsky
Altai State University (Barnaul, Russia)

Psychometric properties of the Russian version of widely employed by western psychologists "Attachment Style Questionnaire" (ASQ), created by J.A. Feeney, P. Noller, and M. Hanrahan, have been evaluated on the sample of Russian university students from Barnaul and Vladimir (n = 102). Additional 5 questionnaires including Attachment to Close People Questionnaire by N. Sabelnikova and D.Kashirsky, Self-Description Questionnaire for Young Adults (SDQ III) by H. Marsh, Singelis Self Construal Scale and a demographic survey were employed in the study. Exploratory factor analysis and confirmatory factor analysis were performed to test the dimensionality of the tool. Factor structure of the Russian version of the questionnaire almost completely reproduces the factor structure of the original tool on the whole, but some items were low on scores in the estimated values of regression. The model was improved by
eliminating of these items. The developed instrument showed sufficient discriminant and convergent validity. Reliability of ASQ scales was confirmed by Cronbach’s alpha coefficients and by retest reliability (N=60) with interval of 2 weeks between time 1 and time 2 testing. The translated instrument has demonstrated good psychometric properties and is suitable for attachment research on Russian samples and for cross-cultural research.

THE ROLE OF ACADEMIC SELF-CONCEPT AND EMOTIONAL SELF-EFFICACY IN POSITIVE AND NEGATIVE FEEDBACK EFFECTS ON ANAGRAM SOLVING

Elena Shepeleva
Inna Krovitskaya
Moscow State University of Psychology & Education (Moscow, Russia)

Ekaterina Valueva
Institute of Psychology of Russian Academy of Sciences (Moscow, Russia)

The problem of the feedback efficacy has great practical importance in the educational psychology. In many researches it was shown that positive and negative feedback can be useful (Dahling, Ruppel, 2016) or to have different efficacy for the different purposes. At the same time, there are reasons preventing the effective use of both positive and negative feedback (Audia, Locke, 2003, Dahling, Ruppel, 2016). We aimed to investigate the interaction of academic self-concept and emotional self-efficacy with positive and negative feedback effects in anagram solving, assuming it is significant. We investigated the interaction of academic self-concept and emotional self-efficacy with positive and negative feedback effects in anagram solving. Two groups of respondents participated in the research — 131 school students aged 12-15 and 124 adults aged 18-37. All participants were randomly divided into three groups. They solved anagrams with positive/negative feedback or without any feedback. School students also filled out Avrora’s questionnaire and Emotional Self-Efficacy Scale. The results showed that positive feedback condition enhanced anagram solving in comparison to absent feedback condition. We also found that efficiency of the anagram solving of participants with high academic self-concept in analytical skills does not depend on feedback type. Additionally, participants with high emotional self-efficacy tend to solve anagrams without any feedback more efficiently than participants with middle and low emotional self-efficacy. Apparently, if the person has a high level of emotional self-efficacy and academic self-concept, the problem solving becomes independent of external assessment. This research was supported by the Russian Foundation for Basic Research, projects Nº 18-013-01023 & Nº 17-06-00574.
STORYTELLING AS A STRATEGY FOR THE SELECTIVE PREVENTION OF HARMFUL USE AND DEPENDENCE ON CANNABIS IN JUVENILE OFFENDERS

Isabel María Herrera-Sánchez
Silvia Medina-Anzano
Samuel Rueda-Méndez
Universidad de Sevilla (Sevilla, Spain)

Storytelling interventions can boost motivation to abandon risk behavior. This technique can generate intentions for change, help set behavioral goals, and facilitate the control of change. From a community approach, storytelling addresses ecological diversity, understood as all those contextual, cultural and differential aspects including the different sections of identity and substance abuse. Storytelling approaches the problem of substance abuse from a fully identitarian perspective. The aim of this study is to test the effectiveness of the storytelling technique in preventing the use of cannabis in juvenile offenders. In particular those who begin to experiment with this substance in order to prevent harmful consumption and dependence on cannabis in juvenile offenders who already manifest harmful consumption to reduce this pattern of consumption. A mixed sequential design will be used with two phases of information collection. Its effectiveness will be shown in juvenile offenders with similar contextual and psychosocial characteristics.

TORAJA CULTURAL FUNERAL: THE EFFECT OF RELIGIOSITY AS MODERATOR VARIABLE ON THE RELATIONSHIP OF CULTURAL VALUE AND ANXIETY ABOUT AGING

Lusy Asa Akhrani
Grace Eka
Universitas Brawijaya (Malang, Indonesia)

This research aims to determine the relationship between the cultural value of AAS (Anxiety about Aging) and religiosity as a moderator variable. The subjects of this research were Toraja community in the middle age group (40-60 years old) and late adults (60 years old and over) who were still performing the ritual of Ma 'Nene' or Ma 'Ta' Da' amounted to 174 research subjects. The instrument used in this research was INDVALS scale (Sihombing, 2014) to measure cultural value ($\alpha = 0.866$), AAS scale (Lasher and Faulkender, 1993) to measure anxiety about aging ($\alpha = 0.82$), and the Religiosity Scale that has been modified and rearranged based on the dimensions of religiosity by Stark & Glock (1968). The method of analysis used was PROCESS method by Andrew F. Hayes, which was used through the SPSS 21.0 for Windows statistical program. The analysis results showed that the significance value ($\rho$) was $0.5687 > \alpha = 0.05$, so the research resulted that religiosity has no effect on the relationship of the variable of cultural value and anxiety about aging of Toraja community. In addition, the cultural value of Toraja community was proven to play a role in anxiety about aging by 33.7%.
THE CORRELATION BETWEEN CAREER SUCCESS AND PROFESSIONAL MOTIVATION CHARACTERISTICS OF MEDICAL PRACTITIONERS WITH DIFFERENT SPECIALIZATIONS

Maria Titova
Lomonosov Moscow State University (Moscow, Russia)

Pervin Ahmedova
Lomonosov Moscow State University in Baku (Baku, Azerbaijan)

Currently, increased attention is drawn to well-being and job satisfaction of professionals in relation to the necessity of work efficiency improving. The research of qualitative differences in professional motivation characteristics of workers with different level of career success is considered as important. Career success is interpreted as a set of positive results of human professional development accordingly to objective and subjective career evaluation criteria. It is necessary to remark that subjective assessment of career success is key for worker. The actual study was aimed to reveal the correlation between career success and professional motivation characteristics of medical practitioners with different specializations. The research was conducted in 50 medical practitioners with different specializations. The hypothesis is that career success of medical practitioners is related to their professional motivation characteristics. The assessment methods included the checklist designed to get data about professional activity and self-assessment of career success, job satisfaction survey, career anchors questionnaire (Schein) and career motivation questionnaire (Noe, Noe and Bachhuber). The results revealed that the medical practitioners with a high level of career success self-assessment are more oriented to entrepreneurship as a career anchor ($r=0.282, p=0.048$) and try to find opportunities for professional and career development ($r=0.292, p=0.041$). They are more satisfied with the work and less prone to evaluate job stress factors which interfere professional success with high rate ($r=0.311, p=0.028$). The medical practitioners with less level of career success self-assessment are oriented on the place of work stability ($r=-0.296, p=0.037$). The data confirm: medical practitioners with different level of career success self-assessment have significantly different professional motivation characteristics. These results allow to elaborate motivation programs for medical practitioners.
DEVELOPMENT OF PERSONALITY IN STUDENTS WITH DISABILITIES IN CONDITIONS OF INCLUSIVE LEARNING

Lada Aleksandrova
Bronius Aysmontas
Moscow State University of Psychology & Education (Moscow, Russia)

Background. Series of studies directed on personality development in university students with disabilities under conditions of inclusive education both in a) traditional and b) distant (online) forms were conducted at Moscow State University of Psychology and Education. Methodology, research design and methods accumulating the achievements of modern domestic and foreign pedagogics and psychology were applied: cultural and historical psychology (L.S. Vygotsky), activity theory (A.N. Leontyev), concepts of personality potential and hampered conditions of development (D.A. Leontyev), self-determination theory (E. Deci, R, Ryan, K. Sheldon), positive Psychology (M.Seligman, M. Csikszentmihalyi), wellbeing concepts (K. Ryff, E. Diener) ideas of inclusion, methodology of distance education and learning.

The main idea under study: inclusive education, assistive/computer technologies, electronic/distance/online learning could be considered as a conditions and tools for personal development in students with disability.

Method. In different studies various methods were applied: 1) different measures of Motivation, Values, Goals, Social adaptation, 2) Scales for assessing disabled students’ special difficulties in learning, 3) measures of personality resources: Noetic orientations test (Leontiev, 1992), Hardiness Survey (Maddi, 2001) MSTAT-I (McLain 1993), COPE (Carver, Scheier, Weintraub, 1989), Generalized self-efficacy scale (Schwarzer, R., & Jerusalem,1995). 4) measures of wellbeing: SWLS (Diener, Emmons, Larsen, Griffin, 1985), VT-d Scale (Ryan, Frederick, 1997), 5) PTG Inventory (Tedeschi. Calhoun), PTSD’ measure, 6) SSQ (Sarason&Sarason). Some studies used longitudinal design.

Results. In all studies were shown the close connection between social, personality resources in students with disabilities and effectiveness of their learning and adaptation. The moderating effect of personality resources in coping with learning and life challenges were investigated. The role of caregivers in personality development and coping with difficulties were clarified. The types dynamics of personality resources in students with disabilities while learning were found. Now our studies are in progress.

Discussion The data is calling for interdisciplinary research including special psychology, psychophysiology, held in different universities and in various conditions of education for students of disabilities in our country and abroad. The study was supported by Russian Foundation for basic research project № 19-013-00904.
PSYCHOMETRIC PROPERTIES OF ALTRUISTIC INVESTMENT SCALE

Tatiana Kazantseva
Larisa Mararitsa
Anatoliy Sventsitskiy
Ludmila Pochebut
Saint-Petersburg State University (Saint-Petersburg, Russia)

The analysis of the phenomenology of prosocial behavior and the idea of functional network roles were used for differentiating the strategy of “altruistic investment” — prosocial networking strategy aimed at accumulating social capital by means of contributing to the welfare of others, improving the quality of the social environment. The concept of networking strategies allows scientists to consider the social behavior of an individual in terms of her involvement in the mechanisms of social capital formation and conversion. The criteria of altruistic investment which formed the basis of the scale were: 1 — the readiness and willingness to help; 2 — benevolence as the norm of relationships with other people; 3 — focus on the common good, on improving the situation for everybody; 4 — willingness to help disinterestedly, without return and out of the perspective of cooperation; 5 — the importance of the common good compared to personal reputation. The strategy has three-part structure and consists of value, motivational and behavioral components. The hypothesis was tested that the scale of altruistic investment is reliable and valid. The online survey sample included 267 respondents from Russia, age 22.78 (σ=3.66), 55% of women. Marlow-Crown Scale, Schwartz value orientation measure (Russian version by Karandashev), social dilemma list (decomposed Dictator game, Ultimatum game and Common Goods dilemma), Dispositional Egoism Scale (Muzdybaev), Altruistic Attitude Measure (Potyomkina); Cronbach's alpha, Spearmen r, Student t-test, factor analysis, structural modeling. The reliability of the scale was 0.75 (Cronbach’s alpha), the correlation with the social desirability scale was not significant (r = 0.105). Constructive validity is confirmed by the expected correspondence with: 1- values of benevolence (r = 0.241, p≤0.001) and universalism (r = 0.422, p<0.001); 2 — the choice of the behavior in social dilemmas; 3 — altruistic attitudes (r = 0.523, p<0.001); 4 — egoism (r = -0.332, p<0.001). It was found also that the strategy assessed by the altruistic investment scale, is associated with all three components in the expected way. These data allow concluding the Altruistic Investment Scale has good psychometric properties, it is reliable and valid. Funded by grant RFH № 17-06-00777.
A MOBILE APP TO HELP MANAGE AND OVERCOME DEPRESSION STEP-BY-STEP

Maria Da Luz Melo
Hélia Guerra
Luís Gomes
NIDeS — University of Azores (Ponta Delgada, Portugal)

João Salgado
Instituto Universitário da Maia (Porto, Portugal)

In their daily work activities, in an attempt to establish new ways of communicating with patients, a significant number of health professionals will use mobile devices in the near future. These forms can provide an opportunity to share information and responsibilities in the treatment of patients, which is an inflection from current models of health care delivery. Considering the state of the mental disorders of the population in Portugal in 2017, the Portuguese Psychologists’ Association proposed the National Depression Prevention Program. This program aims to provide self-help tools for self-care and prevention of depression, following a treatment model based on the matched stepped care approach. In this sense, the "Self-help for Depression" project aims to develop a prototype of a mobile application, in order to allow a new way of communication and information sharing, in real time and in any place, between the person with light depression and his psychologist. It is a project based on the manual of self-help for depression, developed by the project "Stop Depression" in the Laboratory of Research in Psychotherapy of the University Institute of Maia (ISMAI) in Portugal. This manual includes an activity booklet with eight paper sheets filled out by the person with depression, spread out in a three-step treatment plan in six weeks. This activity booklet provides a daily self-registration of activities and problems, as well as the strategies adopted to deal with symptoms and challenging events. The prototype of the application is developed in two different but complementary parts. One part is to design a representation of the activity booklet in digital format, through a relational data model that faithfully represents the paper sheets. The other part, is to conceive, design and experiment a model that takes into account the organization of the activities booklet, the recording of activities, the choice and the adequacy of the graphic and functional elements; in order to enhance and adapt them for the best user experience (UX) for a person with light depression and his/her psychologist.
EXPLORING HEALTH LITERACY NEEDS TO INCLUDE IN A DIABETES SELF-MANAGEMENT APP: A DELPHI STUDY

Diana Taut
Adriana Băban
Babeș-Bolyai University (Cluj-Napoca, Romania)

Diabetes mellitus affects about 10.3% of men and 9.6% of women aged >25 years in the European Region and 11.6% of people in Romania. Numerous interventions focus on modifying lifestyle behaviors in order to reduce the risk for metabolic disorders and to better manage diabetes in those affected by it. Health education apps, although promising given their accessibility and the potential to use them remotely, do not always have contents aligned with evidence-based guidelines nor are they expert-informed. The aim of this study was to map out areas of educational contents for a diabetes self-management app, by using a two-round Delphi approach to collect relevant information provided by experts in the field. 43 key-informants from fields like psychology, ICT, medicine (with expertise in metabolic disorders), and patients’ representatives were approached and asked about their opinions on what would be the educational contents and skills to be included in a diabetes self-management app and the strategies to assist with these contents and skills. Based on the answers of 16 respondents, we compiled a list of contents and strategies that was re-sent, participants being asked to make a hierarchy from the most relevant to the least relevant for our purpose. Key informants agreed that the most important contents for a diabetes self-management app would be: a) educational module regarding what diabetes is, how it should be managed and diabetes complications; b) support for monitoring glycemic values; c) planning and managing nutrition; d) other lifestyle modifications (physical activity, smoking); e) possibility for personalized feedback messages. Little consensus was reached, however, for the strategies of delivering these contents, as there was either a high variability of strategies or listed strategies having similar scores of preference. The results of this Delphi study should be combined with findings from meta-analyses and systematic reviews that deal with the effectiveness of different diabetes self-management apps or with effectiveness of specific modules/features of these apps.
CULTURE FAIR METHODS OF EVALUATING COGNITIVE COMPETENCE

Marie Arsalidou
National Research University Higher School of Economics (Moscow, Russia)

Cognitive competence is an indicator of future financial and physical well-being. Intelligence tests are a well-established, validated, popular method for assessing cognitive competence. Although these tests survived the test of time in psychological practice and research, they have received several serious criticisms. A main criticism is cultural fairness; because intelligence tests mainly rely on culturally based formal knowledge gained through schooling, they are culturally biased. This paper proposes culture-fair methods for evaluating core cognitive abilities across development. Mental attention refers to our ability to maintain and manipulate information in mind, viewed as the maturational component of working memory (1,2). It is a limited ability that improves gradually over school-age years. Measures of mental-attentional capacity are of parametric nature and provide a means with which to measure performance of individuals across variable competency levels (3). In this presentation, I will discuss the design of mental capacity paradigms in three different domains (visual-spatial, verbal, numeric) and present from data from Canadian and Russian school-age children’s performance on these measures. Results suggest that show close correspondence with empirical data derived from classic mental-attentional capacity tasks administered to children in North America, South America, Europe and Australia. Parametric measures have multiple scaled levels of complexity, invariant need for executive control across levels, minimal prior knowledge requirements, and minimal language and conceptual requirements (3). These task properties are critical for culture fair assessment and have advantages over standard measures of intelligence testing. I will conclude with the unique contribution parametric measures can make in better understanding neurocognitive profiles in school-age children. Support is gratefully acknowledged from the Russian Science Foundation #17-18-01047 1. Pascual-Leone, J. (1970). A mathematical model for the transition rule in Piaget’s developmental stages. Acta Psychologica, 32, 301–345. 2. Arsalidou, M., et al. (2010). Misleading cues improve developmental assessment of working memory capacity: The colour matching tasks. Cognitive Development 25, 262-277. 3. Arsalidou, M., & Im-Bolter, N., (2017). Why parametric measures are critical for understanding typical and atypical cognitive development. Brain Imaging and Behavior, 11(4), 1214-1224.
Executive Function (EF) refers to an interrelated set of neurocognitive systems that underlie behavioral control and cognitive flexibility. EF has pervasive influences on cognition and later development. A key challenge is to understand how EF develops early in development, before the age of 3, where early interventions might have the most impact. The present project explored potential early neurobehavioral precursors of EF and how they change over development. In study 1, we investigated how attentional control relates to EF. Participants aged 24-71 months (M=50.1mo; n=60) completed an executive attention task modeled after Johnson et al. (1991). This task measures the ability to disengage from one stimulus to attend to another and the ability to show anticipatory looking (AL). Participants also completed the Minnesota Executive Function Scale (MEFS). Finally, the Effortful Control temperament dimension was assessed with the Childhood Behavior Questionnaire. As expected, older children showed higher EF scores on the MEFS task, r=.77, p<.001. Consistent with previous research, parent ratings of effortful control were not correlated with age. Importantly, participants who produced more AL in the attention task had a higher EF score. Thus, our results suggest that rudimentary forms of attentional control may play a key role in the development of EF. In study 2, we investigated the neurobehavioral bases of attentional control and how it relates to EF. We recorded optical neuroimaging data from bilateral frontal, temporal, and parietal cortex while 2.5-year-olds (M=30.1mo, n=27) completed the executive attention task. Participants completed MEFS outside the imaging session. Consistent with our behavioral study, results suggest that older participants produced more AL and had a higher EF score. We analyzed the fNIRS data using an image-based fNIRS approach and conducted a group-level analysis contrasting conditions in which participants: (1) Produced AL vs No AL (2) Disengagement vs No Disengagement. Regions in the fronto-parietal attentional network showed differential activation sensitive to behavioral patterns in the UEA task. In all, results from both studies suggest that early attentional processes are predictive of concurrent EF. Further, fNIRS results suggest that the dorsal attentional network may play a role in supporting performance within this task.
COGNITIVE STRATEGIES OF FOREIGN LANGUAGE VOCABULARY LEARNING: WORD RECOGNITION AND MEMORIZATION TECHNIQUES

Anna Izmalkova
Irina Blinnikova
Lomonosov Moscow State University (Moscow, Russia)

Among the factors influencing the process of foreign language vocabulary learning the use of mnemonic techniques is one of the particular interest in cognitive psychology. There is a lot of evidence, for instance, in favour of the advantage of "keyword method" for paired associates learning (Atkinson, 1975; Campos et al., 2014). The goal of our research was to analyse perceptual features, underlying different learning techniques, pertaining to different levels of processing (in terms of Craik, Tulving, 1975 and Velichkovsky, 2006). In two different set of experiments we used a research model, comprising a) subjects' post-hoc report of the used mnemonic techniques, b) types of recall mistakes, c) general recall efficiency, d) eye-movement data. The subjects were instructed to learn new vocabulary items, presented either in a text in their first foreign language or as separate words, paired with their translations in their native language. 31 participants took part in the study (we obtained, in total, data of 1052 trials).

In both experiments subjects reported using different vocabulary acquisition techniques, which were classified into 4 groups according to the levels of processing. The techniques were consistent with the types of recall mistakes (e.g., using "phonetic" technique (rehearsal of the words) led to "phonetic" spelling errors, whereas using "keyword method" led to mixing up parts of the words), p < 0.01, which verified the post-hoc report. Eye movement measures of the subjects let us define certain oculomotor patterns for each technique: for instance, in the task of paired associates learning, using "keyword method" resulted in fewer eye movements from foreign word to native word, as compared to "phonetic" technique (p < 0.01). It should be noted, that the choice of the techniques, as well as the eye movement patterns, were related to foreign language learning experience of the subjects. This interrelation can be subjected to future research. The study was sponsored by the RFBR research grant # 118-013-01240.
TEACHING IS CARING: VALIDITY STUDY OF THE PORTUGUESE VERSION OF TEACHER ACCEPTANCE-REJECTION QUESTIONNAIRE (TARQ)

Francisco Machado
Carla Peixoto
Joana Carolino
Maia University Institute (ISMAI) (Porto, Portugal)

Based on the vast amount of scientific literature that underlines the importance of the quality of interpersonal relations between teachers and students for learning and development, it's important to develop and validate measures that can help professionals to assess the incidence of key dimensions for interpersonal dynamics in educational settings, namely interpersonal acceptance and rejection. This study aims to investigate the factorial structure and psychometric properties of the Portuguese version of Teacher Acceptance-Rejection Questionnaire (TARQ; Rohner, 2005), in order to determine the evidence of validity based on its internal structure and relations with other variables. TARQ is an instrument of self-response based on the theoretical framework of the Interpersonal Acceptance-Rejection Theory (IPARTheory, Rohner, 2004), and composed of 24 items distributed through the scales (a) warmth/affection, (b) hostility/aggression, (c) indifference/neglect, and (d) undifferentiated rejection, which evaluate students’ global perceptions and experiences of being rejected by their teacher. Our sample consisted of 365 Portuguese middle school students, 193 females and 172 males, with ages between 10 and 16 years (M = 11.6, SD= 1.22). In addition to TARQ, students completed the Personality Assessment Questionnaire (PAQ; Rohner & Khaleque, 2005), and the Portuguese version of the Teachers Binding Scale (IPPA-R; Armsden & Greenberg, 1987). The results indicated that: (a) The students in our sample perceive themselves to be accepted by their teachers, especially girls when compared with boys; (b) the structure of the TARQ’s four-factor model was confirmed in the Portuguese sample by confirmatory factor analysis; (c) TARQs’ scales and global scale show adequate internal consistency and reliability coefficients; and (d) acceptance-rejection levels are positively associated with student’s psychological adjustment/maladjustment, and rejection levels are negatively correlated with the quality of teacher attachment. Overall, results provide initial, yet strong evidences of the structural invariance and validity of the Portuguese adaptation of TARQ, as well as the importance of the quality of interpersonal relationships between teachers and students.
What do people do when things go right in their lives is important for happiness. The act of sharing good news with others, deriving additional benefit from it, referred to as capitalization (e.g., Langston, 1994). The simple act of sharing good news with others is found to increase happiness regardless of the significance of the event itself (Gable et al., 2004; Gable et al., 2012; Ilies, Keeney, & Goh, 2013; Ilies, Keeney, & Scott, 2011; Kleiman, Kashdan, Monfort, Machell, & Goodman, 2015; Langston, 1994; Lambert et al., 2011). Sense of Uniqueness (SoU) is the one’s unique importance in the world because of who he/she is. It is certainly possible that SoU might influence how one perceives the responses received from a friend upon sharing a positive event. In the present study it is aimed to test whether SoU mediated the association of relationship experiences with various indices of mental health. The sample consisted of 557 (334 women, 220 men, 3 no response) participants.

Perceived Responses to Capitalization Attempts (PRCA), Sense of Uniqueness Scale (SOU), The Subjective Happiness Scale (SHS) and The Positive and Negative Affect Schedule (PANAS), and Brief Symptom Inventory Depression subscale used to assess the variables. Structural equation modeling used by LISREL. A test of the measurement model resulted in acceptable goodness of fit statistics: $\chi^2$ (111, N = 557) = 290.13, p < .05; GFI = 0.94; CFI = 0.97; SRMR = 0.07; RMSEA = 0.05 (90 percent confidence interval for RMSEA = 0.04 — 0.06). A test of the structural model resulted in acceptable goodness of fit statistics: $\chi^2$ (113, N = 557) = 347, p < .05; GFI = 0.93; CFI = 0.96; SRMR = 0.08; RMSEA = 0.06 (90 percent confidence interval for RMSEA = 0.05 — 0.06). Findings concern the LISREL estimates for the indirect effects, indicating that SOU mediated the relationship of PRCA with HAP and DEP.
THE RELATIONSHIP BETWEEN EXECUTIVE FUNCTION AND PLAY IN THE PRESCHOOL AGE

Daria Bukhalenkova
Marina Vasylieva
Lomonosov Moscow State University (Moscow, Russia)

Play was considered by many researchers as an important activity in preschool age in which the child develops (Vygotsky, 2004; Leontiev, 1996; Elkonin, 1976; Kuczaj, 1981; Fisher, 1991). One of the main components of play is the child’s acceptance of a role (Vygotsky, 2004). Taking the role in play requires a work of all components of executive functions: cognitive flexibility (switching from one role to another, from play activity to real activity), inhibitory control (use of game substitution, i.e. restraining the attitude to the game situation as a real situation; following the rules of the game), working memory (the retention of rules, etc.). The goal of our study is to specify how the different kinds of role will effect to executive functions task implementation in senior preschool age. In this experiment, preschoolers performed the same tasks for executive functions three times with an interval of 2 weeks: for the first time as a regular job, then presenting himself as a fabulous hero (positive, clever or negative), and the third time — again without a role. The study used NEPSY-II diagnostic complex subtests aimed at diagnosing the level of executive functions («Inhibition» and «Statue»). We also used the DCCS method. The study involved 81 preschoolers 5-6 years old (58% boys and 42% girls) from four senior groups of kindergartens in Moscow. Based on the results of the primary diagnosis of the level executive functions, preschoolers were divided into 4 groups (3 experimental and 1 control). Alignment of children in groups was carried out both on the current level of development of the executive functions, and the number of boys and girls in each group. We found out that the acceptance of different role help children to control their behavior in task on inhibition and motor persistence. Our results provide important details about understanding the relation between executive functions and play and have practical implications for the creation of programs for the self-regulation development in the senior preschool age. Research was supported by grant of RFBR № 18-013-01057.
PREDICTORS OF INTERNET ADDICTION AMONG HIGH SCHOOL STUDENTS: A STRUCTURAL EQUATION MODELING

Adil Kaval  
Bornoa Altay Vocational and Technical Anatolian High School (Izmir, Turkey)

Dişdem Müge Siyez  
Dokuz Eylül University (Izmir, Turkey)

Background: With the negative effects of internet use in a person’s life, the use of the Internet has become an issue. This subject was mostly considered as internet addiction and it was investigated (Goldberg, 1996; Suler, 1996; Young, 1998). In literature, it is noteworthy that some theoretical models have been proposed to explain the reasons for internet addiction. It was aimed to test the internet addiction model based on the cognitive-behavioral approach with structural equation model with together determined that the prevalence of internet addiction among high school students.

Methods: Sample of the study consisted of 2197 Turkish adolescents (1346 girls, 846 boys, 5 others and aged mean 16.03) selected from 34 high schools in the 2017-2018 academic year in Izmir province. Internet Addiction Test (Young, 1998), Online Cognition Scale (Davis, Flett and Besser, 2002), Brief Symptom Inventory (Derogatis, 1992), The Situational Cues Assessment Survey, and a demographic information form were used in this study.

Findings: Internet addiction is directly effected by situational cues and internet usage time; psychopathology is effected by partial mediation of maladaptive cognition as well as direct effect and the model tested in the study has been determined to have adequate fit values. With this model, 76 % of the internet addiction variance in high school is explained.

Discussion: Internet addiction in high school students has been explained in a significant way with the internet addiction model based on the cognitive-behavioral approach and the factors that have an impact on the emergence of this problem have been revealed in this research. The impact of multiple factors on internet addiction and the role of relationships between these factors may be a guide for further research.
PREVALENCE OF INTERNET ADDICTION AMONG TURKISH ADOLESCENTS AND RELATIONSHIP WITH SOME SOCIO-DEMOGRAPHIC VARIABLES

Adil Kaval
Bornova Altay Vocational and Technical Anatolian High School (İzmir, Turkey)

Diğdem Müge Siyez
Dokuz Eylül University (İzmir, Turkey)

Background: Internet addiction is defined as the inability to prevent the excessive use of the internet and the loss of the time spent without being connected to the internet and the emergence of extreme anger and aggression and the deterioration of work and social and family life (Young, 2004). In the literature, there are many studies investigating the prevalence of this problem, which is a behavioral addiction. The aim of this study is to determine the prevalence of internet addiction among high school students and whether internet addiction was significantly different according to socio-demographic variables.

Methods: Sample of the study consisted of 2197 Turkish adolescents (1346 girls, 846 boys, 5 others and aged mean 16.03) selected from 34 high schools in the 2017-2018 academic year in İzmir province. Internet Addiction Test (Young, 1998), and a demographic information form were used in this study.

Findings: As a result of the research, it was found that the rate of internet addiction in high school students was % 10.2; internet addiction scores averages have significantly differed in terms of internet usage time, internet activities and internet access tools, however, it was found that there was no significant difference according to gender and age.

Discussion: The findings of this study are expected to contribute to parents’, teachers’ and mental health workers’ knowledge about internet addiction in high school students. It will provide the opportunity to compare with internet addiction rates in other countries.
Attention and consciousness are related. We solve problems by directing attention to them and shift our attention to unrelated thoughts when our mind wonders. These circumstances can represent different conscious states. Research shows that adults activate two distinct brain networks when directing attention to a task (i.e., fronto-parietal or executive network) and when mind wondering (i.e., default mode or resting-state network). There is general agreement that a relation exists between these networks, however this relation is not semantically explained. This paper will present functional magnetic resonance imaging (fMRI) data that examine the relation among brain regions associated with the executive and default mode networks. Results reveal a set of areas that gradually increase in activity with increases in attentional load and a decrease in activity with increases in attentional load. Importantly these changes in fMRI signal are linear and graded across many levels of difficulty, revealing a mutually competing activation pattern in the prefrontal cortex(1). Moreover, additional data from adults (N = 23) show that this relation is modulated by mental-attentional capacity (i.e., the ability to maintain and manipulate information in mind). Specifically, linear pattern persists as long as the mental demand of the task is within the mental-attentional capacity of the individual. When task demand exceeds the individuals mental-attentional capacity fMRI signal reverts to signal related to the default mode network. Conclusions are discussed in terms of the protracted development of the prefrontal cortex and speculate on the how shifts between states of consciousness develop in children. Support is gratefully acknowledged from the Russian Science Foundation #17-18-01047 Arsalidou, M., Pascual-Leone, J., Johnson, J., Morris, D. & Taylor, M. J. (2013). A balancing act of the brain: Activations and deactivations as a function of cognitive load. Brain and Behavior. DOI:10.1002/brb3.128.
INFLUENCE OF PARAMETERS AND CONDITIONS OF CREATIVE TASKS ON THE EFFECTIVENESS OF COLLABORATIVE THINKING ACTIVITY

Alla Belousova
Denis Dautov
Don State Technical University (Rostov-On-Don, Russia)

Psychology has evolved a variety of approaches to understanding what is considered a creative task. On the basis of existing research, one can single out the parameters of the tasks that are adequate for the study of collaborative thinking. The purpose of the study was to study the influence of the conditions and parameters of the tasks in order to find their optimal ratio, ensuring the effectiveness of collaborative thinking activity. The study involved 134 subjects from 18 to 20 years, which were divided into two parts: 20 groups of 4 people and 54 subjects, working individually. Participants were presented with four creative tasks. Each had certain parameters. The first was verbal, with a variety of solutions and without time limits. The second verbal, but had one solution and limited in time. The third non-verbal, with a variety of solutions and without time limits. Fourth, non-verbal, with one solution and limited in time. Half of the subjects solved the problem in terms of the formalization of the procedure, following the rules of brainstorming, and half were exempted from this. The results obtained in the study led to the following conclusions: 1. When formalizing the process of solving a problem, the effectiveness of its collaborative solution is higher than the individual, if it combines the following parameters: the problem is verbal, has many solutions, has no time limit. 2. In the absence of a formalization of the solution of the problem, the effectiveness of its collaborative solution is higher than the individual, if it combines the following parameters: the problem is verbal, it has one solution and time limits. 3. When formalizing the process of solving a problem, the effectiveness of its collaborative solution is lower than that of an individual, if it combines the following parameters: the problem is non-verbal, has many solutions and without time limits. 4. In the absence of a formalization of the solution of the problem, the effectiveness of its collaborative solution is lower than the individual, if it combines the following parameters: the problem is non-verbal, has one solution and is limited in time. The author (of the material) is the winner of the Vladimir Potanin Scholarship Program 2017/2018PF Published by the grant of the V. Potanin Charitable Foundation
ACTUAL EMOTIONAL STATE AND TIME PERCEPTION IN ADOLESCENT DEPRESSION

Anastasiia Chetkina
Alla Spivakovskaya
Lomonosov Moscow State University (Moscow, Russia)

According to epidemiological data, the prevalence of depression in adolescence varies from 8 to 20%. In addition, the disease is difficult to recognize early and it has a high suicidal risk. The emotional aspects of time perception in adolescent depressions are not studied enough, so we investigated the influence of actual emotional state on time perception in adolescent depression compared with the norm group. We developed an experimental model for studying the effects of actual emotional state, formed by overstating or understating the results of the methods on the level of aspiration (Kohs Block Design Test, Kraepelin’s tests) on time perception (Life-Line test, Kronik, Golovaha: we used characteristics of total number of actualized events on life-line and number of negative and positive events among them). Sample: 54 study participants (35 in norm group, 19 in adolescent depression). Results of the clinical group and norm group were analyzed with Mann-Whitney criterion. In norm group formed emotional state leads to actualization of a bigger number of events than in the case of absence of it. Positive emotional state formed in the experiment leads to the actualization of predominantly positive events, a negative emotional state—negative events (results at the significance level of \( p < 0.05 \)). In adolescent depression group there are no statistically significant differences in number of actualized events on life-line (negative, positive, total number of events) between the subgroup with formed emotional state and the subgroup without it. The prevailing negative affect in adolescent depression does not allow the positive or negative emotional state formed in the experiment to influence on the time perception. As a result there is no increase in positive events on the life-line, as it has been shown in the norm group. These results also indicate the special importance of working with a negative affective state in the psychotherapy of these disorders.

EFFECTS OF EXECUTIVE FUNCTIONS ON SPEECH PRODUCTION IN SENIOR PRESCHOOLERS: WORKING MEMORY AND NARRATIVES

Ekaterina Oshchepkova
Russian Academy of Sciences (Moscow, Russia)

DariaBukhalenkova
Aleksander Veraksa
Lomonosov Moscow State University (Moscow, Russia)

The child psychological development, as well as his school readiness, are determined primarily by the development of his regulatory functions, including working memory (visual and auditory), as well as the verbal language development. The purpose of this study is to evaluate how maturity of working memory intercorrelates with the level of language acquisition in 5-6 years old children as well as to determine the aspects of speech development that predict the school readiness. 287 children aged 5-6 years old took part in the study. The following subtests were used to estimate the level of executive functions: «Memory for Designs», «Sentence Repetition» for working memory and «Inhibition». In addition, we used the DCCS method. Children were also asked to make narratives on the base of picture series. Storytelling from pictures is a useful tool to evaluate child’s language skills: lexical
diversity, grammar competence, syntactic complexity and the child’s ability to make a coherent and cohesive narrative. Our analysis of the results allowed us to divide children into three groups based on the level of development of visual and auditory working memory. We found that the level of development of working memory is significantly related to the main parameters of speech production: semantic completeness, semantic adequacy/inadequacy, serial organisation, grammar correctness, an average length of a phrase, lexical correctness, number of grammar mistakes (paragrammatisms), number of sentences and phrases, time of speech production and speech tempo etc. Research was supported by grant of RFBR № 17-29-09112.

EFFECT OF MANIPULATING DESCRIPTIVE NORMS ON VACCINATION DECISIONS

Ksenia Erìtsyan
Natalia Antonova
Herzen State Pedagogical University of Russia (Saint-Petersburg, Russia)

A refusal of adults to vaccinate themselves or their children is an important public health problem in the modern world and no effective prevention programs are developed so far. According to the focus theory of normative conduct (Cialdini, Reno, & Kallgren, 1990) descriptive norms (perceived prevalence of the behavior in social group) are supposed to be important factors of performing the behavior. This study was aimed to test if manipulating the descriptive norm might influence the decision about vaccination in the fictitious scenario, as well as if framing of the information regarding descriptive norm would moderate this effect. 1175 citizens of Saint-Petersburg, Russia took part in the telephone interview focused on vaccination attitudes and behavior. The fictitious scenario about new disease and corresponding vaccine was presented and participants were asked to make a decision about vaccination of themselves and/or their children. The 3X2 design was used. Fictitious scenario contained information about the descriptive norm about vaccination (10%, 50% or 90% of others decided to vaccinate) framed positively (% of agreed to vaccinate) or negatively (% of refused to vaccinate). In the case where the majority agrees to vaccination, 62.9% parents decided to accept vaccination; when the social norm is blurred or most parents refuse vaccination, the corresponding number was lower (51.5% and 49.0% correspondingly) (p≤0.01). Exposure of the information about social norm makes it difficult to make a decision parents provided more explanations for making this or that decision. However, in the case of personal vaccination the effect wasn’t found (p≤0.1). Framing effect in contrast was found only in regard to the personal vaccination: positive framing of descriptive social norms is associated with higher rated of agreement to vaccination (48.1% vs. 40.1%, p≤0.01). The same results have been found in the regression model after adjusting by various background information and vaccination. More research is needed in order to better understand differences in decision making about own vaccination and child vaccination.
VALUES STABILITY AND CHANGES FOR ADOLESCENTS FROM DIFFERENT GENERATIONS

Sergey Molchanov
Olga Karabanova
Olga Tikhomandritskay
Ekaterina Dudovskaya
Roksana Nesmeianova
Lomonosov Moscow State University (Moscow, Russia)

Self-determination is the main goal of psychological development in adolescence. Value priorities and value hierarchy is one of the crucial forms of self-determination. Adolescence as the transition period between childhood and adulthood propose many life situations with complicated choices that help to recognize personal value priorities. Social situation of development proposed by L.S.Vygotsky defines specific social and historical conditions where values develop. The modern world with new technical achievements opens new forms of self-realization and communication that influence life and life choices. Modern adolescents socialize in informational world with new possibilities that changes communication forms and social perception. Our goal was to make comparative analysis of value priorities of three generations in adolescence. The data consists of 3 groups of adolescents: the first sample was gathered in 1997-1998, the second one — in 2003-2005; the third — modern subjects in 2018. The gender composition included 52% of boys and 48% of girls. The complete data include 727 adolescents aged from 14 to 18. Different forms of Schwartz Value Survey as the diagnostic instrument were used. The analysis depicted interesting results that showed stability of some values but also some significant changes in value importance were revealed. Importance of such values as benevolence, achievements, low significance of traditions, power and conformism was shown for adolescents as stable for different generation groups. At the same time importance of other values changes for adolescents from different historical epochs. Gender differences in value priorities were reaveled. Possible explanations of changes and stable parts of value hierarchy in adolescence from the perspective of development and social psychology are discussed.
THE EFFECTS OF DIGITAL STUDENT RESPONSE SYSTEMS ON SELF-REGULATION: AN INTERVENTION STUDY AMONG UNIVERSITY STUDENTS

Liv Ragnhild Straume
Torbjørn Rundmo
NTNU (Trondheim, Norway)

The learning effect of digital student response systems, or clickers as many call it, has been found to be ambiguous (Shapiro et al., 2017). Lack of experimental design to allow for comparisons with a control, has been offered as explanation for inconsistent results in this area of research. Furthermore, the main advantage of employing clickers in formative assessment involves the opportunity to give frequent and immediate feedback on learning in an effortless way. Because students use feedback from prior learning experiences to make adjustments to goals and strategies for subsequent efforts (Zimmerman, 2000), the aim of the current study was to examine whether feedback practice was predictive of students’ ability to self-regulate. An additional objective was to examine whether this was revealed by the academic achievements of the students. A total of 438 undergraduate engineering students, primarily in their first year, participated in the study. The students attended introductory courses in mathematics and statistics. A self-report questionnaire consisting of Academic Goal Questionaire and an adapted short version of Motivated Strategies for Learning Questionnaire was administered three times during the teaching period to gain an understanding of students’ change in their ability to self-regulate as demonstrated by goal orientations and meta-cognitive learning strategies. In addition, demographic variables such as gender and student category (traditional/nontraditional student) were included. The study followed a quasi-experimental design, where the five involved classes ranged between 79 and 120 students in terms of size. In the experimental group (n=263), learner-centered teaching methods were adopted and involved use of digital response systems. In the control group (n=175) traditional teacher-centered approach to instruction was employed. GLM analysis with repeated measures showed there were significant differences in changes in goals and learning strategies during the teaching period, and that gender and student category was central in explaining these changes. This change was found independent of the teaching methods. However, Hierarchical Logistic Regression analysis revealed that both teaching methods and students’ ability to self-regulate were related to academic achievements. The authors discuss the implication of these findings.
RELATIONS BETWEEN THE COMMAND OF FOREIGN LANGUAGES AND EFFECTIVENESS OF COGNITIVE CONTROL

Anastasia Ziberova
Boris Velichkovskiy
Lomonosov Moscow State University (Moscow, Russia)

The research aims at identifying the relationship between the indicators of cognitive control effectiveness and the command foreign languages in its various aspects: number of languages known, level of proficiency, linguistic proximity of a foreign language to the native one. Based on theoretical understanding of cognitive control as a complex function that includes task switching and inhibition (Baddeley, 1996; Miyake, 2003) we hypothesized a link between the effectiveness of cognitive control and the linguistic proximity of the languages spoken by one person. This supposition is also supported by the role ascribed to the language in the mental processes in Russian (Vygotsky, 1934; Luria, 1979) and foreign literature (Poulisse, Bongaerts, 1994; Green, 1986, 1998; Hermans, 1998). Using a computer based set of attention tasks ("Practice-MSU", Kremliov, Gusev) we measured the cognitive control efficacy in 62 subjects (56 females) and analyzed it links with the chosen parameters of the languages spoken by the participants. We found that foreign language skills are associated with an increase of cognitive control effectiveness, as well as the level of foreign language proficiency. The number of languages mastered is related to the accuracy of switching as a function of cognitive control. The efficiency of cognitive control is higher in persons that speak languages that are close and far according to the grammatical similarity measures while proficiency in languages with a moderate degree of similarity is not related to the effectiveness of cognitive control functions.
WHAT DO DARK PERSONALITIES WRITE ON FACEBOOK: AN INTERDISCIPLINARY STUDY OF SOCIAL NETWORK USERS BEHAVIOR

Yanina Ledovaya
Polina Panicheva
Roman Tikhonov
National Research University Higher School of Economics (Saint-Petersburg, Russia)

Olga Bogolyubova
Malta University (Msida, Malta)

Arseny Moskvichev
University of California Irvine (Irvine, USA)

The use of internet and social networks has brought the growing body of studies of behavior and misbehavior of social network users. The idea of the Dark personalities, which refer to toxic behavior including manipulating others, lack of empathy and the ability to do harm with little remorse has been developing for the recent 15 years as a theoretical framework for various studies of harmful behavior, both online and offline. The current study aimed to find and describe the linguistic characteristics of Russian Facebook users’ wall posts texts in relation with their scores on the Short Dark Triad questionnaire. The data were harvested twice in 2015 and 2016 (upon informed consent) via a built-in Facebook app, which suggested participating in a psychological study by filling in a number of questionnaires and giving a permit to download user’s wall posts texts in exchange to his or her “psychological portrait”. Study 1 included 6724 users (aged 18-85; mean age 44.96; 77.9% female; 1972 users with text data). The results of semantic clustering using k-means clustering algorithm over a Russian National Corpus-trained word-embeddings semantic space were a list of semantic clusters (each containing 20 words) correlating with the Dark Triad subscales. For Machiavellianism it was, among many others negative correlations, RELIGIOUS MYSTICISM ($r = -0.101, p<0.01$) and SOCIAL RELATIONSHIPS ($r = -0.094, p<0.01$); for NARCISSISM it was APPEAL ($r=0.080, p<0.05$) and POSSESSION ($r=0.076, p<0.05$); for non-clinical Psychopathy it was CURRENCY ($r=0.110, p<0.01$), FOOD ($r=0.080, p<0.05$) and POLITICAL ESTABLISHMENT ($r=0.074, p<0.01$). Study 2 included 3341 users (aged 18-80; mean age 46.19; 52% female; 2852 users with text data). The results of topic modeling using LDA (Latent Dirichlet Allocation) are a number of topics correlating with the Dark Traits. For Machiavellianism it is FAITH ($r = -0.068, p<0.01$) and BUSINESS ($r=0.052, p<0.05$); for Narcissism it is FRIENDSHIP ($r=0.059, p<0.05$) and Diversity of topics in posts ($r=0.075, p<0.01$); for non-clinical Psychopathy it is PATRIOTISM ($r=0.068, p<0.01$), DAILY ROUTINE ($r=0.064, p<0.05$) and a few others. All p-values FDR-corrected. These data help to better understand Dark Personalities motivation and values, which can advance the studies of toxic online and offline behavior.
GOOD RELATIONS, BETTER TEACHING: THE ROLE OF KINDERGARTEN TEACHERS’ PERCEPTION OF ACCEPTANCE-REJECTION BY THEIR SUPERVISOR IN EMOTIONAL INTELLIGENCE AND PSYCHOLOGICAL ADJUSTMENT

Francisco Machado
Carla Peixoto Portugal Porto
Vânia Magalhães Portugal Porto
Maia University Institute (ISMAI) (Porto, Portugal)

The quality of interpersonal relationships that education professionals establish in their work context, namely positive and accepting relationships with significant other, seems to be associated, in scientific literature, with their social and emotional competence (Jennings & Greenberg, 2009; Brackett, Palomera, & Mojsa-Kaja, 2010), and to their personal well-being (Erkman, Caner, Sart, Börkan, & Sahan, 2010). The impact that the quality of interpersonal relationships, that kindergarten teachers specifically, establish with significant figures in their work context, namely with their supervisors/coordinators, is a research field that has not been very explored, with very few studies completed until recently, and especially in Portugal. In this context, this study’s objective was to analyze the role that kindergarten teacher’s perception of being accepted or rejected by their hierarchical superior might have on key dimensions for their psychological wellbeing and professional performance, namely emotional intelligence and psychological adjustment. To accomplish our objective, the Supervisor Acceptance-Rejection Questionnaire (SARQ, Machado, Machado, & Simão, 2016), the Portuguese version of the Emotion Assessment Scale (EAS, Schutte, Malouff, & Bhullar, 2009), and the Personality Assessment Questionnaire (Rohner & Khaleque, 2005), was administered to a sample of 100 Portuguese kindergarten teachers, professionally active at the time of the data collection, with a professional experience ranging from 1 to 38 years (M = 18.38, SD = 11.40). Through the use of hierarchical regression analysis, and after controlling for the effect of years of experience, our results show that kindergarten teachers’ perception of being accepted (or rejected) by their hierarchical superiors is a predictor of their emotional intelligence and psychological adjustment, which are dimensions considered, in specialized literature, to be determinant for the quality of educational experiences provided to pre-school children. Globally, our results underline the importance of including social and emotional development in the academic and professional training of kindergarten teachers, as they seem to be influential in key dimensions for their professional practice and wellbeing.
PROGNOSTIC COMPETENCE AT DYSONTOGENETIC DEVELOPMENT IN PRESCHOOL AGE: KEY THEORIES

Akhmetzyanova, Anna
Tvardovskaya, Alla
Kazan Federal University (Kazan, Russia)

The ability to imagine future events is an integral part of human cognition. The article presents a comparative analysis of modern researches studying prognostic competence as a basis for socialization of preschoolers with normotypical and deviant development according to the following positions: terminological field of the described phenomenon in Russian and foreign publications; key concepts, theories, models that form the structure of the ability to predict at a preschool age; modern ideas about the nature of prognostic competence at preschool age in subjects with hearing, vision, speech, musculoskeletal disorders and autistic spectrum impairments.

The analysis of the state of the problem revealed the following:

Terminological discrepancy in describing the range of phenomena with which researchers correlate the concepts of "forecasting", "anticipation", "prediction", "probabilistic forecasting". Speaking of manifestations of this phenomenon at preschool age, Russian researchers most often use the term "anticipation" in their publications. As for the foreign publications included in Scopus, Web of Science databases, the most common term is "foresight".

In Russian science offers several models describing the ability to emotionally anticipate in preschool age; the components of the phenomenon are well described, and research methods which are used to study the emotional and cognitive mechanisms of anticipation in normotypical children have been developed. When it comes to researching the ability to predict, foreign scientists distinguish two key concepts – theory of mind and social information processing.

The lack of a complete structural-functional model of prognostic competence in the context of significant relationships for preschoolers with impairments and, at the same time, extensive studies of these characteristics in schoolchildren and adult individuals living with neurogenesis, mental disorders. The study of the ability to predict in people with dysontogenetic development abroad is mainly carried out in the context of theory of mind in relation to children with ASD.

The research was carried out with the support of the RFBR within the framework of the research project No 19-013-00251 «Forecasting as a resource for the socialization of children with disabilities: the structural-functional model».
THE HIGHER SCHOOL COMMUNITY RESILIENCY: ASSESSMENT AND IDENTIFICATION

Fatima Valieva
Peter the Great Saint-Petersburg Polytechnic University (Saint-Petersburg, Russia)

Nowadays statistical data indicate that teachers abandon the profession in increasing numbers and are three times more likely to quit jobs than similarly trained professionals. Greater demands, complex responsibilities, and an expanding knowledge base that is continually being upgraded, became challenges of a new type for the higher school community. Over the last two decades, terms connected with personality characteristics emerged within the stress-coping paradigm — resilience or resiliency. Resiliency may be defined as the power or ability to recover readily from depression, adversity, or the like to the original form or elasticity. Conceptually authorized theory, which includes emotional, social and cognitive flexibility, as well as contextual aspects of personality identification that starts with the societal level up to the individual, was used in our project. It was developed as a result of extensive literature review on models and approaches to resilience, and based on resiliency constructs identified by M. Unger, S. Luthar, S. Masten and others. The scientific research was aimed at investigating the education community’s resiliency. That included assessment of students’ and teachers’ abilities to discern and identify the constructs of resilience phenomenon. The participants of the study were about 100 teachers and more than 250 graduates (including 42 foreign students) of linguistics departments of Saint-Petersburg universities. The set of questionnaires consisted of three sections. The first section captured the specificities of individual sustainability through the authorized Resilience Scale. The Cronbach’s Alpha reliability testing on resilience scale displayed $p = 0.972$. The respondents were to choose the most suitable variant of the assessment. The second section was devoted to discerning the resilient behavior of all groups of the higher education community through finding corresponding adjectives. The last comprised respondents’ personal information. The empirical study findings included the description of the sample in terms of resilience level; correlation analysis identifying the relationships between factors stated and resilience subscales as well as among all variables; factor analysis reducing the number of variables and extracting principal factors associated with resilience, personal data.
EFFICACY OF REGULAR COGNITIVE TRAINING IN INDIVIDUALS WITH COGNITIVE IMPAIRMENT

Cornelia-Eugenia Munteanu
Medical Centre of Diagnosis and Treatment (Bucharest, Romania)

The human brain is something dynamic and can be trained. Regular cognitive stimulation improves performance and delays functional impairment. Capacities and cognitive functions as memory, attention, perception, reasoning, planning, judgment, general learning, and overall executive functioning may be partially innate but can be improved via exercises and games. This ability to reorganize and create new pathways is called neuroplasticity, and it’s the science behind cognitive training. Developing these cognitive skills can also lead to improvements in self-consciousness, self-confidence, and emotional stability. The goal of this paper is to assess the effect of cognitive training on the cognitive functioning of persons with diagnosed cognitive disorders. The sample consists of adults diagnosed and treated for affections including cognitive impairment. Ten adults aged between 47 and 87 years (median age, 71.5 years) were selected because they have constant attended to the cognitive training for over two years. The selection criteria of the subjects were the existence of a diagnosed and treated cognitive disease, adequate physical mobility and the motivation to get involved once a month in one hour cognitive training. Cognitive disorders included ischemic stroke, mild cognitive impairment, Alzheimer’s disease (early or late stage), and brain tumor. Mini-Mental State Examination-2: Expanded Version (MMSE-2: EV) has been applied to all subjects at the onset of the disease with follow-up in a month, three months and then every six months. Participants in cognitive training with mild cognitive impairment, ischemic stroke and brain tumor achieved higher scores at cognitive screening with MMSE-2: EV with three or four points. In mild forms of Alzheimer’s dementia, cognitive training succeeded in reducing steep cognitive decline to just one point or two per year, while in severe forms of Alzheimer’s dementia the influence of cognitive training on halting cognitive impairment was minimal. Regular cognitive education helps older adults and cognitively vulnerable people to manage their lives much better and improve their well-being.
The issue of actualization of labor interests as a motivational driver and one of the sources of labor productivity is little-studied in applied and organizational psychology. The study given in the paper fills some "blanks" of this problem. The purpose of the paper is to consider theoretical, methodological and practical approaches to studying and using personal interests of employees in the process of personnel management.

The leading approach to research is the motivational system proposed on the basis of theoretical analysis and the developed psychological model of labor interests, which made it possible to create a methodology for assessing the structure of labor interests. Using the methods of a special survey, questioning and interview guides, the analysis and comparative assessment of the labor interests of 50 candidates for the service manager position (entertainment and restaurant industry field) was conducted (with no regard whether candidates have passed or not passed the selection); as well as of 45 employees of this industry aged 18 to 25.

The main results of the paper show the connection of labor interests with the company's personnel management system, namely with the processes of selection, adaptation and training. It was revealed that the candidates who had been selected for the service manager position were of primary group interest (small social group interest), and financial incentive was only in the second place. At the same time, financial incentive contributed to the successful passage of the adaptation period. Occupational interests of employees depended on their education and job specifics; career interests were influenced by the time planned with the company. The recommendations necessary for the employer to create the conditions corresponding to the leading labor interests of the employees were substantiated.

As a result: theoretical phenomenological description of the structure and psychological model of labor interests is given. In practical terms, the relevance of the accounting, assessment and impact of workers’ labor interests on personnel management is proved.

The materials of the paper can be of interest to scientists working on the field of applied psychology and labor psychology, and also to practicing HR-managers.

Keywords: motivational mechanism, labor interests, personnel selection, adaptation and training, the structure of interests.
Gelotophobia is the fear of being laughed at. Gelotophobes do not experience laughter and smiling as something positive, and they can hardly distinguish between teasing and ridicule. Extreme fear of being laughed at can lead to social withdrawal. Gelotophobia is widely studied as a trait, as well as a clinical syndrome. Healthy gelotophobes tend to response to smiling faces with automatic facial expression of contempt. On the other hand, emotional response to humor under pathological fear of being laughed at in psychiatric patients has not been studied yet. The study included two groups of participants: N=30 controls, and N=32 psychiatric patients. Two short videos, the comic one and the neutral one were administered to the participants while videotaping their facial expression. The level and frequency of their smiles and laughter were assessed. Self-reported emotions were measured after each video. The participants also completed the State-Trait Anxiety Inventory, and the PhoPhiKat<30> to measure gelotophobia. The results confirmed validity of the method: in the control group “comic” video arose significantly more smiles and laughter, and self-reported joy and delight, compared to the neutral video. Patients demonstrated significantly lower smiles and laughter watching comic video, in comparison with the controls. Their emotional expression did not differ significantly between the two videos, the comic one arose higher delight, but not joy. Gelotophobia was significantly higher in the clinical group compared to the controls. In the control group gelotophobia was not related to frequency of smiles and laughter to the comic video, while in the clinical group higher gelotophobia significantly correlated with lower laughter. Gelotophobia was related to anxiety in both groups, but only in the clinical group it was associated with higher state trait measured before and after watching comic video. Thus, gelotophobia prevails in psychiatric patients compared to the controls. At the same time, its structure is different in the two groups: while in healthy people the fear of being laughed at does not affect much emotional response to humor, in mentally ill people it is related to increase of anxiety from humor and decrease of laughing response.
IF YOU START USING FACEBOOK PROBLEMATICALLY YOU WILL FEEL LONELY. PHUBBING, LONELINESS, SELF-ESTEEM, AND FACEBOOK INTRUSION. A CROSS-SECTIONAL STUDY

Agata Błachnio
Aneta Przepiórka
The John Paul II Catholic University of Lublin (Lublin, Poland)

Smartphones are an integral part of people’s life. The aim of the study was to expand the knowledge on the individual determinants of “phubbing.” Two dimensions of phubbing—communication disturbance and phone obsession—were taken into consideration. We tested the model of relations between phubbing, self-esteem, loneliness, and satisfaction with life. We administered the Phubbing Scale, the Facebook Intrusion Scale, the Loneliness Scale, the Satisfaction With Life Scale, and the Self-Esteem Scale. The participants in the online study were 597 Polish users of mobile phones, with a mean age of M=21.22 (SD = 6.52, range: 16-78). The results showed Facebook intrusion to be a cause of phubbing. Women scored higher than men on both dimensions of phubbing. A low level of self-esteem and satisfaction with life predicted Facebook intrusion. Additionally, a low level of loneliness was a predictor of Facebook intrusion, which in turn was a predictor of loneliness. The results demonstrate the multidimensional nature of phubbing and suggest new directions for future studies.

CONFLICTOLOGICAL COMPETENCE OF A TEACHER AS A CONDITION FOR CREATING A PSYCHOLOGICALLY COMFORTABLE AND SAFE EDUCATIONAL ENVIRONMENT

Svetlana Volodina
Moscow State Pedagogical University (Moscow, Russia)

For all its participants, it is necessary to create a psychologically healthy educational environment. Under the psychological safety of I.A. Bayeva understands the state of the educational environment, which helps to meet the needs for personal and trust communication, creates the reference value of the environment and provides mental health included in the participants [1]. Creating a psychologically comfortable and safe educational environment largely depends on the teacher (AK Markova, LM Mitina, and others). To provide psychologically safe conditions for the development and creative self-realization of students, a modern teacher needs, through professional activities, to have a high level of development of such integral personality characteristics as orientation, competence, flexibility and self-consciousness [2]. In the conditions of increasing conflict potential of school society, it is important for a teacher to have formed conflictological competence, which contributes to the establishment of healthy relations in the team, updating the capabilities of both students and the teacher himself. Studies show that the presence of a developed conflictological competence of a teacher contributes to the creation of a comfortable educational environment: • prevention of problem and conflict situations, • creating an atmosphere of goodwill, mutual assistance, • intellectual and spiritual development of the team and each student, • the effectiveness of the educational process as a whole. The lack of this competence of the teacher has a negative impact on the personality, in particular, increases the level of anxiety and aggressiveness among schoolchildren, which affects their psychosomatic state. A competent teacher is
able to create a psychological climate of trust between the participants in the educational process; to ensure cooperation in decision making, to prevent the destructive development of conflicts. The task of creating a safe, psychologically healthy educational environment is one of the most important tasks for a modern teacher. It acquires special significance when working with adolescent students. Literature 1. Baeva I.A. Psychological safety of the educational environment: theoretical foundations and technologies of creation. – Author. dis ... dr. psychol. sciences. – SPb, 2002. – 44 p. 2. Mitina L.M. THE ATTACHMENT AVOIDANCE IN MARITAL RELATIONSHIP IN TURKEY

Elçin Sakmar-Balkan
Nuh Naci Yazgan University (Kayseri, Turkey)
Hakan Kuru
Middle East Technical University (Ankara, Turkey)

The main purpose of the current study is to investigate the association between adult attachment style (i.e. attachment avoidance and attachment anxiety) and marital adjustment of couples in the Turkish sample. The data was gathered using demographic information form, Experiences in Close Relationships-Revised, and Dyadic Adjustment Scale from 270 married couples. The actor-partner interdependence model (APIM) was used to comprehend both intrapersonal and interpersonal influences simultaneously by controlling the length of the marriage, the number of children, and education levels of spouses. The saturated model demonstrated that the associations between attachment styles of husbands and wives’ marital adjustment, and between attachment anxiety of wives and husbands’ marital adjustment were insignificant. Therefore, these four insignificant links were dropped from the model. Eventually, the final model fit the data very well $\chi^2 (4, N = 270) = 3.83, p = .43, \text{GFI} = .997, \text{AGFI} = .961, \text{CFI} = 1, \text{TLI} = 1, \text{RMSEA} = .00$. Dyadic analyses revealed that wives’ dimensions had both actor and partner effects whereas husbands’ dimensions had only actor effects. In detailed, attachment avoidance of wives was negatively related to both wives’ and husbands’ marital adjustment. On the other hand, both attachment avoidance and anxiety of husbands’ were negatively associated with just husbands’ marital adjustment. Findings demonstrated that the paths for wives and husbands were comparable. The attachment avoidance of wives was more risky for her own marital adjustment compared to their husbands’ marital adjustment. These findings are parallel to those in existing and related literature. In the literature, it was shown that attachment avoidance of both wives and husbands was the strongest predictor of both own and partner’s marital adjustment. Moreover, the attachment avoidance of wives is seen more detrimental for both her own and husbands’ adjustment in Turkish culture.
DBT SKILLS TRAINING AND THE CHANGE OF EATING PATTERNS AMONG RUSSIAN WOMEN WITH EATING DISORDERS

Svetlana Bronnikova
Ksenia Syrokvashina
Center for Intuitive Eating IntuEat (Moscow, Russia)

Eating disorders come with high level of emotional dysregulation expressed in distorted eating behaviors such as restrictive food intake, binge and purge, and compulsive overeating. Our research aims to assess the changes in distorted eating behavior patterns among Russian women after participating in DBT skills training. We examined 46 female patients with binge eating disorder, bulimia nervosa, and OSFED before and after taking part in DBT skills training (Linehan 2015). Our methods include NVM (Dutch version of MMPI), DEBQ (Dutch Eating Behaviour Questionnaire), EDI (Eating Disorder Inventory), TAS-26 (Toronto Alexithymia Scale), EAT-26 (Eating Attitudes Test), and IES-2 (Intuitive Eating Scale-2). Statistical analysis (Mann-Whitney test) shows that participation in the DBT group decreases excessive concern with dieting, weight preoccupation, and fear of weight gain (U=156.5; p=0.017). It reduces episodes of binge eating and purging (U=118.5; p=0.001), anxiety level and emotions somatization (U=176.5; p=0.05), and food preoccupation (U=147.5; p=0.09). It increases the effectiveness level and control in participants’ lives (U=166; p=0.03) and the individual ability to distinguish sensations vs feelings and hunger vs satiety (U=142.5; p=0.006). It raises the level of unconditional permission to eat (U=162.5; p=0.095), the reliance on hunger and satiety cues (U=149.5; p=0.04), and eating for physical vs emotional reasons (U=95; p=0.001). External eating tends to decrease (U=165.5; p=0.07). Total IES-2 score goes up (U=109; p=0.003) reflecting an improvement of capability to eat according to body cues. Our study shows that participation in the DBT skills training positively changes dysregulated emotional patterns and distorted eating behavior among Russian woman with a history of eating disorders. Group participants could effectively extend DBT skills to their eating behavior.

CULTURE AND PSYCHOSIS: CRITIQUE OF DIAGNOSTIC CONVENTIONS AND TOOLS

George Eric Jarvis
McGill University (Montreal, Canada)

The influence of culture is inextricably entwined with the experience and interpretation of psychotic symptoms. This presentation will orient clinicians to the wide array of issues at the intersection of culture and psychosis, including how culture shapes the onset, meaning, course, and symptoms of psychotic illness; the challenges and practical strategies/tips for diagnosing culturally diverse patients with psychosis; and the importance of developing culturally competent research and clinical assessment tools. Prominent diagnostic tools for assigning cases of psychosis are gathered from the literature, such as the PSE/SCAN, DIS/CIDI, CASH and DIGS. Strengths and weaknesses of these instruments are compared and contrasted in cultural context. Cross-cultural validation of diagnostic instruments, with respect to the identification of psychotic disorders, is sporadic at best. Commonly reported rates of psychotic disorders by large-scale epidemiologic studies must be accepted cautiously, especially in cross-cultural clinical contexts. Frameworks to assist researchers and clinicians exist to reduce diagnostic error when assessing diverse populations and include: the (1) WHO guidelines...
to adapt epidemiologic tools to the culture of groups being studied; and (2) DSM 5’s Outline for Cultural Formulation (OCF) and Cultural Formulation Interview (CFI), which are clinical tools designed to assist clinicians to understand cultural issues during diagnostic assessment.

**Conclusion:** Cross-cultural adaptation and validation of diagnostic tools and practices is possible with adequate allotment of time and resources. The alternative is to leave diagnostic bias unexamined and perpetuate historical legacies of stereotyping and misdiagnosis.

**POLISH VERSION OF THE TRADITIONAL-ANTITRADITIONAL GENDER-ROLE ATTITUDES SCALE**

Karolina Zalewska-Łunkiewicz  
Maciej Januszek  
SWPS University of Humanities and Social Sciences (Katowice, Poland)

Sex, apart from age and race, is the most commonly used and the most easily engaged category in the process of social classification (Brannon, 2015). In the light of the social constructivism theory, gender roles are social, built in given culture, convictions and observations concerning how women and men should behave, which professional and household niches are “feminine” or “masculine” (Zosuls et al., 2011). Since people differ in evaluation of gender roles it may lead to such consequences as interpersonal distress, partnership conflicts or discriminant behaviour. Thus it is vital to develop a psychological tool for gender role attitudes assessment which may be helpful in intra- and intercultural measurement. The purpose of these presentation is to introduce a process of Polish adaptation of the TAGRAS scale (Klocke, Lamberty, 2015), which takes the most up-to-date approach to the understanding of gender role attitudes: traditional, egalitarian and antitradiotional. The sample consisted of 540 females and males, including 325 adults (aged 19-80) and 215 late adolescents (aged 16-18) from secondary schools. The methodological steps included: translation process, univariate model of CFA, reliability calculating with the use of Cronbach’s alpha and test-retest method, convergent validity assessment. The additional PCA and reliability calculation were conducted for particular sociodemographic conditions — the deviation of scree plot and intercorrelations of items were observed for the oldest researched group (seniors aged over 60). A unidimensional TAGRAS meets the criteria for good enough psychometric tool in the sample of young adults, although the current results give an impact for further studies for properties of the scale to be well grounded. Since the process of adaptation concerns a tool measuring — by definition — a culture-dependent variable, special attention will be given to the problem of TAGRAS’ relevance in terms of culture.
INTERNAL CONSISTENCY OF A BATTERY TO MEASURE THE POWER AND VIOLENCE OF GENDER IN INSTITUTIONS OF CIUDAD JUÁREZ

Alicia Moreno-Cedillos
Universidad Autónoma de Ciudad Juárez (Ciudad Juárez, Mexico)

This study was conducted under the assumption that the power relations that occur in couples and family influence the perception and incidence of gender violence in institutions. The main objective of the study is to explore, based on the premises of beliefs of Mexican families, the factors that affect unequal power relations between members of institutions and organizations and that result in violent events, specifically gender. Studies on power in the couple suggest that it defines and is defined at the same time by gender roles (Rivera and Díaz-Loving, 2002). It has been found that the perception of violence, security, corruption and other concepts, in general, is different for men and women, also based on schooling (Moreno-Cedillos, 2013). Studies on traditionalism and power in Mexican families with students, report significantly less attachment to the more traditional premises of machismo and self-denial on the part of women and greater attachment of men. This polarization between women and men, mostly observed in Cd. Juarez, that in other entities of the country, seems to represent a danger for the traditionally powerful role of men, who react with more attachment to these premises, pretending to assert his traditional supremacy. Perhaps this polarization explains - never justify- the exacerbated violence against women (Moreno-Cedillos, 2011). The instruments are The (Received — Emitted) Formal-Informal Power Questionnaire (Meliá, Oliver, & Tomás, 1993); the Scale Measuring Global Social Power, in employee and students version (Nesler, Aguinis, Quigley, Lee, & Tedeschi, 1999); and The Power Strategies Scale (Rivera Aragón, & Díaz-Loving, 2002). All were applied to a non-probabilistic sample of 600 participants, men and women over 18 years, belonging to one of the five categories of institutions defined for the purpose of this research: official, business, civil society, unions and families. The results were favorable for all the instruments in their complete application, since Cronbach’s alpha values of .91 to .98 were obtained, as well as for their factors, except for the Emitted Formal-Informal Power Questionnaire, where the alpha values for five of its seven factors was less than .8, so it is recommended no use in parts.

LONELINESS AND SOCIAL ISOLATION AS THE DRIVING FORCE BEHIND THE FREQUENT SOCIAL MEDIA USAGE

Shama Patel
Pandit Deendayal Petroleum University, school of liberal studies (Gujarat, India)

Preeti Nakhat
Pandit Deendayal Petroleum University (Gujarat, India)

during last 10 years, there has been major increase in the number of social media sites and users. Similarly, depression, loneliness, anxiety, etc. are also spreading vastly among teenagers and youths of our country. According to a WHO report, 36% of the Indian population is suffering from depression, majority of them are between age 6 to 25. Social media can also work as a defense mechanism against dealing with social isolation and loneliness problems. Majority of the time people are not aware about their feelings of isolation and how it is influencing their habits, such as Social media usage. The consequences of the frequent use can be multiple mental illnesses and physical deficiencies. The solutions to the problems arising because of frequent
usage of social media will only be drawn when the contributing factors will be identified. This study focuses on identifying the causes which contribute in the often usage of three social media handles: Facebook, WhatsApp and Instagram. It also aims to find if people use it majorly because of their isolation feelings. The participants of the study were students from the age span of 18 to 23. The data collection was done through a well-structured questionnaire consisting of 26 questions, both qualitative and quantitative. Some responses were also collected through google forms medium. Quantitative data was calculated through Excel. Qualitative data was analyzed and then the common factors were listed down.

**PERSONAL VALUES: THE SUBJECTIVE REALITY OF CULTURE**

Dmitry Kashirsky
Natalia Sabelnikova
Altai State Pedagogics University (Barnaul, Russia)

The presentation introduces a generalized scheme of the study of personal values in psychology. The importance of joint examination of cultural and ontogenetic development together with combined phenomenological and semantic analysis of personal values is proposed. It is noted that the three aspects of analysis: culture (language, traditions, beliefs, phylogeny of the value consciousness, etc.), development phenomena (age peculiarities and possibilities of formation and development of personal values), representations of values in the individual consciousness (at the level of common values and subjective senses, emotions, sensual tissue) should be considered in the study of personal values. The results of the comparative analysis of personal values of Russian and American students are presented. Participants are undergraduate students of the University of California in Davis (UCD) (N=192) and of universities in Barnaul (N=240). American students were of the ages 19-23 (Mean = 20.81, SD = 1.32), Russian students were aged 18-23 (Mean = 21.34, SD = 2.12). Explicit methods, revealing the content of students’ values existing in their mind as objective meanings and implicit methods revealing the semantic contents of personal values have been employed in the study. Similarities (etic-analysis) and differences (emic-analysis) in value priorities of two cultural groups are revealed. It is shown that the values of family life, love, good and loyal friends, complete self-realization are universal for both cultures. Faith in God, high social status and human management, creativity, patriotism and love for the motherland are of lower priority in both samples. Cultural-specific values for the Russian youth are communication and wealth, for American students – learning new things about the world, nature and a human being, higher education, time. It is shown that even if the value hierarchies of the two groups look similar, they have significant differences in the way of subjective interpretation. These results contribute to deeper understanding of cultural determination of the development of personality and to the development of value’s studies in psychology.
CONSCIOUS AND UNCONSCIOUS COMPONENTS OF INCOMPLETE FIGURE PERCEPTION

Nigel Foreman
Middlesex University (London, United Kingdom)

Yuri Shelepin
I.P. Pavlov Institute of Physiology Russian Academy of Sciences (Saint-Petersburg, Russia)

The Gollin test was originally introduced by Eugene Gollin in the 1960s. It involved the presentation of line drawings that included more and more contour information (5%, 20%, 30% and so on), until the figure (elephant, umbrella) was successfully recognized by the participant. In the original version, cards were used but in a computerized version (Foreman and Hemmings 1987) pixel blocks accumulated on a screen so that the exact percentage of figure required for identification could be ascertained. In a personal communication to one of the present authors (NF) Eugene Gollin said that he had originally envisaged it (the card version) as a developmental test, and indeed data gathered using the computerized version showed that on first presentation, less and less contour was required for identification over the period 18 to 60 months of age. Learning is rapid and the percentage required drops substantially over 3-5 presentations. Recent forms of the test involve presentation of colored or 3-D images. In 1997-2010 we argued that rather than figural "completion", the test reflects the brain's potential to calculate the statistics of the signal and mask (occlusion) even though the mask is unconscious as it is in the traditional version of the Gollin test. The masking idea allows the measurement of the statistics of the texture, conscious and unconscious, including the prevailing levels of internal noise in the visual system and as such it can be used potentially to diagnose forms of visual agnosia. The Gollin test can arguably be employed more widely to examine the effects of brain damage on visual form recognition. To examine this possibility further we have developed versions of the Gollin test using DOG and Gabor wavelet transformations (Chikhman et al., 2006). Foreman N, Hemmings R. The Gollin incomplete figures test: a flexible, computerized version. Perception. 1987;16(4):543-8 Chikhman V., Shelepin Y., Foreman N., Merkuljev A., ProninS.Incomplete figure perception and invisible masking // Perception. 2006. Vol. 35. No. 11. P. 1441–1457.
THE SEEING OF COMPLEX SCENE DURING SACCADES

Vladimir Barabanschikov
I. Zherdev
Moscow State University of Psychology and Education
(Moscow, Russia)

We studied the patterns of perception of complex ecologically and/or socially significant objects during rapid eye movements. We hypothesized that during a saccade the effect of “saccadic suppression” takes place. The experiments were conducted on a hardware and software complex based on the iViewXTM Hi-Speed 1250 video eye tracker (SMI, Germany). The participants were shown a colour face image (3.7°×6°) expressing one of the basic emotions, while performing a targeted saccade. Face image duration was 7–14 ms; average duration of 10° saccades: 41±9 ms; average speed: 224±36°/s. The saccades were initiated by a neutral stimulus, which disappeared immediately after the start of eye movements. The test objects were presented pseudo-randomly along the main horizontal line of the field of view, to the right and to the left of the central fixation point (0°,±5°,±10°). The average probability of accurate identification of facial expressions during saccades for all stimulus situations is above chance (0.61). Expressions of happiness (0.81), fear (0.71) and disgust (0.62) are recognized most accurately. The result of the evaluation depends on the alternative choice. Poorly recognized expressions, as well as a neutral state, are better recognised in intermediate positions (±5°); the frequency of well-recognized expressions is distributed evenly across all egocentric positions; emotion of sadness is reliably recognized only in the centre (0°). The evaluation of the visual direction of the face is different from the actual. The results confirm the possibility of an adequate perception of complex objects when performing rapid eye movements. The recognition accuracy is several times higher than the frequency of detection of point light flashes or than the recognition of simple objects during saccades, but 15-20% lower than the recognition of basic emotions in normal conditions. The results allow to conclude that the perception of facial expressions can begin not only during a stable fixation, but also at the peak of the saccade speed (about 400°/s), both in the centre and on the periphery of the visual field. The idea of “saccadic suppression” as a possible mechanism regulating the perception of ecologically valid objects seems controversial. Supported by Russian Science Foundation, project №18-18-00350.
NEUROTECHNOLOGIES: COGNITIVE BEHAVIOURAL THERAPY AND VIRTUAL ENVIRONMENTS

Liliya Korallo
Middlesex University (London, United Kingdom)

Svetlana Muravjova
Olga Schemeleva
Evgenii Shelepin
I.P. Pavlov Institute of Physiology Russian Academy of Sciences (Saint-Petersburg, Russia)

The aim of this study was to evaluate the effectiveness of the application of neurotechnology with an interactive virtual environment for the correction of cognitive impairment in patients with schizophrenia and depression. We created a neurotechnology using virtual reality for the rehabilitation of patients with neurocognitive disorders. The virtual environment used at the second stage of the analysis represented a video of natural scenes that simulated a bike ride through the landscape with a varying relief completely synchronized with the movement of the patients. The observer’s task included a thorough review of both spatial images (magno-system) and separate objects (parvo-system) presented on the panoramic monitor, but also the fulfillment of the cognitive task. For example, focusing on individual video elements in order to search and account objects with certain characteristics set at the beginning of the session. The effectiveness of the methodology was assessed using the electrophysiological (cognitive visual evoked potentials). Comparative analysis of evoked potentials amplitude during the perception of images, which filtered via digital filtration for selective effect on the magno- (low frequency) and parvo- (high frequency) — channels of the visual system, was used. It was shown that in patients with schizophrenia and depression, exhibited a decrease in the amplitude of the components to stimuli filtered at high spatial frequencies and reduced contrast sensitivity at high spatial frequencies. The difference between these pathologies is the different localization of disturbances. In schizophrenia — the localization of disturbances in the occipital, parietal, central, frontal areas and the right temporal region. In depression — the localization of disturbances in the central parietal, central and frontal areas. According to the obtained data, activation of the parvo system was observed in patients of two pathologies after application to the visual system of interactive virtual environment. And also the improvement of the processes of concentration of attention, early sensory processing, working memory and in-depth analysis of information. Accordingly, this methodology using an interactive virtual environment can be effectively used in patients with neurocognitive disorders.
TYPICAL REACTIONS TO THE DISEASE OF CHILDREN AND ADOLESCENTS SUFFERING FROM RHEUMATIC DISEASES OF VARIOUS SEVERITY

Anna Buslaeva
Alexander Venger
Moscow State University of Psychology & Education (Moscow, Russia)

The National Medical Research Health Center of Ministry of Health of the Russian Federation (Moscow) Rheumatic diseases constitute a risk of social maladjustment and creation of a number of psychologic issues in a sick child. Identify typical reactions to the disease in children and adolescents suffering from rheumatic diseases of various severity. Review of medical documents, follow-up, questionnaire surveys, projective methods. Sampling. 75 children with the disease of various severity (18 – severe, 47 – moderate, 10 – mild). The combination of psychological characteristics of the child determines the type of reaction to the disease: 1. Favorable reaction (33.8%), when the impact of the disease on the psychological state of the child is minimal; personal development is along a trajectory close to the standard. 2. “Life space narrowing” (9.3%) is manifested in the inability of the child to adapt to the environmental conditions outside the hospital, whereas inside the hospital the child is able to maintain contacts with peers and other activities. 3. Children with "intellectualization" reaction to the disease (7.6%) are characterized by lower mood, expressed dissatisfaction with the state of health, concentration on treatment matters, significantly reduced self-esteem with compensatory inflated self-esteem on the "achievement" parameter. 4. Children with “infantilization” reaction to the disease (17.1%) are characterized by a decreased development of self-awareness, a positive mood. 5. "Immersion in the disease" (18.4%) is the acute reaction of the child to the disorders in the main areas of his / her life caused by the disease. They are characterized by significantly low mood, identification with the image of a sick person. 6. Children with "psychological disability" (13.8%) are characterized by physical and emotional dependence on close adults, lack of independence. A mild course of the disease is often characterized by a "favorable" reaction to the disease compared to the moderate (p<0.01). None of children with severe disease showed such a reaction to the disease. We defined the impact of the severity of the diseases on the psychological state, which determines the type of reaction of the child to the disease.
CROSS-CULTURAL COMPARISON OF THE DEVELOPMENTAL PROCESS OF CONFLICT MANAGEMENT SKILLS IN EARLY-childhood

Noriko Hamaie
Jiro Takai
Nagoya University (Nagoya, Japan)

Tatsuo Ujiie
The Open University of Japan (Nagoya, Japan)

The purpose of the present study was to investigate the cross-cultural differences in conflict management styles of children in preschool and elementary school between selected Asian countries. Parents and teachers of 3342 children (from 3 to 6 years old and 8 years old) in China, Japan, South Korea, were surveyed about how their children would react in conflict situations, toward targets varied on intimacy. Measurement was conducted using Rahim's (1979) scales measuring conflict management styles (obliging, integrating, compromising, avoiding, and dominating), and three additional conflict management styles; "conventional rule" (i.e., "lets toss for it"), "third party" (i.e., ask for help from adults); and "self-serving" (i.e., "start playing what s/he wanted to do to begin with"). The two situations of conflict were "differences in opinion" (i.e., "your child wants to play on the swings, while the other child wants to play in the sandbox.") and "competing for resources" (i.e., "your child and another child want to use the same play equipment. However, there is only one piece of the equipment available"). For each strategy, a 3 (country) x 5 (age group) x 2 (rater) x 2 (situation) x 2 (intimacy) mixed design ANOVA was conducted. Results indicated interaction effects of country x situation and country x intimacy for every style, and of country x age group x rater for five style: "conventional rule", compromising, integrating, dominating, and self-serving, with differences observed even amongst the Asian groups. These findings suggest that 1) there are cross-cultural differences in conflict management styles amongst East Asian children, and hence it would appear that there are differences in the developmental process of conflict management skill acquisition, even amongst these regionally similar cultures, and that 2) the popular individualism-collectivism framework maybe insufficient in explaining differences between these cultures, and a closer look at the child rearing practices and developmental processes are warranted to more accurately examine conflict management skill acquisition. Rahim, A., & Bonoma, T. V. (1979). Managing organizational conflict: A model for diagnosis and intervention. Psychological Reports, 44, 1323-1344.

EMPLOYEE SILENCE, COLLECTIVENESS AND ORGANIZATIONAL COMMITMENT: MEDIATING ANALYSIS

Ayu Ayu Dwi Nindyati
Paramadina University (Jakarta, Indonesia)

The competitive climate in business also happen for the way to get the best talent for the company. This situation pushed developing head hunters as one of methods to get the talents and made high turnover for company, because many their employees hijack by head hunters. The organizational commitment was buffering the organization from turn over. This research will explore if employee silence as mediator for effect of collectiveness to organizational commitment. Employee silence refers to situations where employees withhold information that might be useful or harmful to the organization of which they are a part, whether intentionally or unintentionally. When employee shows this behaviour in term of protected their peer, so it will...
Role clarity and management of organizational change are considered in the Management Standards approach (Cousins et al., 2004) as two psycho-social factors that have the potential to lead to stress-related consequences or, if well managed, to employees’ well-being. We hypothesize that if employees experience limited stress, they will be also more satisfied for relationships with colleagues and, consequently, will have a better performance. This study aims to investigate if role clarity and being informed on change have a positive effect on individual perception of team work performance. A second aim is to investigate if individual perception of team satisfaction mediates the relationship between role clarity and change, from one side, and team performance from the other side. A cross-sectional study was conducted in an Italian municipality. About 530 employees answered an on-line survey. The questionnaire included: a) the Italian validated version of the questionnaire HSE indicator tool (Toderi et al., 2013); in particular, 3 items for the role clarity dimension, and 3 items for the change one; b) the individual perception of team satisfaction, assessed using 3 items developed by Smith & Barclay (1997); c) individual perception of team performance, assessed using two items developed for this study. Spss and the macro Process were used to test the mediation hypotheses. Results confirm that role clarity and change have a direct impact on team performance. In addition, in both cases we also observed a partial mediation: role clarity has a significant indirect effect on team performance through perception of team satisfaction (effect: .16; with lower and upper confidence interval between .11 and .21); and also change has an indirect effect on team performance through team satisfaction (effect: .19; with lower and upper confidence interval between .14 and .25). Results suggest that providing employees with clear information about their role and tasks, and also providing them relevant information to understand and manage organizational changes, may avoid interpersonal conflicts, and thus directing attention and effort towards team performance.
LIFE-PURPOSE ORIENTATIONS AND HARDINESS OF PEOPLE WITH DIFFERENT LEVEL OF SUICIDAL BEHAVIOR DEVELOPMENT

Lyudmila Miller
Moscow State University of Psychology and Education (Moscow, Russia)

In the case of suicidal behavior, there is a violation of the socio-psychological adaptation of the individual, appeared at the cognitive, emotional and behavioral levels. The research was aimed at the identifying features of the severity level and the components content of the life-purpose orientations and viability of people with and without suicidal behavior. The study sample included patients from the crisis inpatient facility of the Moscow City Clinical Hospital (60 people of 17-56 years old). Patient diagnoses (ICD-10): adjustment disorder, depressive disorder. Different levels of suicidal behavior have been taken into account (thoughts without intentions, with intentions, attempts). The following methods were used: Test of the life-purpose orientations (D.A. Leontyev, O.E. Kalashnikova, — a modification of the “Purpose-in-life” test by J. Krambo and L. Makholik), the Hardiness test of S. Muddy in the interpretation of D.A. Leontyev and E.I. Rasskazova. The study results are: with the development of a continuum of suicidal behavior, a decrease in the severity of indicators of life-purpose orientations has been revealed. Observed: the lack of life goals, giving it the sense of purpose, focus and time perspective; dissatisfaction with the results of life, life at present; lack of faith in the freedom of choice, in one’s own forces to control the events of life, in the possibility to influence one’s life in accordance with one’s goals and objectives and vision of its meaning; fatalism. With the development of suicidal behavior, a decrease in the severity level of the hardiness components is observed. There is a focus on the negatives of the past and the lack of integration of events into the life experience, an explanation of the failures of the hardships in the past. The existence of passivity and self-disbelief is marked. These targets are the priority for the psychotherapeutic intervention.
EXPLAINING NORMATIVE AND NON-NORMATIVE POLITICAL COLLECTIVE ACTION: THE ROLE OF PERCEPTION OF THREAT ON SUPPORTERS OF THE 2019 INDONESIAN PRESIDENT CANDIDATES

Muhammad Abdan Shadiqi
Hamdi Muluk
Mirra Noor Milla
Universitas Indonesia (Depok, Indonesia)

Since the campaign period of the 2019 Indonesian presidential election, the polarization direction of Indonesian political support has salience increasingly between two group supporters of the presidential candidates. This study aims to explain normative and non-normative political action models using the perception of threat as the main predictor variable. The other predictor variables were politicized identity, group-based contempt, and group efficacy. We modified the model of van Zomeren, Postmes, Spears, and Bettache (2011) with replacing the moral conviction to the perception of threat and anger to contempt, and added the non-normative collective action as the outcome variable. We argue that the perception of threat has a stronger role in collective action model on the supporters of alternative presidential candidate than the supporters of incumbent presidential candidate. We collected data of the alternative candidate supporters’ (N=266) and the incumbent supporters’ (N=207). We analyzed with path analysis using Amos. The results generally proved our prediction, (a) model of the perception of threat on the supporters of alternative candidate had better fit model than the supporters of incumbent candidate; (b) almost all predictors had a positive association with normative and non-normative collective action and only group efficacy had a negative association with non-normative collective action on the supporters of alternative candidate; and (c) specifically, on the supporters of incumbent candidate, the group-based contempt only related to the non-normative collective action, and politicized identity and group efficacy only related to the normative collective action.
COUNTERING RADICALISM ON YOUTH: AN EXPERIMENTAL STUDIES ON THE EFFECTS OF CRITICAL THINKING AND THE SOCIAL IDENTITY COMPLEXITY

Mirra Noor Milla
Haykal Hafizul Arifin
Universitas Indonesia (Depok, Indonesia)

In the current internet era, radical groups such as ISIS target young age groups, which are in the stage of seeking an identity for recruiting new members. In the previous studies described that the vulnerability of identity and cognitive style contributed to explaining radicalism. The purpose of this study was to determine the effect of critical thinking skills and the social identity complexity on the support of radicalism. We conducted two experimental studies in high school student. In study 1, we follow a treatment of critical thinking to test the effect on support for radicalism (experiment vs control). In study 2 we conducted two treatment groups and one control group, by giving critical thinking skill and social identity complexity with counterbalance design. The results of study 1 showed that critical thinking skill could reduce support of radicalism only on support for violence. In study 2, we found that there is a significant difference between two groups of experiment and control group on support of radicalism. The two groups of the experiment have a lower score of support of radicalism compare to control group. The comparison between two groups experiment shows that students that are given a critical thinking skill after social identity complexity have lower support of radicalism than students who were given critical thinking skills before induction of social identity complexity. This result suggests that the more teenagers do not believe in propaganda messages after training, the lower the support for radicalism. This research demonstrates the role of the social identity complexity and critical thinking in increasing resistance to propaganda messages to prevent the adopted of radical ideas on high school student.
PROMOTING SELF-ENHANCEMENT OR AVOIDING SOCIAL REJECTION? COMPARING VERBAL ASSOCIATION AND TEXT NETWORK ANALYSIS OF QUEST FOR SIGNIFICANCE BETWEEN INDONESIA AND UNITED STATES

Joevarian Hudiyana
Hamdi Muluk
Mirra Milla
Universitas Indonesia (Depok, Indonesia)

Is life about pursuing one’s passion, through opportunity for significance gain? Or is it about maintaining social security, through avoiding significance loss? Built from previous evidence regarding goal orientation and regulatory focus, present research argued that quest for significance may differ across cultures. More individualistic societies tend to promote self-enhancement values and concepts (significance gain) while more collectivistic societies tend to promote social security values and concepts (avoiding significance loss). In study 1, we explored the social representation of ‘meaningful life’ from 207 participants in collectivistic society of Indonesia and 200 participants in individualistic society of United States using verbal association task. We found that, indeed, values such as ingroup conservation values tend to be represented more as core values in Indonesia while self-enhancement values tend to be represented more as core values in United States. In study 2, we investigate the homophily of concepts in twitter for two geolocations: Jakarta and New York, by analyzing text networks of hashtags from words that we obtained in study 1. We found that tweets from Jakarta contain concepts emphasizing relationships (family ties, loving god, friendships) while tweets from New York contain concepts emphasizing self-enhancement (travel, health, achievement).
METHODOLOGICAL DIFFICULTIES AND CHALLENGES OF MODERN CLINICAL PSYCHOLOGY

Shevelenkova Tatjana
Russian State University for the Humanities (Moscow, Russia)

Modern clinical psychology is a set of developments and programs that correlate poorly with theoretical concepts and are not correlated with each other, despite the activity of researchers and the apparent growth of specific knowledge. It preserves an outdated initial ontological model. Methodological difficulties in clinical psychology are generated by extremely slow progress from the dominant classical rationality to nonclassical and postnonclassical. Methodological and theoretical “challenges” confront clinical psychology with the questions of the ontological status of the reality being studied and the need to overcome the split of scientific methodology. Within the framework of classical rationality, clinical psychology only constructs the principle of objectivity, realizing the subject-object approach, attributing to the soul the way of being fundamentally similar to the way of being of nature. The cultural-historical approach, psychoanalysis and the existential-humanistic trend in clinical psychology form an understanding that “physicalist” objectivity is only one of the semantic structures in which a person masters in being. Postnonclassical clinical psychology turns to the study of the “living world”, requires ontologically recognize the world of internal reliability of consciousness, reconstruct the experience. The subject of the study become special experiences and the particular ways of constructing particular “living worlds”. The main problem is the development of methodological tools for this kind of research, overcoming the opposition of explanation and understanding. “Challenges” to the development of clinical psychology are also posed by the common problems of anthropology and the crisis of modern culture, the era of postmodernism. The question arises about the basis of a new psychology of health: the formations of consciousness that ensure its strength, preserve its internal integrity, the ability to resist external manipulation, socially organized coercion to illusion. There are “challenges” that clinical psychology ignores. This is a cleavage between research and practical clinical psychology. Understanding of mental disorders within a particular psychological practice reflecting the vision, values and attitudes of those who are its participants (members of interdisciplinary teams), creating an absolute relativism in the understanding of the subject of research.
TRANSFORMATIONS OF SELF AND OTHER REPRESENTATION IN MODERN SOCIO-CULTURAL UNCERTAINTY

Elena Sokolova
Lomonosov Moscow State University (Moscow, Russia)

Sociocultural preconditions and personal predispositions causing modern variety of subjective ambiguity are analyzed as well as connection between uncertainty of modern cultural environment with legalization of destructive mythologems and manipulative technologies of human relations and phenomenon of identity diffusion. Identity as a wholeness of the representation Self-Other system, functioning in the framework of manipulative relationships, undergoes a deep transformation, "beheading", or at least "moral impoverishment", while in the representation of Self the structures of superiority and hatred toward the Other crystallize. The specificity of the mentalization construct is determined in the context of emotionally rich communication with the specifically significant Other — in friendly, love or psychotherapeutic relationships. In the optics of cultural historical conception by L.S. Vygotsky, mentalization and its transformations (reduction, distortion of motivation, refusal to mentalize, or manipulative use of mentalization) are viewed as the phenomena, mediated by the high value of controlling, authoritative and manipulative relationships and dehumanization of relationships per se. As a clinical phenomenon, the mentalization impairments are analyzed in several perspectives: as genetically different "layers" of psychic functioning of self-awareness; as pre-mentalizational stages of its development; as temporal or stable decrease in cognitive mediation of mentalization in crisis or traumatic situations of interpersonal communication. The process of mentalization regresses to its pre-categorical and cognitive-affective non-differentiated levels and structures (syncretic and complex organization), unfolding involuntarily and unconsciously, lacking meaningful coherence, symbolic mediation and focus for understanding the subjective world — of self and the Other. The unconscious substitution of the psychic picture of the inner world with impulsive actions, hypochondriac and narcissistic fixations, autistic pseudo-mentalization and manipulation is lacking the meaningful and sanguineous dialogue with the Other. From the perspective of psychotherapy, the mentalization deficit is understood as a "basic defect," which characterizes the operational style of thinking, hampers the ability to symbolize emotional experience of communication and generates the "dead ends" and "traps" in therapeutic relationships. The mentalization deficit narrows down the possibilities to use the transformative power of imagination and curative power of words in "containment" of traumatic emotional experience and lessens the effectiveness of psychotherapy.
MAKING ADVOCACY CENTRAL TO AN ORGANIZATION’S MISSION

Antonio Puente
University of North Carolina Wilmington (Wilmington, USA)

Jessica Daniel
American Psychological Association (Boston, USA)

In the United States, significant turmoil has occurred in scientific, clinical, pedagogic and social justice issues as they apply to psychology in recent years. The American Psychological Association (APA) has been committed to addressing these issues but economic and infrastructure limitations have limited the association’s ability to address these issues, especially anything outside of the clinical realm. During the last two years, APA dedicated itself to studying the process of advocacy- both governmental and non-governmental. Additionally, the results of this study were then compared to how advocacy has historically been done at APA. The gap between what should be done and what was being done was large and unexpected. As a consequence, APA took a year to then determine how to develop advocacy models that would match the increasing needs in our society. APA was then divided into two parts; APA for psychology and APA for psychologists. This latter part involves advocating for psychologists and further does so in an integrative fashion. The Advocacy Coordinating Committee (ACC) was formed representing all aspects of psychology (and co-lead by the author) in an effort to have a robust and comprehensive advocacy approach. Further, to economically sustain such an effort 60% of all member dues now goes directly to this new organization labelled, APA Services, Inc. The ACC officially started on 01.01.19. The purpose of this presentation will be to discuss how the issues of advocacy can and could be addressed using the APA as a model. The core concepts that could apply across different nations and situations will be additionally presented. One specific aspect of advocacy in action will be addressed- the APA Citizen-Psychologist program. In this activity, psychologists across the US and internationally are recognized for the application of psychological principles to solve societal problems. Several examples will be provided. Overall, the goal of this presentation will be to emphasize how an organization can lead, activate, and acknowledged psychological advocacy across all aspects of psychology.
ASSESSMENT OF IMPLICIT ATTITUDES TOWARDS PREVENTIVE HEALTH AND RISK-TAKING BEHAVIOR IN PATIENTS WITH NASAL OBSTRUCTION BEFORE THE SURGERY AS A PREDICTOR OF ADHERENCE TO THERAPY

Elena Pervichko
Diana Gareeva
Alexandra Grishanina
Lomonosov Moscow State University (Moscow, Russia)

According to the World Health Organization data, the main factors influencing health are related to healthy lifestyle and risk-taking behavior (WHO, 2000). Risk-taking behavior has a major impact on health and is closely associated with adherence to therapy in pre- and post-operational periods. According to our hypothesis, the presence of consistent explicit and implicit attitudes towards health saving behavior can be considered as an important factor of adherence to the treatment of patients with nasal obstruction in the pre- and postoperative period. The purpose of this study was to compare explicit and implicit attitudes towards preventive health and risk-taking behavior between nasal obstruction patients in pre-operative condition, and practically healthy subjects. The implicit association test (IAT, Greenwald, McGhee, & Schwartz, 1998) was used to measure the correlation between implicit attitudes towards preventive health and risk-taking behaviors. We compared implicit attitudes with explicit ones. For this section, we used an author’s psychodiagnostic interview and two questionnaires: Scale for the Assessment of Illness Behavior (Rief et al, 2003) and Illness Perception Questionnaire – Revised (Moss-Morris et al, 2002). 20 patients with nasal obstruction of different etiopathogenesis (the mean age was (33.6 ± 9.7) years), and 20 healthy people (the mean age was (30.35 ± 11.5) years), took the part in the study. After comparing the results interview and illness behavior questionnaires, the following may be stated. The healthy subjects frequently acknowledge risk-taking behaviors, while the patients tend to decline the possibility of risk-taking explicitly (p≤0.05); Patients show higher implicit risk-taking in IAT (0.129±0.56) than healthy subjects (-0.832±1.04) (p≤0.01); IAT results lead to future research consideration and IAT design improvements: if an ill person shows implicit risk-taking in IAT and preventive health in explicit attitudes, it does not imply violations in adherence behavior in all cases. The percentages of explanation has to be considered at the next stage of the research. Conclusion. IAT makes it possible to identify implicit risk-taking of patient and prevent violations of the recommendations in treatment of patients.
MOTIVATIONAL CONFLICTS AND THE PSYCHOLOGICAL STRUCTURE OF PERFECTIONISM IN PATIENTS WITH ANXIETY DISORDERS AND PATIENTS WITH ESSENTIAL HYPERTENSION

Elena Pervichko
Yury Babaev
Anfisa Podstreshnaya
Lomonosov Moscow State University (Moscow, Russia)

Many studies show connections between perfectionism and anxiety disorders (AD), as well as essential hypertension (EH). At the same time, motivation plays a significant role in the development of both types of disorder. To examine the connections between direction and power of motivation, strength of motivational conflicts and the structure of perfectionism in patients with AD and patients with EH compared to healthy individuals. Projective and semi-projective motivation tests (TAT of Heckhausen (Heckhausen, Heckhausen, 2018), Multi-Motive Grid (Sokolowski et al., 2000)), and Perfectionism questionnaire (Hewitt, Flett, 2004) were used. The participants were 21 AD patients (mean age 35.6), 56 EH patients (mean age 51.0) and 74 healthy individuals (mean age 42.7). Both AD and EH patients differ from healthy individuals in total perfectionism level (p<0.05) and socially prescribed perfectionism (p<0.05). EH patients differ from healthy individuals and AD patients in self-oriented and other-oriented perfectionism (p<0.05). Both groups of patients demonstrate lower overall level of achievement motivation (p<0.05) and increased fear of failure (p<0.01) and EH patients show lower hope for success (p<0.01) compared to healthy individuals. Achievement motivation is dominated by the tendency of failure avoidance in AD and EH patients, for healthy individuals the opposite is true (p<0.01). Both AD (p<0.05) and EH (p<0.01) patients show higher fear of rejection than healthy group. AD patients demonstrate higher rate of fear of power (p<0.01) than healthy group. In EH patients other-oriented perfectionism is connected to fear of failure (p<0.05) and in AD patients socially prescribed perfectionism correlates with hope for success (p<0.05). Results of the study help broaden our vision of the psychological causes and correlates of anxiety disorders as well as cardiovascular disorders. Both AD and EH patients differ from healthy individuals in terms of motivation and perfectionism and have their unique profiles. The results open up perspectives for further studies on this topic and may help develop strategies for psychotherapeutic interventions. The research was supported by RFBR; project № 17-06-00954.
THE IMPACT OF FAMILY ON CHILDREN’S HEALTH ATTITUDE

Elena Pervichko
Irina Shishkova
Lomonosov Moscow State University (Moscow, Russia)

According to recent studies, the adult population suffers from various chronic diseases caused by improper behavior habits: poor nutrition, lack of exercise, emotional stress. Many serious health problems originate in childhood, forming together with the process of development and socialization of the child. The purpose of the study was to identify the impact of family on children health attitude. The parents health attitude affects a primary school age children health attitude. The type of family education mediates the translation of health attitude from parents to children. The sample consisted of 70 people: 33 children (7-11 years) and 37 parents (32-54 years). We used the method of «Unfinished sentences about health» (N.V. Yakovleva, 2014) for both children and parents and questionnaire «The Analysis of family relationships» (E.G. Etemiller, V.V. Justickis, 1990) for parents. We applied the χ² — Pearson criterion to determine if the same characteristic values occur in the coherent samples and received this result for health self-assessment, assessment of the health of others, attitude to illness, health-promoting activity and health semantic feature scales. The empirical study showed that the health attitude of a primary school age child is influenced by the type of family education and the peculiarities of his parents health attitude. The type of family education mediates the translation of health attitude from parents to their children. It is possible to analyze how social conditions influence the formation of health-saving behavior and health attitude only in the process of interaction between the child and his family, taking into account basic attitudes and behavior patterns. We conclude that it is important to correct non-adaptive forms of parents behavior in case of preventive, correctional or psychotherapeutic work and search optimal ways of interaction, education and training. Further researches can involve a more detailed study of the component structure of the subject pattern of health and attitude to health and factors that affect the formation of the subject pattern of the child’s health (personal characteristics, personal experience of the disease, social environment).

READING COMPREHENSION IN PRINT BOOK AND ON KINDLE: A COMPARISON OF ADULTS AND ADOLESCENTS

Jean-Luc Velay
Aix-Marseille Université (Marseille, France)

Digital reading devices such as Kindle differ from paper books with respect to the kinesthetic and tactile feedback provided to the reader, but the role of these features in reading is rarely studied empirically. Recently, Mangen and coll. (in press) showed that adult readers of a long text on a print book were better to reconstruct the plot of the story than readers of the same text on e-book. They suggested that, to get a correct spatial representation of the text and consequently a coherent temporal organization of the story, readers would be reliant on the sensorimotor cues which are afforded by the manipulation of the book. The participants to this previous experiment were adults, novices with respect to reading on an e-book. To determine the role of medium expertise and preferences, and to empirically assess the assumptions underlying claims about so-called “digital natives”, the present experiment compared reading of a long text on Kindle and in print in adult and adolescent readers. Seventy-six
participants (adults: N = 28, 24 y.o; adolescents: N = 48, 15 y.o) read a 24 page (4880 words, approx. 30 min reading time) long story on Kindle or in a print pocket book and completed several tests measuring various levels of reading comprehension: recall, capacities to locate events in the text and reconstructing the plot of the story. Results in adult readers confirmed those previously obtained under similar conditions (Mangen et al, in press) and showed that on measures related to chronology and temporality, those who had read in the print pocket book, performed better than those who had read on a Kindle. As a whole, adolescents were less efficient than adults in the comprehension tests, and conversely to adults, they performed identically whatever the reading medium. It is concluded that, because kinesthetic feedback is less informative with a Kindle, adult readers were not as efficient to locate events in the space of the text and hence in the temporality of the story. Interestingly, adolescents who are more familiar with digital media would be less sensitive to the lack of sensorimotor information afforded by e-books.

**MALTEMENT AMONG PEERS IN PRESCHOOLERS FROM DIVERSE CONTEXTS IN MEXICO**

Claudia Lopez-Becerra  
National University Pedagogica (Mexico City, Mexico)

Veronica Arredondo-Martinez  
University of San Nicolás de Hidalgo (Mexico City, Mexico)

Alethia Danae Vargas-Silva  
University of San Nicolás de Hidalgo (Morelia, Mexico)

School violence or harassment represent a socially serious problem (Amemiya, Oliveros, & Barrientos, 2009) as well as an unfortunately everyday event for both the school system and society in general (Trianes, 2000). Bullying or maltreatment between partners occurs from early stages, that is, preschool children are also subject to aggression from their peers (Ladd & Burgess, 1999, Ortega & Monks, 2005), which gives it a more complex character. Based on the above, the objective of this research was to characterize the maltreatment between partners in preschool children, analyzing the types of abuse and how they occur in four social contexts. We worked with four samples of children from the third year of preschool consisting of: 206 children from Mexico City, 160 children from nearby areas to Mexico City, 63 Children from Morelia, Michoacán and 90 children from 2 municipalities of Michoacán. The instrument “Abuse between Partners” (Ortega & Monks, 2005) was applied to evaluate the role that is played within the dynamics of maltreatment among peers, using the peer nomination technique. The results showed the prevalence of each type of maltreatment between partners; verbal and physical direct aggression presents the highest percentage in the 4 social contexts analyzed, there being differences in the prevalence level of victim and witness aggressors among the samples. Children from nearby areas of Mexico City and the municipalities of Michoacán have the highest prevalence of mistreatment among peers, making evident the social, economic and cultural conditions that qualify school bullying. It is concluded that the maltreatment between partners is caused by the interaction of several factors, so the results will be discussed in light of causes that generate and / or trigger school violence as confirmed by results of previous studies on aggression in preschoolers (Crick, Casas, & Mosher, 1997; Monks et al., 2003).
BREAK-UP CONSEQUENCES ON MEN AND WOMEN’S MENTAL HEALTH

Sofía Rivera-Aragon
Fernando Mendez-Rangel
Pedro Wolfgang Velasco-Matus
Mirna Garcia-Mendez
Rozzana Sanchez-Aragon
National Autonomous University of Mexico (Mexico City, Mexico)

Breaking up in couple relationships is considered a common, painful, hurtful, stressing, anxious and highly emotional experience (Banks et al., 1987; Perilloux & Buss, 2008; Sprecher, 1994), and can be seen as one of the most negative events in human life (Caruso, 1969). Boss (2009) suggests that anyone who lives a break-up experiences an ambiguous grief that includes impotence, depression, anxiety and conflicts in social relationships, which impacts people’s health. The purpose of this research was to assess the consequences of a break-up in men and women. 534 volunteers were part of this research (258 men, 276 women), all of them in a couple relationship (158 in dating relationships — Group 1; 103 married without children — Group 2; 148 married with children ages <23 — Group 3; and 125 married with children ages >23 — Group 4). The Modified Natural Semantic Network technique (Reyes-Lagunes, 1993) was used in order to obtain the desired data. Results show for group 1 that men refer sadness, depression, freedom, anger and loneliness as consequences of a break-up. Women mention sadness, pain, anger, loneliness, and depression. For group 2, men indicated sadness, depression, loneliness, freedom, and lack of trust. Women indicate infidelity, loneliness, lack of love, lack of trust, and depression. For group 3, men mention sadness, children, loneliness, freedom, and lack of love. Women refer sadness, depression, loneliness, anger, and pain. For group 4, men enlist sadness, depression, lack of love, and anger. Women indicate depression, loneliness, sadness, freedom, and lack of love. Results show that men report consequences such as sadness, depression, freedom, anger, loneliness, lack of trust, and lack of love. Women report the same, plus pain and infidelity. Men also mention their kids as one of the consequences of the break-up. Results are discussed in terms of sex differences and the effect of culture, due to the fact that most of the negative consequences are emotional, which in turn affects directly people’s quality of life and mental health (Barajas, 2014; Davis et al., 2003) (Project PAPIIT IN306417).

THE MAINTENANCE IN COUPLE RELATIONSHIPS SCALE IN MEXICO

Sofía Rivera-Aragon
Gerardo Benjamin Tonatiuh Villanueva-Orozco

Claudia Ivetha Jaen-Cortes
Pedro Wolfgang Velasco-Matus
Jesus Javier Higareda Sanchez
National Autonomous University of Mexico (Mexico City, Mexico)

Barrón (1993) and Álvarez-Gayou (1996) suggest that couple union and their maintenance relies in preserving the levels of physical, intellectual, and affective attraction, while allowing each member to satisfy the needs and motivations of the couple through effective communication and adequate empathy, promoting self-respect and respect towards the other. Díaz-Loving (1999)
reports that maintenance is synonym to commitment and stability, and it represents a conjunct fight against obstacles, and it is considered as something relevant since it allows a couple to continue growing and later become a family. Acevedo et al. (2007) add that two key components for maintenance are love and friendship. Considering the afore mentioned elements, the purpose of this research was to construct and obtain the psychometric properties of a maintenance scale. A total sample of 731 volunteers (364 men, 367 women) with ages between 18 and 83 years (M = 36.07, SD = 12.75) was used for this research. Items were developed considering previous findings around four areas of maintenance: Meaning, motives, strategies, and consequences. Four exploratory factor analysis (one for each dimension) with orthogonal rotation were conducted for construct validity, and Cronbach’s Alpha was used for reliability (internal consistency). The meaning subscale produced 41 items distributed in 6 factors (understanding, dedication, entertainment, caring, company, complications) that account for 50.81% of the variance and an Alpha of .96. The motives subscale yielded 30 items distributed in 4 factors (need, company, trust, commitment) that account for 49.6% of the variance, and an Alpha of .91. The strategies subscale resulted in 46 items distributed in 6 factors (communication-coping, loyalty, empathy, protection, sexuality-tenderness, self-modification) that explain 63.69% of the variance, with an Alpha of .98. The consequences subscale had 56 items distributed in 4 factors (happiness, personal wellbeing, lack of trust, responsibility) with a total variance of 51.39% and an Alpha of .93. This research shows that the Maintenance in Romantic Relationships Scale (and its 4 dimensions) reflects the cycle of any relationship (Díaz-Loving, 1999), and can be considered a valid, reliable, and culturally relevant scale for the Mexican culture (Project PAPIIT IN306417).

PSYCHOEDUCATION OF SELF-CONCEPT TO PREVENT FROM RADICALISM

Amanda Pasca Rini
Andik Matulessy
Jawa Timur (Surabaya, Indonesia)

Radicalism has become a pattern which used as a tool for the desires of certain groups to return to the elements believed. These groups use the pretext of "Jihad" as an effort to influence their followers, who are willing to take radical actions, such as suicide bombings. The culprit is random, not just adults and teenagers, but also, it has spread to children as happened in Surabaya recently. It is necessary to prevent our self from understandings of radicalism. We should have done prevention earlier. This studying aim to educate teachers been able to grow self-concept to the children, so that, children can prevent them self from understandings of radicalism independently. The research used pure experiment method where Forty-eight (48) teachers in Makassar were the subject. The results showed that p = 0.000 (p <0.05). This means that there is a difference between before and after being given psychoeducation self-concept to the decreasing tendency of radicalism. This psychoeducation can cut down the tendency of radicalism in society and need to be applied to the student at school.
THE INDIVIDUAL DIFFERENCES IN FOREIGN LANGUAGE APTITUDE AND
ITS RELATION TO COGNITIVE ABILITIES

Evgeniya Gavrilova
Moscow State Pedagogical University (Moscow, Russia)

Many studies in differential psychology and psycholinguistics conclude that certain cognitive abilities, namely fluid and crystallized intelligence, short-term memory capacity and working memory capacity, seem to be the most important predictors of individual differences in language achievements (Kormos, Sáfár, 2008; Robinson, 2001). However, some recent empirical findings demonstrate that facilitative effects of cognitive abilities appear to lessen with increasing L2 proficiency (Serafini, Sanz, 2015). Thus, the interactions between individual differences in foreign language aptitude and cognitive abilities need to be further examined. This study was carried out taking the above mentioned into account. Within the sample of 205 L2 English learners (L1 Russian) verbal reasoning abilities, abstract reasoning skills, working memory capacity and short -term memory capacity were measured by number of certain psychometric tests. The ‘Language Aptitude test’ adapted from Modern Language Admissions Tests (administered by the University of Oxford, 2014) was used for measurement of foreign language aptitude. This test includes two scales to estimate the ability to translate from the invented language Z and the ability to explicate its rules. To analyze the relations of cognitive abilities and foreign language aptitude the hierarchical confirmatory factor analysis was applied. The three-factor model showed a suitable fit to empirical data ($\chi^2 = 9,374; p = .928; GFI = .959; AGFI = .914; CFI = 1,000; RMSEA = .000$). According to the model the latent factor of foreign language aptitude which was formed by two scales of Language Aptitude test showed strong positive correlations with the factor of fluid intelligence loaded by abstract reasoning skills, working and short-term memory capacity measures ($r = .52, p = 0.05$), and the factor of crystallized intelligence loaded by three verbal subtests ($r = .67, p = 0.03$). However, the further correlational analysis revealed that only verbal reasoning ability retained positively correlated with foreign language aptitude at the whole range of its distribution. As for working memory capacity and abstract reasoning abilities, the robust effect was found only for low and middle language-skilled participants. We discuss our findings in terms of contemporary approaches to understanding of differential impact of certain cognitive factors on foreign language aptitude.

EATING DISORDER SYMPTOMS AND PERSONALITY: IMPLICATIONS FOR
CLINICAL ASSESSMENT FROM A NETWORK PERSPECTIVE

Swetlana Wildfang
Europäische Fernhochschule Hamburg (Hamburg, Germany)

Philipp Yorck Herzberg
Helmut-Schmidt-Universität (Hamburg, Germany)

Research and theory suggest that meaningful variance in the onset, clinical course, symptomatic profile, and maintenance of eating disorders (EDs) can be explained by certain personality traits (e. g. Neuroticism). However, for various other personality traits there is no such coherent picture. In this article, we investigated associations of global (Big Five) and specific personality traits (e. g. self-esteem) as well as attitudes with typical psychopathological symptoms of Anorexia nervosa (AN) and Bulimia nervosa (BN). Contrary to customary approaches
investigating personality and ED relations, we utilized a network perspective, which focuses on the centrality of the variables and their associations. Comparing the networks of AN and BN patients reveals that personality traits are important for both groups, but there are differences in the network associations. Results emphasize the clinical assessment of global and specific personality traits in patients diagnosed with AN or BN.

THE USE OF DRAWING TECHNIQUES IN WORK OF LEGAL PSYCHOLOGIST

Gayane Vartanyan
Saint Petersburg State University (Saint-Petersburg, Russia)

Juvenile sex crime is currently the social problem. Thus, psychological and educational work with the juveniles convicted is undoubtedly relevant in order to ensure their re-socialization and integration in society. In order to address this problem, psychologists are actively using projective techniques. These techniques allow us to study self-esteem, current psychological state of convicted juveniles as well as those traits which these techniques are narrowly aimed to study. Can we discover a link between psychological traits and clinical and psychological anamnesis and aspects of a completed delict? We tried to check this hypothesis in the PhD research aimed at studying clinical and psychological traits of juveniles convicted of sexual assault. We used the projective technique in the author’s experimental modification in addition to the basic set of techniques (“Picture a man and a woman”). This study was attended by 318 participants: juveniles aged 16-17 years convicted of crimes of various severity (including sexual) and juveniles who didn’t commit crimes. The instruction was to draw a man and a woman. Then participants were interviewed about their pictures: who are these people? How do they communicate with each other? Do they have a story? Interpretation was carried out according to the general rules for processing projective drawing tests. Both individual figures and their interaction were analysed. Interpreting the picture, we paid special attention to possible connection with aspects of the completed delict (sex and age of the victim, the number of offenders, the degree of violence, and also suggested a possible motive of the crime). We compared the results with the available clinical and psychological anamnesis in the personal file. Analysis of clinical cases allows us to assume that there are some connections, showed in the pictures of convicts, with aspects of their completed delicts. Increasing the sample is currently underway followed by the correlation analysis. After this a procedure for standardization and validation of the technique is planned. The results demonstrate one of new options for using the projective technique in practice of clinical and legal psychologists. However, it’s worth noting – this modification, like any projective techniques, is indicative and requires combining with other techniques as a main instrument.
THE FEASIBILITY OF PARENT-MEDIATED INTERVENTION FOR YOUNG CHILDREN WITH AUTISM SPECTRUM DISORDER IN INDONESIA: A PRELIMINARY STUDY

Muryantinah Mulyo Handayani
Airlangga University (Surabaya, Indonesia)

Subandi Gadjah
Mada University (Yogyakarta, Indonesia)

This study aims to explore the feasibility of parent-mediated intervention for young children with autism spectrum disorder in Indonesia. Parent-mediated interventions for children with autism are spreading around the globe, as a response for the high cost of professional interventions. However, the implementation of parent-mediated intervention in the developing countries is very limited. It is argued that inequities in access to this program remains a challenge, due to insufficient autism awareness, differences in child care practices, geographic, social and cultural barriers. The data of this grounded research is being collected by using an open-ended questions online survey for parent of children with autism and in-depth interview with key persons. Seventy five parents (mother/father) of children with autism has been completed the ongoing online survey and this number is still increasing. An in-depth interview with a mother of 2 girls with autism has been conducted and interview with the health care representative is in progress. The data suggested that 96% parents received intervention from therapy center, schools and hospital, while 4% have not get any intervention. It also reported that 77.3% parents actively involved in the intervention, 21.33% medium involved and 1.33% not involved. Most of highly involved parent in intervention identified that parent responsible for their children development and parent involvement would support children development, while parent with lower involvement in intervention indicate that they do not have time to do the intervention or do not have sufficient skills so leave the responsibility to the therapist/teachers. Further analysis would be provided when all data collection is completed. The results of this study are expected to provide a sufficient empirical data in developing an intensive research on the efficacy of parent-mediated intervention for young children with autism in Indonesia. Furthermore, it would produce recommendations to the government and other relevant parties in developing the regulation and sustainable support system for children with autism spectrum disorder.
POSITIVE CBT IN GROUPS TO INCREASE ADOLESCENTS RESILIENCE AND ASSERTIVENESS IN SURABAYA

Hamidah Hamidah  
Nurul Hartini  
Vania Ardelia  
Airlangga University(Surabaya, Indonesia)

Teenagers in Surabaya need to have the resilience and strength of themselves to be able to prevent, avoid, and protect themselves from conditions at risk of mental health and behavioral disorders. If not, then it will influence into negative situations and behaviors. Because it requires the ability to develop resilience and assertiveness. This study aims to determine the effectiveness of positive cognitive behaviors therapy in groups to increase youth resilience and assertiveness in Surabaya. This research is using experimental method. The subjects of the study were male and female adolescents in Surabaya, aged between 13-15 years, taking junior high school education (junior high school), having low resilience and assertiveness. The number of research subjects was 20 people who were divided into two groups, namely the experimental and control groups. CBT therapy is given in 5 sessions, each session is held for 3 hours in the counseling room. Therapy is carried out by a professional assisted by a facilitator.

Data is collected using a scale of resilience and assertiveness. Data were analyzed using Wilcoxon Mann Withney test and supported by qualitative data from three subjects in the experimental group and two from the control group. The results showed a significant difference in the resilience and assertiveness scores of Surabaya adolescents between the experimental and control groups between the gain scores in the pre-test and post-test on the experimental group and the control at 0.000. The size effect of the variable resilience is 0.854 with power of 0.95 and the Assertiveness variable is 0.480 with power of 0.531. This means that the treatment of Positive Cognitive Behavior Therapy in group has a significant role with a considerable effect to increase adolescent resilience and assertiveness. This means that positive cognitive behavioral therapy in group is effective to increase resilience and assertiveness of Surabaya adolescents in the experimental group.
ABOUT PARENTS’ DISREGARD OF TREATMENT OF CHILDREN WITH CHRONICAL DISEASES

Tatiana Sviridova
Svetlana Lazurenko
M. Ritsheva
A. Gerasimova
Anna Buslaeva
Institute of Correctional Pedagogy of Researcher the Russian Academy of Education (Moscow, Russia)

Family life style and quality of childcare are the medical and social factors that in many cases lead to deterioration of children wellbeing. Investigation of factors of parents’ disregard of treatment of children with HIA for determination of necessary types of family assistance promoting treatment compliance. 93 cases of parents’ disregard of treatment of children have been investigated in the “National Medical Research Center for Children’s Health” Federal state autonomous institution of the Russian Federation Ministry of Health. The structure of chronical health problems in children: 71 patient (76.4%) — somatic diseases (including 47.3% — respiratory diseases), diseases of nervous system — 22 patients (23.6%). The analysis of medical documentation and regulatory documents concerning defense of children rights from abuse by parents, standard methods of psychological testing have been performed. Data mathematical analysis has been performed using descriptive statistics methods, criterion X2 (for \( p \leq 0.05 \)). Two variants of parents’ disregard of treatment of children have been revealed: I variant — isolated disregard of treatment of the child (33.4%/31); II variant — disregard of treatment in association with child abuse (66.6%/62). It was found that parents’ disregard of treatment of the child was caused by the combination of factors: insufficient level of culture and medical knowledge, as well as personal and social immaturity, depletion of emotional resources of parents. The situation is worsened by social and financial difficulties of the family, resulted from severity and continuance of child disease. Parents’ disregard of the child is often associated with abuse, what is critical to be considered when providing comprehensive assistance to the family. A long-term comprehensive support of parents and child is required from the moment of diagnosis to eliminate and prevent disregard of treatment, child abuse in the family.
This study presents an updated meta-analysis replicating the study of Stavro, Pelletier and Potvin (2013) regarding the cognitive functioning of alcoholics as a function of time abstinent. The authors noted that individuals with one month of abstinence had similar levels of neuropsychological deficit as did individuals with 12 months of abstinence and that recovery in performance on multiple cognitive tasks occurred with protracted abstinence, and they specifically noted that “generally, dysfunction abates by 1 year post sobriety” (Stavro et al, 2013, p. 203). The current analysis refined the previous meta-analysis however by only including those studies that incorporated the use of standardized neuropsychological tests for which norms are widely available. A total of 34 studies (including a total of 2786 participants) that met pre-determined inclusion and exclusion criteria were included in the analyses. The alcoholics were categorised into recently detoxified alcoholics (0-31 days sober), alcoholics 32-365 days sober and alcoholics >365 days sober consistent with the previous study. The current study employed more stringent control on the tests included in the analysis to include only those tasks described in contemporary neuropsychological test compendia. Forty seven percents of the papers surveyed were not include in the previous meta-analysis. The results indicated that there was a diffuse and pervasive pattern of cognitive deficit among recently detoxified alcoholics, and that these deficits, particularly with regard to memory functioning, persisted even in longer-term abstinent alcoholics. This was inconsistent with the prior meta-analysis which contended that significant cognitive recovery was possible after as little as one year. The persisting cognitive deficits were noted across a wide range of cognitive functions, supporting the notion of a diffuse rather than a specific compromise of cognition in alcoholism following discontinuation as measured using standardised neuropsychological tests. Limitations on the finding included the fact that it was a cross sectional rather than a longitudinal analysis, was subject to heterogeneity of method, had low representation of females in the samples, and had fewer studies of long-term sober samples.
THE ASSOCIATIONS BETWEEN EATING ATTITUDES, SOCIOCULTURAL ATTITUDES TOWARDS APPEARANCE, AND SELF-ESTEEM AMONG TURKISH WOMEN

Ezgi Deveci  
Işık University (İstanbul, Turkey)

Başak İnce  
İstanbul Arel University (İstanbul, Turkey)

Women are known to be under pressure of ideal beauty standards which are mostly shaped by written-visual media, social media, family and friends. Recent studies demonstrated that women who try to adapt themselves to these societal demands which sometimes result in serious problems in eating attitudes and behaviours. In this regard, this study aimed to investigate the relationships between eating attitudes, sociocultural attitudes towards appearance, and self-esteem among Turkish women. For this purpose, 124 women aged between 19-46 years with body mass index (BMI) ranged between 17.58 — 39.01 were recruited. Participants were asked to complete questionnaires on sociocultural attitudes towards appearance, eating attitudes, and demographic information form. Findings showed that 50.8 % of the participants had Facebook account, 86.3% of them had Instagram account, and 23.4% of them had snapchat account. 52.4% of the participants followed body appearance related accounts. A multiple regression was run to predict eating attitudes based on internalization: general attractiveness, internalization: muscular and BMI. These variables statistically significantly predicted eating attitudes (F(3,119)=18.44, p < .000, R2 = .32). All three variables added statistically significantly to the prediction, p <.05. Overweight and obese participants were found to be significantly more influenced by the social pressure from family, peers and significant others compared to those with low and normal BMI. Moreover, low body fat and internalizing attractiveness were positively related to eating attitudes. Participants with a psychiatric illness had significantly lower self-esteem, and higher scores on problematic eating attitudes, sociocultural attitudes and internalization of attractiveness than participants without a psychiatric illness. In this respect, it is plausible to conclude that sociocultural attitudes and pressure have influence on problematic eating attitudes which increase with the rise of BMI. It is also possible to suggest that pressure from collectivistic societies like Turkey might be risk factor for internalized ideal beauty standards.
HOW PERCEIVED ANONYMITY AND SENSE OF SOCIAL RESPONSIBILITY INFLUENCE THIRD-PARTY PUNISHMENT IN NETWORK INJUSTICE EVENTS

Wang Wan
Liu Huiying
Zhengzhou University (Zhengzhou, China)

In order to explore the impact of perceived anonymity and sense of social responsibility on the third-party punishments when individuals encounter unfair events in the network environment, we conducted this research on students of Zhengzhou University. Study 1 recruited 60 participants (29 males and 31 females) to investigate the impact of anonymity on third-party punishment by the dictator game paradigm. The results suggested that the main effect of injustice on third-party punishment was significant (F=473.62, p<0.001) and the interaction effect of anonymity and injustice on third-party punishment was significant (F=2.51, p<0.05). When higher degree of unfairness, the third party punishment under high anonymity conditions was significantly higher than the low one (F=4.53, p<0.05). In the second study, the Questionnaire of Willingness of Forwarding and Commenting on Network Injustice Events was compiled to survey the network third-party punishment. 704 college students finished it and Perception Anonymity Questionnaire, Social Responsibility Questionnaire. The results showed that perceived anonymity positively predicted the willingness of forwarding and commenting on network unfair events (β=0.08, t=2.08, p<0.05). Social responsibility moderated the effect perceived anonymity on the willingness of forwarding and commenting (β=-0.10, t=-2.54, p<0.05). The willingness of forwarding and commenting increased with the perceived anonymity among low sense of social responsibility group (simple slope=0.18, t=3.28, p<0.01), but didn’t among the group with high sense of social responsibility(simple slope=-0.02, t=-0.40, p>0.05). This research draws the conclusion that people with less sense of social responsibility prefer doing third-party punishment under anonymous environment when meeting network injustice events.

LAYPEOPLE’S DECISION-MAKING IN REPORTING CHILD MALTREATMENT: CHILD AND FAMILY CHARACTERISTICS AS A SOURCE OF BIAS

Maria Calheiros
Universidade de Lisboa (Lisbon, Portugal)

The process of reporting child maltreatment is vulnerable to judgment bias, which may affect the various stages of the child protection system continuum. In this study we examine the role of child (gender, racial/ethnic and age) and family characteristics (family structure and socio-economic status) in laypeople’s severity assessment and probability of referral of child maltreatment (abuse or neglect). 353 participants (262 females) between 18 and 72 years old (M = 28.95; SD = 11.71), responded to a questionnaire presenting situations of abuse or neglect (based on Portuguese legal standards) that varied in the characteristics of the child and the family and assessed either the severity of abuse or severity of neglect, and the probability of referral of each situation. Several repeated measures ANOVA were conducted. Results indicate pervasive bias. Despite acknowledging the severity of both abuse and neglect situations, the likelihood of reporting maltreatment was higher a) for female, younger, Caucasian and Black children compared to male, older children and children of Gipsy ethnicity; and b) for families with economic difficulties, divorced,
single parent, and stepfamilies compared to nuclear families. These results emphasize the importance of studying the referral process of child maltreatment at a community level. We suggest that public awareness may facilitate the referral of maltreatment practices, minimizing the over-reporting and underreporting of cases, and encouraging early and preventive intervention.

INTERCULTURAL FRIENDSHIPS, SOCIAL IDENTITIES AND PSYCHOLOGICAL WELL-BEING AMONG THE RUSSIAN MINORITY IN NORTH AND SOUTH CAUCASUS

Viktoriya Galyapina
Nadejda Lebedeva
Zarina Lepshokova
National Research University Higher School of Economics (Moscow, Russia)

In recent years, researchers (Hamm et al., 2005; Newgent et al., 2007) have noted an increase in the prevalence of intercultural friendships. Intercultural friendships have potential advantages because they provide new resources and perspectives for maintaining self-esteem and self-respect for young people (Brody et al., 2008). Previous studies showed that cultural diversity, the ethnic status of the groups, its size, the language of communication, the nature of intercultural relations influence on intercultural contacts and its relationship with psychological well-being. On this basis, the study of intercultural friendships in different sociocultural contexts is relevant. This study focused on the relationship between intercultural friendly contacts, ethnic, religious identities, identification with the large society and psychological well-being of Russian ethnic minority members living in North and South Caucasus: RNO-A and KBR — two republics of North Caucasus of RF; Georgia — is a country of South Caucasus. The sample included 948 respondents (RNO-A — 327, KBR — 309, Georgia — 312). We used a questionnaire developed in the framework of MIRIPS project (Lebedeva, Tatarko, 2009). We carried out data processing using structural equation modeling in AMOS. Results showed that intercultural friendly contacts predicted the psychological well-being of the Russians in the inclusive contexts (RNO-A, KBR). Intercultural friendly contacts were positively related to the identification with the large society in all contexts. Ethnic identity predicted self-esteem of the Russians in RNO-A, KBR (inclusive contexts), and, in contrast, was negatively associated with life satisfaction in least inclusive context (Georgia). The identification with the large society promoted life satisfaction only in most inclusive context (RNO-A). Religious identity predicted psychological well-being in less inclusive (KBR) and least inclusive contexts (Georgia). We found the mediation role of ethnic identity and identification with the large society in the relationship of intercultural friendly contacts with psychological well-being only in very inclusive context (RNO-A). In general, the study showed that intercultural friendly contacts predicted the psychological well-being of members of ethnic minority, both directly and indirectly through ethnic identity and identification with the large society only in inclusive contexts.
A CONFIRMATORY FACTOR ANALYTIC STUDY OF AN AUTHENTIC LEADERSHIP MEASURE ON A NIGERIAN SAMPLE

Bright Mahembe
Tolulope Balogun
Charles Allen-Ile
University of the Western Cape (Cape Town, South Africa)

The expression of an authentic self is a fundamental requirement in leadership (Goffee & Jones, 2005). It is a challenge that every authentic leader is faced with. There is an anticipated authenticity that every follower demands of a leader — to be real, trustworthy, sincere, dependable, genuine, just and honest. Luthans and Avolio (2003) referred to authenticity as the congruence between what one says, is and does whilst Avolio, Gardner, Walumbwa, Luthans, and May (2004, p. 802) citing McCain and Salter (2004) referred to the importance of being authentic as learning to love honesty and justice, "not just for their effect on personal circumstances", but for their impact on humanity and on the world at large. When authentic characteristics are demonstrated by the leader, followers are motivated to adhere, obey the leader’s rules and initiate more commitment towards the organization. Although the authentic leadership construct is not a new theory, there are still few divergent opinions about what authentic leadership really portrays and how it stands out from other effective leadership styles like transformational leadership. It has even been argued that conceptually, authentic leadership intersects with some other forms of positive leadership behaviours (Avolio & Gardner, 2005). However, despite the dissenting opinions that persist, most scholars have noted and accepted authentic leadership and its four dimensions as a distinct, separate leadership construct (Gardner, Cogliser, Davis, & Dickens, 2011; Klenke, 2007; Yammarino, Dionne, Schriesheim, & Dansereau, 2008) with some researchers engaged in refining its theoretical models (Gardner, Avolio, Luthans, May, & Walumbwa, 2005; Ilies, Morgeson, & Nahrgang, 2005), some in redeveloping its measures of assessment (Luthans et al., 2007; Neider & Schriesheim, 2011; Walumbwa et al., 2008) and others preoccupied with testing for antecedents, consequences, mediators, and moderators (Alok, 2014; Gardner et al., 2011).

AN INTEGRATED MODEL OF THE ROLE OF AUTHENTIC LEADERSHIP, PSYCHOLOGICAL CAPITAL, PSYCHOLOGICAL CLIMATE AND INTENTION TO QUIT ON EMPLOYEE WORK ENGAGEMENT

Bright Mahembe
TV Balogun
C Allen-Ile
University of the Western Cape (Cape Town, South Africa)

A plethora of previous studies have proven that efficiency, productivity, high performance and stability on the job can be better achieved when the employees are dedicated, committed to their work roles and experience work engagement. The experience of work engagement on the part of the employees is not a random event; it depends on a myriad of factors that include authentic leadership. Leaders have a cumulative change effect on their followers; hence, leaders in an organization can be termed as core drivers of employee engagement. Hence, it becomes
imperative to seek to understand what authentic leadership as a construct has to offer to the workplace. Authentic leaders know what they stand for, what their value systems are and they candidly and effectively communicate these moral values to their followers. The authentic leaders through their relational transparency and self-awareness amongst their attributes are likely to engage in behaviours that promote employees’ psychological capital (hope, efficacy, optimism and resilience) through an enhanced focus on employee coaching and mentoring. These leaders are likely to also cultivate a conducive psychological climate for the development of work engagement. The use of authentic leadership to influence employees’ work engagement via the psychological capital and psychological climate is likely to ultimately help organizations reduce employment costs through reduced turnover intention feelings. The aim of the study was to test an integrated model of relationships that exist between authentic leadership, psychological capital, psychological climate, intention to quit and work engagement.

THE AMERICAN PSYCHOLOGICAL ASSOCIATION’S CLINICAL PRACTICE GUIDELINE INITIATIVE

Howard Kurtzman
American Psychological Association (Washington DC, USA)

Clinical practice guidelines, which provide evidence-based recommendations for interventions for specific health conditions, are increasingly used in health care systems throughout the world. The American Psychological Association (APA) has designed a set of policies and procedures for guideline development and, since 2017, has released guidelines in three areas (depression, obesity, and post-traumatic stress disorder), covering both psychosocial and medical interventions. It is currently working on a guideline on treatment of chronic pain. APA’s approach draws from best practices for assessment of clinical evidence and formulation of guideline recommendations as described by organizations such as the U.S. National Academies of Sciences, Engineering, and Medicine (Institute of Medicine), the GRADE Working Group, and the Guidelines International Network. In accord with these best practices, APA’s guidelines are based on systematic reviews of evidence, clinicians’ experiences, considerations of patients’ values and preferences, and public input. Panels that develop guidelines are composed of scientists and clinicians from multiple disciplines as well as patient representatives. The panels operate under a policy for identifying and managing panel members’ conflicts of interest. This presentation will review the structure and mechanisms of APA’s guideline development effort, assess the progress made thus far, and discuss the scientific, logistical, and policy challenges that have been faced. It will also address how APA’s guidelines are disseminated and implemented in various sectors of the health care system, including: health care providers (such as psychologists, physicians, nurses, and social workers), patients and families, national and local government health agencies, and insurance companies.
INDIVIDUAL FEATURES OF INTERNET ADDICTS

Victor Moskvin
Nina Moskvina
Russian University of Physical Education, Sport, Youth and Tourism (Moscow, Russia)

Arbitrary regulation of the psyche occupies one of the central positions in modern psychology. Previously, we obtained data on the accumulation of signs of right-hemispheric dominance in chemical addicts. Currently, Internet addiction is considered as one of the forms of mental illness; however, no research has been conducted regarding asymmetry regarding Internet addicts. We carried out the work, which was based on the concept of partial domination of A.R.Luria and on the principles of neuropsychology of individual differences of E.D. Chomsky. To study the characteristics of the manifestations of Internet addiction in connection with the lateral and individual psychological characteristics, the following study was conducted. Students aged 17–18 years of a sports university were taken as subjects, the total sample size was 100 people. In the sample of subjects, a wide range of psychodiagnostic and psychophysiological methods was used, which will be presented in the report. As a result of the use of factor analysis, 9 factors were identified (factorization completeness was 90%). The report analyzes the factor "Normativity of behavior". Subjects with a predominance of left laterality (right-hemisphere) show higher rates of Internet addiction, their time perception is more connected with their orientation to the present and the past. The data indicate weak regulatory processes in the group of Internet addicts and the accumulation of signs of right-hemispheric dominance in their sample. Thus, previously obtained data on the accumulation of signs of right-hemispheric dominance in chemical addicts (in young people with manifestations of chronic alcoholism or drug addiction) can be extended to Internet addicts, which indicates the weakness of the functions of arbitrary regulation and speaks about the features of time perception. The results can be used in the differential diagnosis of manifestations of Internet addiction in young people, as well as in conducting psychocorrectional measures. The study was carried out with the financial support of the Russian Foundation for Basic Research, project No. 18-013-00856A: "Individual characteristics of a person's mental health and his psychophysiological prerequisites (on the example of studying the features of Internet addiction)".

SCHOOL BACKGROUND AND ADJUSTMENT TO UNIVERSITY

Gillian Finchilescu
Carlista Mosenene
University of the Witwatersrand (Johannesburg, South Africa)

Twenty-five years after the fall of apartheid, the quality of South Africa’s schools is highly variable, and divided along race/socio-economic lines. While many more Black learners now enter universities, there is still a disproportionate number that fail or drop out. In this study, we investigated whether the type of school students attended affects their adjustment to university. Schools in South Africa are categorized into 5 quintiles. Schools in the first 3 quintiles (LQ) largely cater for lower socio-economic classes, have low fees and are often under-resourced. The top 2 quintiles (HQ) cater for the middle to upper socio-economic classes. These schools charge high fees, and are generally better resourced. Thus the type of school was divided along these criteria into 2 categories. Adjustment was assessed in two ways. The Student Adaption to
College Questionnaire (SACQ) developed by Baker and Siryk (1999) measured four dimensions—academic, social, and emotional adjustment as well as attachment to the institution. The second way used Berry’s model of acculturation which argues that there are four categories of responses to a new culture—assimilation, integration, separation and marginalization (Berry, 1997). First-year students at the University of the Witwatersrand were invited to complete an online survey which contained the relevant adjustment items as well as a number of other questions. Only the responses of the 158 Black participants are considered in this paper. Surprisingly, using t-tests, it was found there was no difference between students from LQ and HQ schools on the SACQ dimensions, suggesting that school background did not influence adaptation to university (p>.05). However, using the Berry model, a very different picture emerged. A high percentage (46.9%) of the respondents who attended HQ schools fell into the ‘Integration’ category, indicating they were comfortable in both the university and their home environment. In contrast, a large number (48.9%) of those in LQ schools fell into the ‘Marginalized’ category ($\chi^2(3)=18.2$, p<.000). This suggests that these students did not feel comfortable in either the university environment or their home environment. Exploration of performance at university showed, overwhelmingly, that proficiency in English was the key determinant.

SI TOU TIMOU TUMOU TOU (ORIGIN PHILOSOPHY LOCAL WISDOM PROSOCIAL BEHAVIOUR IN MINAHASA’S CULTURE)

Preysi Sherly Siby
Universitas Kristen Indonesia Tomohon (UKIT) (Manado, Indonesia)

Socializing people need other people, so that there is an interaction of mutual respect, mutual love and mutual help among each other. This prosocial behavior that will form a mutually sustainable civilization. Helping behavior is an action taken to provide benefits / well-being for other people (who are helped) either physically or psychologically without any benefit for individuals who take action (helper). Minahasa’s culture is a culture that dominates (the biggest tribe) in North Sulawesi province. Minahasa society still hold firm the culture tradition. And has one view or philosophy (local wisdom) that underlies prosocial behavior in social life. The philosophy is Si Tou Timou Tumou Tou. Si Tou Timou Tumou Tou was conceived by National hero from north Sulawesi, Dr. Gerungan Saul Samuel Jacob Ratulangi “Sam Ratulangi”. It’s means humans live to revive other humans. Humanizing human beings. Man lives to educate others. Some forms of helping behaviour in Minahasa’s culture are Mapalus, maramba, brantang, baku-baku bantu, etc. Writing is done through library study methods and learning experiences from writers through community life.
EXPERIMENTAL CHANGE OF ATTITUDE TOWARDS TRANSPLANTATION (POLISH SAMPLE)

Hanna Danuta Liberska
Kazimierz Wielki University (Bydgoszcz, Poland)

In some diseases, the only remedy is to transplantation of the organ. In Poland, specialists observe many different problems with organ donation and transplantation in practice related to medicine, psychology and the socio-cultural area, including education and legislation. The research problem concerned the attitudes of young adult Poles towards transplants and the possibility of changing them. The attitude is a relatively permanent tendency towards positive or negative evaluation of the subject of attitude (Wojciszke, 2011). The evaluation of the subject of attitude can be manifested by the type of emotion aroused by this subject (see Aronson, Akert, Wilson, 2012; Kendrick, 2006) or by endowing it with a certain value in the life of an individual. Main questions: 1. What are the attitudes of young adult Poles towards transplants? 2. Is it possible to change the attitude of young adult to transplants? 3. What persuasive influences directed at changing attitudes of towards transplantation are the most effective in young adults? The possibility of changes in the attitudes towards transplantation in young adults was experimentally tested. In the test the peripheral strategy was applied and the features of the deliverer of persuading communication were manipulated. The person delivering the same communication to the three study subgroups had different features; reliability/ competence, physical attractiveness or personal engagement. The sign and strength of the attitude towards transplantation was measured by a scale SPWT prepared by author. This tool includes 8 items, (one of the items: “Transplantation of organs is not consistent with the system of my believes”). The participants were 90 young adults, aged 20-30. On the basis of the results marked on the SPWT scale it was found that the majority of respondents had positive attitude towards transplantation (89%). In all groups the sign and strength of attitudes changed as a result of exposure to the persuading communication. The most effective was the delivery by the personally engaged deliverer. The results confirmed the hypothesis of the key importance of emotions aroused by the communication referring to the loss and gain.
Psychological security online implies protection of the individual in conditions of cyber interaction. The state of psychological security can wipe out the internet risks mitigating negative consequences. The identification of people with high psychological security can help indicate socio-psychological factors contributing to special "secure" thinking and behavior of children on the Web. The purpose of the study was to explore specifics of children psychological security online. The following methods were used: Semantic differential (D. Peabody) modified by A.G. Shmelyov; The Children’s Personality Questionnaire (R. Cattell), adapted by E.M. Aleksandrova, I.N. Gilyasheva; The High School Personality Questionnaire (R. Cattell). The first group of the respondents consisted of 87 teenagers aged 11-12, the second group involved 84 adolescents at the age of 14-15. The results showed that the level of online psychological security and the revealed system of interrelations between psychological security and personal characteristics of 11-12- and 14-15-year-olds differ a lot. Older schoolers (14-15-aged) feel more secure on the net, which can be explained by greater user experience. In addition, younger children’ assessments of similarity of states "I’m secure" and "I’m online" have less congruence of values. It was found that psychological security of children on the Internet is based on a child’ integral security irrespective of his age. The assessment of one’s actual state as a secure one is the most significant predictor of psychological security. That is, assessing his environment, ambient conditions as secure the child is inclined to extrapolate this estimate of security to the content of the internet with which he interacts. The study resulted in indicating predictors defining psychological security of children online. For 11-12-year-olds characteristics of their emotional sphere are important predictors. In the group of 14-15-year-olds regulatory-communicative features — self-control, self-organization, social brevity and dominance — greatly contribute to the formation of online psychological security. The analysis of psychological security of children on the internet depending on their involvement in this environment can be targeted for further research since in the course of the study the tendency of teenagers’ assessing their online surfing as more secure than their actual state "I’m now" was revealed. Acknowledgements The article was supported with a grant from the Russian Science Foundation (project № 16-18-00032).
PSYCHOLOGICAL SECURITY OF INTER-ETHNIC INTERACTION

Olga Zotova
Lyudmila Tarasova
Sergey Mostikov
Liberal Arts University — University for Humanities
(Yekaterinburg, Russia)

The state of psychological security can reduce barriers providing people with the opportunity to interact with the world. In this light, security as a socio-psychological category is a key pillar for strengthening inter-ethnic harmony. When people feel psychologically secure they do not experience a threat to identity and their sense of dignity. Domestic and foreign research shows that people being psychologically secure are more likely to use constructive strategies. The sampling of the study consisted of 514 subjects. The methods used in the study included: Semantic differential (D. Peabody) modified by A.G. Shmelyov; “Assessment of Need for Security Satisfaction” questionnaire by O.Yu. Zotova; G.U.Soldatova and S.V.Ryzhova “Ethic Identity Types” questionnaire; “Index of Tolerance” express-questionnaire by G.U.Soldatova, O.A.Kravtsova, O.E.Khukhlyaeva, L.A.Sgaigerova. This study revealed the characteristics of inter-ethnic relations perceived by the respondents as psychologically secure. They are: trust, opportunity to be active and an individual’s strive for free self-expression without discriminating people according to their ethnicity. The absence of dependence of the group’s trust level on ethnic belonging of this group members in the course of interpersonal interaction was indicated. Significant differences in dominating types of identity in the respondents with various level of need for security satisfaction were stated. Statistically significant linear dependence between variables “Need for security satisfaction” and “General tolerance level” was found. It was revealed that the respondents from the region with greater ethnic diversity tend to give lower estimates to their psychological security than the respondents from regions with average ethnic heterogeneity. In the society where people often face numerous types of threats insecurity acts as a limitation of inter-ethnic contacts. In this situation many forms of interaction between representatives of different ethnic groups cannot develop even if potential complementarity of interests has been achieved. The forms of interaction can have been blocked due to lack of trust or lack of the opportunity to exercise constructive interaction. If a person in his security depends on his community support self-identification should be clearly expressed and confirmed by this community members; any departure from this can be construed as identity and security weakening. Acknowledgements The article was supported with a grant from the Russian Science Foundation (project №18-18-00112).
Integrating various scientific-theoretical approaches to ontogenesis of emotions helps us to understand emotional development as a complex natural process of its complication and enrichment in the context of the general socialization of children and teenagers. We assumed that emotional development at children’s and teenage age is carried out in three interconnected clusters and has three components — cognitive, affective and expressive with different structural dispositions that allowed us to design a priori model of emotional development representative for these age categories. Methods: diagnostic complex of the emotional development of children and teenagers (E.I. Izotova); social experiences and affective decentration (T.D. Martsinkovskaya, T.P. Gavrilova, V.V. Boyko), emotional intelligence (D.V. Lyusin); photo and video fixation of expressive signs and estimation of its intensity and localization. Statistical methods of the analysis of data: correlation analysis, factorial analysis (IBM SSPS Statistics v.22.0; R version 3.4.1); modeling by the structural equations of SEM (IBM AMOS Graphics v.19). Participants of a research 326 people participated in a research (N = 326): the children of preschool age from Moscow (n1 = 111); the children of preschool and younger school age from ethnic regions RF — Tatarstan and Buryatia (n2 = 106); the children and teenagers from south regions RF and from Venezuela (n3 = 109). The informed consent on participation in the research was received from parents of minors. Facts and conclusions As a result of coordination of statistical parameters for estimation of the model, the values of the statistical indicators are: χ² (chi-square) = 3.99; df (number of degrees of freedom) = 13; p.value (significance value of distinctions) = 0.991. The comparative index of consent of CFI(Comparative Fit Index) matters 1. The rated index of consent of NFI (Normed Fit Index) — value 0.981. Both indexes at norm (not less < 0.95) show good coordination of the model. On the basis of this fact a priori model of emotional development of children and teenagers with a secondary factor (the sociocultural standard of experiences and expressions of emotions) can be transformed to the status of well-founded a posteriori model.
PARENTAL FACTORS OF MORAL DEVELOPMENT OF CHILDREN AND TEENAGERS

Tatiana Avdulova  
Moscow State Pedagogical University (Moscow, Russia)

Interrelations between representations of parents of justice, empathy and features of moral development of children and teenagers are investigated. Justice Sensitivity by M. Schmitt; Scale of conscientiousness by Melnikov, Test of Empathy by T. Avdulova; moral dilemmas by G. Piaget; V. Boyko’s Technique of level of empathy, Analysis of Family Relationship by Eydemiller, Yustitskis. Statistical methods of the analysis of data: correlation analysis (IBM SSPS Statistics v.22.0). In total by a research it has been captured 178 respondents (on Russian sample). In total 46 teenagers at the age of 16-17 years; 43 children (age 8-9) and 89 adults (fathers and mothers) participated. Facts and conclusions

The statistical analysis of data has confirmed high positive communication between sensitivity to justice of parents and sensitivity to justice of the teenager. Similar correlation was received on empathy indicators for schoolers. Significant positive correlation between Sensitivity of the Victim at fathers and teenagers was found at the level of p≤0,01. Similarly, high correlations are found for sensitivity of the Beneficiary, Violator and Witness. So the first research hypothesis that teenagers in the representations of justice reproduce ideas of parents of justice has been reliably confirmed. On high sensitivity of the teenager to justice from a position of the Victim such components of style of parental education influence: infantilization of the child from a mother’s side, a hyper care from the father (opposite relation), the minimum parental requirements. Direct significant link between a projection of children’s qualities by mothers and sensitivity of the victim at teenagers. When mothers stimulate such children’s feelings as spontaneity, naivety, the teenagers demonstrate the position of Victim. When fathers spend less attention, time and forces for the teenager, the level of a position of the Victim in relation to justice is higher. In general, according to our research, fathers play more important role in formation of positive moral identity of teenagers whereas maternal guardianship detains development of this vector. The second hypothesis of influence of style of education of parents on sensitivity to justice of teenagers was confirmed.
ETHNIC IDENTITY OF SAAMI TEENAGERS — REPRESENTATIVES OF THE INDIGENOUS PEOPLES OF THE FAR NORTH OF RUSSIA

Natalya Flotskaya
Svetlana Bulanova
Mariya Ponomareva
Nikolay Flotsky
Lomonosov Northern Arctic Federal University
(Arkhangelsk, Russia)

The present article is devoted to the problem of studying ethnic identity of Saami adolescents, representatives of the indigenous peoples of the Far North of Russia. The aim of the study is to analyze the ethnic identity of Saami boys and Saami girls during adolescence. The article presents the results of the empirical study conducted using the method of G.U. Soldatova, S.V. Ryzhova “Types of Ethnic Identity”. Thirty-nine Saami adolescents who are 12-13 years old (18 boys and 21 girls), as well as 40 Saami adolescents who are 14-15 years of age (23 boys and 17 girls) participated in the present study. The respondents of the study live in the village of Lovozero, Murmansk region. In order to identify the characteristics of the development of the ethnic identity of Saami adolescents, adolescents of the Russian nationality were also included into the study: 59 participants aged 12-13 (31 boys and 28 girls), and 62 participants aged 14-15 (32 boys and 30 girls). The data collection was carried out during the period April-May 2018. Analysis of the data collected allowed us to establish the dynamics of development of ethnonihilism, ethnic indifference, positive ethnic identity, ethno-egoism, ethno-isolationism and ethno-fanaticism among boys and girls of Sami nationality during adolescence (from 12 to 15 years of age). The features of the ethnic identity of Saami adolescents in comparison to the ethnic identity of their peers of the Russian nationality were revealed. The acquired results can be applied to preservation and development of the identity of adolescents — representatives of the indigenous peoples of the Arctic territories of the European North of Russia. This will allow future development of individual routes for training and education of adolescents — representatives of indigenous peoples of the Far North, as well as improvement of the system of psychological assistance and support for such adolescents. This will provide prospects for preserving the culture, traditions and ethnic identity of indigenous peoples, which, ultimately, will contribute to the development of the northern territories and the realization of national interests, and the achievement of the strategic goals of the state policy in the Arctic zone of the Russian Federation.
INVESTIGATING HOMICIDE OFFENDER TYPOLOGIES BASED ON THEIR CLINICAL HISTORIES AND OFFENCE PATTERNS

Valeria Abreu Minero
King’s College London (London, United Kingdom)

Previous research has shown specific homicide offence characteristics differ in relation to the offender’s psychiatric diagnosis. Data on offenders convicted of homicide in England and Wales between 1997 and 2014 who were in contact with mental health services in the year preceding the offence (n= 759) was derived from the National Confidential Inquiry into Suicide and Safety in Mental Health (NCISH). The NCISH obtained data from three main sources: psychiatric reports prepared for trial, the Homicide Index; and mental health services. Variables describing: (1) the offender’s mental state at the time of offence; (2) characteristics useful for police investigations; and (3) patterns of offence characteristics were included. Multiple Correspondence Analysis was used to investigate the interrelationships between all variables and Hierarchical Agglomerative Clustering to identify subgroups of individuals. Analyses revealed three homicide typologies: Comorbid, Psychosis and Depression. Findings suggest differences in offender’s clinical history are related to differences in offence patterns. Identifying which aspects of the offender’s history and demographics that may differ depending on the type of homicidal act may help to inform investigators of the most likely unknown offender based on offence characteristics.

ART OF CARE: SOCIAL BARRIERS FOR A SAFE WORKPLACE

Bianca Quintao
B. Solutions (Rio de Janeiro, Brazil)

Raphaела de Melo Baesso
Inmetro (Rio de Janeiro, Brazil)

Since 90% of all accidents at the workplace are related to human factors, the application of Social and Organizational Psychology may offer strategies to decrease this score and consequently the total number of accidents. The objective of this work is to present an assessment tool created to i) measure social and psychological aspects in a workplace that contribute to a safe environment, ii) enable the applicant to identify gaps and fragilities in the maturity of work groups and iii) determine to which extent leadership impacts safety. This study intends to measure the degree of mutual care and devotion considering new ways to promote a safe environment to individuals at risk. A group maturity on safety related to social barriers can be analyzed by reviewing aspects such as interpersonal ability (cooperation and empathy), emotional intelligence (positive attitude and self-control), responsibility (integrity and honesty), problem-solving ability (decision making and independence attitude), cordiality (kindness and respect), team player skills, participation (initiative), resist group pressure ability, eliminate horseplay, clear understanding of functions, duties and responsibilities. For this purpose a comprehensive survey has been conducted. The related questionnaire was divided into 32 affirmative phrases where each participant was asked to assign values from 1 to 5 related to their work group, their leadership and themselves. The chosen group of participants consisted of 18 male and female employees of an assembly department in an international oil and gas service company in the State of Rio de Janeiro, Brazil. Their age ranged from 18 years to 45 years. 3 participants attended pre-test sessions to ensure a common understanding of
all questions and themes. The remaining 15 interviewees answered to the questionnaire directly while the survey was reviewed to be in line with Cronbach’s alpha calculation.

Cronbach’s alpha (α) is the most widely used tool to validate a survey. In this study α was higher than 0.9 which indicates that the results of the survey are reliable.

PROFESSION AS ONE OF ASPECTS AFFECTING THE QUALITY OF LIFE

Dace Medne
J. Vītols Latvian Academy of Music (Riga, Latvia)

Ērika Gintere
University of Liepaja of Social sciences (Liepaja, Latvia)

Quality of life is a satisfaction of individual’s values, targets and needs, actualizing a person’s skills or lifestyle. In Latvia every year a working resident spends at work at least 1910 hours (Grīnberga, 2018), therefore the quality of life at work is a significant part of the overall quality of life. Teachers in Latvia work more than their colleagues in other European Union countries and OECD countries (Education at a Glance 2018: OECD indicators). In order to improve the quality of life for teachers it is essential to identify the teachers’ professional needs. In accordance with the actualised problem there was determined a purpose of a study: to identity teachers’ actual professional needs and to develop. In the study participated 78 interested persons. In order to identify the educators’ professional needs there was developed and approbated a survey. As a result of a study there was detected that mostly there are mentioned the following needs: for courses and seminars of professional perfection, for creativity and related activities, for full provision of latest educational aids, including ICT, to use for work in lessons, for appropriate salary and social warranties, for comprehension, support and assessment from school management, as well as friendly, supportive team, for convenient, safe and psychologically comfortable work environment. It is concluded that main background for the satisfaction of teachers’ professional needs and improvement of quality of life at work is an exhaustive healthy mutual cooperation in levels of employees, management, education industry administration and international level.

PSYCHOLOGICAL CHARACTERISTICS OF WOMEN WITH DIFFERENT STAGES OF BREAST CANCER

Diana Tsiring
Evgeniya Evstafeyeva
Chelyabinsk State University (Chelyabinsk, Russia)

Marina Mironichenko
South Ural State Medical University (Chelyabinsk, Russia)

The present research allowed acquiring new knowledge about psychological factors of survival of patients with malignant neoplasms as well as psychological factors of cancer course. An empirical study was conducted on a sample of women with breast cancer (N=200), under the supervision of an oncologist from diagnosing to 6 months. Based on comparative analysis of psychological factors of patients with malignant neoplasms being in remission during 6 months or more and patients with IV stage malignant neoplasms, the complex of psychological factors contributing to the current and long-term effectiveness of treatment was determined, which in turn, shows their effect on the duration of relapse-free and overall survival. The features
of the system of patients with malignant neoplasms mental organization were studied such as implicit cognitive beliefs, optimism or pessimism as the disposition of the individual, coping strategies to overcome the situation of the disease, viability, personal helplessness/independence, quality of life, subjective age. Peculiarities of psychological characteristics depending on the stage of the disease were defined.

GENERAL THEORY OF PSYCHOTHERAPY

Alexander Katkov
International Institute of Social Psychotherapy (Saint Petersburg, Russia)

According to the results of the implementation of the thematic basic research program (2000-2017), it was determined that the professional psychotherapy, in accordance with the modern framework concept, is a single profession (according to the Strasbourg Declaration on Psychotherapy of October 21st, 1990, established by the European Association for Psychotherapy); research and practice direction, which able to argue belonging to the codified scientific knowledge system; major and the most demanded social practice, capable of meeting the contemporary challenges At the same time, each of the above-cited positions is substantiated by a fundamental and comprehensive general theory of psychotherapy, which serves as a true integration pole capable of overcoming any centripetal tendencies in the development of the profession. The general theory of psychotherapy is a multi-level, complex system, the core of which is represented by the following developed components: principles of organization of modern science and guidelines for conducting academic research, that meet the contemporary level of development of fundamental and applied science, as well as the complexity of the research subject in the field of professional psychotherapy; a full-fledged basic research program, in which the scientific research methodology of the fundamental and applied problems of psychotherapy and related areas is presented and argued; the concept of the subject area of professional psychotherapy, in which the content and the basic requirements for the deducing of the essential characteristics of the subject area of psychotherapy are presented; the concept of the main vectors of differentiation-integration of professional psychotherapy, demonstrating both the essential difference of psychotherapy from the so-called maternal disciplines, and the "donor" information potential of this research and practice direction; the concept of a disciplinary matrix of professional psychotherapy, demonstrating a hierarchy of structural levels of the considered research and practice direction; developed theoretical, psychotechnical and instrumental concepts— which are components of the general theory of professional psychotherapy, distributed among the appropriate levels of the disciplinary matrix, aggregated into the desired general theory of psychotherapy.
FORMATION OF ANTITERRORIST VALUES IN THE INTERETHNIC AND INTER-ETHNIC INTERACTION OF UNIVERSITY STUDENTS

Viktoriya Boguslavskaya
Academy of Psychologists and Pedagogics of the Southern Federal University (Rostov-on-Don, Russia)

An important place in the system of countering the ideology of terrorism is occupied by educational technologies of forming the psychological stability of young people to the destructive influence of extremist information. Educational programs focused on the formation of anti-terrorist values in the youth environment should use communication technologies in order to form a tolerant interethnic interaction. The purpose of the experimental study is to identify the value orientations of university students in relation to the antiterrorist ideology. According to the results obtained, training in the polyethnic environment of a modern university can lead to an aggravation of ethnic identity and interethnic relations. The study was conducted in 3 universities of cities in the south of Russia and the North Caucasus. Methods were used to diagnose the level of civic identity, adaptation in the student environment, interpersonal trust, and others. The object of study — freshmen in the amount of 546 people. Among them, 317 girls and 229 boys from 17 to 21 years of different specialties. Differences on a territorial basis are revealed in the analysis of poorly adapted students. Students of SFU and IDNK showed in most cases an average level of civic identity (medium — 67%; high — 5%; 18% — low), and KBSU students had a low level of civic identity (86% — low; 14% — average). In groups with a high level of adaptation, a significant excess of the number of students with a high level of interpersonal trust (medium — 27.0%) over the number of students with a low level of interpersonal trust (14.0%). For students with a low level of adaptation, a statistically significant excess of the number of people with a low level of interpersonal trust (27.6%) over the number of students with a high level of interpersonal trust (13.3%) was established. So, students with different levels of personal and academic adaptations found differences in the level of interpersonal trust and empathy. At the same time, the differences in the level of development of interpersonal trust in the multiethnic environment of the university turned out to be more pronounced.
PARENTING AND DIGITAL WELLNESS FOR ALPHA GENERATION IN SURABAYA

Aurelia Diastari
Rudi Cahyono
University Airlangga Indonesia (Surabaya, Indonesia)

Parents have two main tasks in parenting, namely developing children’s character and competence (Baumrind, 1996). Character consists of responsibility in facing challenges, controlling impulsivity, having morals, and self discipline. While competence is the ability of individuals to achieve personal and social goals. The challenges in parenting always exist from generation to generation. Parents with early childhood are now faced with the challenges of the Alpha generation. Alpha generation was born in the 21st century starting in 2010 (McCrindle, 2014). 2.5 million children of the Alpha Generation are born in the world every week. According to McCrindle, the Alpha Generation cannot be separated from gadgets, which in turn has impacts on lack of socialization, lack of creativity, being individualistic, wanting things that are instant, and not appreciating the process. Characteristics of Alpha Generations are related to digital wellness. The definition of digital wellness is physical and psychological well-being in the digital technology world (Ribble, 2007). On the other hand, realizing psychological well-being in children is part of the parenting works.

THE HISTORICAL CLINICAL RISK-20 (HCR-20): 15 YEARS OF VIOLENCE PREDICTION AMONGST MENTALLY DISORDERED OFFENDERS.

Gary Macpherson
The State Hospital (Glasgow, United Kingdom)

There remains a responsibility on the mental health professional to identify variables associated with violence and an increased demand for evidence based risk assessments. The predictive validity of the Historical Clinical Risk-20 — Version 2 (HCR-20V2) violence risk assessment scheme was assessed with respect to in-patient violence within a maximum security forensic mental health facility in Scotland. The HCR-20V2 was found to have predictive accuracy in determining risk across different populations and outcome variables and the HCR-20V2 became the cornerstone violence risk assessment within low, medium and high secure forensic mental health settings across Scotland. The Historical Clinical Risk-20 — Version 3 (HCR-20V3) captures both evidence-based and clinician-led modifications from the HCR-20. The predictive validity of the HCR-20V3 is growing and appears to replicate the predictive utility of the HCR20V2. Recent evidence within forensic inpatient samples is growing and recent studies across the forensic network in Scotland has continued to demonstrate the significant predictive ability of the HCR-20 scheme for violence and physical violence.
Parents of children with developmental difficulties (DD) face many challenges on every day basis. Compared to a parent of a typically developed (TD) child, these parents are in risk to experience a drop in well-being in general and in specific domains. As a part of the CRO-WELL project, earlier we explored differences in well-being of parents of children with DD and matching group of parents of TD children. Results showed that both groups of parents were equally happy and satisfied with their lives in general, but parents of TD children where more satisfied with their free time and felt pleasant more frequently. Aim of current study was to explore what happened in one-year time. Out of initial sample of 41 parents by group, second wave of this longitudinal project was completed by 19 parents of children with DD and 27 parents of TD children. Results showed that, after one year, parents of children with DD were less happy, less satisfied with health, family, friends, security, future and felt positive emotions on fewer occasions compared to parents of TD children. During that year, parents of children with DD experienced three times more negative events than parents of TD children. Additionally, they evaluate life events to be less positive and more negative compared to parents of TD children. Parents of children with DD have lower well-being but also experience more negative life events. Therefore, it seems that having a child with DD reflects on many life domains and shapes lives of parents.
EXPLORING THE NEURAL MECHANISM OF VOLITIONAL QUALITY: A BRAIN MORPHOMETRY STUDY ON NATIONAL-LEVEL ATHLETES

Si Ruoguang  
Cardiff University (Cardiff, United Kingdom)

Wei Gao-Xia  
Zhang Shu  
Chen Li-Zhen  
Yao Ying  
Chinese Academy of Sciences (Beijing, China)

Volitional quality is a complex psychological trait by which an individual decides on and commits to a particular course of action towards a concrete goal. It is human-specific and of significance for development of human beings as well as individual achievement. This study aimed at investigating the neural mechanism of volitional quality by comparing brain morphometry between national-level Chinese athletes and university students with Magnetic Resonance Imaging (MRI). The participants were 38 healthy young adults, including 19 short track speed skating athletes from Chinese national team (age: 18.3 ± 1.5; 10 males, 9 females) and 19 university students as controls (age: 19.2 ± 1.2; 9 males, 10 females). The volitional quality was measured with Volitional Quality Questionnaire (BTL-LYZ1.0, Li, 2014). The brain morphometry-cortical thickness was measured with high-resolution T1 MR images. Preprocess of the structural images was done by FreeSurfer 6.0, which is implemented in the Connectome Computation System (CCS: http://lfcd.psych.ac.cn/ccb.html) (Xu et al., 2015), a pipeline system for discovery science of brain. The parcel-wised cortical thickness was computed between groups based on Destrieux atlas by considering sex, gender, education and intracranial volume as covariates. Also, partial correlational analyses in athlete group were conducted for exploring the association between volitional quality and cortical thickness. Athletes had higher score in goal clarity (p=.000), continence (p=.008), belief confirmation (p=.000), persistence (p=.000), thoughts concentration (p=.000) and difficulty bearing(p=.000) than the controls. Athletes also showed greater cortical thickness than the controls in brain areas in the right hemisphere including cuneus, precuneus, inferior parietal lobule, rostral middle frontal gyrus, superior frontal gyrus and calcarine fissure (Desikan-Killiany-atlas-based parcel-wise analysis with a Bonferroni corrected p=0.05/68). Additionally, significant correlations between cortical thickness with significant difference and scores of volitional qualities were detected, including the rostral middle frontal gyrus and thoughts concentration (p=.004), and inferior parietal lobule and self-fulfillment (p=.049). It suggested that the athletes showed greater volitional quality. Greater cortical thickness in middle frontal gyrus and inferior parietal lobule might revealed neural substrates of volitional quality. It also indicated that sports training is a crucial path to develop individual’s volitional quality by optimizing regional brain morphometries.
THE IMPACT OF EMOTIONAL INTELLIGENCE ON THE RELATIONSHIP BETWEEN TRANSFORMATIONAL LEADERSHIP AND TEAM PERFORMANCE: THE MEDIATING ROLE OF LEADER MEMBER EXCHANGE AND JOB CHARACTERISTICS

Jurgen Becker
University of the Western Cape (Somerset West, South Africa)

Organisations exist to combine and transform scarce factors of production into products and services with economic utility. Organisations use internal resources to develop and deliver key products and services. Leadership plays an important part in the coordination process through its role in managing employees. The impact of leadership on task performance, organisational citizenship behaviours (OCB), organisational commitment, and job satisfaction is well documented (Ceri-Booms, Curseu, & Oerlemans, 2016). Leadership behaviour theories emphasise the importance of leaders’ patterns of behaviour in influencing the actions and intentions of their followers (Burke, Stagl, Klein, Goodwin, Salas, & Haplin, 2006). Leadership behaviour can be grouped into two broad categories, namely those directed towards the accomplishment of a task (transactional leadership), and those directed toward maintaining positive relations with others (transformational leadership). In contrast to early leadership theories, such as trait and behavioural approaches, the leader-member exchange theory (LMX) argues that leaders do not treat all followers equally. In high LMX relationships, leaders provide support and encouragement. Contrastingly, in low LMX relationships, work is often performed according to formal rules with rewards being contingent upon the execution of prescribed tasks (Boies & Howell, 2006). The current study argues that transformational leadership leads to high quality LMX relationships which subsequently results in higher levels of team performance. This relationship is moderated by the leader’s emotional intelligence. Furthermore, transformational leadership is expected to have a direct effect on job-team performance via job characteristics. If the organisational context enables high quality LMX relationships, the impact of transformational leadership on team effectiveness will be higher. The structural relationship between variables was operationalised and tested using Structural Equation Modelling using an ex post facto cross-sectional research design. Participants included 230 mid-level managers from a large commercial bank. Strong support was found for the mediating role of LMX and job characteristics on the relationship between transformational leadership and job performance. This supports the idea that transformational leadership alone is insufficient to meaningfully impact team-based performance. High quality LMX relationships and leaders’ emotional intelligence are key enabling factors in the leader-team performance pathway.
SANOGENIC REFLECTION OF THE MOTHER AS A FACTOR IN THE PSYCHOLOGICAL WELL-BEING OF THE CHILD

Svetlana Morozyuk
Elena Kuznetsova
Moscow Pedagogical State University (Moscow, Russia)

Tatyana Smoleva
East-Siberian State Academy of Education (Irkutsk, Russia)

the article reveals the peculiarities of the mother’s sanogenic reflection and its manifestation in the styles of relationships with children, which act as factors of the child’s psychological well-being. Modern science and practice pays great attention to issues related to the preservation of the uniqueness of childhood. The solution of these problems is the family, where the child learns to think, feel and worry, which forms the prerequisites for his psychological well-being. Research by T.O. Smoleva showed that the experience of emotional relationships is manifested in the distant social distance in communication and mutual understanding with others. It is very important that with a preschooler should be a competent adult who is able to consciously and adequately respond to changing environmental conditions and choosing one or another style of attitude towards the child. This is especially important in the dyad of «mother—child». The mechanism that triggers the psychological well-being or distress of the child lies in his past experience, in his relationship with his mother. In

the research by S.N. Morozyuk, it is experimentally established that the object of reflection of persons with accentuated character traits are the experiences themselves, and not their causes. This gave us reason to assume that the style of attitude towards the child is often determined by the quality of reflection of the mother (sanogenic, pathogenic). In the research by S.N. Morozyuk, E.S. Kuznetsova, T.O. Smoleva was found that mothers with a pronounced protective reflection from feelings of failure, guilt, shame, resentment and aggression is characterized by insecurity. This is manifested in the instability of the style of upbringing, sanctioning with punishments and prohibitions prevails, followed by excessive satisfaction of their needs, which causes the child’s psychological distress. In the group of mothers with developed «sanogenic thinking» (according to Yu.M.Orlov, S.N. Morozyuk) and «systemic reflection» (according to D. A. Leontyev), the largest percentage of children with high levels of psychological well-being.
Lev Vygotsky's main methodological heritage and challenge for contemporary psychology was in determining its keystone to be the «philosophy of practice», «psychotechnical methodology». Practice is meant to become the veritas criteria for theory. Cultural-activity psychology has been realized in education, medicine, etc., but what about psychology's own practice — psychotherapy? In Russia, such methodological issues were raised and thoroughly researched for more than 30 years by professor Fyodor Vasilyuk (1963-2017) and his disciples. He realized Vygotsky's project by establishing his own approach — Co-experiencing psychotherapy. Here, he engrafted a branch of Carl Rogers's person-centered practice to a juicy tree of Vygotsky-Leontiev's cultural-activity theory. What are the fruits of such a union? Academic psychology by this union was enriched in the following: 1) a model of an «integral unit of psychological analysis» was proposed — an original approach to research of consciousness; 2) a theoretical understanding of «experiencing» as a productive internal meaning-generating activity (Vasilyuk, 1991); 3) the conceptual models of levels, registers and structures of consciousness. For the psychological practice: 1) a methodological definition of psychotherapy as a specific practice in specific cultural- anthropological contexts; 2) several original models, such as «psychotechnical units», levels of consciousness and others; 3) a structural analysis of the psychotherapeutic situation. Psychotherapy here becomes not just as a subject, but a method of research (Vasilyuk, 2015). To the education, it brought an original step-by-step program with creative exercises and didactical principals which are now realized in the main universities around Russia. The program has been empirically proven to be highly effective in developing main counseling skills which determine an effective psychotherapeutic outcome. Hence, Co-experiencing psychotherapy is an innovative methodological solution to the problem of the schism between academic psychology and psychological practice, an elegant project fruitful both for science and practice of psychotherapy and education.

EMOTIONAL STATE OF YOUNGER PRESCHOOLERS WITH CHRONIC SOMATIC ILLNESSES

Maria Afonina
FSAI “NMRC for Children’s Health” (Moscow, Russia)

Deterioration of health, somatic diseases in particular, change the habitual social situation, stipulates the appearance of a psychological deviation complex, this collectively complicates the process of a child’s social adaptation. The emotional status is an important criterion of a preschooler’s mental well-being, this is why a study was conducted with the aim to examine it. The study involved 56 children aged 3-4 years (mean age 3,8; 27 (48%) boys, 29 (52%) girls) with chronic somatic illnesses (asthma, atopic dermatitis, psoriasis) in remission, undergoing inpatient observation in FSAI “NMRC for Children’s Health”. The comparison group consisted of 20 apparently healthy children (mean age 3,7; 9 (45%) boys, 11 (55%) girls) who applied for prophylactic medical check-ups to the same institution. All children were brought up at home, didn’t attend preschool educational facilities. Emotional state assessment was conducted with the following: standardized observation method — D.Stott’s Observation Card (adapted version), the Luscher Color Test — LCT (modification by S.Veliyeva for children from 2,5 years). Statistical analysis of the results was carried out using the software package StatisticaBase. The results analysis of the LCT method revealed significant differences between the groups (p<0,05). All children (100%) with chronic somatic illnesses had a negative mental state of different kind (mean score 2,1). 54% of children had voluntary regulation difficulties — instability of emotions and behavior, short-term purposeful activity, negativism reactions, a small amount of self-care skills. Another 27% of children had notable anxiety — lowered mood, neurotic reactions, fears. In the rest 19% of children negative attitude towards anything new, symbiotic relationships with close adults, a low level of social competency were detected. A negative mental state was observed in 40% of children in the comparison group (mean score 3,3) — voluntary regulation difficulties (25%) and anxiety (15%). Children with a low level of social competency were not found. 60% of children in the comparison group had a positive mental state — stable positive mood, purposeful activities, sufficient degree of independence. Thus, all younger preschoolers with chronic somatic illnesses and 40% of apparently healthy children have emotional state patterns and are in need of differentiated psychological care.
LINGUISTIC ORGANIZATION OF THE STRUCTURE OF PERCEPTION OF CHARACTERISTICS "POWER" OF FACIAL EXPRESSIONS OF MIXED EMOTIONS

Olga Stepanova
Svetlana Korshunova
Lomonosov Moscow State University (Moscow, Russia)

According to the concept of the spherical space of emotions suggestion that perception of facial expressions of mixed emotions is the result of the superposition of the linguistic structure of consciousness on sensory information revealing in subjective grouping of similar expressions into categorical groups based on the mechanism for calculating estimates of the similarity is checked. This hypothesis is proved by the congruence of perceptual and semantic levels of structures of perception of expressions obtained in the tasks: of their direct distinction in pairs “face – face” and of their identification through the distinction in pairs “face – word”. A set of six rows in each of five mixtures obtained by combining morphs of two adjacent on a circle “happy-surprise-fear-sad-disgust-anger-happy” expressions of basic emotions was used as the facial material. Names of six basic emotions and three synonyms of each were used as a verbal material. Two matrices of distinction “face–face” and “face–word–face” averaged over samples of 121 and 92 respectively served as experimental data for the construction by MDS method of two models RSQ=0.986 / 0.994, Stress=0.037 / 0.002 in the form of spherical 6-dimensional spaces of perception of expressions at two levels. In both spaces the subjective characteristic of “power” of expressions is measured by the polar coordinates on the plane formed by the combination of linear axes-scale, defined through opposition of basic categories of “anger-disgust” and “fear-surprise”. On estimates of angular distances on both circular scales groups in the form of segments consisting of perceptual “synonyms” with common categorical value are revealed. On the perceptual circular scale four segments are distinguished, each of which includes 70% and 90% of the expressions and is inserted in sequence “fear, happy-disgust-surprise-sad, anger” with gradual increasing values of degree of expression of “power-aggressiveness”. On the semantic level, this scale is transformed into a 6-graduational sequence “happy-fear-disgust-surprise-sad, anger” due to the separation of two complexes “fear/happy” and “sad/anger” into their components of categories of basic emotions. Results are discussed in terms of the categorization mechanism on the characteristic of “power-aggressiveness”, on which social domination-submission is evaluated.
INDIVIDUAL PSYCHOLOGICAL CHARACTERISTICS OF REPRESENTATIVES OF THE "INFORMATION" GENERATION WITH DIFFERENT PROFESSIONAL SUCCESS

Vlada Pishchik
Don State Technical University (Rostov-on-Don, Russia)

Galina A. Molokhina
(Rostov-on-Don, Russia)

Elena Petrenko
Southern State University (Rostov-on-Don, Russia)

The subject of the study was the individual psychological characteristics of sales managers that underpin their professional effectiveness. The novelty lies in the fact that they studied managers belonging to the "informational" generation, manifested in mental activity, interpersonal relationships and emotional reactions to environmental influences. Research Methods: J. Brüner's "Determining Types of Thinking and the Level of Creativity", G. Ayzenck's "Self-Assessment of Mental States", T. Leary's "Interpersonal Relationship Diagnosis" Test, S.Richi and Motivational Profile Test, PSM25 Lemur- Tese-Fillon a in N.E. Vodopyanova, a method for diagnosing the type of emotional reaction to environmental stimuli V.V. Smartly The sample consisted of 160 people aged 20 to 27 years, bank employees, work experience of up to 10 years, divided by the criterion of effectiveness into two groups. As a result of statistical analysis, significant differences in individual psychological characteristics (type of thinking and level of creativity, features of psychological state, type of interpersonal relations, professional motivation, emotional response to environmental stimuli and level of psychological stress) were revealed in sales managers with different levels of professional efficiency. Effective managers are more aggressive, more closed, do not aspire to long-term relationships, are financially oriented, have a need for achievements and recognition, good working conditions. Ineffective managers are more rigid, anxious, frustrated, aggressive, strive for structured work, are focused on long-term relationships, have a low need for improvement, in good working conditions. The article was prepared with the financial support of the Russian Foundation for Basic Research. Project No. 18-013-00910 "The Dynamics of the values of the generations as a marker of the transformation of social relations in Russian society".
In conditions of transitive economy of modern Russia there coexist enterprises with multiyear problems of modernization (ordinary) and successful innovative enterprises with high durability. They differ in type of organizational culture (OC). The influence of OC on socio-psychological age practically has not been investigated yet. Research objective — to reveal the manifestations of the socio-psychological age of the personnel of enterprises with OC of different types. Respondents: 200 employees of different age (100 — male and 100 — female) of ordinary and innovative enterprises. Cameron-Quinn organizational culture assessment method, Kuhn-McPartland twenty statements test, Thomas-Kilmann conflict mode instrument, the method of concrete situations, Spielberger state-trait anxiety inventory, Mann-Whitney U test. Willingness to changes, personal involvement in the labor process, specifics of behavior in conflict situations, responsibility and openness of decision making, stress exposure have been studied as characteristics of socio-psychological age. Not so much chronological age as the type of organizational condition largely determine the manifestations of qualities associated with aging. The management of enterprises with market-innovative OC implements the principle: it is only productivity and quality that determine a person’s position in organization. In such enterprises typical socio-psychological age characteristics have statistically less pronounced manifestations than in ordinary enterprises with archaic clan-hierarchical OC. Even younger people there develop psychological signs of aging. Personnel gender characteristics have their own specific manifestations. For example, younger men working in clan-hierarchical OC enterprises are less prone to stress (are more stress-resistant) than women or older men. Female older staff in innovative enterprises develop psychological stress defense in the form of advance preparation for changes. Gender and age peculiarities of socio-psychological age of the personnel belong to the actual unconscious phenomena of organizational life. Labor activity is the sphere in which the discrepancy between the chronological and socio-psychological age of personnel is found out. Organizational conditions of enterprises significantly influence the process of psychological aging of employees and the manifestation of their socio-psychological characteristics. Different age groups of personnel in their social-psychological characteristics are much more closer within one OC than groups of the same age in OC of different types.
While beliefs about sleep are related to sleep improvement (Perlis et al., 2011), less is known about factors of daytime alertness. The aim was to reveal the role of psychological factors in alertness improvement with different focuses of attention. 123 good sleepers (83 females) 19-45 years old filled Glasgow Content of Thoughts Inventory (GCTI, Harvey, Espie, 2004), Insomnia Severity Index, Dysfunctional Beliefs About Sleep Scale (Morin, 1993), Hospital Anxiety and Depression Scale (Zigmond, Snaith, 1983) and were randomly assigned to three conditions for 7 days: to use any possible strategies to improve their sleep, their wakefulness and sleep hygiene. For 2 days before and 2 days at the end they appraised every evening their day (using 0-10 Likert scale, Cronbach’s alphas .66-.83) and every morning filled GCTI and Sleep Diary (Morin, 1993). Instruction to improve sleep increased daytime mental loading, difficulties of diary activities, but also morning alertness (p<.05). In this group depression was related to decrease in sleepiness (β=-.34, p<.05) while anxiety— to increase in sleepiness (β=.27, p<.05, ΔR2=8.4%). The more thoughts before sleep had participants the more prominent was decrease in them under alertness instruction (β=-.33, p<.05, ΔR2=6.3%). In those improving sleep hygiene physical load and diary difficulties of activities but also morning alertness and sleep quality became higher, sleepiness — lower. In this group anxiety was related to increase in daytime stress while depression was related to decrease in achievement, emotions and productivity (β=.53-. .40, p<.05, ΔR2=7.4-21.7%). Decrease in thoughts before sleep under this instruction was related to initial sleepiness (β=-.20, p<.05) and less dysfunctional beliefs about sleep (β=.28, p<.05, ΔR2=9.5%). Focus on sleep improve morning alertness but could be stressful for depressed people. Focus on daytime alertness might improve achievement, daytime alertness and could be especially helpful for depressed people. Research is supported by the Russian Foundation for Basic Research, project No. 18-013-01211.
BLURRED LINES BETWEEN NORMAL AND ABNORMAL, DELUSIONAL BELIEFS IN THE SOCIETY

Derya Eryiğit
Marmara University (Istanbul, Turkey)

Delusions are defined as false beliefs in which the person believes in a serious sense, but without any logical explanation. Although delusional beliefs are considered as the existence of psychopathology, it is still possible to have beliefs that have similar structure with delusions and not being categorized as pathological. The aim of this study is to reveal the beliefs which have the characteristic of delusions throughout the society. The idea of “normal” and “abnormal” is evaluated in a different perspective by Michel Foucault and within this study delusional beliefs are evaluated with his perspective. Within the scope of the study, 20 adult individuals between the ages of 18-40 were asked 9 questions which were prepared by the researcher and these interviews were analyzed with content analysis method. Themes that emerged from the analyses are evaluated with Foucault’s ideas about normalization. The questions were about beliefs, how strong these beliefs are believed, how the individual expresses these beliefs, how the beliefs affect their daily lives, the situations in which these beliefs come to mind more often, the ways of coping with beliefs, the reactions taken when shared, and the reaction when people around him/her advocate otherwise. The result of analysis showed that deceitfulness, jealousy, persecutory, being punished by god beliefs were seen more often. In coping strategies with beliefs, themes such as self-affirmation, prayer, sharing with a friend, getting support and suppressing these ideas emerged. Participants choose to explain these ideas with their past experiences, beliefs systems that they get from the people around them, religious themes have that support this belief. When asked about sharing their thoughts with the people around them, 16 of the 20 participants shared their thoughts and 4 participants expressed that they preferred not to share. This study showed even in a small sample it is still possible to see beliefs that have similar structure with delusions but with different levels of certainty and effect on the individual’s life.
ADULTHOOD CRISIS: PROBLEMS, OPPORTUNITIES, OVERCOMING

Elena Sapogova
Moscow Pedagogical State University (Moscow, Russia)

The author presents some results of comparative theoretical study of two maturity crises — the midlife crisis and the crisis of aging. From the standpoint of the existential paradigm the essential difference in the meanings, potentials and resources of their overcoming is shown: 1) the midlife crisis is experienced in the phase of development when the person has all psychic fullness of himself; the crisis of aging — on the wave of extinction of physical and psychological possibilities; 2) the midlife crisis is perceived as a transition from a given primary socialization-inculturation to a self-induced secondary socialization-inculturation; the aging crisis is a transition from a potentially open horizon of events to its deliberate limitation; 3) the center of the midlife crisis is the process of individuation, which replaces previous identifications; the center of the crisis of aging is the acceptance of one’s life as held, only possible and completed in all its feasible existential completeness; 4) a common feature of both crises is the person’s experience of the moments of disidentification with himself, but in the midlife crisis it is used for modeling the future “Me-otherwise”, and in the aging crisis — for the acception of “Me-as-is” as a result of the fundamental existential unattainability of the completeness of self-embodiment; 5) all transformations of the of midlife crisis are directed to the potential future, outside; personal transformations of the aging crisis turn the subject to himself, his past and his own inner world.
CULTURAL INTELLIGENCE (CQ) AS SUPPORTIVE FACTOR IN ACADEMIC SUCCESS: AN EXPLORATIVE STUDY ON CQ AND ITS RELATIONSHIPS WITH GROWTH MINDSET, GRIT, CONSTRUCTIVE CONFLICT COPING AND ACADEMIC STRESS IN MULTICULTURAL POPULATION OF STUDENTS IN THE UNITED ARAB EMIRATES

Magdalena Mosanya
Middlesex University Dubai (Dubai, United Arab Emirates)

This study was an exploratory research conducted with a multicultural population of students living in the United Arab Emirates with a multi-fold objective. First, it intended to evidence relationships between cultural intelligence (CQ) and academic success (growth mindset and grit, stress and constructive coping.). Secondly, it attempted a first validation of the Cultural Intelligence Scale (CQS) (Earley & Ang, 2003) in academic multicultural population. And finally, it aimed at comparing the levels of cultural intelligence between third culture individuals (TCI) and non-third culture individuals (non-TCI).

This was a cross-sectional, questionnaire-based research conducted on a population of 200 multicultural students in the United Arab Emirates. The results confirmed a significant correlation between cultural intelligence and measures of academic success, namely grit and growth mindset, as well as the predictive influence of cultural intelligence over constructive conflict coping. Additionally, it was evidenced that a higher level of CQ was characteristic of individuals with lower academic stress. The last finding shed new light over the process of acquisition of cultural intelligence as no differences between Third Culture Individuals and Non-TCI were found. The findings were critically evaluated based on theoretical approaches to multiculturalism and against the results of previous studies. Limitations as well as further directions were also discussed. This study could be considered a first contribution to fill the gap in the understanding of the role of cultural intelligence in multicultural academic success with Cultural Intelligence Scale (CQS) showing promising results. Additionally, the findings of this study questioned previous assumptions on the dispositional character of cultural intelligence of third culture individuals and opened new fields for further research.

STRESS AND COPING AMONG SINGLE WOMEN IN COLLECTIVE SOCIETY: THE PALESTINIAN CASE

Camelia Ibrahim
Bar Ilan University (Ramat Gan, Israel)

Singlehood is known as a stressful situation. A few studies that were conducted in the Arab world indicate that the experience of being a single woman is unique, complex and stressful. The aim of this study was to understand the stressful situations that single women face and to identify strategies used for coping with these situations. The research model is based on a systemic approach that combines Lazarus and Folkman's (1984) stress theory with Berjot and Gillet's (2011) model, which focuses on socially labelled persons. And it was conducted in a mixed method. 20 single women participated in the qualitative research and 190 women between the ages of 25 and 60 in the quantitative one. The main results show that single women are subject to social labelling, controlling practices and they are deprived of intimate partner relations,
motherhood, which cannot occur outside of marriage due to the traditional patriarchal structure and policing in Arab society. However, there is evidence that some women enjoy being single and fulfill themselves despite the patriarchal structure and policing. Our results identified several coping strategies used: focusing in finding a partner, coping with negative feelings, protecting social and individual identity, and self-fulfillment. The stress experience and the coping were varied between different age categories.

UPON INTERRELATION BETWEEN PEDAGOGY AND PSYCHOLOGY IN POST-INDUSTRIAL SOCIETY

Svetlana Ivanova
Institute for Strategy of Education Development of the Russian Academy of Education (Moscow, Russia)

Irina Tagunova
Laboratory for Comparative Education (Moscow, Russia)

Irina Elkina
Institute for Strategy of Education Development (Moscow, Russia)

Relevance Postindustrial society is qualitatively different from the one of the twentieth century. The speed of change is incredible, a person needs protecting and preparing for acceleration. Problem statement Traditional school is unable to socialize the learners in different-aged community; to teach children to evaluate critically knowledge; to think creatively; to create a friendly atmosphere, mutual respect and assistance; to work effectively with laggards; to solve the problem with migrants, representatives of other cultures. Research questions Solution of these problems involves solving not only the psychological and pedagogical aspects of education, but also the organization of education space. Neuropsychology and other related sciences have brought new knowledge. Today, pedagogy still solves social problems aimed at the realization of social justice, economic development of the country, ensuring its stability. However, they acquire new meanings in modern conditions: changes in understanding of human capital, in growing role of the human factor. Purpose of the study Education begins to line up in the context of post-industrial factors in the development of society: network structure, interpenetration of cultures on a global scale; new economic reality, in which the most efficient form of economic growth is the development of people’s abilities. The school ceases to be a repressive tool for the formation of an authoritarian, tough, competitive personality. The basis of education is tolerance and mutual assistance. The focus is given to developing students’ soft skills: sociability, creativity, critical thinking, providing students with knowledge and skills that will allow them to live and work together in a post-industrial society. New trends in education radically change the role and place of the teacher in the educational process. Today in the work of a teacher, leadership qualities of a person and mentoring skills are of particular importance. Special attention is paid to the training of “paraprofessionals” (school personnel who help teachers in the teaching process). The widespread use of “soft power” technology, which involves the use of intangible resources, cultural achievements, methods of persuasion changes the role of education in the global space: it also acts as one of the tools of “soft power”.
to reveal the influence of L.S. Vygotsky’s psychological ideas on Russian didactics, on teaching theory and practice at primary school. The characteristic of primary school didactics changes is given on the basis of the pedagogical understanding of the cultural-historical concept of person’s mental development by L.S. Vygotsky, his theory of the dependence of the child’s development on the process of his/her learning. The paper is based on a theoretical study proving the reality of a consistent convergence of psychology and pedagogy. The initial contribution to this process was made by the students and followers of L.S. Vygotsky. It is revealed that the translation of the ideas of their teacher has found concrete realization in the teaching theory and practice. The main psychological ideas are as follows: 1) The real basis of a personality is the totality of his/her social relations to the world, which are realized in his/her diverse activities. 2) Each period of childhood is self-valued, the child should not be looked at as a small adult. Successful mental development of the child is associated with mastering the meaning of his/her own practical actions. 3) Education and development of the schoolchild correlates with his/her educational and cognitive activity. The schoolchild as a subject of learning demonstrates the qualities of independence, activity, and initiative. Implementation of these psychological ideas allows expanding the zone of influence of psychology on the improvement of the learning process at primary school. The author reveals the reasons for the insufficient use of psychological knowledge in the organization of the educational process at primary school, the slow convergence of psychological positions and specific educational practice. On the one hand, the reason is the teacher’s unwillingness to rely on the psychological patterns of the child’s development in constructing the didactic process, and, on the other hand, we see a certain detachment of psychologists from the real teaching practice, striving for “pure” science. The novelty of the author’s approaches consists in disclosing ways to improve the learning of a modern student based on the implementation of the ideas of L.S. Vygotsky.
THE STUDY OF THE EMOTIONAL IMPACT OF SCENTS OF ESSENTIAL OILS BY THE METHOD OF SEMANTIC DIFFERENTIAL

Anastasiia Kravtsova
Lomonosov Moscow State University (Moscow, Russia)

Nikita Khokhlov
Centre for Testing and Development "Humanitarian Technologies" (Moscow, Russia)

The influence of smells on emotional sphere is a prospective direction of psychological research. There is a necessity to study the emotional influence of essential oils smells with the help of psychological methods. The first goal of our research was to find out which emotions the smells of essential oils may cause. The second goal was to verify if emotional perception of these smells is universal for all people. The third goal was to verify the factors, which stand behind the emotional evaluation if smells. In our research there were 38 healthy respondents at the age of 15-26 years — 9 young men and 29 young women. As odorants there were 12 essential oils and concentrated perfume with pheromone. The instruction included an assessment of emotional state caused by the smell on 21 bipolar scales (16 scales of semantic differential [1] and the big five personality trates) using 5 gradations of the severity of the trait. Kendall ‘s coefficient of concordance is 0.314, which indicates unsatisfactory consistency of experts. To identify latent variables behind the evaluation of odors in 16 emotional categories, the obtained data were factorized using the principal components method. There were 3 factors, which explain 85% of the initial data. The first factor (51.5% dispersion) included categories soft, light, kind, young, sweet, pleasant. This factor reflects the assessment on the basic scale of "pleasant-unpleasant". The second factor (20.6% dispersion) included the categories cowardly, stupid, weak, passive. This factor is a rating on a scale of "weak — strong". The third factor (13% dispersion) included the category of cold and fast. This factor is similar to the basic scale of "active — passive". Thus, it has been shown that the emotional evaluation of essential oils is not universal. In this regard, when using essential oils in psychotherapy, it is recommended to offer the client a preliminary assessment of the odorants using a semantic differential. 1. Artemieva Fundamentals of psychology subjective semantics / ed. by I. B. Khanina. M.: Science; Sense, 1999. 350 PP.
POLYMODALITY OF REFLECTION: TRIANGULAR RELATIONS BETWEEN MODALITIES

Tatyana Sizikova
Novosibirsk State Pedagogical University (Novosibirsk, Russia)

A deep knowledge of reflection in different areas of psychology allows us to create a holistic view on it. The modal psychology of reflection is developed on the basis of critical ontology. Method — modal, correlation and factor analysis. Group: 807 people (261 men, 546 women), age 18 — 64 years. Using the test "Focus of reflection" (T. Sizikova [2]) and correlation, factor analysis, we confirmed triangular relations between the reflection modalities. We have weak force correlations (p ≤ 0.001). Basic modalities of possibility, reality, necessity and their opposites are fundamental for reflection. The second row is scales of reflection formed on the basis of triangular relations between basic modalities and consists of six modalities: transcendental, transgradient, temporality, conscious, sufficient, multidimensional, and their opposites. The first factor with factorial load of modality (0.70 — 0.80) and between basic modalities (0.94). The ratio of the three scales of the modalities "not real — possible — random" is associated with the scales "not transgradient" (r = 0.31) and "not multidimensional" (r = 0.29). The same connection is characteristic for the opposite scales of modalities. The second factor with factorial load of modality (0.70 – 0.80) and between basic modalities (0.96). The relation of modalities "real — not possible — random" is associated with scales "non-temporality" (r = 0.32) and "unconscious" (r = 0.39). The same connection is characteristic for the opposite scales of modalities. The third factor with factorial load of modality (0.80 – 0.90) and between basic modalities (0.97). The relation of modalities "not real — not possible — necessary" is connected with the scale "non-sufficient" (r = 0.21). The ratio of opposing basic modalities is connected with the scale "sufficient" (r = 0.21). Theoretically justified connection with the modality of "transcendental" — "non-transcendental". Conclusion. The modal psychology reveals the integrity of reflection. The integrity of reflection is a polymodality, where relations between modalities are built on the basis of a triangular network. PROMOTING QUALITY OF LIFE FOR CHILDREN WITH THE AUTISM SPECTRUM DISORDER (ASD) AND THEIR FAMILIES BY PSYCHOLOGY: LAPITEA/BRAZIL

Amanda Lima Rubim
Ana Flávia Lima Teles Da Hora
Daniel Carvalho de Matos
Universidade Ceuma (São Luís, Brazil)

The Assessment, Research and Intervention in Autism Spectrum Disorder Laboratory (LAPITEA) from CEUMA University in Brazil seeks to promote the development of skills, such as language, communication, imitation, motor and other behavior repertoires through interventions based on principles of Applied Behavior Analysis (ABA) applied to the treatment of children diagnosed with ASD. The purpose of this research will be to present an experience report on the formation of Psychology undergraduate students in implementing interventions directed to these children. For the selection of children, mothers representing to NGOs from the city of São Luís in Brazil were selected to send a list of approximately 80 children for later assessments. Criteria were established for selection of some children, regarding economic status of the families, age and cognitive impairments. The selected children receive interventions based on ABA twice per week, during 1 hour and 30 minutes each day. The purpose consists in producing change in several behavior repertoires through an individual curriculum organized for each child. Two weeks after the establishment of basic repertoires to establish attention to therapists, more formal assessments are conducted through the Verbal Behavior Milestones Assessment and Placement Program (VB-MAPP) and the Assessment of Basic Language and Learning Skills — Revised (ABLLS-R). In two years of systematic procedures being conducted with each child, many showed improvements in repertoires, regarding eye contact, sitting still, imitation, pairing identical and similar objects and pictures and, also, more advanced repertoires, such as mands, tacts, echoics, intraverbals and listener discriminations by function, feature and class. The results are discussed as to the efficiency of the teaching of therapist skills for undergraduate students. Interventions based on ABA proved to be effective in improving behavior repertoires in children with ASD, by having Psychology students as therapists.

INTERVENTIONS IN PSYCHOLOGY BASED ON APPLIED BEHAVIOR ANALYSIS (ABA) CAN IMPROVE DEVELOPMENT: CASE STUDY

Amanda Lima Rubim
Daniel Carvalho de Matos
Ana Flávia Lima Teles Da Hora
Universidade Ceuma (São Luís, Brazil)

The Autism Spectrum Disorder (ASD) is a term, which incorporates a group of qualitative and quantitative deficits in aspects of social communication (either verbal or non-verbal) and in the patterns of restrictive and repetitive behaviors. In the spectrum, the level of severity varies according to the level of support demanded by the individual. The purpose of this research is to present the efficacy of psychological interventions based on Applied Behavior Analysis (ABA), conducted in The Assessment, Research and Intervention in Autism Spectrum Disorder (LAPITEA) from CEUMA University in Brazil, in developing...
behavior repertoires in a 5 year old boy with ASD. During the initial psychological assessment, the child showed high frequencies of inappropriate behaviors, summed to deficits on verbal and non-verbal communication. Systematic interventions were conducted with the purpose of establishing basic and advanced skills through discrete trial teaching in a structured environment. The repertoires consisted in establishing eye contact; sitting still, demonstrating imitation of actions; following verbal instructions; tacting non-verbal stimuli; pairing non-verbal stimuli; and discrimination among non verbal stimuli through verbal instructions specifying function, feature and classes to which the stimuli pertain. Data regarding interventions conducted over a year will be presented and the child received treatment twice a week, 1 hour and 30 minutes each day. The child developed skills related to expressive and receptive language, communication, imitation, motor behavior and also showed significant decrease in undesirable behavior. Interventions based on ABA proved to be effective in establishing important repertoires, which improve the quality of life for both the child and the family.

FEATURES OF COGNITIVE SPHERE OF TEENAGERS WITH ADOLESCENTS
DIGITAL ACTIVITY

The research is devoted to the study of relationship between the level of Internet use intensity by adolescents 11—17 years old and the development of their cognitive functions (memory, attention, speech, arbitrary regulation of activity). The sample consisted of 100 adolescents (53 boys, 43 girls). The cognitive functions were studied by a brief neuropsychological examination (Akhutina T., 2016), which includes methods for evaluating the functions of programming and control (dynamic praxis, counting, test "Points"), serial organization of movements (dynamic praxis, graphical sample "Fence"), functions of processing auditory speech (memorizing 2 groups of 3 words, compiling a story on a series of scene pictures) and visual-spatial information (memorizing 5 figures). For the study of development of verbal functions used were subtests of the Wechsler test (Information and Comprehension). The study of the digital activity of adolescents was conducted with the specially developed socio-psychological questionnaire. The adolescents were divided by digital activity into groups: low activity (33%) — up to 3 hours online a day; average (31%) — up to 5 hours a day, controlled high activity (19%) — 5 hours on weekdays and up to 8 hours on weekends; uncontrolled high activity (17%) — 8-9 hours daily. The results of comparing the cognitive functions of adolescents with different online activity indicate the existence of some "optimum" digital activity that positively affects the development of higher mental (cognitive) functions, which is reflected in the most successful performance of neuropsychological tests. Thus, adolescents with average digital activity showed the best results in the functions of programming and control, serial organization, processing of visual-spatial information. Adolescents from this group performed better and faster than others counting operations, less than others made regulatory errors in memorizing words, reacted faster in the test «Point». They demonstrated a greater amount of visual-spatial memory and a better awareness and outlook in the Information subtest. Thus, different trends in the productivity of cognitive functions in adolescents with different user activity were obtained. The work is supported by the Russian Foundation for Basic Research, grant № 17-06-00762-ОГН.
GABITAR IMAGE OF A VOLUNTEER

Galina Zvezdina
Irina Abakumova
Ekaterina Zvezdina
Tatiana Shcherbakova
Marina Elagina
Don State Technical University (Rostov-on-Don, Russia)

In connection with the spread of the volunteer movement in the youth environment, the formation of a positive image of the volunteer, his image characteristics, becomes topical. The image of a volunteer is made up of a complex of personal qualities, appearance, behavioral characteristics, while his actions and appearance, verbalization, and the color scheme of the presented image are equally important. Gabitarny image — as the primary component of the general image of the picture, is its important component, as it translates visible, visually perceived information about the personality to others. The researchers note that the external image includes components that are focused on the perception of others. In order to study the voluntary image of the volunteer, its visual appeal, a study was conducted with students of humanitarian faculties of the DGTU (72 students). With the help of the method of private semantic differential, students evaluated photos and drawings of volunteers on seven-digit scales. On the basis of the analysis of the obtained data, semantic universals of group evaluation were determined in the range of — 90%, 80%, 75% — to the sampling frequency criteria. Using the cluster analysis method, it was found that the predictors of estimating attractive and unattractive volunteer images can be combined into specific groups based on similarity. It was found that the presentation of the image of the volunteer in symbolic form, which received the highest rating on basis of "attractiveness", is the following structure: smart, good, friendly. The attractiveness of the photographic image is determined by the predictors describing the personal qualities of the volunteer — friendly, responsive, confident, responsible, sincere, sociable, decisive, fair and evaluative categories — useful and good. The symbolic image presented in the figures is largely described by the portrait characteristics of the volunteer, the photographic image is presented in the form of description, such as appraisal characteristics, a description of the appearance, and personal qu Thus, we can conclude that with the help of a well-formed, voluntary image of volunteer, we can position certain personal qualities we need and contribute to the formation of a positive image.
COGNITIVE STYLE AND SOCIAL COGNITION: HOLISTIC INDIVIDUALS SHOW ADVANTAGE IN PERSPECTIVE TAKING AND THEORY OF MIND

Meng Zhang
Hui Chen
Zaifeng Gao
Junying Liang
Zhejiang University (Hangzhou, China)

Cognitive style refers to an individual’s preferred and habitual approach in the information processing, which is regarded as a crucial individual difference. Numerous previous studies have indicated that the individual differences of cognitive style significantly influence the way of how information being processed, as well as relevant cognitive performances. However, relatively limited number of studies have focused on whether and how cognitive style may influence social cognitive functions, such as perspective taking and Theory of Mind (TOM). The study included two experiments. In each experiment, participants were examined with their holist-analytic cognitive style by the Extended Cognitive Style Analysis – Wholist-Analytic test (E-CSA-WA, Peterson, 2005). In Experiment 1, 141 college students completed the adopted visual perspective taking task (Samson et al., 2010) in order to determine their efficiency of physically taking others’ perspective. In Experiment 2, Reading the Mind in the Eyes Test (RMET, Baron-Cohen et al., 2001) and YONI ToM Task (Shamay-Tsoory et al., 2007) were conducted on 126 college students to explore the influence of cognitive style upon one’s ability to recognize and infer others’ mental states (i.e. TOM). Results revealed, after controlling for gender differences, significant correlations between the holist-analytic cognitive styles scores and perspective taking indices, as well as significant correlations between the cognitive styles scores and participants’ performances on the RMET and the YONI ToM Task. Findings suggested that, holistic individuals, who tend to perceive and organize information globally, in relative to analytical individuals who perceive information in an analytical way, are generally advantageous in taking the views of others, or recognizing/infering others’ mental states (i.e. emotions and beliefs). Cognitive style could influence one’s social cognition. The findings may complement a unified framework for explaining how cognitive style differences may lead to diverse behavioral tendencies.
Companies are managing to introduce sustainability policies through Triple Bottom Line (TBL) concept (ELKINGTON, 2002): they can reduce some socio-environmental impact, but almost exclusively in those cases where financial gains can also be obtained. (SAVITZ; WEBER, 2007). This study addresses the following research question: how can strategic decision making processes based on substantive rationality (based on ethical values) foster more sustainable actions into corporations? An action research was developed in the initial phase of developing a start-up inserted in the field of health care business. All strategic business decisions were based on a long-term perspective and on the four macro values of sustainable development presented by Bolis et al. (2017): (i) economic value as a mean and not an end, (ii) quality of life, (iii) altruism and sense of community and (iv) respect for the natural environment. About 300 affordable medical consultations was developed for university students in Brazil. In line with the TBL concept, these consultations led to financial gains for the start-up and created social value in terms of students’ health. In addition, decision making from a substantive rationale in line with the values proposed by the research enabled several social benefits for the start-up stakeholders. However, the study showed a great difficulty in aligning the decision values for more sustainability with those of the decision makers of the start-up, in particular when social benefits led to additional financial costs. The action research shown that people are driven by values. It is really important to engage people from their personal values. Although competition can help increase sustainable behavior (VAN HOREN; VAN DER WAL; GRINSTEIN, 2018), in the current economic context, values related to sustainable development seem “external” and not natural in people’s personal values. In this context, it is recommended that companies deal with this issue with not only instrumental rationality focused on financial gains, but in a more complex way. Considering cognitive aspects and employees subjectivity and values can improve corporate sustainability policies to achieve more sustainable development (GRAVES; SARKIS, J.GOLD, 2019).
The ability of children to interact with their peers and adults with consideration of culturally accepted rules and norms of behavior allows them to adapt to new social conditions. The aim of the research was to study how preschoolers with developmental disorders understand the rules in a normative situation. The research involved 227 children of 5-7 years of age: 95 children with no developmental disorders and 132 children with speech, motor, sensory and emotional disorders. The research used the technique developed by L.F. Bayanova, T.R. Mustafina called "Methodology for the study of a preschooler compliance with the rules in a regulatory situation." To identify statistically significant differences between the values in the samples of children with developmental disabilities and children without developmental disabilities, we used Student’s t-test (p <.001). In all groups of children with developmental disabilities, the values of the “safety” factor are significantly lower than in children without developmental disabilities: children with sensory impairments (t = 4.00); children with autism spectrum disorders (t = 4.48); children with severe speech disorders (t = 2.49); children with motor disorders (t = 5.58). Children with autism spectrum disorder (t = 3.29); with severe speech disorders (t = 1.96) and children with motor disorders (t = 6.81), showed poor results in orientation towards interaction with adults and compliance with the expectations of adults. The differences in the factor of "self-care, hygiene" (t = 4.11) were statistically significant only in children with movement disorders. The research suggests that children of all nosological groups have problems social adaptation. Limited opportunities of obtaining information from the outside world make it difficult for them to develop means for communication with adults and peers. The research was carried out with the financial support of the Russian Foundation for Basic Research under research project No. 19-013-00251 "Prediction as a resource for socialization of children with disabilities: the structural-functional model"
SPHERICAL NEURAL NETWORK MODEL OF A LOCAL VISUAL ANALYZER AND ITS QUANTUM-LIKE GENERALIZATION

Boris Bespalov
Lomonosov Moscow State University (Moscow, Russia)

The human visual analyzer includes a large number of local analyzers that are "directed" to different parts of the visual field and participate in the determination of the perceived values of the properties of objects. In the spherical neural network model of the local visual analyzer there are three layers of formal neurons — receptors, pre-detectors and detectors (Fomin et al. 1979; Sokolov, Vaitkyavichus, 1989). When an object with the q-th value of the one-dimensional φ property affects the analyzer receptors, the output of the ensemble of two pre-detectors is described by the unit-length vector Fq = \cos \lambda \phi q \tau_1 + \sin \lambda \phi q \tau_2, where λ is the analyzer sensitivity, and τi are the basis vectors of the pre-detectors. The vector Fq enters the synaptic inputs of each k-th detector and activates their outputs up to the value dqk = (Fq, Ck). The analyzer determines the neurophysiological value of the object property by the number of the most excited detector, for which dqq = 1. The quantum-like generalization of the neural network model describes the dynamics and microgenesis of images of objects at different time stages of their perception and recognition (Bespalov, 2019). In this model, the vector Fq is replaced by the time-dependent complex ket-vector |Fq(t)> = (\cos \lambda fqt + i \sin \lambda fqt)|fq>, where i is the imaginary unit, the |fq> is the basis vector of the Hermitian space, andfq is the q-th sensory value of the property. Vector |Fq(t)> describes the time-varying sensory state of the object presented for perception. The vector |Fq(t)> obeys the psychological analogue of the Schrödinger equation and describes the time-varying sensory (mental) state shown for the object’s perception. The Hf operator included in the model is similar to the Hamilton energy operator in quantum physics. Therefore, sensory values ("sensations") of various properties of an object (its perceived brightness, size, color, shape, etc.) can be interpreted as quanta of the "objectified" mental energy (activity) of the subject, aimed at the object’s perception.
The purpose of the current study is to reveal the effect of Early Maladaptive Schemas (EMS) on the occurrence of emotional overeating and to identify the most efficient treatment. 105 females aged 28 to 43 were recruited. The participants completed YSQ-S3R (a validated questionnaire to diagnose EMS) and SCL-90-R (Symptom Check List-90-Revised) at baseline and post intervention. The treatment was consistent with the standard Schema Therapy protocol and aimed at acknowledging and overcoming coping modes, reducing the demands of the Inner Critic Mode and shaping a Healthy Adult Mode. A 30-day intensive intervention targeted EMS via interactive daily contacts through a closed online group and one-to-one sessions. Dietetic interventions were based around Mediterranean diet with moderate energy restriction and daily support with menu planning/nutritional education. Unrelenting Standards and Approval-Seeking EMS were most abundant (81% and 72% respectively), 69% of participants had Insufficient Self-Control EMS. 70% had low, 10% moderate and 5% high depression levels. 15% of participants had moderate anxiety levels. During the intervention higher rates of underlying schemas of Abandonment (47%) and Defectiveness (28%) were revealed. The behavioural analysis demonstrated that the Inner Critic Mode manifested mostly as self-exacting. The negative inner messages drove the participants to using the ‘Vulnerable Child Mode’ resulting in soothing binge eating behaviour. Post treatment questionnaires showed a significant drop in Unrelenting Standards Schema rate (61%) (below average). At baseline, the mean weight was 77.6kg (SD11.4) with BMI=27.8 kg/m² (SD3.79). The weight loss and the BMI drop at 1 month were significant; 2.78kg and 1.01 unit of BMI respectively with p<0.001 for both. The mean percentage weight loss was 3.62% (SD2.69) with 26% of participants losing >5% of weight, 44% losing between 2 to 5%. The identified high rates of EMS attest to probable adverse changes of state (e.g. emotional overeating) in stress situations. Application of standard Schema Therapy techniques can elicit a considerable decline of schemas and alleviate the impact of negative inner messages. This, consequently, may potentially decrease the need for the emotional state correction by food consumption and promote healthier relationships with food and weight loss.
PROMOTING MENTAL HEALTH AT WORK IN PORTUGAL

Samuel Antunes
Portuguese Psychologists Association (Lisbon, Portugal)

The Portuguese Order of Psychologists (Association which represents the Portuguese psychologists), in the scope of the Workplace Mental Health Promotion Program, has been developing since 2014 a series of initiatives at national level aimed to promote physical, mental health and well-being in the workplace. This program includes four major initiatives: 1. Raise awareness of government officials and parliamentarians, managers, business leaders and employees about the importance of promoting health in the workplace and how to promote healthy workplaces. This initiative involved conferences and joint actions with business associations and trade unions; 2. Creation of a platform that allows psychologists to evaluate free of charge the psychosocial risks in their organizations using COPSOQ II; 3. Creation of an annual prize to raise awareness and highlight companies (small, medium and large) that implement good health and safety practices in the workplace. This award is promoted in partnership with the local authority of EU-OSHA. 4. Development of a Program for Primary Prevention of Psychosocial Risks and training of Psychologists in this program. With this communication, the author intends to share the results of this Program in Portugal, namely results obtained in terms of psychosocial risk assessment, results of the Healthy Workplaces Award and the experience of promoting healthy workplaces in public and private Organizations.

THE PILOT STUDY OF COGNITIVE FUNCTIONING IN LATE ONSET PSYCHOSIS

Alexander Tkhostov
Ekaterina Abdullina
Georgiy Rupchev
Lomonosov Moscow State University (Moscow, Russia)
Vladimir Sheshenin
Mental Health Research Center (Moscow, Russia)

Late-onset schizophrenia (LOS) is schizophrenia at the age of onset after 40 years old. Very-late onset schizophrenia-like psychosis (VLOSLP) is a condition with the onset of psychosis after 60 years old (Howard et al., 2000). According to the latest literature review, processing speed, executive functions (and control), memory and language are impaired in LOS and VLOSLP patients in comparison with healthy participants of the control group (Van Assche et al., 2017). The results regarding visuoconstruction and perception are inconsistent. Yet, the studies devoted to the cognitive features of LOS and VLOSLP are limited. Thus, the present pilot study aims at investigating the cognitive functioning in the mixed group of LOS and VLOSLP patients in comparison with normally aging individuals. The experimental group consisted of 10 LOS and 5 VLOSLP patients (15 females; the mean age of 60 years old, SD=8.6). The control group consisted of 10 normally aging individuals (7 females and 3 males; the mean age 55.6 years old, SD=9.6). To assess the cognitive functioning, we used the Brief Assessment of Cognition in Schizophrenia (BACS) test and the Montreal Cognitive Assessment (MoCA) technique. The Mann-Whitney U test was used to determine the significance of differences between the two groups. We obtained the following results. The mean BACS scores were 25 for the patients and 50 for the healthy subjects. SD was 15 for the experimental group and 9 for the control one. The
mean MOCA scores were 23 and 27, and SD was 4 and 2 for the clinical and control groups, respectively. The clinical group performed significantly worse than the control one in MOCA (p=0.007) and BACS (p=0.0004). We also identified differences between the two groups on each subtest of the BACS. The performance in all the subtests was significantly worse in the clinical group (List learning, p=0.005; Digit Sequencing Task, p=0.005; Token Motor Task, p=0.02; Verbal Fluency, p=0.008; Symbol Coding, p=0.0001; Tower Test, p=0.02).

BODY IMAGE IN PERSONS WITH THE SPECIAL CORPOREAL EXPERIENCE
(ON THE EXAMPLE OF FUTURE BALLET DANCERS)

Alexander Tkhostov
Lomonosov Moscow State University (Moscow, Russia)
Anna Neliubina
(Moscow, Russia)

Within the conception of psychology of corporeality (Tkhostov A.Sh., 2002), physical activity and the acquisition of physical skills are ones of the circumstances of the objectification of corporeality and distinction of some separate parts of the integral image of the body. Classical dance training is a perspective research model of the body image formation under the effect of a long and specific training and the acquisition of a particular corporeal experience by a student. The present study aims at demonstrating how the comprehension of one’s own body changes in the process of the profession acquisition, and how it is objectified, verbalized and assessed, turning into the main “instrument” of a dancer. 149 trainees in classical dance of the third to seventh forms in Vaganova Ballet Academy partook in the study: 104 girls and 45 boys aged 13 to 17 years old. The "body image” technique (by Zhelatelev D.V., 1999) was employed: the adolescents listed all the body parts known to them, and ranked them according to their significance degree. The following parameters were analyzed: the volume and content of the vocabulary of body parts, its structure (frequency analysis of high-ranking body parts). The data were compared with the conditional norm (150 persons). In the course of the profession acquisition, a number of phenomena have been observed. The vocabulary volume of body parts in the ballet adolescents is statistically significantly more (where p≤0.05) than that in “usual” students. In junior school, it exceeds “usual” children’s vocabulary twice: a pedagogue draws students’ attention to the significant body parts and teaches them to control their position in the space. By middle school, one observes the vocabulary reduction, body part enlargement, and then by the graduation, its backward “unfolding” but qualitatively different. The body parts, important for dancing only, stay in the image. The verbalization of body parts also changes, in particular, that of “working” ones. Trivial names are replaced by professional ones; “working” parts are highly differentiated, particularly, during the periods of setting of the hands and feet. The structure of the body of the ballet adolescents differs from that of usual ones.
THE STUDY OF THE PERCEPTION OF CONTRADICTIONS IN NORM AND IN PATIENTS WITH SCHIZOPHRENIA

Alexander Tkhostov
Georgy Rupchev
Andrey Alekseev

Lomonosov Moscow State University (Moscow, Russia)

The emergence of the concept of incoherence has enhanced interest to the problematic of contradictions in the image of the world in norm and in different types of mental pathology. The present research aims at studying the perception of contradictions in the representations about a person in norm and in patients with schizophrenia. 40 patients with schizophrenia (15 women and 25 men; the mean age — 38,15 years old) and 42 healthy subjects (20 women and 22 men; the mean age — 30,8 years old) partook in the present study. For our study, the "Contradictions Study" questionnaire was worked out. It included 39 pairs of personality features, being contradictory and non-contradictory in the meaning (physical, psychological and social). When filling out the questionnaire, the subjects under test were required to reply "YES" or "NO" to the question, whether the both of features of the pair could be characteristic of the same person. For instance, "Can a person be simultaneously dull and cheerful?" The processing of our results was fulfilled according to four scales: physical antonyms (for instance, "fat and thin"), physical non-antonyms (for instance, "tall and lightweight"), social and psychological antonyms (for instance, "kind and angry") and social and psychological non-antonyms (for instance, "kind and sad"). The differences between the groups were analyzed (p<0,05). The majority of the subjects in the both groups did not suffer any difficulty in filling in the questionnaire. In the equal degree, the patients with schizophrenia and healthy subjects under test seldom admitted the co-existence of contradictory physical features in a person. However, statistically significantly oftener, the healthy subjects accepted a simultaneous presence of contradictory psychological and social features in a person. The mean values on scale "social and psychological antonyms" were 9,07 in the group of the healthy subjects and 6,02 in the group of the patients with schizophrenia. Within the psychodynamic approach, that corresponded to the widespread ideas of polarization and dissociation of the "good" and "bad" Self-and object-representations in patients with schizophrenia.
QUALITATIVE SELF NON-INTEGRATION PHENOMENA IN REPERTORY GRIDS OF ADOLESCENTS WITH EATING DISORDER

Anfisa Zakharova
Center for the Study of Eating Disorders (Moscow, Russia)

Andrey Ryzhov
Lomonosov Moscow State University (Moscow, Russia)

Background: for teenagers with eating disorders are characterized by social isolation, perfectionism, obsession, sense of self inadequacies that can be seen as reinforcing super-value of control over food consumption and one-sided fixation on looks in self-rating. The method of repertory lattices can used to investigate how the patient "constructs" view of himself in comparison with other people, as well as serve the basis for intervention programs aimed at the development adequacy and flexibility of such assessments.

Methods: a modified method of Kelly's repertory grid was used. The method was aimed to study how people form beliefs about themselves and significant others by assessment of average distances between aspects of self, adults and peers according to the method of Makhlouf-Norris and Norris [Makhlouf-Norris & Norris, 1972]. The study was conducted into the clinic 'Center for ED research in Moscow CIRPP'. 23 adolescent girls with eating disorders, 19 patients with anorexia nervosa, 6 of whom have a history of bulimia episodes, and 4 patients with nervous bulimia was examined during the study.

Results: The phenomenon of "self non-integration" is quite rare for the norm [Makhlouf-Norris and Norris, 1972], but often occurs in subjects of the study. This was found in 35% of lattices.

A phenomenon we named 'inversion of the trajectory of development', founded in 48% of lattices, that consists of the distance from "I" to the" I ideal" increases, "I ideal" becomes unattainable, was found during assessing the average distances between the aspects of self. Although, in the normal case this distance reduces. Also, the distance from "I actually" to "which I will probably become" should generally be less than the distance to "which I would be".

Conclusion: study of the peculiarities of self-representation of patient informatively reflects the impact of the disease on the personality. It can provide goals for intervention during treatment process. Further study of discovered phenomena is proposed to understand their origin and dependence/independence on the features of the ratio of elements in the role list in repertoire lattices, as well as to analyze the consistency of ideas about themselves in the time perspective.
A TEACHER-FAMILY CONSULTATION APPROACH TO SCHOOL-BASED SUPPORT AND INTERVENTION

Zaytoon Amod
University of the Witwatersrand (Johannesburg, South Africa)

Advances in school psychology and mental health highlight that effective teacher-family engagement can result in improved educational, socio-emotional, and behavioural outcomes for young people. School-based collaborative consultation and systemic intervention strategies are particularly relevant in responding to the contextual demands and paucity of mental health resources in developing countries, such as South Africa. The objective of the current study was to explore the application of Adelman and Taylor’s (1979, 1983, 2010) Initial Assessment and Consultation (IAC) family collaboration model by teachers, as a strategy for school-based support and intervention in South African schools. The IAC approach represents a paradigm shift from the reductionist individual deficit orientation to an interactional family empowerment approach to psycho-educational support and intervention. This shift aligns with the contextual needs and education policy reform initiatives in post-apartheid South Africa. The IAC model has been researched, adapted, and applied in psychology professional training programmes at the University of the Witwatersrand; however, this exploratory descriptive research was the first study of the IAC approach that has been extended to a school setting. Using a mixed-methods data collection procedure, the study explored the views of parents and learners of the IAC shared problem-solving procedure. Methods of data collection included 4 focus group interviews with 44 parents/caregivers and the administration of pre-post-intervention questionnaires to 72 learners. Eighteen schools from under-resourced South African communities participated in the research project. Findings of the thematic content analysis of qualitative data revealed that despite the challenges described, parents felt that they had actively participated in the problem-solving and decision-making process concerning their children. They also expressed that several of the identified concerns raised during the IAC consultation sessions had been addressed. Paired t-test results showed significant improvements in learners’ views regarding their homework, behaviour, and family interaction. While more extensive research is recommended, the findings of this exploratory study suggest that the IAC is a flexible and adaptable approach which can potentially be applied within diverse socio-cultural school settings to foster teacher-family engagement and collaborative team practices.
PSYCHOLOGICAL WELL-BEING OF WOMEN DURING PREGNANCY

Kseniya Kuleshova
I.M. Sechenov
First MSMU (Moscow, Russia)

As directions of women’s possible development during pregnancy, we distinguished (2013, 2017): 1) “healthy personality development” of a pregnant woman; 2) development, accompanied by woman’s voluntary termination of pregnancy (making a decision to abort a pregnancy); 3) “adaptive”-to-pregnancy development. The success / failure of the development of a pregnant woman in each of these directions are influenced by its own group of factors. The empirical base included: a) data from the Clinic of Obstetrics and Gynecology of I.M. Sechenov First MSMU, b) database, collected by the results of an anonymous survey of women-“containers” via the Internet. The total sample size (taking into account the preliminary pilot study) is 569 women (369 pregnant women; 100 — after the abortion; 20 — in the postpartum period; 73 women for whom the topic of pregnancy was irrelevant during the period of the survey; 2 groups of pregnant women: aged from 20 to 30 years – 25 women, and from 40 to 44 years – 25 women). All women were medically classified as healthy. To solve the empirical research tasks, the following methods were used: (a) questioning; (b) interviewing; (c) observation in the workplace; (d) a set of psychodiagnostic methods (Karlinskaya I.M., Khanina I.B., 2001, 2011) to identify the level of person’s self-actualization, mental states, self-understanding and interaction with the social world; e) standard psychodiagnostic methods to assess the quality of the subjects, quantify the positive or negative impact of the body image on the life quality, measure trait and state anxiety, study differential emotions, assess mental activation, interest, emotional tone, tension. According to the results of our empirical research, we identified the conditions (physiological, psychological, social) for satisfying the needs significant for a pregnant woman, which are accompanied by certain psycho-emotional states. Pregnancy as the actualization of female body capabilities can be both congruent and incongruent with the development level of woman’s personality, which will also affect her psycho-emotional state as an indicator of her state of well-being / ill-being. The quality of pregnant woman’s emotional states, self-understanding and interaction with the social world depend on the level of her self-actualization (on the state of her spiritual sphere).
SOCIAL FACTORS OF STUDENT’S EMOTIONAL WELL-BEING

Nadezhda Tvorogova
I.M. Sechenov
First MSMU (Moscow, Russia)

The overall purpose of our research: identification of the relationship between mental and social well-being of the individual. The research involved 351 students of I.M. Sechenov First MSMU. The following psychodiagnostic methods were used: structured version of TAT for measuring the affiliation motive, Izard’s differential emotions scale, SAM, the questionnaire by Pluchek, sociometry, autosociometry, UCLA loneliness scale, and the questionnaire developed by us. The data of the empirical research of the dependence of the level of person’s emotional tension (E) on the relationship between the actually (Irs) received (information about the sociometry results was communicated to him/her) and the desired (Ids) result of his/her communication, as well as on the activation of the intrapsychic defence mechanisms allow us to state the existence of such dependence. For students with a high level of the need for communication that we study, the regression line of the random variable E by (Irs — Ids) has the form of a hysteresis curve, the upper branch of which corresponds to the dynamics of emotions appearance, and the lower one corresponds to the dynamics of their decline due to the activation of intrapsychic defence mechanisms. The size of the area enclosed within the hysteresis curve increases with increasing need and decreases with its decrease. At the same time, for students with a low level of the studied need, the regression line of the random variable E by (Irs — Ids) is close to some straight line passing near the origin of coordinates (the type of the relationship between E and (Irs — Ids) is close to the one discovered by P.V. Simonov, 1970). A part of the emotional tension caused by dissatisfaction or not enough satisfaction with the person’s actualized need remains in the person despite subjective psycho-emotional well-being, achieved due to the unconscious activation of the intrapsychic defence mechanisms (the presence of residual tension is demonstrated by the area enclosed within the hysteresis curve — in electrical engineering, hysteresis curve demonstrates the saturation of the system with energy, then the release of the energy from it; the area within the hysteresis curve indicates that although the system is discharged, some of the charge remains in it).
THE FACTORS INFLUENCING THE GROWTH OF LOOKISM: APPEARANCE PERFECTIONISM, SATISFACTION AND CONCERN WITH APPEARANCE

Daria Pogontseva
Vera Labunskaya
Southern Federal University (Rostov-on-Don, Russia)

One of the prominent tasks of the psychology of physical appearance is to investigate the factors influencing the growth of lookism accessibility during communication. The researchers stress various cultural, social-psychological, and personality factors that impact lookism (Pogontseva, 2017; Rumsey & Harcouter, 2009; Swami & Furnham, 2009). In spite of the central role of physical appearance in lookism development little research was conducted scrutinizing the interplay of appearance perfectionism, satisfaction and concern with own appearance in these processes. Named socio-psychological and personality aspects reflect the importance and functional value of physical appearance as well as an individual’s attitude towards own appearance. In the frameworks of developed approach (Labunskaya & Drozdova, 2017) a complex structure of physical appearance as well as connections between its different components are considered. Further on we suggest that in contrast to the concept of bodily perfectionism (Arina,2009; Tarhanova & Holmgorova; 2011; Tarkhanova,2014; Yang, 2012) the concept of appearance perfectionism is more suitable due to wider range of appearance components incorporated (K. Srivastava,2009), for example, direction of perfectionism tendencies, attitude towards appearance including satisfaction and concern with own appearance. Therefore, we define lookism accessibility as tendency to physical appearance change. Interplay between appearance perfectionism and satisfaction and concern with appearance impact the tendency to appearance change as indicator of lookism accessibility growth. The participants were 41 males and 82 females aged from 20 to 35. The questionnaire “Attitudes towards Own Appearance: Satisfaction and Concern” consisted of three scales: 1) “Concern with Appearance”; 2) “Satisfaction with Appearance”; 3) “Tendency to Appearance Change” (Kapitanova & Labunskaya, 2014) and the Appearance Perfectionism Scale (APPS) (Srivastava,2009) were administered. The correlation between appearance perfectionism, satisfaction and concern with appearance is significant. Appearance perfectionism and satisfaction with appearance are associated with tendency to appearance change. The growth of lookism accessibility during everyday interaction defined as tendency to appearance change is dependent on interrelations between appearance perfectionism and satisfaction with appearance. This study is conducted in the frameworks of the research project № 17 1801260 supported by Russian Science Foundation.
EXPLORATION OF EEG CHARACTERISTICS DURING THE PERFORMANCE OF SHOOTING EXERCISES IN EXPERIENCED ARCHERS

Irina Polikanova
Sergey Leonov
Lomonosov Moscow state university (Moscow, Russia)

The goal of the study was to investigate the dynamics of EEG characteristics (dynamics of dominant and average frequencies of theta-, alpha, low (LF) and high (HF) beta-rhythms) during the performance of various archery exercises in experienced athletes. The next exercises were used: mental representation of a shot (imagery), motor imitation of a shot without a bow (motor imagery, MI), real archery shot (real shot, RS) and aiming from a bow without a shot (aiming).

11 athletes of the junior national Russian team were participated in the study (average age – 17). EEG recording was performed using 16 channels. For the analysis of theta-rhythm were used the F3, Fz and F4 channels, for alpha rhythm – P3, Pz and P4, for LF and HF beta rhythms – the C3, Cz and C4 channels.

The athletes performed each exercise for 6 times in appropriate order. EEG recording was carried out throughout the exercises. Statistical analysis was carried out between rest state with open eyes and each shot (or imagery shot) during exercises also with open eyes.

The most significant changes in EEG during the shooting exercises were observed in alpha-rhythm (P3 and Pz) and HF beta-rhythm (C3) almost for each trial. Significant increase in frequencies were observed mainly in left hemisphere.

Average values of dominant (DF) and average (AF) frequencies of alpha- and beta-rhythms for the appropriate exercises (rest state, imagery, MI, RS, aiming):
- alpha (P3): DF – 9,4; 10,1; 11,46; 11,64; 11,37; AF – 9,96; 10,51; 11,51; 11,4; 11,5;
- alpha (Pz): DF – 9,8; 9,2; 11,67; 12,09; 11,75; AF – 9,7; 10,51; 11,4; 11,4;
- beta (C3): DF – 22,2; 21,96; 25,1; 25,11; 26,71; AF – 24,76; 25,13; 26,15; 26,13; 26,45.

Thus, archery shooting exercises are associated with increasing of attention (beta-rhythm) and at the same time with capacity and speed of informational processes and also with relaxation (alpha-rhythm).

It’s interesting that EEG dynamics during motor imagery was as similar as during real shot. Thus, motor imagery can be used as an additional form of training in archery sports, allowing to change the brain activity in certain way more rapidly, and thereby to provide more effective training process of athletes.

The work was done under financial support of the grant 19-78-10134 of the Russian Science Foundation.
5-HTTLPR POLYMORPHISM OF THE SEROTONIN TRANSPORTER GENE PREDICTS SENSATION SEEKING BEHAVIOR. THE EEG STUDY

Irina Polikanova
Sergey Leonov
Lomonosov Moscow state university (Moscow, Russia)

The goal of the study was to investigate the relations between sensation seeking behavior with genetic and electrophysiological (EEG) characteristics of the person.

36 right-handed male (age 24+/-6) without any mental and neurological diseases were divided into 2 groups depending on the presence of S-allele in the 5-HTTLPR polymorphism of SLC6A4 gene associated with serotonin transporter. Group «S+» included 18 subjects. Group «S-» included also 18 subjects.

EEG recording was performed using 256 channels. The groups were compared by two EEG parameters: individual alpha frequency (IAF) – the frequency in alpha-rhythm range (7-14 Hz) where the maximum power is observed, and index of functional state (IFS = (α+σ)/β). IAF and IFS were measured and averaged in five separate brain regions (frontal (F), central (C), temporal (T), parietal (P) and occipital (O)) for both hemispheres.

Statistical analysis showed significant differences between groups «S+» and «S-» in "Sensation seeking scale" (SSS) scores as well as in EEG parameters.

SSS consist of 4 subscales: Thrill and Adventure Seeking (TAS), Disinhibition, Experience Seeking (ES), and Boredom Susceptibility (BS). In SSS questionnaire «S+» group showed much more higher scores on the following scales: TAS (p≤0,02); ES (p≤0,015); BS (p≤0,034).

EEG results showed lower IAF values at «S+» group. Significant differences were observed only in the left central region (9.49 Hz vs 10.04 Hz). EEG results also showed lower IFS scores for «S+» group in almost all areas of the brain: left hemisphere – F (p≤0.026), C (p≤0,046), P (p≤0,011), T (p≤0,013), O (p≤0,021); right hemisphere – C (p≤0,019), T (p≤0,026), O (p≤0,013).

This results can mean that the «S+» group is characterized by a predominance of slow wave activity compared to «S-» group and accordingly less activation of the cerebral cortex.

Thus it can be supposed that S-allele in the 5-HTTLPR polymorphism of SLC6A4 gene is associated with less activation of the cerebral cortex and tendency to have more risky behavior to increase this activation (risky sports, travel, change of residence and social environment).

The work was done under financial support of the grant 19-013-00951 of the Russian Foundation for Basic Research.
EFFECTS OF MINDFULNESS ON EMPATHY AND SELF-COMPASSION: AN ADAPTED MBCT PROGRAM ON FILIPINO COLLEGE STUDENTS

Reginald Paul R. Centeno
Ateneo de Manila University

Attending college is meaningful for many young adults (Wilt, Blerdorn & Revelle, 2016). This period is marked by physical, emotional, and psychological changes that can have both positive and negative effects on college students. The last two decades has seen an alarming increase in the number of college students who suffer from mental health conditions such as depression, suicide, anxiety and alcohol abuse (Kirsch, Doerfler, & Truong, 2015). It is recommended that actions to support the students’ wellbeing must be creative and evidence-based (Greeson, et al., 2014). Research suggests that a mindfulness-based intervention may be an effective strategy to address mental health conditions among college students. This study examined the efficacy of an adapted Mindfulness-based Cognitive Therapy (MBCT) Program that was implemented in a classroom setting in the Philippines and to explore how mindfulness practice can affect empathy and self-compassion on senior Filipino college students aged 19-22 years old. Two classes were used to compare the effects of mindfulness intervention. One class underwent the adapted MBCT program while the other class underwent the same kind of class without mindfulness interventions. Self-report measures of Five Facet Mindfulness Questionnaire (Baer et al., 2006), Perspective Taking subscale and Empathic Concern subscale of Interpersonal Reactivity Index (Davis, 1980), and Self-compassion scale-short form (Neff, 2011) were administered before undergoing the adapted MBCT and after the program. After going through the adapted MBCT, college students’ mindfulness significantly improved. Empathy and self-compassion also significantly improved after undergoing the program. This corroborates previous studies done on mindfulness and its efficacy with adolescents and suggests how mindfulness practice can improve empathy and self-compassion with Filipino college students. It provides a promising groundwork for the emerging interest and research in Asia particularly the Philippines on how the practice of mindfulness can help with mental health of college students.
THE ROLE OF PARENTAL ASSESSMENTS OF PHYSICAL APPEARANCE IN THE FORMATION OF "LOOKPHOBIA" IN YOUNG PEOPLE

Irina Drozdova
Gennady Serikov
Psychological center "Zhesture" (Yerevan, Armenia)

Currently, in psychological science there is an interest of researchers to the persons’ experiences associated with the assessment of their physical appearance (PA). We can talk about such a phenomenon as a "lookphobia", which is an obsessive fear of evaluation of one’s appearance by other people, especially in the situations of increasing its importance and value (Labunskaya, 2016). Questions about the role of the significant environment in the emergence of this phenomenon are relevant.

The aim of our research is to study representations of young people with "lookphobia" (a high degree of PA concerns) about parental assessments of their PA. To determine the degree of concern about PA, we used the scale "Concern" from the questionnaire "Attitude to one’s physical appearance (Labunskaya, Kapitanova, 2017). The representations of boys and girls as to the assessment of the components and characteristics of their PA by the parents were revealed using a modified version of the method "Assessment and meaningful interpretation of the physical appearance and its conformity to gender and age constructs" (Labunskaya, 2009).

The representations of young people about parental "rating" of their PA were examined separately as to fathers and mothers.

Among the participants of the study (62 respondents, aged 16-17 years) a group of girls with lookphobia was found. Between them and the rest of the study participants were found significant differences in the representations about the evaluation of their PA by parents: assessment of the face and physique by father (p≤0.05), evaluation of the PA by father (p≤0.01), and evaluation of the PA by mother (p≤0.05), evaluation of the PA attractiveness for the opposite sex by father (p≤0.01). It turned out that the girls with lookphobia believe that parents do not appreciate their PA highly (especially their fathers). It can be concluded that parental assessments of the PA of their children may contribute to the emergence of "lookphobia". Parents’ negative assessments and comments may lead to the formation of children’s critical attitude to their PA, to "fixation" on its real or fantasized defects and to the suffering associated with their low self esteem of PA.

The study was supported by the Russian Science Foundation, project № 171801260.
FEATURES OF THE LIFE WORLD OF MIGRANTS AS THE SUM OF THEIR IDENTITIES

Victor A. Klimenko
Director, Siberian Design Centre, Russia

The aim of the study is to investigate different psychological aspects of life-world as a sum of identities among representatives of different cultures and age groups.

This is a pilot study. In this study we will focused in respondent groups of young migrants, including those who arrive in Russia from neighboring countries and beyond.

The methodological foundation of the study is the system-anthropological psychology approach and some concepts of psychology of migrants (Zotova O.Yu., Carpentier & Sablonnière, Esses).

The methods used in the study included different questionnaires and interview. The data obtained were processed with the help of content analysis and statistical methods. We use three levels of analysis of the life-world of migrants: country, city and institute. These systems encompass those identities which undergo maximum transformation in life-world of young migrants and impact on their self-fulfillment.

Results. There are different migrant groups in age 16-30, including those who arrive in Russia from neighboring countries and beyond, took a part in the study.

The preliminary results show that different groups of respondents feel varying degrees of dissonance in emotions and mental constructions for example due to their parent family and native language group. Migrants from mixed marriages and native speakers of the host country language feel less stress. Moreover, identifying oneself as a student becomes an opportunity for self-regulation and effective self-fulfillment.

Main data of research will be presented across all outcome measures on different samples.

Conclusions. The findings will be used to educational and psychological support of migrants.
PERSONAL PECULIARITIES OF ENTREPRENEURS OF DIFFERENT GENERATIONS

Smetanova Iuliia V.
Associate Professor, Tomsk State University, Russia

Background. It’s a part of cross-cultural research of young people belonging to the generation of ‘Millennials’ in the Russian and Bulgarian samples, who are involved in entrepreneurship, and here are the results obtained on the Russian sample.

Aim. The aim of the study was to identify and describe the personal characteristics of entrepreneurs of different age groups (generations).

Methods. The methodological foundation of the study is the system-anthropological psychology approach. The research methods used are: the method of investigation of personal potential, value orientations questionnaire and interview. There were 184 high-school students and 160 mature entrepreneurs who took part in the study.

Results. The results of the research show that young entrepreneurs are focused on achievements and are open to experience. They value individualism and independence, but at the same time they understand the need to build high-quality, long-term relationships with others. The latter feature is characteristic of young people and is practically not expressed among the representatives of more mature age and the X and Y generations.

The last ones perceive entrepreneurship as the scope of self-realization. The work in social or innovative entrepreneurship helps them to translate higher values into reality. As a result we were able to identify three types of entrepreneurs and three types of personal potential profiles that correlate with the indicators of successfulness of business.

Discussion. The results of this research helped us to develop coaching programs and use them in practice.
ORTHODOX ORIENTED PSYCHOLOGICAL CONSULTING IN CONTEMPORARY RUSSIAN SOCIETY

Tatiana Filipieva
Moscow, Russia

Psychologists cannot change the situation, but they can help change attitudes towards it, understand spiritual reasons and sources. Comparative analysis of quality, structure and content of the process of psychological consulting reveals basic distinctions in approaches between Orthodox and non-Orthodox psychologists. Orthodox oriented psychologists in dealing with human life feel awe, as they treat people not as clients or patients, but as the owners of the greatest Charisma – the relic of the soul that is the image and likeness of the Creator.

Consulting psychologists are obliged to know well both the body life and the person’s spirit.

Spiritually-oriented psychologists use the best achievements of world psychological science and the heritage of holy fathers to lead to understanding of the purifying psychotherapeutic effect of confession and communion, not trying to replace them by psychological help. Any spiritual-oriented counseling is a meeting and interchange of the two souls, moving from darkness to light, from unbelief to belief, from suffering to gladness. Universally each person is responsible for committing sins. What helps avoid a sinful act? Remember that sinful intoxication of the whole world is increased by adding to the accumulation of planar evil. However Orthodox psychology is optimistic and life-affirming, and emphasizes that just as sin poisons the world, so repentance cleanses the world by kindness and love. The secret of professional success of Orthodox psychologists is as following: 1) live in harmony with God and oneself; 2) heal your soul by confession and communion; 3) be worthy of the name of Orthodox Christian and psychologist.

THE DEFINITION OF CYBERPSYCHOLOGY: GAMES COMPUTERS PLAY

Alexander Libin
Scientific Director, GHUCCTS, Georgetown University, Washington, DC, USA

Background: If psychology is the science of the mind, does it mean that CyberPsychology is the science of the digital mind? Does the digital realm has become a human habitat in its own rights? The answer today is a distinct "yes." We define CyberPsychology as the science of digital humans, a recent phenomenon, that emerged as a direct result of human multilevel engagement with artificially designed computer-generated reality (Libin, 2001, 2005). The CyberReality is not just a replica of our earthly world, it exists through specific physical embodiment through the ever-growing body of the hardware, psychological space shaped by peoples’ interactions, and societal forces defined by the impact the information makes on global society.

Methods: Evidence-based analytics derived from more than 3,000 peer-reviewed articles, research reports including think tanks outcomes disseminated as books and white papers, diplomas and PhD thesis, industry reports, and mainstream news narratives in English, Russian, French, German, Spanish, and Chinese on the subject of physiological, psychological, and socio-cultural effects produced as a result of computerized technologies impact on individuals, groups and large communities. This is an ongoing crowdsourcing effort originated in 1983 and continued through network-based open source international collaboration.
Findings: Four distinct patterns emerged, describing the following core elements of the CyberPsychology as a scientific inquiry, university discipline, and everyday reality framework: psychosocial competence including self-management of one’s own identity, coping with negative consequence of digital immersion, CyberSecurity as it relates to personal and societal safety, and CyberEthics.

Discussion: Well-being – security;

COPING INTELLIGENCE VS ARTIFICIAL INTELLIGENCE: WHO’S TURN IS NEXT?

Elena Libin
Founder, Coping Intelligence Institute, Chevy Chase, USA

Background: Coping Intelligence is defined by a broad repertoire of life skills essential for successful management of everyday challenges in order to sustain individual and social well-being (Libin, 2003, 2019). A concept of Artificial Intelligence (AI) evolves from the notion put forward by Marvin Minsky (1959), who defined AI as “the science of making machines do things that would require intelligence if done by men.” We investigate decision-making in the real-life context, focusing on the criteria that differentiate decisions based on human intellect from algorithms programmed into AI.

Methods: A cross-cultural mixed-methods study on children and elderly interacting with social robot characterized by advanced artificial intelligence and synthetic sensory feedback. More than 300 participants of different age, gender and life experiences in USA, Russia, Ukraine and Japan were involved since 2001 with our project, funded by Coping Intelligence Institute (USA).

Findings: AI algorithms despite their programming complexity were extremely limited in their capacity to adopt to the multidimensional complexity of challenges presented by real-life situations. Human communication with the robot, as well as any interactions with the AI system by that matter, are shaped by our personal experiences and world-views. In fact, the very way we deal with so-called “smart” gadgets of any level of complexity, serves as a litmus test, or, to be more specific, a projective psychological assessment, thus revealing coping or destructive strategies in managing life difficulties.

Discussion: The results suggest, that an attempt to replicate a broad repertoire of interactive strategies, offered by human coping intelligence, with the programmed, AI-based, responses, is doomed by default. Even the most advanced technology can not compensate for the lack of human ability to cope in real world situations. Our communication is not based on “trigger – response”, or “stimulus-and-response,” model, similar to how it is done in systems guided by an artificial intelligence. There is always a mediation of our interactions with the world by a coping intelligence – a tool, suggested by Nature and nurtured by Society, in order to solve any real-life problem with human touch.
ACADEMIC PERFORMANCE AND ITS RELATIONSHIP WITH PERSONALITY AND EMOTIONAL INTELLIGENCE IN EDUCATION STUDENTS

JLuis Antoñanzas
Carlos Salavera
Lucia Tomás
University of Zaragoza, Faculty of Education

A study was conducted with students of the Faculty of Education of the University of Zaragoza to see the relationship between personality and emotional intelligence in students of the Degree of Education and its impact on academic performance. The EPQ-R, a personality test, and the TMSS24, which measures emotional intelligence, were used. In turn, a clinical personality questionnaire (PNP) was also passed to rule out any type of mental disorder. The results revealed the relationship of Personality and emotional intelligence with academic performance.

TO THE ISSUE OF THE METHODS OF STIMULATING THE MOTIVATION OF TEACHING STAFF OF HIGHER SCHOOL

Galushkin A.A.
Stolypin International Institute (Moscow, Russia)

The work of teaching staff often becomes the object of various studies in the context of increasing its efficiency, which can be achieved by increasing the motivational potential of the teacher. The motivation of the teacher has a complex nature, which is emphasized by domestic researchers, for example, A.D. Griega, I.A. Orlitskene, K.V. Khudyakov say, that there are four aspects of motivation, two of which relate to internal characteristics — employee behavior and personality type, as well as two aspects related to external motivation — management methods used by the manager and the procedural approach [1]. An important aspect is the ways to increase motivation, which can be divided into two large groups: tangible and intangible and their impact on the motivation of labor.

In the experiment in 2010, test persons were asked to perform both mechanical and complex cognitive tasks [2]. The system of material rewards gave motivation for more efficient performance of mechanical tasks. The learning process, in its essence, is cognitively challenging, therefore, intangible rewards have a significant effect. However, it does not diminish the value of material incentives for motivation. A general increase in the basic salary of teachers is necessary, so money does not act as a deterrent when applying for a job. It can be said, that the non-material incentives for the motivation of higher school pedagogical specialists play more significant role than the material one. At the same time, creating of the system of combining methods of material and non-material motivation will be more right way.
PROBLEM OF EATING BEHAVIOR MEASUREMENT

Ilya Leonov
Udmurt State University (Izhevsk, Russia)

Eating behavior is related to food choice and motives, feeding practices, eating-related problems and disorders. It is a complex phenomenon, regulated by physiological and psychological mechanisms. Biological sciences actively study central and peripheral mechanisms of eating behavior. But psychology is interested in studying of cognitive, personal, emotional and social aspects of eating behavior realization. One of a serious research concern is a lack of validated and reproducible on different samples russian questionnaire, capable for identify and measure different types of eating behavior. To date, there are several questionnaires for eating behavior “measurement”: Restraint Scales (RS) by Herman & Polivy (1980); Eating Attitudes Test (EAT-26) by Gerner et al. (1982); Binge Eating Scale (BES) by Gormally et al. (1982); Eating Disorders Inventory (EDI-1) by Garner et al. (1983), Three-Factor Eating Questionnaire (TFEQ) by Stunkard & Messick (1985); Dutch Eating Behaviour Questionnaire (DEBQ) by Van Strien et al. (1986); Bulimic Inventory Test, Edinburgh (BITE) by Henderson & Freeman (1987); Bulimia Test-Revised (BULIT-R) by Thelen et al. (1991); Food Neophobia Scale (FNS) by Pliner & Hobden (1992); Child Feeding Assessment Form (CFAF) by Birch et al. (2001); Eating Pathology Symptoms Inventory (EPSI) by Forbush et al. (2013). But most of them demonstrate problems with reproducibility of factor structure and with construct validity. One other problem is a lack of quality adapted questionnaires on russian language, based on language- and cultural related features (some are just translated in Russian). Another problem is related to dominance of clinical researches of eating behavior, without interest in psychological mechanisms of regulation of “normal” eating behavior. Thus, construction of reproducible on normal and clinical samples cultural sensitive questionnaire may be a current objective for psychology.
NEUROTIC SYMPTOMS, THEIR DIFFERENCES BETWEEN MEN AND WOMEN

Arkadi Aghvan Mehrabyan
Psychological center “Zhesture” (Yerevan, Armenia)

We will not make any discovery saying that neurosis is the most common psychological disorder of our time. Although the term neurosis came out of circulation as a disease, but since it is still widespread in society, we decided to preserve the collective name of the group of disorders in our speech.

As we all know, almost all types of neurosis are accompanied by symptoms of the vegetative system. The most common symptoms include dizziness, headaches, noise in the ears, mouth dryness, constriction of throat, pain in the limbs, palpitation, pressure, nausea, abnormal abdominal sensations, a feeling of unreality, fever and non-somatic manifestation of insomnia, absent-mindedness, memory loss and so on.

Today we focus on the following key point:

Despite the challenges of our time, the tendency to create open societies, and Western orientations that are against the distinction between "sex", "gender" or similar words and expressions, we had the courage to separate the difference in neurotic symptoms between women and men.

It is accepted that there are three main types of internal conflicts:

A) hysterical (increased demands on the environment)
B) obsessive-psychasthenic (the conflict between needs and responsibilities)
C) neurasthenic (increased demands on oneself)

Recent 7-year studies have led to the following patterns, in which the hysterical type of conflict prevails in women, in a neurasthenic conflict men predominate. This is due to differences in the mentality of women and men, as well as differences in their upbringing and lifestyle. And the obsessive-psychasthenic type of conflict is mixed.

And it is not surprising that every type we have separated is characterized by its own symptoms. In particular, the hysterical type that occurs in women is characterized by cardiovascular-related symptoms (palpitation, pressure, tachycardia, nausea), and abnormal feelings in the abdomen, constriction of throat and pain in the limbs. In the case of a neurasthenic type of conflict, which men are more likely to have, the symptoms are more associated with limbs, such as dizziness, headaches, noises or sounds in the ears, mouth dryness, pain in the limbs.
THE DECISION TO DIVORCE, MADE BY A MAN OR A WOMAN AS AN UNFINISHED GESTALT

Deciding to divorce is a hard process for a man and a woman: it is preceded by a long-term pre-divorce phase. Over the past 15 years, couples come to psychological center “Zhexture” to understand whether or not to stay together, and overcome the divorce decision. The reasons of the decision to divorce as an unfinished gestalt are presented /n=520, nW=240, nM=280/:

- A life scenario when a woman / man continues the decision made by her mom/dad. Case, the majority of the family’s women/men have decided to divorce, when there seems to be no serious reason. In this case, gestalt therapy is directed towards the consciousness of the woman/man’s own life scenario and taking control of their life. The effectiveness of therapeutic interventions is about 75% for women and 68% for men.

- An incomplete feeling till the marriage, when a woman/man does not finish the previous relationships, they create a new family, moving here the incomplete emotions of their previous relationships. In this case, gestalt therapy is aimed at ending the previous relationship, overcoming hurt, guilt, and other negative emotions. The effectiveness of therapeutic intervention is 50% for women and 50% for men.

Gestalt therapy is aimed at accepting a man’s image of a woman, not looking for a father in the opposite sex. The effectiveness of therapeutic interventions is 78% for women and 52% for men.

Studying the cases of divorced women applying to psychological center “Zhexture”, the failure or delay in divorce decision was mainly due to the following circumstances:

- The public opinion which is different for women and men-12%.
- Fear of the future, how will I continue to live - 21%.
- Fear of adaptation to new changes or losing the comfort - 25%.
- Avoidance of responsibility, failure to make a decision - 11%.
- Woman’s sacrifice- 31%.
SPEECH IMPACT AS THE MAIN STRATEGY IN THE ADVOCATE’S SPEECH

Mariam Vardan Karapetyan
Psychological center “Zhesture” (Yerevan, Armenia)

This presentation discusses certain speech impact strategies, focusing particularly on psychological and linguistic factors that are used by advocates during defense speeches.

Speech impact is a targeted communication that aims to change the object’s consciousness, the world-view model, and / or control the behaviour.

The speech Impact Strategy is perceived as a way of using information that aims to alter the behavior of the object in the direction previously planned by the subject of the speech impact.

In defense speeches, the influence is not bending to another’s will, it involves motive and conscious evaluation of the significance of the struggle. The effectiveness of the impact through persuasion is associated with the modeling of the subject of the addressee’s field of consciousness without changing the significance of the field. It gives an opportunity to present the case in a rhetoric favorable perspective, appealing to particular strategies of some values and generating sensitivity in the auditorium, using the meaningful saturation of natural language units. Therefore, both the collection of the arguments and the techniques of persuassion are important.

The main structure of the personality are connected with the role essence. Personality is considered as a combination of its social roles. According to these views, a person never remains "just a man", but always acts in one or another role, is a carrier of certain social functions and social standards. These roles are considered in three plans:

- In the sociological - as a system of role expectations, i.e. a role model set by society, which is of great importance for the formation of a person’s personality and the mastery of social roles;
- In the socio-psychological - as the execution of the role and implementation of interpersonal interaction;
- In the psychological - as an internal or imaginary role, which is not always realized in role-playing behavior, but in a certain way influences it.

The advocate, based on his intended purpose, changes his masks to the audience by selecting a unique and typical mask from his arsenal to upgrade the overall memory of the audience.
FORMS OF MANIPULATIVE BEHAVIOR IN CHILDREN AS A RESULT OF INTRAFAMILIAL CONFLICT

Mariam Vachagan Mehrabyan
Psychological center "Zhesture" (Yerevan, Armenia)

The family is the micro-social environment in which a new generation is being formed. Not only the result of public relationships: the individual is born and brought up in the family, but also a person with psychological features and peculiarities. The family is a system that has become the subject of one of the branches of family therapy: systemic psychotherapy in recent years.

During the 2011-2019 period, 520 families in the post-divorce stage were examined at the psychological center “Zhesture”. Initially, we’ve studied family histories of the couples, cases, types and causes of conflicts, common patterns, how couples decide to divorce after family conflict, and what psychological impact it has on children. Couples presented their story, from acquaintance to divorce, and completed the Wiesbaden questionnaire, Dubrovskaya’s "Family Conflict Diagnostic Method", drew Projective Test "My Family". As a result, it turned out that there are legitimate causes in the form of manipulations - man-child, woman - everything, hidden goals and so on. All couples had a sentence of divorce and the court needed to find out why the children didn’t have normal contact with one of their parents. All couples who came to our center were sent by the court, as their children had a conflict with a parent with whom they didn’t live. Based on the results and psychological analysis, we found out that after a long conflict and difficult divorce process, children become an instrument in which parents continue to apply familiar types of manipulation.

Thus, as a result of our theoretical analysis and research:

1/ If the wife was the victim of the marriage, she always represented herself as a victim, and in her subsequent behaviour she continues to influence the children that she is the victim, because their father made her so. As a result, we have a manipulative child accusation against their father.

2/ If a married man is a neurotic, demanding, overburdened and at the same time a moral preacher, after the divorce, he necessarily declares that his wife is immoral, always betrayed and/or he was sure that his wife always wanted to betray him.
FEATURES OF DIGITAL SOCIALIZATION IN DIFFERENT GENERATIONS

Galina Soldatova
Svetlana Chigarkova
Lomonosov Moscow State University (Moscow, Russia)

The research is devoted to the study of the features of digital socialization understood as mediated by all available digital technology process of mastering and appropriating a social experience acquired in the online contexts, the reproduction of this experience in mixed offline/online reality and shaping digital personality as part of a real personality.

The sample included 1553 adolescents 12-17 years old and 1219 parents from 8 Federal districts of the Russian Federation. In accordance with the indicators of digital socialization, the questionnaires included blocks of questions devoted to the digital world image, perception and exchange of information, communication with the living and non-living elements of the online space, online consumption, as well as social-cultural, psychological and technical aspects of e-devices use.

The paper presents some of the findings of the study. Among adolescents there is a mass and earlier mastering of hi-tech arsenal of new cultural means – the personalized mobile e-devices. Overtaking parental user activity, the duration of the child’s online presence increases. Adolescents master digital space actively, independently and spontaneously and use it as a communication platform and a source of developing, educational and entertainment content. For adolescents, social networks have become an important platform for self-presentation, mastering various social roles, experimenting with identity and self-realization. Compared to their parents, adolescents are actively increasing their social capital through online contacts, including weak connections of subscribers and «unfamiliar friends». Thus, online chronotopes, as spatial-temporal configuration of Internet use, differ between adolescents and parents. Online immersion leads to encounter with new difficult life situations – online-risks. However, parents are often not sufficiently aware of such experiences and do not have the appropriate strategies to provide the necessary support. The digital gap between generations of children and parents reduces the universality of the adult figure and its role in child-parent relations. The digital competence of children and parents increases, but if parents have high level of knowledge with a lack of skills and responsibility, then adolescents, on the contrary, have higher skills and responsibility, but knowledge and motivation “lag behind” skills.

This work is supported by the Russian Science Foundation, grant № 18-18-00365.
The research is devoted to the study of the relationship between the features of intercultural experience and cultural intelligence (CQ) as individual capability to function effectively in culturally diverse settings. According to the concept of C. Earley and S. Ang, cultural intelligence consists of 4 factors: metacognitive, cognitive, motivational and behavioral.

The sample included 1545 respondents, 67.8% women and 32.2% men (mean age 28.46 ± 11.82 years) from 10 cities of Russia. The research methods included various psychodiagnostic tools, in this paper we use only the data of 1) author’s questionnaire devoted to intercultural experience and 2) Russian version of Expanded Cultural Intelligence Scale (Soldatova, Chigarkova, Rasskazova, 2018).

The study of the relationship between the features of intercultural experience and cultural intelligence showed that the intensity of communication with representatives of other nationalities is weak connected with CQ (r = 0.15, p<0.01). More strong patterns are obtained in the relationship of CQ and intercultural social capital: the more representatives of other nationalities among friends and colleagues, the higher CQ in general (η² = 0.09 and η² = 0.04, respectively). Respondents with a higher level of CQ generally rate their success in interaction with representatives of other nationalities more generally (r = 0.30, p<0.01). Subjective success is most closely associated with greater motivation for communication (r = 0.35), especially intrinsic motivation (r = 0.36), general knowledge of other cultures (r = 0.26) and control of knowledge (r = 0.25). Finally, CQ is associated with a more positive attitude towards the presence of representatives of different nationalities in the working and learning environment (η² = 0.11). The most positive attitude depends on motivation for cross-cultural interactions: both internal (η² = 0.18) and external (η² = 0.10).

Thus, not quantitative, but qualitative characteristics of intercultural interaction are associated with cultural intelligence. So it is not the intensity of intercultural contacts, but intimacy of relations with representatives of other cultures, as well as the self-esteem of the success in culturally diverse interaction and attitude to the intercultural environment, are positively connected with cultural intelligence.
XVI European Congress of Psychology

2-5 July 2019 MOSCOW, RUSSIA

Poster Presentations
Death is an inexorable event for any being. Unlike other species, humans become aware of this early on in their development, and this awareness influences their beliefs and behaviors. Political ideology forms a central part of the human system of beliefs by establishing the importance of roles, attitudes or statuses within a social context. Death reminders [mortality salience (MS)] can affect individuals’ political ideology by: a) increasing conservatism (a conservative shift); or, b) polarizing ideology, either conservative or liberal (a worldview defense). These contrasting ideas were tested in an experiment designed and run by means of E-Prime 2.0, in which 35 Spanish volunteer participants (M= 35.51 years; SD= 16.27) performed a decision-making task with 16 dilemmas, which included 12 distracters, and 4 targets involving political issues (e.g., immigration). Prior to this, 18 of the participants had carried out a 60-trial emotional Stroop task that incorporated death-related words (in English, e.g., death; MS condition), while the other 17 participants had done the same task, but with dental pain-related words (e.g., cavity control condition). Participants were asked to identify their political ideology on a continuum ranging from 1 (left-wing) to 11 (right-wing), and only the participants whose political ideology value (PIV) was at least 0.5 SD above or below the mean were selected. Thus, the sample was divided into a left-wing (or liberal) group (MPIV= 2.27; SDPIV= 0.96; Mage= 35.53; SDage=17.45; MS=7; control= 8) and a right-wing (or conservative) group (MPIV= 7.89; SDPIV= 1.90; Mage= 37.56; SDage= 16.58; MS= 5; control= 4). The most compelling finding was a quasi-significant main effect of Condition (F(1,20)= 4.29; p=.05; $\eta^2_p = .18$). Meaning, participants showed less liberal responses in the MS rather than in the control condition, both in the right-wing (.300 vs .563) and the left-wing groups (.607 vs .813). While the sample size was limited, these results support the conservative shift hypothesis regarding the effects of death reminders on political ideology, and highlight the usefulness of the emotional Stroop paradigm to induce death-related political attitudinal changes.
THE IMPACT OF MINDFUL AGENCY COACHING AND MOTIVATIONAL INTERVIEWING ON THE DEVELOPMENT OF POSITIVE LEARNING DISPOSITIONS: A QUASI-EXPERIMENTAL INTERVENTION STUDY

Qing Wang  
Yanan Peng  
East China Normal University (Shanghai, China)

The current study details the design, implementation and evaluation of mindful agency (MA) coaching and motivational interviewing (MI) interventions based on coaching psychology and learning theories in order to develop undergraduate students’ positive learning dispositions, including mindful agency, academic motivation, self-efficacy, emotional intelligence, emotion regulation and meta-cognition. A quasi-experimental design was employed in the study. We recruited one active control group (n=50) and two intervention groups that received MA coaching only (n=100) and MA coaching plus MI (n=30), respectively. Repeated AVOVAs was used to analyze the pre- and post-intervention psychometric data of the three groups. The main findings showed that significant interaction effects of time and group were observed in mindful agency (p< .001), self-efficacy (p< .001), and emotional intelligence (p< .001). The group received MA coaching plus MI achieved the greatest increases in most variables. Participants’ improvement in mindful agency fully mediated the post-intervention increases in self-efficacy, emotional intelligence and meta-cognition. It could be concluded that mindful agency coaching and motivational interviewing are promising and highly applicable coaching approaches for undergraduate students to become mindful, resilient and self-determined learners.

INTERNET GAMING DISORDER CRITERIA: EMPIRICAL ANALYSIS AND CLINICAL RELEVANCE

Halley Pontes Brazil  
Nottingham Trent University (Nottingham, United Kingdom)

Internet Gaming Disorder (IGD) has received increased scientific attention since May 2013, and its assessment can be conducted using the nine criteria suggested by American Psychiatric Association (APA). This study examined the role of each IGD criterion using a conditional inference tree model. A total of 3,377 gamers (82.7% male, mean age 20 years, SD = 4.3 years) were recruited to the present study. In addition to collecting sociodemographic information, participants filled out the Internet Gaming Disorder Scale–Short-Form (IGDS9-SF) based on the DSM-5 criteria. The conditional inference tree model revealed that endorsement of ‘withdrawal’ (criterion 2) and ‘loss of control’ (criterion 4) increased the likelihood of IGD by 77.77% (95%CI: 62.09-93.45) while endorsing ‘withdrawal’, ‘loss of control’ and ‘negative consequences’ (criterion 9) increased the likelihood of IGD by 26.66% (95%CI: 4.28-49.04). Finally, not endorsing ‘withdrawal’ but endorsing ‘preoccupation’ (criterion 1) increased the probability of IGD by 7.14% (95%CI: 1.63-12.65). Overall, these results suggest that not all IGD criteria carry the same diagnostic weight as each criterion can play a different role in the development of IGD. It is envisaged that these findings will help improve the assessment of IGD in the future.
Access to mental health care for general population is a major concern shared by psychologists in Europe and Germany. According to the Professional Association of Specialists in Psychosomatic Medicine and Psychotherapy, one third of the adult population suffers from at least one mental illness in one year in Germany. Among the most common mental illnesses are depression and anxiety. The German mental healthcare system is characterized by a large variety of providers from different medical specialties divided between in- and outpatient’s services. Federal governmental analyses show increasing rates of hospital services utilization (inpatient departments) due to mental disorders (1). In spite of this high and increasing utilization rate, studies indicate considerable degrees of under-treatment in Germany. The share of specialized inpatient and outpatient psychiatric services among all healthcare service utilization increased with increasing depression severity. While this reached nearly 90% of all cases in the inpatient departments, the rate only reached 45% in outpatient setting. This indicates that physicians of ambulatory care provide services to approximately half of all severely depressed persons in Germany and means that 65% of depressed persons do not receive appropriate assistance. Where will the other persons receive their support? The psychosocial counseling centers are for example an important pillar of in- and outpatient care and an important field of work for psychologists and psychological psychotherapists. Since psychosocial counselling is the right to provide support in as many problems as possible, the counseling offers are manifold. This presentation will highlight 1. the present status of psychologists working in in- and outpatient care; 2. Depression, suicide and other mental health problems in German population. 3. Future challenges in developing mental and behavioral healthcare, with particular consideration of the work of the Association of German Professional Psychologists (in German: BDP) established in 1946 in Hamburg and represented the professional interests of established, self-employed and employed/civil psychologists from all fields of activity in Germany.
THE MAIN SPECTRUMS DIFFERENCES OF EVOKE OSCIILLATIONS OF BIOELECTRICAL POTENTIALS OF THE BRAIN DUE TO CHANGES IN THE AUTONOMIC NERVOUS SYSTEM OF GAMERS

Olga Klochkova
Tihookeanskiy gosudarstvennyy medicinskiy universitet
Ministerstva zdravoohraneniya (Vladivostok, Russia)

Gennadiy Shabanov
Aleksandr Rybchenko
Research Center 'Arctic' Far East Branch of Russian Academy of Science (Vladivostok, Russia)

The report presents the results of the study of the amplitude-frequency spectrum of the induced function of the bioelectric activity of the FBA brain in the range of 27-0.13 Hz, during a computer game in subjects with different types (sympathetic or parasympathetic) of the autonomic nervous system. The experiment involved 18 women aged 23-58 years. The results revealed the frequency range of the main differences in the function of bioelectric activity of the brain. The relationship between the number of errors in the game and the spectrum of FBA of gamers due to differences autonomic nervous system is revealed. Vegetative index (VI) decreased by 40% (from 2.39 to 1.42) during the game compared to the background value in subjects with the dominance of the sympathetic vegetative system. During the game, there is vegetative index increased by 77% (from 0.49 to 0.89) in subjects with the dominance of the parasympathetic system. This should be due to the work of brain memory structures, including the hippocampus (theta spectrum) and the work responsible for the logic of the left hemisphere. Autonomic system must to improve the blood supply of the brain and the work of the hormonal system during the game. The graph of bioelectric brain function, obtained on the complex "MAGGIE", shows that the right hemisphere works more powerfully in the subjects with the dominance of the sympathetic system. The greatest amplitude of biofunction brain reaches on segments Th12 at range of functions F3 (adrenoceptors of veins of the internal organs), F4 (nerve tissue receptors), and F5 (cholinergic receptors) of 4.72 Hz to 0.76 Hz. The minimum of the left hemisphere biofunction of T1 segment at the frequency range F2-5 (9.37 Hz) and F4-1 (2.6 Hz) (adrenoreceptors) means that at these frequencies the left hemisphere works more powerful in the subjects with the dominance of the parasympathetic system.

MOTHER’S AND CHILD’S BRAIN STRUCTURE ASYMMETRY.
NORMAL AND PATHOLOGICAL ATTACHMENT WITHIN THE DYAD

Svetlana Grigoreva
Centr razvitiya rechi (Odessa, Ukraine)

We compared lateral indices of the postural brain asymmetry of 312 persons — adolescents and their mothers. Eye Dominance testing results, listed in two-way tables, showed significant inverse correlation of the dominant hemispheres, which could be formed inside thalami probably as a substantial interaction. Whether mother’s and adolescent’s relationships will be balanced depends on mother’s ability to accept her child’s inverse structure of thinking. Mother’s and child’s
bond through the thalamus presumes that an infant (who does not have α-rhythm till 3 months old) unconsciously adjusts his thalamic pacemaker of α-rhythm to mother’s α-rhythm and compensatory focuses on supporting her sensory impulses. That’s why attachment is created not through the sight, but through co-alignment of child’s brain with mother’s (or other person who looks after him) brain via α-rhythm. In the research we analyze attachment in families having children with cerebral palsy and early childhood autism.

“SENSATION” AND “CONTEMPLATION”: SPECULATIVE PHILOSOPHICAL DEFINITIONS AS THE SOURCE OF CONTENT FOR PSYCHOLOGICAL CONCEPTS

Vladimir Suvorov
Lomonosov Moscow State University (Moscow, Russia)

The problem of revealing the psychological content of philosophical texts is discussed. Using the examples of sensation and contemplation, the evolution of knowledge about mental abilities since Antiquity is described. Philosophical descriptions are compared with modern psychological knowledge, including the results of neuropsychological research involving evoked potentials (EPs) and event-related potentials (ERP) (Suvorov, 2018). The productive potential of philosophical descriptions for the development of psychological concepts is demonstrated. The possibility of applying Hegel’s speculative dialectical method to sensation and contemplation in the modeling of artificial intelligence is showed. In modern literature, contemplation is mentioned mainly in publications on aesthetics, religion, and psychotherapy. In psychology, the following appraisal can be found: “Contemplation is a rarely used term in modern psychology and has no categorical status” (G.V. Akopov). Such an appraisal contrasts with the philosophical past of this concept. Sensation and contemplation have been explored as concepts and consciously applied as tools of thinking in philosophical studies going back to Antiquity. A.F. Losev writes: “Greek philosophers still speak of contemplation in the purely mental sphere ... The Greek wanted to show ... that his thinking was just as direct and immediate ... as any sensual experience”. “The highest activity of thought, according to Aristotle, is the activity of contemplation” (V.F. Asmus). The study of these abilities takes an important place in the philosophical systems of many thinkers. Hegel writes: “Sensation contains all the content of the mind. All our ideas, thoughts, and concepts about external nature, about law, about morality, and about the content of religion develop in our perceiving intelligence; and, conversely, after they receive the full disclosure of their content, they are concentrated into a simple form of sensation.” This statement would seem to be unrealistic, but it has found justification in modern knowledge and confirms the productivity of the speculative philosophical method for the development of knowledge about the content of a person’s mind and the development of psychological concepts. References Suvorov V. Hegels Begriff der Empfindung, experimentellen Daten der Neuropsychologie und „qualia” der Philosophie des Geistes // Proc. 32nd International Hegel-Congress, Tampere, Finland, June 5-8, 2018.
VALIDITY AND RELIABILITY OF THE DIFFICULTIES IN EMOTIONAL REGULATION SCALE (DERS) IN THE ECUADORIAN POPULATION

Geovanny Genaro Reivan Ortiz
Universidad Católica de Cuenca Docente (Cuenca, Ecuador)

The objective of this research was to analyze the reliability and validity of the Difficulties in Emotional Regulation Scale (DERS) in the Ecuadorian population. A self-report instrument that assesses the difficulties in the emotional regulation process. The study consisted of a non-probabilistic sample of 559 participants (M = 21, SD = 2.82) university students. The reliability indices were adequate and factor structure congruent with the features presented in the original scale. The results affirm that the DERS is a reliable and valid instrument in the evaluation of the difficulties of emotional regulation in the Ecuadorian population.

EATING DISORDERS ASSOCIATED WITH THE PERSONALITY TRAITS OF INSTITUTIONALIZED DRUG USERS

Geovanny Genaro Reivan Ortiz
Delia Velasquez Cordova
Universidad Católica de Cuenca Docente (Cuenca, Ecuador)

The objective of this research was to determine the relationship between Eating Disorder (Anorexia Nervosa, Bulimia Nervosa, Binge Eating Disorders) and the personality traits of institutionalized drug users. Methodologically, a cross-sectional non-experimental design of correlational descriptive type was used, with a non-probabilistic sample of 60 interns aged between 18 and 60 years (M = 32.5, SD = 9.6) from three rehabilitation centers in the city of Ecuador basin. Two scales were applied to the EAT-40 and the Millon III Test. The results show that there is no statistically significant relationship.

WHEN CONSERVATIVES ARE AS TOLERANT OF REFUGEES AS LIBERALS

Fatih Özdemir
Bursa Uludag University (Bursa, Turkey)

Ashwini Ashokkumar
William Bill Swann
University of Texas at Austin (Austin, USA)

The purpose of the current research is to explore the xenophobic and anti-immigrant attitudes of people in Turkey. Considerable research asserts that the “rigid” political right is more anxious about immigrants and thus more likely to support exclusionary policies than the political left. Contrary to these claims, in three studies (total N = 1,347), we find that Turkish conservatives do not favor restrictive policies regarding the rights and movement of Syrian refugees apparently because they feel a sense of shared values with these refugees. Importantly, this pattern of conservative tolerance does not emerge with regards to a minority group with whom Turkish conservatives typically do not share values: the Kurdish people. Further, liberals with a fervent
allegiance to (i.e., those who are “fused” with) Turkey are especially likely to endorse anti-refugee policies and attitudes, more so than conservatives, and this effect is mediated by fused liberals’ greater perceptions of threat. Taken together, these findings suggest that while conservatives may generally be more xenophobic than liberals, there are circumstances in which conservatives welcome refugees while some liberals do not. We discuss the importance of these findings for interventions that aim to reduce anti-immigrant sentiment.

METACOGNITIVE IDEA ON HYPERMNESIA

Omer Kose
Cekdar Aytimur
Bingol University (Bingol, Turkey)

Flavel (1979) made the definition of metacognition: ‘thoughts about thoughts’. Hypermnesia was defined by Payne (1986) as an increase in the number of items recalled by repetition or retention interval. The aim of this study was to investigate how monetary incentives and item type (image, word) shape predicted hypermnnesia and actual hypermnnesia. For the study, 134 undergraduate students aged 18-25 were recruited from Psychology Department of Bingol University, Turkey. Experimental task consists of either 80 images or 80 words, depending on the participants’ condition. Participants were randomly allocated to the conditions, 2 (Incentives: incentive vs. no-incentive) x 2(Item type: image vs. word) x 2(forecast: prediction vs. performance). A three-way ANOVA was conducted and result showed that there was a statistically significant interaction between independent variables. Additionally, two-way ANOVA was conducted between incentive and item type in terms of performance and this interaction was also statistically significant. However, in terms of prediction, no interaction was found between incentive and item type. Findings generally supported previous research and present study additionally focused on the metacognition during the hypermnnesia.

THE PECULIARITIES OF MENTALITY REPEATABILITY OF THE MODERN RUSSIAN GENERATIONS

Vlada Pishchik
Don state technical University (DSTU) (Rostov-on-Don, Russia)

The view on the problem of succession of generations and repeatability of the components of mentality type is presented. We noted the ambiguity of the concept "generation" as a sign of grouping or of constructed reality. We emphasize the socio-cultural concept of transformation of generations mentality. The article aims at finding similarities and differences in the components of mentality types of the modern Russian generations. We studied the groups of respondents, who relate to the transition generation — working adults, to the information generation — students and to the new generation — schoolchildren (a total of 605 people). The technique of measurement of mentality type of generations was used, which identifies traditional, transitional, innovative, post innovation types. The results are differentiated regarding the intensity of tradition or innovation in the components of mentality. It is shown that in the group of the transition generation innovation is realized in the image of the world, and the tradition is embodied in the ways of relationships. In the information generation innovation is presented in lifestyle, post innovation is presented in relations. The new generation showed innovation in the way of life and in forms of interaction, but tradition is
realized in relationships. The conclusion about the partial continuity of the components of mentality generations. The article was prepared with the financial support of the Russian Foundation for Basic Research. Project No. 18-

THE MATTHEW EFFECT IN BUSINESS ETHICS

Thomas Li-Ping Tang
Middle Tennessee State University (Murfreesboro, USA)

In 1968, Robert Merton published an article on the “Matthew Effect in science”. The Bible tells us: “For to anyone who has, more will be given and he will grow rich; from anyone who has not, even what he has will be taken away” (Matthew 25: 29). The Matthew Effect is a double-edged sword, creating the “haves” and the “have-nots”, or “the rich get richer and the poor get poorer”. In this paper, I will present the Matthew Effect in business ethics. In materialistic societies, most people want to be rich. “Those who want to be rich are falling into temptation and into a trap and into many foolish and harmful desires, which plunge them into ruin and destruction. For the love of money is the root of all evils” (1 Timothy 6: 9-10). “No one can serve two masters. You cannot serve God and mammon” (Matthew 6: 24). Money and Ethics are on two completely opposite sides of the same coin. If one focuses on Money, then, one must turn a blind eye to Ethics. The reverse is also true for Ethics. This paper provides empirical findings in the literature.

On the one hand, Enron CEO and executives had intelligence but no wisdom. They rigged the organization and reaped financial reward for themselves. Their corruption caused the destruction of Enron and 130,000 people’s lives (Tang & Chen, 2008; Tang & Chiu, 2003; Tang et al., 2018a, b). On the other hand, corporate social responsibility is much more than a cost, a constraint, or charitable deed, but is rather a potential source of innovation and competitive advantage (Porter & Kramer, 2006). Recent research empirically supported the notion that perceived corporate social responsibility—at its high level—excites “exponential” positive employee engagement (Zhou, Luo, & Tang, 2018). The sustainable development of positive employee attitudes—organizational pride, job satisfaction, and affective commitment—may lead to employee engagement, value creation, and, eventually, to long-term financial success in the market, creating the positive Matthew Effect.

EXPLORATORY FACTOR ANALYSIS OF THE RUSSIAN TRANSLATION OF THE OTTAWA SELF-INJURY INVENTORY VERSION 3.1 AMONG RUSSIANS

Christopher Alan Lewis
Bishop Grosseteste University (Lincoln, United Kingdom)

Sarah Davis
Glyndŵr University (Wrexham, United Kingdom)

Mikhail Khukhrin
Svetlana Galyautdinova
Bashkir State University Lecturer (Ufa, Russia)

Among both researchers and clinicians, there is growing interest in self-harm (non-suicidal self-injury). This interest has been accompanied by the development of a number of self-report measures of self-harm. One such reliable and valid measure of self-harm that has been widely used is the Ottawa Self-injury Inventory Version 3.1 (OSI 3.1), which measures both the functions
and potential addictive features of self-harm. The OSI 3.1 has been translated into a number of foreign languages, including Russian. However, as yet, the Russian translation of the OSI 3.1 has not been subjected to any form of empirical analysis. The aim of the present study was to examine the factor structure of the Russian translation of the OSI 3.1 and four additional items in the Addictive Features section among a non-clinical sample of young female Russian speakers. Data was collected from a non-clinical convenience sample of 200 Russian university students who completed the Russian version of the OSI 3.1 and four additional items in the Addictive Features section. Data was subsequently subjected to exploratory factor analysis, in order to establish the factor structure. Exploratory factor analysis of the OSI 3.1 and four additional items in the Addictive Features section revealed four functions factors (internal emotion regulation, social influence, external emotion regulation, and sensation seeking) and one addictive features factor. Each of the four functions factors was significantly positively associated with each other. These findings are comparable to those reported previously among other samples with other linguistic versions of the OSI 3.1. These findings provide preliminary evidence for the factor structure of the Russian version of the OSI 3.1 and four additional items in the Addictive Features section among a non-clinical sample of university students in Russia, and it is recommended for further use among Russian speakers. Suggestions for further research with the OSI 3.1 and four additional items in the Addictive Features section are provided, including, utilising clinical samples, establishing both age and gender norms, and examining the factor structure using confirmatory factor analysis.

**PSYCHOSOMATIC MANIFESTATIONS OF ABORTIONS**

Mariam Hergnyan

In our practice, there are quite a lot of cases (almost 60%) where the basics of the problems lead to the loss of children during pregnancy. Psychological literature talks a lot about psychological (Postabortion syndrome) and physical effects, in this article we will try to analyze psychosomatic manifestations. 30% of visitors don’t see a connection between the loss of children and their current state. Psychosomatic effects on women / men / future generations

- Painful menstrual cycles

Women - in each cycle, a woman gives birth to a child, because the child subconsciously is in the womb of a woman. Generation - My body has the pain of my unborn ancestors, guilty of life and the denial of the image of a woman

- Problems with having child

Women: prohibition of generation, you have no right to become a mother again. Men: sperm slows down, I forbid me to continue with my offspring. Generation: infertility, my nation does not need a child.

- Frequent miscarriages

Women - the uterus has a memory and does not allow the child to go outside. They hurt you in the world. Generation - Intergenerational trauma, a ban on the continuation of a generation, your uterus carries ancestors.

- Ectopic pregnancy

Women - The uterus is full, the trauma of abortion is in the womb of the woman

- Nervous pain in different parts of the body.

Women - the body is destroyed, the connection between mental and physical is broken. Man-Sense of guilt, I didn’t save my child, my particle was subjected to fragmentation. Men can have allergies, I hate myself. Generations: Pregnancy is defined as the process of strengthening the bond between generations, I received information about the death in my gene.
Various problems with the uterus, Pelvic organ prolapse, fibroids, cyst and cancer.

Woman-dead child lives in the womb, there is an open wound. I can no longer carry a heavy child. Generations. The wound is present, and I will make you remember me.

Thus, the very fact of abortion as a stressful phenomenon during psychological work is an important part of working with traumas.

Refugee and asylee families and individuals flee their countries because of various adverse conditions (e.g., war, ethnic cleansing, natural disasters, persecution). In recent years, they have fled, in large numbers, to Europe, North America, Australia, and some countries in the Middle East. Researchers and clinicians note refugees and asylees are typically unprepared emotionally for the arduous physical and emotional trek and might experience double emotional trauma from a lack of emotional preparedness required to (1) flee familiar surroundings and (2) assimilate and settle into a new culture. Are psychologists and other mental health professionals prepared to treat their trauma and facilitate the resettlement process without unintentional re-traumatization? What are current best practices to facilitate resettlement and treat trauma? A comprehensive, international, 5-year literature review (2013-2018) will summarize best practices to (1) mitigate emotional trauma among refugees and asylees and (2) facilitate successful assimilation and resettlement of migrant families. Best practices for treating trauma, facilitating assimilation, and addressing emotional needs of the most vulnerable relatives (i.e., seniors; children; and those experiencing a disability, substance abuse issue, or mental illness) will be included. Findings will highlight culturally sensitive best practices to (1) facilitate successful assimilation and resettlement and (2) treat trauma effectively. Successful resettlement includes teaching culturally appropriate life skills necessary for a positive cultural assimilation into the adopted homeland and addressing cultural stigmas (e.g., mental illness, substance abuse, sexual orientation). An English language reference list will be disseminated. Discussion based on current global geo-political events, refugees and asylees will continue to seek refuge in safe countries for the immediate future. Psychologists and other mental health professionals will benefit from knowledge of current culturally sensitive best practices to facilitate successful resettlement and treat resultant trauma at the individual, couple, family, youth, group, and community levels. Successful resettlement paves the journey for refugees and asylees to “Create a (Different and Affirming) Future Together” in their adopted homeland.
MENTAL HEALTH LITERACY AMONG AN ONLINE CONVENIENCE SAMPLE OF RUSSIAN ADULTS: EXAMINING IMPLICIT THEORIES OF THE CAUSES OF ALCOHOLISM

Christopher Alan Lewis  
Bishop Grosseteste University (Lincoln, United Kingdom)

Sarah Davis  
Glyndwr University (Wrexham, United Kingdom)

Elena Filimonova  
Bashkir State University Lecturer (Ufa, Russia)

In comparison to other countries, Russia has a comparatively high rate of heavy drinking and alcoholism, which are both leading causes of illnesses, disability, and death. There is increasing attention paid to understanding psychological and medical explanations of illnesses, and how the relationships between explicit and implicit theories are linked. Lay beliefs about alcoholism are an important factor associated with treatment-seeking behaviour. The aim of the present study was to examine implicit theories of the causes of alcoholism among Russians. An online convenience sample of 200 Russian adults completed a Russian translation of Furnham and Lowick’s questionnaire, in which they were asked to rate 30 explanations for their importance in explaining the causes of alcoholism, alongside some demographics questions, including, age, sex, level of alcohol use. The 30 explanations were ranked for importance in explaining the causes of alcoholism. In addition, demographics questions, including, age, sex, level of alcohol use were compared. Moreover, comparisons were made between the present data and the results originally reported by Furnham and Lowick among a sample of lay people in the United Kingdom. The results were discussed in terms of the research on mental health literacy, lay understandings of psychological and medical illnesses, and the relationships between explicit and implicit theories. Further research on mental health literacy among Russian samples was proposed.
BIBLIOMETRIC ANALYSIS OF THE JOURNAL MENTAL HEALTH, RELIGION & CULTURE: DISSEMINATING RESEARCH IN THE PSYCHOLOGY OF RELIGION

Christopher Alan Lewis
Bishop Grosseteste University (Lincoln, United Kingdom)

Kate M. Loewenthal
Royal Holloway, University of London (London, United Kingdom)

Simon Dein
Goldsmiths College, University of London (London, United Kingdom)

Kenneth I. Pargament
College of Arts and Sciences, Bowling Green State University (Bowling Green, USA)

Over the last 25-years there has been renewed interest in the psychology of religion. One area of particular area of focus for research has revolved around the intersection between religion, mental-health, and culture. This area of research has been served by the journal Mental Health, Religion & Culture (MHRC), which recently celebrated its 21st anniversary, having commenced publishing in 1998. MHRC provides an authoritative forum and a single point of reference for the growing number of clinicians and academics working in this area. Over 1,000 research articles have been published in MHRC over the last two decades. In acknowledgement of this anniversary, the aim of the present study was to provide a retrospective bibliometric assessment of MHRC over its initial 21 years of production. Previously published articles in MHRC (1998-2018) were empirically examined by two analytical tools: Google Scholar and Scimago Journal Rank (SJR indicator). Four findings are noted. First, various scholarly metrics including impact factor, five-year impact factor, h5-index, number of citations received, and self-citation rate were presented. Second, the most cited articles were identified and the common themes of these publications were explored. Third, the international diversity of the journal's author base was outlined. Fourth, a list of Special Issues published by MHRC was also presented. These four findings were discussed. The utility of MHRC for disseminating research on the psychology of religion is highlighted.
ROLE OF THE APPRAISAL AND COPING FOR THE RELATIONSHIP OF CYBER VICTIMIZATION AND DEPRESSION

Christopher Alan Lewis  
*Bishop Grosseteste University (Lincoln, United Kingdom)*

Sadia Musharraf  
*The Women University (Multan, Pakistan)*

Sheri Bauman  
*University of Arizona (Tuscon, USA)*

Muhammad Anis-ul-Haque  
*National Institute of Psychology, Quaid-i-Azam University (Islamabad, Pakistan)*

Although there is growing evidence that cyber victimization is linked to poor mental health, little is known about the role of cognitive appraisals and coping strategies to understand this link. The effectiveness of specific cognitive appraisals or coping strategies can be investigated in two ways: the extent to which it buffered the negative emotions, and the extent to which it stopped the cyber victimization. This study utilized the transactional model of stress to understand the role of appraisal and coping for the relationship of cyber victimization and depression. Sample of 1314 Pakistani university students were administered Cyber Victimization Scale, Appraisal of Cyber victimization, Coping with Cyber Bullying Questionnaire, Depression Scale, ICT Self-efficacy Scale, and Social Desirability Scale. After controlling the effect of ICT self-efficacy and social desirability, results showed a significant direct effect of cyber victimization, threat appraisal, and retaliation coping (B = .15, .17, and .08, p < .01) on depression. Both interaction terms were significant but opposite in direction. Interaction one (between threat appraisal and retaliation coping), representing moderation on indirect effect, showed a positive moderating effect (B = .01, p < .05) and interaction two (between cyber victimization and retaliation coping), representing moderation on direct effect, showed negative moderating effect (B = -.01, p < .05) of retaliation coping on depression. Results indicated that retaliation coping decreases depression in cyber victims, but when an incident is appraised to be threat, retaliation increases depression. A significant index of moderated mediation supported the conceptual model. These findings have clear implications for prevention and intervention efforts to reduce cyber victimization. Existing programs tend to stress that retaliation should not be used by those who are cyber-victimized. However, the present finding, that retaliation has a positive effect (less depression), challenges this approach, and suggests that more work is needed to understand how cognitive appraisals of cyber victimization affect the mental health outcomes.
LINGUISTIC PROFILE IN PEOPLE WITH ATTENTION DEFICIT HYPERACTIVITY DISORDER

Noelia Pulido
Esther Moraleda
Patricia López
Estela Cañadas
Castilla-La Mancha University (Talavera de la Reina, Spain)

Language skills appear as a specific difficulty in people with Attention Deficit Hyperactivity Disorder (ADHD). The studies previously carried out confirm that there are problems in all areas of language production, but also in comprehension. However, data on the particular characteristics of the language associated with this population, especially in Spanish, are scarce. Therefore, the objective of this study has been to know the linguistic profile presented by children and adolescents with ADHD. The sample consisted of 90 children and adolescents between 5 and 15 years of age matched in two groups: people with ADHD and people with typical development, matched in chronological age. Both groups were evaluated at language level through the Celf-4 test. The results obtained show that children and adolescents with ADHD show worse language skills in general than people with typical development, and that, they seem to present more specific difficulties in comprehension. These results support the idea that this group needs to receive linguistic intervention as part of the treatment.

OBEDIENCE TO AUTHORITY: EFFECTS OF GENDER AND SKILL LEVEL

Bernard Gangloff
Amine Rezrazi
Paris 10 University (Rouen, France)

Luisa Mayoral
Sofía Diez
Tandil University (Tandil, Argentina)

It is hypothesized that, in the workplace, the influence of a source of authority varies according to his/her competence and genre. It is also expected variations of influence depending on the subordinate gender. 240 participants, in four groups of 30 men and 30 women, answered an allegiance at work questionnaire. A competence and a gender effect are observed. It is particularly noted that, confronted with a competent leader, the submission of women is superior to their insubordination only if the leader is a woman, and that, conversely, confronted with an incompetent leader, the insubordination of women does not take precedence over their submission only when the leader is a man. An analysis in terms of male and female management style is proposed.
CREATING A BETTER FUTURE: IMPLICATIONS FROM FUTURES IMAGINATION EDUCATION IN TAIWAN

Szu-Yin Lin  
National Kaohsiung University of Science and Technology (Kaohsiung, Taiwan)

I-Heng Chen  
Wen-Chuan Hung  
Hsien-Chun Chen  
Taiwan  
National Sun Yat-sen University (Kaohsiung, Taiwan)

Yun-Ping Li  
National University of Tainan (Tainan, Taiwan)

As the world is changing and transforming at a fast pace, students today are expected to face more challenges in the future. For example, they need to prepare for jobs that do not yet exist; use technologies that haven’t been invented yet, or even solve problems that have not been discovered yet (Gunderson, Jones, & Scanland, 2004). The current study proposed that futures imagination is the key to better prepare students to face unknown challenges. This article introduces the development process and results of Futures Imagination Education (FIE) program in compulsory education in Taiwan. Since 2011, the Ministry of Education in Taiwan started promoting the Futures Imagination Education (FIE) program in all levels of education through different action plans for 4 consecutive years. The current study examined the “Grades 1-9 Action Plan” and its teacher education workshops throughout this period. The Grades 1-9 Action Plan was implemented in the compulsory education. The subjects of this study are teachers who participated in the Action Plan; they learned how to implement futures imaginative approach in their classrooms. Through their cycle of planning, action, observation, and reflection from 2011 to 2015, they reported their findings through written reports, and then we collected their results through interviews and surveys. The results showed that students’ show higher learning interests, and will have a more in-depth view of the future, which is expected to prepare students to adapt to their futures, and this contributes to their wellbeing.
PSYCHODIDACTIC PRINCIPLES OF DEVELOPING TEENAGERS’ COMPREHENSION OF LYRIC POETRY

Ksenia Mironova
Psychological Institute of the Russian Academy of Education (Moscow, Russia)

Reading lyric poetry provides enormous opportunities for personal development of adolescents, expanding the scope of aesthetic experiences available to them. However, there is a widespread antipathy to poetry, for it is often difficult to understand. Although much of the prior work stressed the importance of teaching poetry to teenagers, the psychodidactic principles of developing their lyric poetry comprehension and the role of textbooks in this process remain unexplored. This brings us to the aims of our work which were to reveal these principles and develop techniques for their implementation in an educational book of new – psychodidactic – type. During our research we singled out the principle of open individuality as the basic one. It implies, firstly, meaningful communication with the poem regarded as a soul opened to the reader; secondly, counter reader’s self-discovery and self-disclosure which presupposes personal and interpersonal reflection. This principle was elaborated in four sub-principles: wholeness, polylogy, multidimensionality, value hierarchy. In order to bridge the gap between theory and practice, we developed implementation techniques and wrote two chapters on poems by A.S. Pushkin and M.Yu. Lermontov. The next step of our research was the experimental approbation of the principles and chapters. Participants were 311 Moscow secondary school students aged 12-14. Work with the experimental groups included chapter reading and whole-class discussions of the poems. For the purpose of assessment, students completed open-ended writing tasks. Differences within the groups before and after intervention were compared using the Wilcoxon signed-rank test. The results of the control groups showed no significant changes, whereas the final results of the experimental groups revealed significant (p < .01) increases in the levels of the assessed aspects of poem comprehension: description of one’s impression, interpretative opinion, lyrical plot, experiences of the hero, figurative language, poem structure. The obtained findings suggest that these psychodidactic principles and chapters built upon them are effective in deepening teenagers’ poetry comprehension. The practical significance of our work lies in the possibility to use these principles and books in educational practice: teachers can incorporate them into their classrooms; they can serve as a foundation for creating new methods and educational books.
EFFECTS OF A/R/TOGRAPHY COMMUNITY-BASED READER’S THEATER ON ENGLISH LEARNING ATTITUDE IN THE ELEMENTARY SCHOOL

Ying-Ching Chen
Chen Ying-Ching
Huang Hsiu-Shuang
National University of Tainan (Tainan, Taiwan)

A/r/tography is an art-based research methodology and a creative practice within arts and education; however, there are only a few scholars of note who have mentioned the developing methodology and teachers rarely apply it to teaching in Taiwan. In addition, a/r/tographic communities are mostly composed of teachers, not of students. The purpose of this study was aimed at exploring the effect of applying an a/r/tographic community to students participating in reader’s theater and finding whether students change their learning attitude and enhance their learning motivation and interests in learning English. An a/r/tographic community of practice was a community of inquirers working as artists, researchers and pedagogues. Eight students in an elementary school in Tainan City, Taiwan were chosen to participate in the reader’s theater competition for the city of Tainan. Based on the communities of a/r/tographic practice of Irwin, it was proposed that the students center learning community could be an a/r/tographic community. During a period of seven weeks, the researcher implemented an a/r/tographic community as an instructional tool to aid in the coaching of the eight reader’s theater participants. Quantitative data was obtained by administering pre- and post-test gauging learning attitude. Data was analyzed using t-test and descriptive statistics. The study also used Qualitative methods, such as practicing observations, interviews, introspection journal entries, and video-taped recordings for data collection and analysis. The result indicated that: 1. Applied A/r/tographic in English learning field was possible. 2. A/r/tographic communities could be composed of students. 3. After the reader’s theater competition, the participants mentioned that they changed their learning attitude in learning English. 4. The participants’ learning experiences in the reader’s theater activities enhanced their motivation to learn English by building a temporary a/r/tographic community. 1. Irwin, R. L. (2008). Communities of A/r/tography Practice. In S Springgay, R. L. Irwin, C. leggo, & P. Gouzouasis(Eds.). Being with A/r/tography. (pp.71-80). Netherlands: Sense Publishers. 2. Ou, Y. S. (2010). Community-in-the making: Constructing Aesthetics Community. Secondary Education, 61(3), p8-19. Doi:10.6249/SE.2010.61.3.01
THE VOICE OF PSYCHOTHERAPISTS — A COMPLETELY NEGLECTED SUBJECT

Lothar Schattenburg
Psychosomatic Clinic Bad Neustadt (Bad Neustadt, Germany)

The research of the voice of psychotherapists is neglected very seriously (Grawe, 2008; Schattenburg, 2017). In Germany no textbook neither in Clinical Psychology nor in Psychiatry focuses on the voice of psychotherapists. As a teacher of psychology and super-visor in psychotherapy we have asked about 100 students if their voice has been a topic during their training. The answer was in unison: No! To develop a questionnaire to supervise the voice in psychotherapy we have asked students what would be helpful for them. Further we analysed case studies and made a systematic study of the literature. We are focusing only on the perception of the voice of psychotherapists—not of patients. We have developed 20 Items, each with a Likert-Scale (0-4). Examples for 10 Items for the Questionnaire for the Supervision of the Voice of Psychotherapists (Q-SVP): Did you ask colleagues or teachers for a supervision of your own voice by using your smart phone, pc-aided feedback or video? Do you feel comfortable when your voice is supervised? Do you have in general a feedback-loop for listening and for speaking? Can you balance listening and speaking in a therapeutic manner? Do you have a feedback-loop for the self perception of your voice? Are you aware of the prosody of your voice? Are you aware of the prosody of your voice using special interventions? Do you have a feeling in which therapeutic situations your voice is changing? Do you still have a feeling for your voice when you come under pressure? Can you stabilize your voice when you are nervous or insecure? The students said that the Q-SVP is very helpful. They can reinforce their feedback loop for their voice. We can calculate an index of our Q-SVP and correlate this with the outcome. Further the question arises: What are the elements of a therapeutic voice?

ACCULTURATION, ETHNIC IDENTITY, AND PSYCHOLOGICAL WELL-BEING OF ALBANIAN-AMERICAN IMMIGRANTS IN THE UNITED STATES

Albina Balidemaj
Rochester Institute of Technology (Prishtina, Kosovo)

This study examined the relationship between acculturation, ethnic identity, and psychological well-being of the Albanian-American immigrant community in United States. A total of 139 Albanian-American immigrants aged 21-35 years old participated in the study. In order to utilize the data, participants filled out four different surveys, including a demographic questionnaire, the Multigroup Ethnic Identity Measure (MEIM), the Vancouver Index of Acculturation (VIA), and Ryff’s Psychological Well-Being scale. A correlational design relying on cross-sectional survey data and multiple regression analysis was used to study the correlations between acculturation, ethnic identity, and psychological well-being. The results showed that ethnic identity, acculturation, and psychological well-being were positively correlated to each other. In addition, the results showed that both ethnic identity and acculturation affected the psychological well-being of Albanian-American immigrants in the United States. This relationship was further moderated by gender and length of residency in the United States and mediated through graduate school education. The results of this study will help clinicians, social workers, and policy makers that work with immigrants to better understand the psychological consequences of immigration due to acculturation and ethnic identity factors.
DIFFERENTIAL EFFECTS OF ANXIETY SENSITIVITY ON E-CIGARETTES PROCESSES: THE IMPORTANCE OF E-CIGARETTE QUIT ATTEMPT HISTORY

Lorra Garey
Tanya Smit
Nubia Mayorga
Natalia Pereza
Michael Zvolensky
University of Houston (Houston, USA)

Electronic cigarettes (e-cigarettes) are recognized as a prevalent form of substance use among adults in the United States. The rise in e-cigarette use has motivated research to identify subgroups of the population that may be particularly vulnerable to e-cigarette use and its associated harm. Individuals with elevated psychological vulnerability are one such group more at risk for being a lifetime or current e-cigarette user. Yet, little is known about how factors of psychological vulnerability relate to perceptions of e-cigarette use within the context of e-cigarette quit attempts. The current study evaluated the differential relations of anxiety sensitivity (AS), a core affective vulnerability factor, on several relevant e-cigarette processes across those with and without a previous attempt to quit using e-cigarettes. Our sample consisted of 547 current e-cigarette users (51% female, Mage = 35.38 years, SD = 10.1). Results indicated that AS significantly related to greater perceived risks, benefits, and positive outcome expectancies of e-cigarette use among current e-cigarette users who reported at least one attempt to quit e-cigarettes, but was unrelated among those who had never attempted to quit. Findings identify e-cigarette users who fail to quit as a potential vulnerable subgroup of users who experience more strongly held perceptions about e-cigarettes because of increased AS. This work provides initial evidence for a conceptual model in which levels of AS and e-cigarette processes are strengthened by and differ across e-cigarette quit attempt history.

MEDIATING EFFECTS OF EMOTIONAL LABOR ON THE RELATIONSHIPS BETWEEN CUSTOMER ORIENTATION AND FRONTLINE EMPLOYEES’ JOB SATISFACTION

Yan Li
Beijing Institute of Technology (Beijing, China)

Khalid Mehmood
Tong Ji University (Islamabad, Pakistan)

This study examines the mediating effects of emotional labor on the linkage between customer orientation and frontline employees’ job satisfaction. 536 frontline employees from 80 hotels in China participated in this study. The results of structural equation modeling turned out that the positive relationship between customer orientation and frontline employees’ job satisfaction was partially mediated by employees’ surface acting and deep acting. In particular, deep acting positively mediated the positive relationship, however, the positive relationship was negatively mediated by surface acting. Managerial implications were discussed.
NARRATIVE ANALYSIS OF MEN’S LONG-TERM EXPERIENCE IN BDSM

Pao-Ling Yeh
National Pingtung University (Pingtung, Taiwan)

Shih-I Tsai
New Taipei Municipal Kuokuang Elementary School (New Taipei, Taiwan)

Topics related to bondage and discipline, domination and submission, and sadism and machoism (abbreviated as BDSM) have gradually been widely discussed in Taiwan, and relevant communities have been established for opinion and experience exchanges. However, local studies on BDSM have been rare. Accordingly, the author adopted the qualitative research method of narrative analysis to gain an in-depth understanding of BDSM participants’ experiences. In a pilot study, the author interviewed a male participant with 4 years of experience in BDSM, and subsequently recruited three males aged 29, 30, and 46 with 6 years, 13 years, and 18 years of BDSM experience, respectively. Each participant underwent an average of 8 hours’ worth of interviews, after which the interview recordings were transcribed for data analysis and summarization. The results indicate that BDSM does not necessarily involve sexual intercourse but can cause sexual excitement. The characteristics of BDSM include obedience and domination, an emphasis on sensory stimulation and power play, pleasure from imitation and acting, role plays that are usually detached from reality, and psychological and corporeal satisfaction attained during role play. Five roles in the BDSM role plays are dominator, ordinary individual, prisoner, animal, and object, and the roles participants engaged in may undergo quantitative or qualitative changes over the course of their life. The interviewees in this study believed that BDSM tendencies are related to trauma and that the motivation for engaging in BDSM is to resolve the pain of loneliness and interpersonal alienation. Additionally, the interviewees reported that they engage in BDSM more frequently when they encounter emotional setbacks. BDSM is a relatively sensitive research topic, and future researchers are advised to establish a positive relationship with interviewees to avoid challenges in conducting in-depth interviews. Additionally, during interviews, researchers should be prepared to face the darker side of human nature and should provide strong support for the interviewees.

DIAGNOSIS OF THE INTELLECT WITH COLOR MATRICES RAVEN. STANDARDIZATION FOR THE AGE OF 12-14 YEARS OLD CHILDREN

Veronika Ivanova
Medical university, Prof. d-r Paraskev Stoyanov (Varna, Bulgaria)

In the work of the psychologist in children’s clinic one of the most basic measurements is that of intellectual development. Practically there can be psychological study of the child, without determining the profile of intelektualnoro development. According to recent studies, the colored plates of the Raven is the best diagnostic tool for children with mental retardation, autism spectrum children. Most of the children who are not doing the subskalite Veksler, deal with methods that do not require verbal processing of information. Such methods are children’s progressive matrices of Raven. The objective of this report is to present standardized norms for age 12-14 years ago, in a clinical sample. Indicators for validity and reliability are different for a sample of healthy and for clinical sample, most of normiranite tests are applied on a non-clinical sample, which makes insufficient precision their application.
SCREENING FOR ANXIETY AND DEPRESSION IN PEOPLE WITH INTELLECTUAL DISABILITY — A FEASIBILITY STUDY

Melanie Jagla
Antonia Tschache
Stefanie Wagner
Gabriele Franke
University of Applied Sciences Magdeburg-Stendal (Stendal, Germany)

Julia Knuhr
AWD-hospital Jerichow psychologist (Jerichow, Germany)

People with an intellectual disability (ID) have a significantly increased risk of developing mental disorders. In German-speaking countries, there are so far no self-assessment instruments for detecting depressive and anxious symptoms. In order to increase participation of people with ID in the field of psychodiagnostics, the Glasgow scales for assessing depression (GDS) and anxiety (GAS) were translated into German and tested in a German sample consisting of patients with psychiatric disorders and ID and persons with ID working in a protected environment. In total 93 people with ID (41 years ± 14, 57% female) were examined by using the German versions of the Glasgow scales. N = 34 persons (41 ± 12 years, 60% female) were examined in inpatient psychiatric context; N = 59 subjects (41 ± 15 years, 55% female) worked in sheltered workplaces and were examined there. The GAS consists of 27 items, and the GDS of 20 items; both scales calculate a global score (sum). The original versions provide cut-off values (GAS ≥15, GDS ≥13) that differentiate between inconspicuous and clinically conspicuous individuals. People with ID were able to handle the German version of the Glasgow scales well and stated that they understood the content of the items and the scaling. They said they felt "accepted and understood" and that filling in the questionnaires did not cause any problems. The statistical examination showed differences between the clinical and the non-clinical group in terms of GDS (t=-3.419, p=.003, d=.80) and GAS (t=-3.090, p=.003, d=.75); with regard to both scales, the global scores of the clinical sample were above the cut-off and the non-clinical sample were below. In the overall sample, the internal consistency of both scales was above .80; hypothesis-conforming correlations showed up. The German versions of GAS and GDS are well usable and understandable for people with ID; reliability is good, first indications of validity are available. Sensitivity and specificity should be checked on a larger sample and cut-off values should subsequently be set. Overall, there are two screening instruments that can be used well in practical setting.
THE IMPACT OF DIGITALIZATION OF EDUCATION AT A TEACHER’S PSYCHOLOGICAL HEALTH

Marina Kalashnikova
Novgorod State University after Yaroslav the Wise
(Velikiy Novgorod, Russia)

Modern education as a society at whole is increasingly becoming digital. The goal of the research was to study the characteristics a teacher’s psychological health in the context of intensive digitalization of education. A psychological health was considered as a dynamic combination of person’s mental properties which provide the harmony between the needs of an individual and a society. These properties are considered to be a prerequisite of an individual’s orientation toward the fulfillment of his or her life task. The highest level of psychological health, i.e. creative health, includes the people with a steady adaptation to the environment, the presence of reserve forces to overcome stressful situations and an active creative attitude to reality. The people who are adapted to the society in general but who have a slightly increased anxiety will be attributed to an average level, i.e. adaptive. The lowest level is maladaptive. It includes the people who are seeking to adapt to external circumstances to the detriment of their desires and opportunities and the people who are seeking to subordinate the environment to their needs. We have formed three samples of subjects in terms of an intensity level of the digital educational environment where respondents work: rural school teachers (low digitalization level), secondary school teachers (middle level), gymnasia teachers (high level). The composition of the subjects is homogeneous, i.e. women. An average age of the subjects in each group is 40 ± 5 years. One hundred and twenty people took part in the research. The methodical complex consisted of a battery of 10 methods (“Diagnosis of Health. Psychological Practicum. / Edited by Prof. G.S.Nikiforov.- SPb, Rech, 2007”). An integrative indicator of the level of a mental health was calculated as the result. The general results of the research include the fact that the smallest number of respondents with a low level of mental health work at rural schools (only 5%), the largest number works at ordinary urban schools (38%). The teachers with a high level of mental health mostly work at gymnasias (25%) and the least number of them (15%) work in urban schools.
THE ROLE OF PSYCHOTRAUMATIC FACTORS IN THE GENESIS OF SCHIZOPHRENIA

Sofya Tarasova
Psychological Institute Russian Academy of Education (Moscow, Russia)

Anna Bobrovnikova
Dubna State University (Dubna, Russia)

Schizophrenia is a common mental disorder. However, the question remains what role stress factors and psychotraumatic situation play in the genesis of this illness. Another interesting aspect of studying schizophrenia is how gender, intersexual, and cultural differences affect the progression of the disorder. We have conducted a research involving adults with the diagnosis of schizophrenia (F20). The purpose of our research is to study the role of psychotraumatic situation in the progression of schizophrenia and its interrelations in a wider context of clinical symptoms. Materials and research methods. Detailed clinical conversation along with the life-line, sentence completion tests and genograms. Pathopsychological examination. Thematic Apperception Test (TAT). Analysis of medical records. Analysis of patients’ verbal and graphic production. Dynamic observation. The research lasted for 2 years and was carried out using the facilities of Moscow Regional Psychiatric Hospital No. 14 and psychological and social support service at this hospital. The sample included 62 patients: 31 men and 31 women. If the duration of the disease was more than 5 years the trigger mechanism was analyzed focusing mainly on the theme of the delusion. The statistical analysis of the data was performed using the methods of descriptive statistics. Conclusion 1. The role of psychotraumatic situation in the genesis of schizophrenia is significant in both women and men. Unhappy love and sexual experience can be a common important psychotraumatic factor. But the proportion of this factor is larger for women (69% as compared to 28% of men). 2. The results of the research have shown that the level of disadaptation because of schizophrenia is lower in women than in men. Women demonstrate a more critical attitude towards their defective condition and orient themselves better in their own personality than men (56% and 37% of cases, respectively). 3. Considering the evidence that both hetero-and auto-aggressive behaviour is possible in schizophrenia, during the treatment special attention should be paid to the role of psychotraumatic situation in the genesis of the illness. At the same time, it is necessary to take into account gender differences related to the psychotraumatic situation.
A RESEARCH ON THE MARITAL CONFLICT AND MARITAL ADJUSTMENT OF ADULTS WITH ATTENTION DEFICIT HYPERACTIVITY DISORDER

Burcu Kahveci Oncu
Ankara University (Ankara, Turkey)

Sennur Tutarel-Kisliak
Ankara University (Ankara, Turkey)

Attention deficit hyperactivity disorder (ADHD), negatively affects the academic, social and individual experiences of individuals; in adulthood, especially in close relationships and marriage, causes many problems. Failure to recognize the disease and not to treat it with appropriate ways may lead to termination of marriages. For this reason, it is thought to be important to investigate the effects of ADHD especially in marital relationship. The aim of this research is to examine differences between healthy couples and couples in which one of the spouses has been diagnosed ADHD, in terms of marital adjustment, marital conflict, conflict resolution styles and spouses's evaluations about each other. The sample of the study were consistedof 33 subjects with ADHD and 28 spouses who volunteered to participate in the study and 43 healthy pairs. Wender Utah Rating Scale (WRS), Adults ADHD Self-Report Scale (ASRS), Marital Conflict Questionnaire (MCQ), Marital Adjustment Scale (MAS), Conflict Resolution Styles Scale in Romantic Relationship (CRSS) and The Birtchnell Partner Evaluation Scale (BPES) were used as data collection tools. The analysis showed that adults with ADHD and their spouses in terms of marital conflict level, marital adjustment and conflict resolution styles, differ significantly from healthy couples. These people have more conflict in their marriage than healthy couples and show less marital adjustment. As a result of the regression analysis; conflict frequency and spouses's evaluation each other as dependable and negative, predicted marital adjustment of couples in ADHD group at a level of %67 whereas conflict frequency, negative and retreat conflict resolution styles predicted marital adjustment of healthy couples at a level of %47. There is not so much research on this topic but results compatible with literature. It is expected to help patients and mental health specialists for recognition of disease and elimination of marital problem.

THE DEVELOPMENT OF EYE-TRACKING AND PUPILMETRICS IN THE ASSESSMENT OF COGNITIVE LOAD

Yuju Chou
National Dong Hwa University (Hualien, Taiwan)

This study aims to develop a new paradigm, pupilmetrics, to measure the cognitive load with a high resolution eye-tracker. With a sensitive eye-tracking device and an experimental design, this study will measure collect five pupilmetrics and five behavioral indicators in the process of word categorization on mono- or poly-semous words. We hypothesize that the number of meanings comprised in a word is going to influence cognitive load and thereafter the changes of pupilmetrics. This study uses subjective and objective measures, including pupilmetrics, such as maximum pupil dilation and relative changes of pupil size, and behavioral metrics, such as self-rating difficulty scale and accuracy, etc. It is hoped that the establishment of this promising technique, the developing strategy of the corpus of Chinese polysemies, and the database of various indicators will become effective tools for the assessment of cognitive load in the recognition of various languages.
CURRENT PRACTICES AND PERSPECTIVES ON GRADUATE COUNSELING STUDENTS AND COUNSELING PSYCHOLOGISTS RECEIVING PSYCHOTHERAPY IN TAIWAN

Pao-Ling Yeh
National Pingtung University (Pingtung, Taiwan)

Seeking personal psychotherapy is conducive to therapists’ personal and professional development. This study investigated current practices and perspectives on graduate counseling students and counseling psychologists receiving psychotherapy by using a questionnaire survey with high expert validity. After the questionnaire items were developed by the research team, copies of the questionnaire were mailed to participants selected through purpose sampling. A total of 892 valid questionnaires were retrieved. The results indicated that: (1) personal psychotherapies that were cost-free and lasted 30 hours were the most sought after among the respondents, the majority of whom received psychotherapy for self-development purposes; (2) the number of psychotherapists whose advice was sought and the total hours spent on psychotherapy were significantly greater among graduate counseling students than counseling psychologists; (3) 92% of the respondents believed they had benefited from psychotherapy, primarily in terms of self-awareness, self-identity, and mood improvement; (4) 30% of the respondents reported being traumatized during psychotherapy because of the psychotherapists’ attitude, ethical problems, or efficacy; (5) most of the graduate counseling students received personal psychotherapy at school-based counseling centers, whereas counseling psychologists mainly sought personal psychotherapy in their neighborhood based on a referral by their peers; (6) 90% of the respondents believed that receiving personal psychotherapy benefited their professional development, and 70% believed that it should be included in curricula or internship programs for counseling psychologists; and (7) 50% disagreed that receiving personal psychotherapy should be included as part of continuing education, with a significantly greater number of counseling psychologists than graduate counseling students opposed to this. In summary, because most of the respondents underwent personal psychotherapy during their graduate years, graduate students should be encouraged to receive personal psychotherapy. Future studies could investigate why graduate counseling students consulted more psychotherapists than did counseling psychologists and explore the respondents’ perceived trauma in psychotherapy.

THE CONCEPT OF INTONATING CONSCIOUSNESS

Alla Toropova
Moscow State Pedagogical University (Moscow, Russia)

The development of the idea of operationalization of the category “experiencing” led us to an understanding of the psychological importance of distinguishing the observed phenomenon “intonating”, which gives an understanding of the way the experience mark is formed and the individuality of the individual’s experience turns into the mental language tool of humanity for preserving experiencing in the intonation signs and symbols. The psychological concept of the intonating phenomenon can be expounded in terms, the main ones among which are: The intonating phenomenon is a form of the primary mental activity of consciousness included in all mental functions, as their explication for themselves and others. The intonating consciousness forms a layer of metalinguistic non-verbal signs that are used in the process of various types of communication, in verbal communication, in targeted and indefinite-targeted expression of experiences. We consider it both as a pre-language, and as a pre-
layer (meta-level) of language consciousness, the basis for the development of non-verbal cultural languages and ethno-linguistic forms of consciousness, including musical-language consciousness. An intonated experience provides a primary preverbal categorization of sensory experience based on the emotionally experienced understanding of meaning of this situation for a given subject with his unique personal and generic experience of intonated experiencing, that impact psycho-semantic structure of his mind.

PSYCHOMETRIC PROPERTIES OF THE URDU TRANSLATION OF THE DISSOCIATIVE EXPERIENCES SCALE AMONG A NON-CLINICAL SAMPLE OF PAKISTANI UNIVERSITY STUDENTS

Christopher Alan Lewis  
School of Social Sciences, Bishop Grosseteste University  
(Lincoln, United Kingdom)

Sadia Musharraf  
The Women University (Multan, Pakistan)

Jamil A. Malik  
National Institute of Psychology, Quaid-i-Azam University  
(Islamabad, Pakistan)

Martin J. Dorahy  
University of Canterbury (Christchurch, New Zealand)

Mary Jane Lewis  
Glyndwr University (Wrexham, United Kingdom)

Dissociative disorders are common in Pakistan, accounting for over 10% of admissions in psychiatric wards. Despite this, little attention has been given to the suitability of established psychometric measures of dissociation in this context. The Dissociative Experiences Scale (DES) is a widely used 28-item self-report measure of dissociation that has been translated into a number of languages. The aim of the present study was to examine the psychometric properties of the recently translated Urdu version of the DES among a non-clinical sample of university students in Pakistan. A convenience sample of 253 university students in Pakistan completed a short survey comprising of the Urdu version of the DES and the English version of the DES, along with the Urdu version of the Eysenck Personality Questionnaire (EPQ). The Urdu version of the DES demonstrated high internal consistency (alpha = .91), cross-language validity (rs = .89 to .93), satisfactory temporal stability over four weeks (r = .89), and good convergent validity with the Urdu version of the EPQ’s Extraversion, Neuroticism, Psychoticism, and Lie subscales. Exploratory factor analysis of the Urdu version of the DES suggested a single factor model was the best description of the data. These findings provide satisfactory evidence for the reliability and validity of the Urdu version of the DES among a non-clinical sample of university students in Pakistan and it is recommended for further use among Urdu speakers.
IDENTITY FORMATION FROM EARLY CHILDHOOD TO ADOLESCENCE: AN INTERPERSONAL APPROACH

Neringa Bagdonaite  
Mykolas Romer University (Vilnius, Lithuania)

Within the realm of clinical psychology, identity is increasingly viewed as a dynamic, personality-defining system, where early childhood experiences with significant others play a critical role and are thought to be the foundation of identity formation in adolescence. However, recent research in identity area is mostly focused on adolescence, as it is perceived as the most intense period of identity development. Moreover, in the period of adolescence identity is often examined in terms of making social role choices, ignoring family context, relationships, and their significance to identity formation. Regardless of the indisputable agreement on the importance of the early experiences to identity formation in adolescence, any consistent analysis of identity shaping factors during both developmental periods is still scarce. This study attempts to address this issue by analyzing interpersonal constructs of identity formation in the context of theoretical and empirical data within the psychodynamic theory and developmental psychology. The central focus of this study is the examination of the attachment, mentalization and separation-individuation constructs and their dynamics in identity formation from early childhood to adolescence. Based on theory and research available, further analysis revealed attachment style to be a universe factor generating both the development of mentalization and separation-individuation processes during both: childhood and adolescence. The analysis allowed to propose mentalization to be a mediating factor between the attachment and separation-individuation processes. Future research concerning those factors would significantly contribute to the consolidation of current empirical data and the expansion of theoretical formulating. The conclusions drawn from this study have important clinical implications: parental educational programs focusing on promoting emotionally healthy parent-child environment could help to create a more balanced family relating atmosphere, which would facilitate the formation of identity process during both periods: early childhood and adolescence.
HOW TO MANAGE STRESS? THE INFLUENCE OF CULTURE VALUE ON CHINESE WORKERS’ INTERPERSONAL RESOURCES

Feng Hsia Kao
National Taipei University of Nursing and Health Sciences (Taipei, Taiwan)

Occupational health psychology is an important topic in both organizational behavior research and management practice. However, most previous researchers focused on exploring the negative effect of stress, and ignoring the positive approach to consider the resource acquire perspective in stress research. Thus, the present study will focus on exploring interpersonal relationship which is the Chinese workers’ core job task, from the positive perspective to offer a comprehensive definition of interpersonal resource, hoping to break the blind spot of job stress management. The purpose of this study is to capture the main content and domains of Chinese workers’ interpersonal resource, development an initial theoretical framework. A total of 67 Chinese full-time workers in this study were used for the descriptive interpersonal incidents collection and the dimensions development. There are 206 descriptive interpersonal incidents are generated. Through content analysis clarified 8 dimensions of interpersonal resources, including appreciation, promote, Gratitude, empathy, people person, provide, being cared, and in the same boat. Four dimensions are similar to some Western-development constructs, but the others are extended. Based on the results, the limitations of this study are discussed and possible directions for future study are indicated. In addition, some managerial implications are mentioned.

SELF-DETERMINATION AND MENTAL DISORDERS: A PHENOMENOLOGICAL APPROACH

Neringa Bagdonaite
Mykolas Romer University (Vilnius, Lithuania)

The main focus of this study was to explore how self-determination interplays in suicidal and addictive context leading one to autonomously choose self-destructive addictive behavior or suicidal intentions. To address these issues phenomenological descriptions of the experiential structure of self-determination in addiction and suicidal mental life were used. According to the phenomenological approach, a sense of self-determination in the context of suicidal and addictive behavior is possibly impaired. In the context of suicide, it’s proposed that suicide is always experienced at least minimally self-determined, as it’s the last freely discovered self-efficient behavior, in terms of radically changing one’s desperate mental state. More importantly, suicide can never be experienced as fully self-determined because no future retrospective re-evaluation of behavior is possible. Understanding self-determination in addiction is challenging because addicted individuals perceive themselves and experience situations differently depending on: (I) their level of intoxication; (II) whether the situation is in the moment or in retrospect; and (III) the goals set out in that situation. Based on rich phenomenological descriptions of the studied phenomenon, this paper draws on the premise that to experience self-determination in both suicide and addiction, underlying desperate or negative emotional states are needed. Such underlying desperate or negative mental life experiences are required for one to pre-reflectively evaluate suicide or addictive
behaviors as positive, relieving or effective in terms of changing one’s emotional states. Such pre-reflective positive evaluations serve as the base for the continuation of behavior and later are identified reflectively. The phenomenological approach employed to analyze self-determination in suicidal and addictive behaviors could be extremely helpful in the area of clinical practice: with respect to better understanding the perspective of individuals suffering from these conditions.

**WOMEN’S INTENT TO COMBAT CLIMATE CHANGE IS GREATER THAN MEN’S, ESPECIALLY IF MOTIVATED BY THE LEGACY FOR FUTURE GENERATIONS**

Leslie Zebrowitz  
Isabe; Rappoport  
Brandeis University (Cambridge, USA)

The U.S. public ranks climate change as a low national priority despite growing evidence that its devastating impacts require immediate action. This presents a grave danger to the entire world, since the U.S. ranks second in fossil fuel emissions and is the only nation that has rejected the Paris Climate agreement. Some encouraging evidence suggests that arguing for economic benefits can increase climate policy support. Another promising mechanism is encouraging thought about one’s personal legacy. Gender differences suggest other avenues of influence. Men may be less likely to endorse sustainable behaviors because stereotypes suggest these are associated with “femininity.” Indeed, women are more worried about climate change. The present study examined the impact of economic and legacy motivations on attitudes and behavioral intentions regarding climate change, as well as gender differences in the response to each motivation. Participants were 422 adults (207 men) recruited through Amazon's MTurk. All were 18 years of age or older and located in the U.S. Participants were randomly assigned to an economic, legacy, or control motivation condition. Each condition provided 90 words of information about climate change followed by 35 additional words to manipulate motivation. In the economic condition, these words emphasized the benefits of transitioning to a low carbon economy for job growth and the American economy. In the legacy condition, they emphasized the benefits of reducing carbon for a thriving planet and future generations. Behavioral intentions and attitudes were subjected to **Gender(2) X Motivation(3) between-subjects analyses of variance.** There were no significant main effects of motivation. As predicted, women expressed more positive attitudes and behavioral intentions than men. In addition, a significant gender by motivation interaction revealed that both legacy and economic motivations yielded more positive behavioral intentions than the control condition for women, but not for men, and that the tendency for women to express more positive behavioral intentions than men was greater in the legacy than in the economic motivation condition, as predicted. Future research should investigate whether the gender differences generalize beyond the U.S., and how gender-specific motivations can be successfully leveraged to combat climate change.
PHASED FORMATION OF AGENCY AS PHENOMENON OF DEVELOPMENT OF CONSCIOUSNESS

Ekaterina Kolesnikova  
Samara State Technical University (Samara, Russia)

Alexandr Kaptsov  
Samara Humanitarian Academy (Samara, Russia)

Victor Panov  
Psychological Institute of Russian Academy of Education (Moscow, Russia)

At the present time the inquiry on theoretical and applied researches of agency in the field of education is actual. In connection with the formation of competencies at high school the formation of stages of agency is considered as its manifestation in actions, being a necessary condition and phenomenon of the development of consciousness. The closest and providing the individual ability to be a subject of different competencies is an ecopsychological approach to the development of the psyche, at the framework of which an ecopsychological (ontological) model of the formation of agency has been developed (V. Panov). An individual should pass a series of stages at the development of own properties: from the subject of needs (motivation) through the subject of perception of the sample action (observer) to the subject of productive development (creator). To study the processes occurring at different stages of the formation of agency a pilot study on a sample of engineering students, divided randomly into control (64 people) and experimental (58 people) group was conducted. In the experimental group, classes were conducted by scheme, directed on the development of the stages of the formation of agency in accordance with ecopsychological model. In the control group, training took place in the form of traditional training. For diagnose the stages of formation of agency, the author's method was used. A regression analysis was conducted by us: the “observer” stage in the experimental group as predictors includes the initial value of the “observer” stage. The “apprentice” stage already includes two links of relationships: the initial value of this stage before the experiment and the value of the previous “observer” stage, formed at the end of the experiment. Among the predictors of relationships there are several asymmetric ecopsychological types. Similar conditionality is inherent all stages of the formation of agency. Thus, the results of the regression analysis show the continuity of the formation of stages. The subsequent stages of the formation of agency include its development at previous stages as predictors. Work is executed at financial support RFBR-OGN, grant 17-06-00871.
REGRESSION PSYCHOLOGICAL DEFENCE AS CAUSE AND EFFECT OF INTERPERSONAL RELATIONSHIPS IN YOUTH ENVIRONMENT

Mikhail Basimov
Polina Basimova
Rossiyskiy gosudarstvennyy socialnyy universitet
(Moscow, Russia)

Turning on the synergetic platform and considering to not only linear but simple nonlinear relations, we find three interesting psychological defence mechanism dependencies "Regression" (method of R.Pluchik) and parameters of interpersonal relations (methods of T.Leary). The dependency research was conducted using the M.Basimov method. Dependence of the parameter "Aggressive (Self-ideal minus Self-real)" (Y) from the parameter 'Regression' (X) as comparative weightiness of the parameter Y for quinters on a scale X: X-1(Y=+1193); X-2(Y=-2226); X-3(Y=+6513); X-4(Y=-547); X-5(Y=+65) Factor of the connection strength=0.56 (reverse dependency=0.11) Coefficient of correlation=0.01 Moderate use of such mechanism of psychological defence as regression (an average level at the 3rd quinter), calls the trend to a sharp increase in the desire to be more aggressive (Self-ideal minus Self-real) – the explicit maximum (comparative weightiness=+6513). Dependence of the parameter 'Regression' (Y) from the parameter "Selfish (Self-real)" (X) as comparative weightiness of the parameter Y for quiners on a scale X: X-1(Y=+15663); X-2(Y=+220); X-3(Y=-6131); X-4(Y=+184); X-5(Y=-358) Factor of the connection strength=0.81 (reverse dependency=0.10) Coefficient of correlation=-0.07 The intention to become more selfish (the 4th quinter) facilitates the appeal to the regression psychological defence mechanism (the maximum, comparative weightiness=+7555). But excessive aspiration to selfishness (the 5th quinter) leads to the opposite result. The dependencies presents no interest even for adherents of the "meaningful" correlation. It also staticizes acceptance synergetic paradigms in psychological science.
Depression was stated to be the main concern of 21st century by the World Health Organization. Medical studies describe overt symptoms so as to allow psychiatric diagnosis. There are not enough psychological tools to objectively support clinicians’ look. This deficiency became evident while working in a public health structure in Rome: rigorous diagnosis were urgently required because of high suicidal risks and of the necessity of targeted pharmacological interventions. Drawing techniques are the quickest psychological tool, so we wondered whether some graphic cues could be significantly related to depressed adults. Results are so consistent that our aim is to open the way to further research. Free drawing is known to facilitate expressing cognitive/emotional states (Maresca, 2018) because it bypasses unawareness, defense mechanisms, and communication difficulties. Longstanding research has confirmed that traceries of a tree, human figures, and families, show features correlated to personality diseases: but hitherto none were correlated to depression. The widespread belief is that depression is a ‘low mood’, thus, translating from children’s outcomes (Koppitz, 1968), also depressed adults are expected to draw: small figures; located on the lower edge of the sheet; with a light pressure of the lines. There is no previous research to compare with, and we had no economic grants, so we explored only our exiguous group of fifty inpatients. Diagnosis of depression syndrome was previously clinically assessed by skilled psychiatrists together with BHS (Beck Helplessness Scale). We looked for recurrent graphic features in the drawings of human figures and real/ideal families. Unexpectedly, most of the scripts were located on the upper edge; the same subjects’ strength of pressure varied. Dimensions were mostly small. Human figures showed regressive signs such as stereotypes and positions on the left side, and two remarkable features such as missing or stylized hands and disproportionately large heads. Subjects frequently omitted themselves in the real family and/or refused to draw their ideal family. In our globalized society it may be difficult to verbally contact disturbed subjects, thus drawing techniques can become an elective tool to support diagnosis of depression and to understand its internal dynamics.
THE ‘DRAW A HUMAN FIGURE’ TECHNIQUE FOR PEDAGOGISTS AND SCHOOL-TEACHERS

Aliai Cristiani
Massa, Italy

Laura Maresca
psychologist, Sorrento, Italy

Psychodiagnostic tests can be used only by authorized experts, as all medical instruments. But thermometers, for example, can be used by anybody for a quick preventive purpose. Psychology instead provides for two exclusive categories of ‘personality’ and ‘structural/objective’ tests, forgetting that drawing techniques are neither one nor the other, because they are not a ‘test’. Statistical normative data of children’s free ‘drawing human figures’ (DHF) were assessed by the North-American Koppitz (1968). We carried out an Italian standardization, in order to update information. Correlation between some features in children’s free drawings and their cognitive/emotional state was found by a pedagogist at the end of 19th century. Many authors added more correlations, until human figures became a well validated psychological technique. Later this was absorbed by the psychoanalytic movement which used it in order to describe the whole ‘personality’, and confined it among the so called ‘projective tests’ (Maresca, 2018). Recovering the correlational trail, it may be given back to a modern psychological science and commonly used for prevention. We arranged a well balanced sample of almost one thousand schoolchildren, aged from 5 to 10, according to the geographical characteristics of Italy. Specific features of all traceries were detected and added up, cutting them out according to the percentage of how frequently they appeared, for each age range and for both genders. Tables of significant features will be presented, where outcomes can be descriptively read. DHF is an easy task to be administered and has few definite referring data: the elemental reading key is that the most frequent graphic features must be present in a specific age range for different gender, so their absence certainly denotes cognitive and/or emotional problems. As such, it is suitable to be offered to pedagogists and to school-teachers as a useful preventive aid. They do not need to make clinical interpretations, but just detect a problematic child and call experts who will then intervene in time. Moreover the technique is culture-free, so its standardized norms are valid anywhere in our globalized society.
SKILL OF PARAPHRASING IN UNIVERSITY STUDENTS

María Luisa Cepeda Islas
Estado de México Universidad Nacional Autónoma de México (Tlalnepantla, Mexico)

Hortensia Hickman Rodríguez
UNAM-FES-Iztacala (Tlalnepantla Mexico)

Paraphrasing is understood as a skill that the reader has to reformulate the main ideas of the text without distorting them, so the subject needs to master the language to understand the meaning of the text (Arechavala, Catoni, Ávila, Riquelme and Aedo, 2011; Arbusti, 2010; León, Solari and Escudero, 2011). In the college this ability is important because it is a way to show reading comprehension. There are some typologies of paraphrases that allow to measure different types of reading comprehension, ranging from the simple to the complex. In this sense, the aim of the present study was to evaluate the type of paraphrase in a sample of 99 university students, selected through an invitation to participate in the study. During the evaluation session an experimental article was given to them, informing them that they would read it and then respond to a questionnaire of 10 questions. All the answers to the questionnaire were analyzed, typifying them in the following categories: 1) Copy, 2) Substitution, 3) Elimination, 4) Transformation, 5) Segmentation and 6) Change of order. The results indicate that the type of paraphrase is a function of the type of question, whether it is a textual question, an analysis question or an inference question.

THE ROLE OF PERSONALITY, COPING AND OPTIMISM IN PREDICTING LIFE SATISFACTION

Lilly Both
University of New Brunswick (Quispamsis, Canada)

Researchers examining life satisfaction have focused on both dispositional traits and situational influences. Past studies have shown that people who are extraverted, emotionally stable, and engage in problem-focused coping tend to score higher on measures of life satisfaction. The purpose of the present study was to examine whether optimism makes a unique contribution to life satisfaction. Optimism, or positive bias, refers to the belief that misfortunes are more likely to occur to others than to oneself. A total of 178 individuals participated in this online survey study (Mage = 23.00; SD = 6.27). They completed questionnaires that assessed demographic characteristics, personality (BFI-2), coping (Ways of Coping Scale), optimism and pessimism (Future Events Scale), and life satisfaction (Satisfaction with Life Scale). The variables of age and gender were added on the first step of a hierarchical multiple regression analysis and did not significantly predict life satisfaction. In the second step, personality factors made a significant contribution and accounted for 29% of the variance in the model. Significant predictors were lower Neuroticism and higher Extraversion and Conscientiousness scores. In the final step, coping and optimism also made a significant contribution, adding an additional 9% of variance to the model. Specifically, life satisfaction was predicted by lower scores on emotion-focused coping, and higher scores on optimism. When pessimism scores were substituted for optimism scores in a separate model, they did not make a significant contribution. Thus, a positive bias or outlook can be beneficial in terms of buffering against life’s stressors and contributing to life satisfaction. Pessimism is amenable to change, and should be a focus of clinical interventions.
Hallucinations are the most common phenomena in altered states of consciousness (ASC) and the essential symptom of schizophrenia. However, due to the difficulty in approaching subjective experiences through positive research, the lack of a systematic analytical framework has seriously impeded the in-depth research on hallucinations.

Different from most research focusing on the generation mechanism of hallucinations from the perspective of neurophysiology, this paper attempts to propose a universal model to reveal the formation mechanism of different states of hallucinations from a unique perspective. Our starting point is that there are two pathways through which to affect perception: When false internal stimulations and external objective stimulations affect perception together, the changes in their relative strength will result in the consistence, breakdown and re-consistence of the five senses, leading to three basic states of hallucinations (one can distinguish reality from fantasy, one cannot distinguish reality from fantasy, and reality and fantasy are totally reversed).

Moreover, in the second state of hallucinations, the inconsistence of the five senses, on one hand can also explain the generation mechanism of out-of-body experiences and synesthesia; on the other hand, makes it possible to integrate internal and external stimulations together, thus bringing about various marvelous psychedelic phenomena in ASC, combined with the amplifying function of enhanced awareness caused by the weakening of the brain-filtering function which always occurs along with hallucinations.

Furthermore, the third state of hallucinations suggests a novel hypothesis to interpret extrasensory perception (ESP): the essence of ESP is that false internal stimulations are mistaken as external objective stimulations which enter through sensory organs, while real external objective stimulations are mistaken as perceptions which do not result from sensory organs when one is in deep hallucinations. In this situation, one would naturally treat the inconsistent and "unexplainable" external stimulation as information acquired through psychic abilities such as clairaudience, clairvoyance or telepathy since he cannot find the counterpart in the imaginary world.

Finally, we arrive at a conclusion that paranormal phenomena are simply illusions that happens along with deep hallucinations and drop some helpful hints for the clinical treatment of schizophrenia.
THE ABILITY TO DIAGNOSIS AS A PROFESSIONAL COMPETENCE OF A PSYCHOLOGIST

Sergey Elshansky
Federal State Budgetary Educational Institution of Higher Education «Moscow Pedagogical State University» (Moscow, Russia)

In recent years in the domestic education competence approach is declared as a priority methodology and basic paradigm. The formation of abilities and willingness necessary for successful professional activity in a specialist as a goal of education is obvious. However, the specific sets of competencies required for a specialist, presented in the existing educational standards, are not yet fully and clearly defined. The development and effective implementation of the competence approach is impossible without special studies aimed at studying both the actual content of the professional competencies requiring formation, and the possibilities and methods of such formation. In particular, there is a need for psychological research in this area, since many competencies can be considered as professional cognitive abilities. A professional diagnostic capability is needed to almost any specialist (e.g. psychologist, doctor, engineer, etc.), diagnosis in a problematic professional situation is a necessary action that helps the specialist to solve a professional task. The condition for the formation of diagnostic competencies is the ability to diagnostic thinking, which is a special form of perceptual-mental activity. By analogy with the mental operations of generalization or classification diagnosis can be viewed as a complex mental operation that integrates the following essential elements of mental activity, as a comparison, analysis, synthesis etc. At the same time diagnosis as the mental operation is present not only in professional but also in everyday life. Diagnostic competence is related to understanding. If we consider understanding as a universal operation of thinking, then diagnostics can be considered as an element of understanding. It is believed that understanding provides a connection of new properties of the object of knowledge with the already known, forms an operational sense. Therefore, for understanding (especially if we are talking about forms of understanding that require a deep understanding of the causes and consequences) it is necessary to solve a certain mental task, for which the diagnostic operation is used. Actually understanding (as a new meaning, not as a process) we can consider as a result of diagnosis (especially if we talk about causal diagnosis, diagnosis of causes).
VALUE-MOTIVATIONAL SPHERE OF THE DEVIAN'T PEOPLE

Mariam Arpentieva
Tsiolkovskiy Kaluga State University (Kaluga, Russia)

Objective: analysis of problems of deviant behavior in the context of the processes and results of deformations of the system of values of the individual and the community. The method of research is a theoretical analysis of the problem of deviant behavior in the context of the processes and results of deformations of the value system of an individual and the community.

Results and conclusions. Deviations in human behavior in different ages are manifested in a variety of forms, such as aggression and autoaggression, alcoholism and drug addiction, offenses and crimes, and new forms of the addiction. The problem of the (re/tras)formation of a system of values is touched upon in the multitude of works by modern and classic scientists, pedagogues, social workers and other specialists. Production-technological, socio-psychological and politico-economic changes in worlds have led to the destruction and desacralization of the customary system of values, such as moral norms, theirs representation in interaction with fatherland, family and friendship, professional and work communication. Modern societies began to exist in the spirit of principles and rules of life, that values are formed spontaneously and exists in individual forms. This makes these norms very vulnerable to deviations, and also crushes the very understanding of deviations, "reducing" them to individual versions of the "norm". The destruction of the universality of the rules that guaranteed the survival and development of peoples and people, the development of culture, leads not only to the destruction of culture (lack of culture), but also to the loss of their potentials of viability and extinction by communities.

Discussion. Deviant (inormal) behavior is a social behavior that deviates in its motives, value orientations and results from the accepted in a given society, social stratum, group of norms, values, ideals, that is, normative standards. Equilibrium (stability) of social interaction involves the integration of the actions of many, which is violated by the deviant behavior of one or several people. There are different types of societies, so behavior that is deviant in one society will not be so in another.
According to the ‘Psychology of Working Theory’ (PWT; Blustein, 2006), decent work is an important component of well-being. However, recent changes in the world of work are contributing to the decrease of decent work (Blustein, 2013), which is reflected by underemployment augmentation (work conditions that are inferior to certain standards). As underemployment (Allan, Tay, & Sterling, 2017) is regarded as a non-symmetrical experience between work conditions and type of position (e.g., benefits, salary, required level of education), personal resources may, according to PWT, alleviate underemployment conditions. The current study investigated how available personal resources, career-adaptability (CA), volition (VL), and ambiguity-tolerance (AT) affect underemployment. The role of attachment style in the linkage between personal resources and underemployment was also examined. We hypothesized that secure attachment would result in high resource availability, which in turn would reduce underemployment. Two-hundred and three participants (142 women and 61 men) aged 24–66, with at least one year’s seniority at the workplace, completed the following questionnaires: Attachment Style (secure, anxious, avoidant), Career-Adaptability, Ambiguity-Tolerance, Volition, and Underemployment (pay, status, hours, temporary work, and field). Structural equation modeling analysis using AMOS was employed to examine the proposed mediating model. Structural equation modeling analysis indicated that available personal resources (CA, VL, and AT) reduced underemployment ($\beta = -.11, -.17, -.19$, respectively). In addition, anxious attachment (but not secure/avoidant attachment) affected underemployment via the mediation of CA and AT ($\beta = .04, .06$, respectively). Individuals who are characterized by high levels of CA, VL, and AT might experience less underemployment, and hence cope better with changes in the world of work. Counselors (private, or in the organization) are advised to foster these individual capacities, especially when anxious-attachment is identified. The findings suggest new directions for counselling to make work more just by enhancing specific individual capacities. This is particularly relevant, according to PWT, for marginalized groups who typically encounter more underemployment.
TRANSVITAL SENSE IN LATER LIFE

Liubov Akopian
Samara State University of Social Sciences and Education (Samara, Russia)

Life experience accumulated over many years allows an elderly person to navigate in the surrounding social space, but at the same time, the same life experience can become “difficult doorstep to step over” at the intersection of change, when meanings, values, needs and attitudes are changing. The presence and “work” of consciousness presupposes an understanding of life, corresponding to the social situation and individual possibilities, also in old age. The transvital sense in the system of semantic formations of the personality of the late age is characterized by the search for new meanings that motivates post-professional, social or other activity at the final stage of life, as well as the realization of post-life continuation through descendants or personal achievements: leave behind a memory in deeds, ideas, in created material and intangible values, etc. At a later age, a person searches and acquires a transvital sense only when he has a semantic life context. Not every person of a late age certainly thinks about the transvital sense, but the context of approaching the final stage, explicitly or indirectly, prepares the formulation of this question and the need to solve it in one way or another, in one form or another. As a rule, a certain “trigger mechanism” is needed, which actualizes the search for transvital meaning (“what remains after me”, “what else can you manage to do”, “what can I leave behind, what memory, trace”, etc.). For people of late age it is especially important to understand what they have achieved in their entire life span (a question turned to the past), what they have now (now) and what will happen after they leave, what and how “I will exist” (a question addressed to the future), which is, in our opinion, the task of searching for transvital meaning.
Previous studies on the effects of visual design elements have concentrated on such characteristics as image colour (Gao & Xin, 2006) or size (Codispo, De Cesarei, 2007). However, there is data that interconnection of various image elements is also important. For example, cognitive complexity of an image can affect observer’s emotional reactions (Winkielman, Cacioppo, 2001; Reber, Schwarz, & Winkielman, 2004). Together with the fact (Kallgren, Reno, & Cialdini, 2000) that arousal can be an important factor in the effectiveness of public service announcements (PSAs), this proposes evidence that manipulating image composition to control image complexity can be one of the key means to increase the effectiveness of visual PSAs. That is why a two-part laboratory experiment was conducted with the goal to assess the role of two common composition techniques that affect visual complexity: cropping and overlapping objects in an image. The aim of Study 1 was to evaluate the individual effects of cropping and overlapping objects in an image. 30 participants observed 70 monochrome images that had persons and objects cropped and/or overlapped to a varying degree. Emotional (valence, arousal) and visual complexity ratings were collected together with the eye movement pattern that was registered using eye tracker. The Study 2 was designed to assess the effectiveness of PSAs constructed using the same composition rules as in the first part. Different 30 participants observed 71 PSAs promoting pro-environmental behaviour and had to rapidly answer questions related to pro-environmental behaviour. Eye tracking data was also collected together with the evaluation of the memory of PSAs. The main findings were that cropping and overlapping objects increased the visual complexity of an image, although emotional effects were weak. Nevertheless, visual complexity was related to the effectiveness of PSAs. So concluding recommendation would be for public health and safety policy makers and ad agency customers to consider image composition as a critical determinant of the effectiveness of PSAs in addition to aesthetical purposes. This research was funded by a grant (No. S-MIP-17-134) from the Research Council of Lithuania.
THE EFFECTS OF DIFFERENT DESIGN ELEMENTS ON THE PERCEIVED EFFECTIVENESS OF VISUAL ADVERTISEMENTS

Arvydas Kuzinas
Rasa Pilkauskaitė-Valickienė
Mykolas Simas Poškus
Mykolas Romeris University (Vilnius, Lithuania)

There is already available data about the psychological effects of visual design elements. However, most of the existing studies evaluated each element separately and ignoring a specific context. The goal of the present study was to observe combined effects of several design elements in a specific field of application—advertising. 50 advertisements were presented to 70 participants who rated ads based on 4 criteria: how effective they are in attracting attention, evoking emotion, promoting behaviour, and acceptability. The following variables were manipulated by ensuring an equal number of ads of each type: size (colour vs. greyscale), content (commercial, political, social), emotional valence (negative, neutral, positive) and the usage of text (photo only vs. photo with text). Results demonstrated that different elements had specific effects. As expected, advertisements constructed from large photos were rated as attracting more attention and evoking more intensive emotions compared to ads made from small photos. However, an interesting finding was that larger size also led to more acceptable ads (despite each size being represented by an equivalent content and emotional valence).

Moreover, an important finding was that advertisements with text in addition to photos were evaluated as more positive (even though the same texts were used in each group). Equally significant was the fact that the effect of emotional valence of content was not limited to emotional reactions, but also influenced attention and behaviour. Positive advertisements were rated as more effective in attracting attention compared to neutral or negative ads. At the same time both positive and negative advertisements had stronger effect in promoting behaviour compared to neutral ones. Lastly, a valuable colour effect was observed. Full colour advertisements were evaluated as evoking less positive emotions compared to greyscale ones. Together with other studies that found similar effect (e.g. Polzella, Hammar, & Hinkle, 2005) this provides data that the use of colour is highly context dependent. All in all, the results of the present study provided valuable insight in the usage of combined design elements to achieve desired effects in advertisements. This research was funded by a grant (No. S-MIP-17-134) from the Research Council of Lithuania.
THE ACADEMIC TUTORIALS. ANALYSIS OF THE OPINION OF THE TEACHING PERFORMANCE BY PSYCHOLOGY STUDENTS

Hortensia Hickman Rodríguez
Martha Elba Alarcón Armendáriz
UNAM-FES-Iztacala (Tlalnepantla, Mexico)

An academic tutor is a person committed to improving the academic skills of a novice student to integrate him / her into a professional role (De la Cruz et al., 2011). In Mexico there are few Higher Education Institutions that include in their curricula the academic mentoring as a teaching-learning tool; among the pioneers we can point to the Universidad Nacional Autónoma de México (UNAM). The FES-Iztacala-UNAM, was one of the first schools that incorporated in its programs to mentoring as a transversal strategy of teaching, whose general objective is that students acquire generic skills and competencies that complement their training. Given the importance of this activity in the training of future professionals, the objective of the work is to analyze the opinion of students of the career of Psychology regarding the performance of their professors during academic tutorials. In order to obtain information, the written opinions of the students were used in the Student Opinion Questionnaire on Teaching Practice (COPDE), in the application made in the 2016-1 semester. 350 opinions were obtained from students in the first, third, fifth and seventh semesters of the Psychology degree and the resulting opinions were categorized for their analysis. The data suggest that the contents and meanings of the opinions of the students vary according to the semester and if the teacher is classified as an effective teacher or not in their performance. Qualitatively different opinions were also evidenced in the different dimensions analyzed: Teaching methodology and general satisfaction; Program compliance and evaluation; Attitude and ethical behavior. Specific teacher training strategies are proposed, aimed at improving or strengthening the competencies that comprise each of the dimensions analyzed.

PSYCHOLOGICAL PECULIARITIES OF PROFESSIONAL SELF-DETERMINATION PUPILS IN MONGOLIAN SCHOOLS

Enkhmaa Baasankhuu
Mongolian National University of Education (UlaanBaatar, Mongolia)

Psychological peculiarities of professional self-determination pupils in Mongolian schools Professional orientation is the core of human resource management at the country level. It is effective only in personnel system and human resource management. Mongolia is very “diverse” country therefore professional orientation in different aimags (towns) is complex. What is a profession? It is difficult to answer since the discussion is currently being unfold. After all, if we discuss traditional scopes of work, we can talk generally about lifestyle rather than profession.
CONTEMPORARY ISSUES OF ADOLESCENT DEVIATIONS

Elena Levanova
Moscow Pedagogical State University (Moscow, Russia)

The complexity and ambivalence of adolescence make it a risk factor for many undesirable manifestations. Different types of deviant behavior are a particularly pressing issue. The report presents the results of research on the causes of this phenomenon which constitute the base for preventive programs for asocial and antisocial behavior among adolescents, including the innovative program “Psychoplastic of adolescent personality”.

SOCIAL CATEGORIZATION OF CULTURALLY DIFFERENT PEERS AMONG PRESCHOOL-AGE CHILDREN

Marina Chibisova
Moscow Pedagogical State University (Moscow, Russia)

Multicultural educational environment needs to be based on clear understanding of social categorization of peers; whereas there is a lack of empirical research on this topic among preschoolers. We have developed an inventory to examine social categorization of peers among preschool-age children. The results of its practical testing are presented. The bases for social categorization of peers among preschool-age children are analyzed. The importance of cultural background as the basis for social categorization of peers is discussed.

FEATURES OF ATTITUDE TO THE SITUATION OF NON-NORMATIVE BEHAVIOR OF A CHILD OF PRESCHOOL AGE

Inna Zuravlyova
Moscow Pedagogical State University (Moscow, Russia)

At every historical moment in society, it can be observed some constants and metamorphoses in the context of the meanings and senses of a certain cultural era. Preschool children assign an idea and attitude to the situation of abnormal behavior in the modern world. A child of preschool age understands what deception is, describing it as disapproving behavior followed by punishment. A child of preschool age is able to recognize the situation of deception in interactions with peers. The child does not identify the deception situation when the adult is the source of the deception. In preschool age motives of deception prevail: a lie in order to avoid punishment, a lie in order to avoid humiliation and shame. Motives for offensive behavior vary between boys and girls.
THE ORGANIZATIONAL CULTURE AND IS INFLUENCE ON THE INDIVIDUAL PERCEPTION OF JOB INSECURITY

Anna Smirnova (Saratov, Russia)
Saratov State University

The theoretical foundation of the study is The Opder approach to the organizational culture (L.N.Aksenovskaya). The purpose of the study is to examine the role of the type of the organizational culture into the job insecurity perception. Participants were 347 male and 178 female employees holding in a variety of job positions in a large firm nested in several groups. The measures used in the present study are: the ‘Work-Related Behavior and Experience Pattern’ questionnaire (AVEM), the Survey of Perceived Organizational Support (SPOS), Organizational Justice Scale, the Job Insecurity Scale, the Order leadership type scale. Structural equation modeling were used to test the hypothesis. It was shown that Order leadership type and type of the culture created by leaders influence on perceived organizational support, organizational justice, job insecurity. Some types of leaderships is created culture of insecurity and it is influence on the individual perception of job insecurity.

DOSE COMPACT JOB DEMAND LEAD TO EMPLOYEE DELAYS? THE MEDIATING EFFECT OF JOB BURNOUT AND THE MODERATING EFFECT OF PERCEIVED CONTROL OF TIME

Lin Tzu-Ting
National Chengchi University (Taipei, Taiwan)

Considering the fast and compact working style of the contemporary, the purpose of this study is to testify the effect of time-related job demand on work procrastination and job performance, and to further explore the mediating role of job burnout as well as the moderating role of perceived control of time, based on the job demand-resource theoretical model (JD-R model). Through the integration of temporal personal resource and time-related job demand, this study applied a moderated mediation model to test the research framework, and to comprehensively explore the buffer effect of perceived control of time on health impairment process of temporal JD-R model, that is, job demand-job burnout-job performance. Using the questionnaire method, this study collected 221 sets of valid dyadic questionnaires of supervisors and their single pairing subordinates. Time-related job demand influenced burnout, which, in turn, influenced job performance. In addition, perceived control of time had negative moderating effects not only on the relationship between time-related job demand influenced burnout, but also on the mediation of burnout between time-related job demand and job performance. The current study adds to the research pointing at perceived control of time as a promising personal resource for employees’ thriving at work.
THE NATURE OF TECHNOLOGICAL IMAGINATION AND CREATIVITY: COGNITIVE TASK ANALYSIS

Ruey-Yun Horng
National Chiao Tung University (Hsinchu, Taiwan)

Ching-Wen Wang
Yung-Ja Yen
National Chung Hsing University (Taichung, Taiwan)

The purpose of this study was to propose a model of technological imagination based on cognitive task analysis and report some preliminary supports for the model. Technological innovation is a long and tedious process involving mental, physical, and social activities to create new products or procedures that are valuable to humans. Technological imagination, a cognitive process, that spurs the technological innovation can be characterized as contextualization of a combination of physical knowledge/mechanism to achieve a specific functional requirement. Wallas’ (1926) theory of creative process and Klahr and Simon’s (1999) theory of scientific discovery were combined to account for cognitive processes involved in technological innovation. Conceptual combination in the mind is the mental mechanism that brings forth technological imagination. Four stages in technological creativity include: 1. preparation stage, various sorts of domain knowledge must be assembled and available. 2. incubation stage, before the key idea is found, conceptual combination, a simple heuristics to generate new ideas, is at work either consciously or unconsciously in one’s head so that ideas from different domains may meet each other. 3. Illumination stage, the pattern recognition ability to spot the most likely candidate ideas is the key at this stage. 4. The validation stage. The vintage idea is tested and validated by prototyping and experiments. Interview data from twenty experts in technological and engineering domains provide evidence that conceptual combination is the key cognitive mechanism that works to bring forth the vintage idea to the solution. Efforts to test the idea and create the product then require extensive collaboration and investment of social resources. Results of several studies have shown that conceptual combination training can enhance college students’ originality in product design task. The model lends great implications for engineering education and methods for cultivation of technological innovation ability.
ATTENTIONAL BOOST EFFECT IN MULTITASKING SITUATIONS: IMPLICATIONS FOR IN-CAR INFORMATION SUPPORT SYSTEM DESIGN

Ruey-Yun Horng
Ming-Hsuan Hsieh
National Chiao Tung University (Hsinchu, Taiwan)

Attentional boost effect (ABE) is an phenomenon that while performing a secondary signal detection task, the memory for the primary task are enhanced in dual task situations. This study aimed to examine the ABE in a multitasking driving situation involving picture memory, speed judgment and signal detection. Two variables, alignment of the signal to the road signs and practice, were manipulated. Sixty-four college students’ data showed that ABE was not observed either in speed judgement or picture recognition. However, large individual differences were observed in the picture recognition. ABE was observed in sixteen (25%) participants. It suggests differences in attentional resource might cause some participants to adopt a strategy to allocate more attention to the speed judgment task in sacrifice of the picture memory task. Practice could improve performance in all tasks. The alignment of the location of the signal to the speed sign did not affect accuracy of the responses, but affected the false alarm rate. When signals were presented in the center (misaligned condition), picture recognition task showed higher false alarm rate, probably because the attention had to move from the road sign to the center and thus decreasing the time to process pictures. In contrast, when signals were presented under the road sign (aligned condition), signal detection task showed higher false alarm rate, probably due to feature overlap between the speed sign and the signal. Implications for in-car information support systems were discussed.
ADVERSE CHILDHOOD EXPERIENCES AND ALEXITHYMIA IN PATIENTS WITH MAJOR DEPRESSIVE DISORDER

Kirsi Honkalampi
Niko Flink
University of Eastern Finland (Joensuu, Finland)

Soili Lehto
University of Helsinki (Helsinki, Finland)

Anu Ruusunen
Heimo Viinamäki
Kuopio University Hospital (Kuopio, Finland)

Adverse childhood experiences have been found to negatively affect the development of emotion regulation and lead to increased alexithymic features (Taylor, Bagby, & Parker, 1999). However, little is known about specific associations between adverse childhood experiences, alexithymia and depression in patients with major depressive disorder (MDD). We sought to 1) compare adverse childhood experiences (emotional neglect, emotional abuse, physical neglect, physical abuse, sexual abuse) between alexithymic and non-alexithymic patients with MDD, 2) and explore whether specific adverse childhood experiences, depression or their interaction with depressive mood predict alexithymia and its components.

The study sample consisted of 137 psychiatric outpatients with MDD (aged 21-61 years, mean age 34.9 years) recruited from the Department of Psychiatry at Kuopio University Hospital between 2016-2017. Alexithymia and its components were assessed using the 20-item Toronto Alexithymia Scale (TAS (Bagby, Taylor, & Parker, 1994). The level of depression was assessed with the 21-item Beck Depression Inventory (BDI, range 0–63) (Beck et al. 1961). The Trauma and Distress Scale (TADS) (Salokangas et al., 2016) was used to assess adverse childhood experiences. Results: Alexithymic MDD patients reported more childhood emotional neglect than non-alexithymic MDD patients. Both BDI (β = -0.30, t (132) =3.52, p = 0.001) and TADS total scores (β = 0.17, t (132) = 2.01, p = 0.045) significantly predicted TAS scores. In addition, when individual TADS domains, together with BDI, were investigated in an age- and sex-adjusted linear regression model, BDI (β = 0.14, t (132) =3.17, p = 0.002) and emotional neglect (β=0.28, t (132) =2.81, p=0.006) significantly predicted TAS component Difficulty of identifying feelings (F (4,132) =11.13, p=0.001, R2=23.0). The interaction between BDI and TADS did not predict TAS scores or TAS domains. Severity of depression and elevated levels of adverse childhood experiences associated with alexithymia. Emotional neglect predicted not only alexithymia (Güleç et al., 2013), but also its "Difficulty in identifying feelings" -component regardless of age, sex or the level of depression. Thus, these findings suggest that difficulty in identifying feelings is linked with experiences of emotional neglect in MDD patients.
THE EFFECTS OF PSYCHOLOGICAL GAMES ON COMMUNICATION SKILLS FOR PERSUASION

Koshi Makino
Setsunan University (Neyagawa, Japan)

This study examined the effects of psychological games on communication skills for persuasion of young people. Theoretical framework of this study is social learning theory and this study is based on social skill training for young people. It is supposed that the participants learn persuasive communication skills by watching and imitating others through the games. Werewolf-Game was used as a psychological game. Werewolf game has about 10 participants and they were divided into 2 teams, werewolf team and citizen team. Werewolf tells a lie and attacks the citizens, citizens try to find the wolf by conversation and expel it. Participants must have discussions and need to persuade others in this game. Therefore, communication skills for persuasion become very important to win. Survey participants were 60 university students (who have experienced few werewolf-game before, 36 males and 24 females, Average age is 20.62). Half participants were divided into an experimental group, and the others were into a control group. The experimental group members played werewolf-games 6 times during 2 weeks, and the control group members did not. Their communication skills for persuasion (4 factors) were measured: logical argument, humor and empathy, profit of the partner, and faithful manner. The questionnaire was carried out 3 times: 2 weeks before the games, 2 weeks after the games, and 4 weeks after the games. According to the ANOVA (2(between: experimental, control) ×3(within: before, after 2 weeks, after 4 weeks), interaction effect was significant. There was no significant difference in the means of all scales between experimental group and control group before the games. 2 weeks after the games, all communication skills for persuasion in experimental group became higher than before, and those skills were higher than those of control group. In addition, all skills were maintained high 4 weeks later. These results indicate the possibility that communication skills for persuasion are promoted by the training using the psychological games. Young people learn the persuasive communication skills by participating the games while enjoying them. According to this study, it is possible we can use the psychological games to promote communication skills for persuasion.
INVESTIGATING STEREOTYPES AMONG MINORITY GROUP MEMBERS IN ISRAEL: THE ROLE OF INGROUP AND OUTGROUP SYMBOLS

Lipaz Shamoa-Nir
Zefat Academic College (Safed, Israel)

When do minorities endorse stereotypes toward the majority group, and what factors are involved in these perceptions? Apparently, the field of minority studies lends itself to the conflation of ethnicity, culture and religion, and their possible effects should be acknowledged. Objectives: This research examined the influence of exposure to ingroup and outgroup concepts on stereotypes of minority group members toward the majority. Method: Arab participants were primed by symbols representing group affiliation content (Jewish symbols or Arab symbols) and then their stereotypes towards Jewish people were examined. Results: It was found that priming group symbols has differential effects on Arab minority sub-groups, where the Muslim group revealed more negative stereotypes towards Jews compared to the non-Muslim group. These effects were found for both ingroup and outgroup symbols: When primed with outgroup symbols Muslims perceived Jews as more unpleasant, and when primed with ingroup symbols they perceived Jews as more antagonist. Conclusions and Research implications: The activated group content has an important role in increasing stereotypes as a function of the role of group affiliation among members of a minority group. Given the paucity of psychological research focusing on how outgroup stereotypes are formed as a function of ethno-religious group affiliation, the present study has furthered our understanding of the role of group symbols in shaping stereotypes of ethno-religious minority members towards the majority. The main conclusion suggests that following exposure to ingroup or outgroup concepts, negative impressions towards the outgroup may be greater in sub-groups with stronger identification with their higher ordinate minority group. Future studies should examine further theoretical explanations for this process and the conditions under which they operate.
INTERVENTION TO IMPROVE EMOTION KNOWLEDGE IN KINDERGARTEN — AN EVALUATION STUDY ON THREE LEVELS

Aileen Wosniak
Leuphana University of Lueneburg (Lueneburg, Germany)

Support emotion knowledge of young children is an important social matter. Children with extensive emotion knowledge are better in self-regulation and will have more future school success (Denham et al., 2012). In addition, further education is an important task in professional life. Studies showed: professionalisation could have positive effects (Lipowsky, 2012). Different evaluation levels must be considered. Lipowsky (2010) postulated four levels of intervention success. In this study three of four levels were examined. The aim of this study was to create and evaluate an intervention for kindergarten teachers on different levels and took the following questions in account: 1) Satisfaction of kindergarten teachers with intervention 2) Learning growth of kindergarten teachers in the field of emotion knowledge 3) change of emotional-related interaction between kindergarten teachers and children. Sample size (N=41) was acquired in six kindergartens in Hamburg and Lower Saxony. 1) Self-reported satisfaction was raised immediately after training. 2) To test the knowledge growth of kindergarten teachers, a pre-experimental design with only one experimental group (with measuring repetition) was applied. Kindergarten teachers had to solve an emotion knowledge crossword puzzle three times. 3) Self-reported frequency of emotional-related interaction with children in different situations was raised backdated. Results: 1) Summing up, there are “good” reviews (M=1.99, SD=.67) for the intervention. 2) Variance analysis with repeat measurement results in a significant meaning effect over time (F=12.483, p=.000,

TRANSCULTURAL MIDWIFERY: THE VALUE OF DIVERSITY

Leonarda Anna Vinci
Roberto Ghiaccio
Maria Giuseppina Colatruglio
Maria Di Carlo
Sara Cicchella
Italy Ordine degli Psicologi della Campania Napoli (Benevento, Italy)

The aim of this survey is to examine how the motherhood is experienced in situations of migration to understand whether these situations affect the way in which a mother thinks and deals with the birth, or not. To analyze this concept, I conducted a qualitative research, using informal dialogues with 25 women between 20 and 45 years old, coming from different countries of Africa, Asia, Europe and America, but living in Italy during the periods of their pregnancy, delivery and postpartum. These dialogues have been performed at the Employment Centre and, during my training activities, at the Hospital "Rummo", in the city of Benevento. What I investigated is related to: differences of habits during pregnancy between Italy and the native countries; desires, discontents and behaviours associated with the labour; habits concerning the postpartum and differences with the Italian mothers. The results of this study show that there are a lot of different needs, different desires and different habits to approach pregnancy, that
are all depending on the native country. It would be useful for midwives and maternal-child experts to acquire a transcultural perspective of assistance to satisfy mothers’ wishes, still following protocols for the welfare of women and children.

EFFECT OF PRIMING EMOTION NAMES AND ATTACHMENT STYLES ON TURKISH LEXICAL DECISION TASK PERFORMANCE

Vahide Ulusoy Gökçek
Fatih Sultan Mehmet Vakıf University (Istanbul, Turkey)

The aim of the study is to examine the response times (RT) of participants who have different attachment styles, to target stimuli consisting of attachment-related and general words, under threat, secure and neutral priming conditions. In line with this aim, three main hypotheses are investigated: First, RTs under the threat condition are longer than other priming conditions. Second, RTs to attachment-related words are longer than the general target words. Third, RTs to target groups under different priming conditions are statistically different according to attachment styles. The sample of the study consists of 113 volunteered under-graduate and graduate students from Fatih Sultan Mehmet Vakif Üniversitesi. Participants were given informed consent, and then completed Demographical Information Form and Experiences in Close Relationship Scale. To eliminate the effects of the design, anxiety and depression levels were measured and Beck Anxiety Inventory and Beck Depression Inventory are conducted for this purpose. The performance in the priming and target conditions were measured by RTs in the lexical decision task. According to the results, the differences between RTs under threat, secure and neutral conditions are not significant. RTs to attachment-related words are longer than the non-attachment stimuli. According to t test, RTs under both conditions, priming and target, are not statistically differentiated by attachment styles. But ANCOVA analyze shows that RTs of participants who have attachment anxiety are statistically different under both conditions when effect of levels of anxiety and depression are neutralized. The results are discussed under the light of the literature.
DO BETTER INVENTED SPELLERS IN KINDERGARTEN SHOW MORE ADVANCED READING AND WRITING SKILLS AT THE BEGINNING OF PRIMARY EDUCATION?

Ana Albuquerque
Margarida Alves Martins
ISPA — IUL (Lisbon, Portugal)

This study aimed at researching the impact of invented spelling training in the last year of kindergarten on European-Portuguese children’s reading and writing skills throughout the first year of primary school. Since its immediate beneficial effects have been pointed out by various authors, our goal was to expand previous researches and design a 2-year follow-up study until the end of Grade 1, where students engage in formal literacy instruction activities (Alves Martins et al, 2013, 2014; Hofslundsengen, Hagtvet & Gustafsson, 2016; Levin & Aram, 2013; Ouellette & Sénéchal, 2008; Rieben et al, 2005). 45 Portuguese five-year-old children took part in this study and were randomly assigned into two matching groups: experimental group and control group — alphabet knowledge, phonological awareness and cognitive ability were initial controlled variables. In the intervention phase, over a 5-week period, the experimental group participated in 10 invented spelling sessions and the control group took part in storybook reading sessions. Children’s reading and writing skills were tested five times: twice in kindergarten (before and after the training sessions) and three times in Grade 1 (at the beginning, in the middle and at the end of the school year). Statistical data analyses presented significant differences between both groups in kindergarten and in the follow-up year. Experimental group children scored higher in reading and in writing as compared to control group participants, suggesting that better invented spellers in kindergarten also developed more advanced literacy skills at the beginning of primary education. The current study provides empirical support for the development of early literacy activities in preschool aiming children’s future academic success.

ETHICAL CLIMATES AND ATTITUDES TOWARD WHISTLE BLOWING IN JAPANESE ORGANIZATIONS

Wang Jinmin
Chiba Institute of Science (Choshi City, Japan)

The purpose of this study was to investigate the influence of ethical climates on the attitudes toward whistle blowing in organizations. Seven hundred Japanese employees participated in a web survey. The participants rated their own organizations on ethical climate scales, as well as their attitudes to whistle blowing. The results show that (1) ethical norms and rules practice and checking practice in organizations related to positive attitudes toward whistle blowing in organizations; (2) ethical norms and rules practice and ethical characteristics of organizations related to the perceived colleagues’ positive attitude toward whistle blowing; (3) ethical norms and rules practice, checking practice and ethical sensitivity in organizations positively related to the ratings about the possibility of correcting wrongdoings in organizations. These results suggest that strengthening specific aspects of organizational ethical climates can lead employees’ attitudes more positively on whistle blowing and be more confident on ethical behaviors in their own organizations.
Irrelevant background speech can disrupt performance on cognitive tasks like writing, a task relevant for office work. This disruption can be explained by two theoretical frameworks. Attentional capture can impair cognitive performance as interesting or relevant aspects in the background speech can draw attention from the cognitive task to the background speech. According to the theoretical framework of interference-by-process, an interference between similar processes, needed both for analysis of the automatically incoming background speech and for performing on the writing task, occurs. Hence, the level of speech intelligibility (i.e. how much of the speech we can understand) in background speech should influence the magnitude of the performance loss, as, when intelligibility increases, the amount of distracting information and semantical content to process increases too.

In two experiments, we manipulated speech intelligibility by changing the number of voices talking simultaneously for students with different native languages. We expected speech in native language or speech consisting of only one or a few voices to be more disruptive as such speech signals have higher speech intelligibility compared to speech in a foreign language or speech consisting of many voices talking simultaneously. We asked Swedish (Exp. 1) and Dutch (Exp. 2) students to write different stories of five minutes per story, while exposed to Swedish background speech, consisting of 1, 3, 5 and 7 voices talking simultaneously. For Swedish students, writing fluency (i.e. the total number of characters in the final edited text plus the total number of deletions generated during the writing period) increased, as number of voices talking simultaneously increased. For the Dutch students (listening to speech in foreign language), there was no difference in writing fluency between the different conditions. The results support the expectations and are in line with the concept of interference-by-process and attentional capture. This study underlines that levels of speech intelligibility in the background should be very low to avoid performance loss on a writing task. This is relevant knowledge for the architecture and design of for instance open office environments, as high intelligible irrelevant background speech is common place in such work environments.
CREATING A FRAMEWORK FOR WHOLE-BODY EMOTIONAL EXPRESSION TO IMPROVE THE SOCIAL COMMUNICATION ABILITIES OF ARTIFICIAL AGENTS

Rebecca Smith
Frank Pollick
Emily Cross
University of Glasgow (Glasgow, United Kingdom)

A sophisticated framework for detecting emotion from facial expressions is beginning to emerge, but until we develop a clear understanding of how affective information is conveyed through whole-body movements our appreciation of human social-signalling remains incomplete. Some forms of classical dance involve the performance of abstract whole-body movements designed to induce an emotional state in the observer. Therefore, dance can provide an ideal tool for exploring how the human body in motion can transmit affective valence information. Previous research shows that dancers demonstrate superior accuracy in recognising emotion from the body and that dancers’ expertise-driven visual-fixation patterns differ from non-experts. It is possible that these outcomes are related but this has never been empirically tested. Therefore, this investigation aims to identify how different body-regions communicate expressed emotionality to an observer. Our study was conducted to bridge this gap by exploring the relationship between emotion recognition and visual-fixation patterns across three groups: professional dancers (n=7), amateur dancers (n=16), and non-dancer controls (n=16). Participants watched a series of 5-6s whole-body dance sequences and completed a binary-choice affective-valence decision task while their eye movements were recorded. Visual-attention for four body regions of interest (head, arms, torso and legs) was explored. Dancers (experts and amateurs) were significantly more accurate in identifying movements with a positive affective-valence compared to non-dancer controls. Results from eye tracking did not support the hypothesis that divergent visual processing strategies support this difference. No significant group differences emerged in visual-attention toward any of the target features, nor did any relationship emerge between emotion-recognition accuracy and location of visual-attention. Through examination of perceived affect and different quantitative movement-parameters, we found that slow, fluid motions with an indirect trajectory significantly predicted perceptions of negative valence. This study forms part of an ambitious three-year project (funded through the ESRC Artificial Intelligence remit) which aims to benefit the technological industry through creation of a framework for characterising affective expression in human movement. The ultimate aim is for this resource to be used by engineers and computer scientists to increase social communication abilities of artificial agents (including robots and avatars), by improving their motion profiles.
A FUNCTIONAL PERSPECTIVE OF AVERSIVE CONTROL IN PSYCHOLOGICAL THERAPY

Maria Xesús Froxán-Parga
Jesús Alonso-Vega
Nerea Galván-Dominguez
Rocío Castaño-Hurtado
Miguel Núñez de Prado-Gordillo
Autónoma University Madrid (Madrid, Spain)

Aversive methods of behavior control have been the subject of controversy for decades, at the center of an intense debate in which the arguments are often based on myths, prejudices and opinions, rather than on data and empirical evidence. We decided to focus on aversive verbal control because we consider that therapist-client verbal interaction is the catalyst for the learning processes that lead to clinical change. To conduct this study, 58 complete therapy sessions from 4 cases with different psychological problems, treated by 3 therapists with different experience level, were analyzed. The therapists’ and clients’ verbal behavior was categorized with the Sistema de Categorización del Control Verbal Aversivo en Terapia (System of Categorizing Aversive Verbal Control), which consists of 8 categories for therapists and 3 categories for clients. Also, the software The Observer XT 12.5 (Noldus®) was used for the observation, categorization and to calculate the agreement percentage and the intra- and inter-observer reliability. The statistical analysis was made with Excel 2016 (Microsoft ®) and IBM SPSS Statistics 24 (IBM®). The therapists use aversive verbal control through grouping verbalizations that function as a unit, thematically defined and always oriented to reduce or eliminate the anti-therapeutic behavior to which they reference. Aversive verbal control is based both on Pavlovian and operant mechanisms, and one cannot be studied without the other because they are intrinsically interconnected. Indeed, aversive verbalizations can function as punishments because they previously acquired their aversive qualities through Pavlovian conditioning processes. Equally, aversive verbal counterconditioning works to eliminate behaviors because the subject learns to avoid them, through a negative reinforcement process (operant). The potential effects of aversive verbal control can cover behaviors that are happening when and where it is applied, those that happen in different times and places, and even ones that have never happened. Hence, aversive verbal control has great utility in eliminating and preventing anti-therapeutic behaviors.
RECI PROCAL RELATIONSHIP BETWEEN PARENTING STYLES AND INDIGENOUS PERSONALITY AMONG CHINESE ADOLESCENTS

Weiqiao Fan
Mengting Li
Shanghai Normal University (Shanghai, China)

Fanny Cheung
The Chinese University of Hong Kong (Hong Kong, Hongkong)

Numerous studies have highlighted the associations between parenting style and offspring’s personality development, mainly focusing on the influences of parenting style on the development of personality. The corresponding empirical evidence about the effects of a child’s individual characteristics on parenting style, however, is largely lacking, with a few of exceptions. This study examined a reciprocal relationship between parents’ parenting styles and their children’s personality. 672 Chinese secondary school students from Shanghai, China, were assessed on the personality trait of Interpersonal Relatedness (Assessed by the Cross-cultural (Chinese) Personality Inventory for Adolescents) and on perceived parenting styles at Grade 6 and Grade 8. Correspondingly, one of parents of each student reported their parenting style two times as well. Significant reciprocal associations between adolescents’ indigenous personality and their parents’ parenting styles were largely supported. The dynamic process of adolescents’ personality and their parents’ parenting styles, and cultural influences on the process were further discussed and empirically highlighted in the present study. Key words: indigenous personality, parenting style, Chinese adolescents, reciprocal relationships, culture
THE CHOICE OF SPORTS EFFECTS MENTAL ROTATION PERFORMANCE IN ADOLESCENTS

Stefanie Pietsch
Petra Jansen Germany Regensburg
Jennifer Lehmann Germany Regensburg
Universität Regensburg (Regensburg, Germany)

Physical activity and sports cause positive effects on different parts of cognition. Especially in the area of visual-spatial capacity, athletes exhibited superior performance in spatial tasks compared to physically inactive people. However, the influence of individual sports disciplines on different forms of mental rotation performance requires more precise research. This study investigates the specific relationship between different sports and specific kinds of mental rotation tasks with embodied stimuli to specify the relation of motor and visuo-spatial processes. 60 young females, 30 soccer players and 30 dancers, completed a chronometric mental rotation task with object-based and egocentric transformation of male and female figures, which were displayed either in front or back view. During their sport-specific activity soccer-players and dancers very often have to adapt their movements to the movement of a partner or opponent, soccer-players especially in front view positions. While for soccer-players reaction time often is crucial for sporting success, dancers mainly focus on the accuracy of their movements. Therefore, we expect significantly faster reaction times for soccer players for front view stimuli but no differences between soccer players and dancers for back view stimuli. The main result was a two-way interaction between 'group' and 'view', $F(1,54) = 4.302, p < .05$, partial $\eta^2 = .074$. Soccer-players showed a significantly shorter reaction time than dancers for stimuli presented in front view in object based and egocentric transformation, $t(54) = -2.113, p < .05$. There was no such difference, when the stimuli were presented in the back view, $t(54) = -.754, p = .454$. Contrary to literature we didn’t find significantly higher reaction times and error rates for stimuli presented in front view compared to back view in general but only for egocentric transformations. The results of this study indicate, that specific aspects of mental rotation performance can be affected by different forms of physical activity and that individual aspects of mental rotation performance depend on the sport-specific demands of visual perception. Keywords: mental rotation, sports, object-based transformations, egocentric transformations, dancing, soccer, visual-spatial abilities.
THE EARLY INTERVENTION PROGRAM EFFECTIVENESS FOR CHILDREN WITH VARIOUS DEVELOPMENTAL DISORDERS

Mariya Korgozha
Marina Kolobanova
Ekaterina Romanova

Center of social rehabilitation of disabled and children with disabilities in Kalininsky district of St. Petersburg (Saint-Petersburg, Russia)

The qualitative development of the early intervention system in Russia is one of the state priorities in the field of protection of maternal and child health, prevention and reduction of child morbidity and disability. Within 8 years the early intervention program to families with children with various disabilities is carried out in the Center of social rehabilitation of disabled and children with disabilities in Kalininsky district of St. Petersburg. The main program objective is to organize educational, developmental and playing space for a complex of comprehensive physical, emotional, cognitive, social, and personal development of a child with various developmental disorders. Material is designed as the one-year calendar program and is implemented by a team of specialists: a psychologist, a speech therapist, an APE teacher and a social teacher. The study purpose is to analyze the effectiveness of the early intervention program. As the result, 118 children with various developmental disorders (delayed speech development, autism spectrum disorder, Down’s syndrome, cerebral palsy, deafness and genetic disorders) completed the program during 2017 and 2018. Diagnostic methods in research were KID-R Scale and RCDI-2000. Data were compared with the use of Mann-Whitney U-test and Spearman rank correlation test. It was found that the greatest positive dynamics was achieved in the group of children with delayed speech development (74% of the group, p≤0.01) in terms of social development (1265, p≤0.01), self-service (1021, p≤0.001) and fine motor skills (1236, p≤0.01) in comparison with children with multiple developmental disorders. The association between the severity of concomitant violations and self-service skills formation (0.27, p≤0.05) was revealed. Due to this fact the achievement of positive dynamics for this indicator was one of the main program objectives. The early intervention program has shown its effectiveness, and further study of its implementation with children with various developmental disorders is also important.
THE RELIABILITY AND VALIDITY OF CHILDREN’S LEARNING-TO-LEARN INVENTORY

Wenying Lin
Hung-Yu Lin
Fo Guang University (Yilan County, Taiwan)

Chang Yu-Wen
National Taipei University of Education (Taipei, Taiwan)

The development of learning to learn is seen as crucial for success in the global knowledge economy. The aim of this study is to develop a learning-to-learn scale for 12-year-old children as a large-scale research instrument. A literature review and pilot study identified four dimensions, which were used to construct a 22-item, 4-point scale inventory. The four dimensions are curiosity, meaning-making, interpersonal learning, and self-regulated learning. The inventory was administered to the 1560 children in the pilot study of Taiwan Birth Cohort Study. In addition, three-wave TBSC data of 5-, 8-, and 12-year are merged to investigate the reliability and validity of learning-to-learn scale. The results from confirmatory factor analysis showed the data fit four-factor model well with RMSEA 0.051, CFI=0.978, TLI=0.974. The Cronbach’s alpha for the four subscales are .64, .83, .81, .82. The correlations between academic performance and four subscale scores of the scale are significantly but low (.18, .23, .16, and .25). Teachers’ ratings of students’ learning to learn dispositions are significantly correlated with students’ academic performance (.54,.72, .47, and .72 respectively). Liking to go to school and satisfaction with academic performance are the influencing factors for the development of learning to learn. Results from 8-and 12-year data showed that there are low but significant correlations between 8-year academic performance and 12-year learning-to-learn scores, indicating that prior achievement slightly influence the development of learning to learn. Five temperaments measured at 5 years old has low but significant correlations with learning-to-learn scale scores. The results provide evidence for a valid and reliable 4-factor learning-to-learn inventory.
ANALYSIS OF FACTOR STRUCTURE OF PARENTAL TOLERANCE

Raisa Ovcharova  
Kurganskiy gosudarstvennyy universitet (Kurgan, Russia)

In the author’s concept, parental tolerance is considered as an integral formation of the parent’s personality. It manifests itself at three interrelated levels: cognitive, emotional and behavioral and determines the subjective development of the child’s personality and his psychological well-being. The study involved 73 families with children aged 5 to 10 years. The study used a set of methods: "Conscious parenthood", "Positive parental feelings", "Parental love and sympathy", "Method of express diagnostics of the style of family education, "Method of diagnosis of general tolerance." The structure of all types of tolerance is identical with the specific content. To prove the assumption that parental tolerance is an integral formation of the personality of a parent, having a similar structure and specific content, factor analysis was used. Factorization was based on 40 variables, characterizing the structure of parental tolerance. In the factor structure of parental tolerance, 4 factors were identified, the cumulative percent of the variance of which is 54, 27%. Factor I "Emotional", covering 24, 39% of the variance, is the central factor. Significant weights in it indicators of positive parental feelings have. Factor II "Communicative tolerance" covers 14, 07% of the variance. Significant weights in it 10 indicators have, defining different manifestations of the antipodes of tolerance. Factor III "Cognitive" covers 8, 24% of the variance. Significant weights in it 5 indicators of conscious parenthood have. Factor IV "Behavioral" covers 7, 56% of the variance. Significant weights in it six indicators have, relating to the style of family education and its accompanying parameters. The factor structures of fathers and mothers are similar. However, fathers have more cognitive component than mothers and less communicative tolerance and behavioral component. The factor analysis confirms the three-component structure of parental tolerance, its specific content and indicates the special role of communicative tolerance. The results of the research can be used in the psychological support of parenting in the work of practical psychologists with socially and pedagogically neglected children and their parents with manifestations of intolerant attitude towards children.
ACTIVE IMAGINATION FOR PSYCHOLOGY WITHOUT BORDERS

Sonia Lyra
Ichthys Instituto De Psicologia Analitica (Curitiba, Brazil)

Our time is different from the preceding ones by the rediscovery of psychic channels buried in earlier cultures, where the psyche was no more than a metaphysical system. At present, we can no longer do without this knowledge, denying or omitting the obscure powers of unconscious realities, even though such ideal of the Middle Ages has been replaced by the ideal of material and physical safety, general well-being and humanitarianism. Powers that cannot be inserted in the rational order of the world, but that act generating and mobilizing symptoms both in the singular individual as in the social environment where such individual lives, make us realize that this ideal also seems to mean an increasing threat and an even worse catastrophe. Given this situation what could the future hold for us? It seems that the psychological interest of our time expects something that the external world cannot give, and even religions that could come from within are nothing more than inventories of an outer world. Can Brazil, a country of Latin America, contribute to forging a psychological future in common with the European Community? We will present here Active Imagination as the new possibility to be shared with psychologists and psychiatrists from all over the world, who are the only ones worldwide authorized to use the method. Our proposal is to describe this technique, as it is being developed in the South of Brazil, and to indicate the ways to access it. We believe this way we can offer something unprecedented and effective for the treatment of the Individual and, consequently, of the environment where such an individual lives, based on a unique experience and not only on assumptions.
WHEN ARE OVERQUALIFIED EMPLOYEES MORE INNOVATIVE? IT DEPENDS ON THE POWER ROLE OF EMPLOYEES’ PROMOTION FOCUS

Shin-Guang Liang  
National Chung Cheng University (Chiayi, Taiwan)

Fei-Fan Chen  
National Chengchi University; National Defense University (Taipei, Taiwan)

Po-Hsun Chen  
Air Force Command Headquarters, MND (Taipei, Taiwan)

Previous studies have suggested that perceived overqualification is an important antecedent of employee innovative behavior (Deng et al., in press; Lin, Law, & Zhou, 2017; Luksyte & Spitzmueller, 2016). However, the existing research showed the mixed findings regarding to the relationship between perceived overqualification and employee innovative behavior (e.g., Deng et al., in press; Luksyte & Spitzmueller, 2016). Based on regulatory focus theory, we examined whether employees’ promotion focus (promotion focus is concerned with gains, ideals, accomplishments and aspirations, which is driven by a need for growth and self-development) moderate the relationship between perceived overqualification and employee innovative behavior. Further, we explored whether work engagement mediate the above moderating effect. To enhance generalizability, we collected data from various types of industries in Taiwan and from multi-wave (both perceived overqualification and promotion focus were collected at Time 1; both work engagement and innovative behavior were collected at Time 2) and multiple sources (innovative behavior was evaluated by supervisors). In total, 264 valid paired questionnaires were returned. The results of Mplus showed that: (1) for employees with higher level of promotion focus, perceived overqualification was positively related to supervisor evaluation of employee innovative behavior, whereas for employees with lower level of promotion focus, this relationship was negative; (2) work engagement mediated the above moderating effect. Finally, we also discussed the theoretical and practical implication of our findings and provided several suggestions for future studies. References: 1. TRANSTHEORETICAL MODEL AND SPORTS MOUTHGUARD USE: APPLICATION OF TRANSTHEORETICAL MODEL TO JAPANESE ATHLETES NOT REQUIRED TO USE A MOUTHGUARD

Mitsuhiro Amazaki
Yoichi Niino
Aichi University (Aichi, Japan)

Chihiro Kemuriyama
Gifu Shotoku Gakuen University (Gifu, Japan)

The most significant factor in preventing sports-related injuries is wearing basic protective devices such as a mouthguard (MG), a soft plastic or laminate device used in sports to prevent oral injuries to the teeth, mouth, cheeks, tongue, and jaw. However, only a small number of young Japanese athletes use MG, simply because there is no mandate to do so in their particular sport. The Transtheoretical Model (TTM) is a successful framework for guiding behavioral change programs but it has not yet been applied to the issue of increasing MG use by young Japanese athletes. The purpose of this study is to examine whether the TTM can be applied to understanding the change in MG use behavior among young Japanese athletes not required to use a MG. The present study employed a cross-sectional survey of 1047 young male Japanese athletes (baseball, handball, and football). Demographic variables, experience of oral injuries, possession of MG, and the TTM constructs questionnaire (stage of change questionnaire, decisional balance, and self-efficacy) were assessed. One-way ANOVA was used for the statistical analysis of the data. Of the 1047 athletes, 83.6% were in the pre-contemplation stage of using MG, 6.1% were in the contemplation stage while 5.8% were in the maintenance stage with the rest of the participants distributed among other stages of MG use. The decisional balance for MG use and MG use self-efficacy differed significantly among the stages of MG use behavior. A post hoc test found that the mean score of decisional balance for MG use and MG use self-efficacy were significantly lower among young Japanese athletes who were in the pre-contemplation stage than those who were in the other stages. The widespread prevalence of the pre-contemplation stage of MG use behavior among young Japanese athletes indicates the necessity of intervention programs to promote MG use self-efficacy and the perceived benefits of MG use behavior. The results indicate that the TTM was useful for determining the stages of MG use behavior among young Japanese athletes not required to use a MG.
Caregiving has evolved as an important issue not only for those receiving care, but also for those providing it. Rehabilitation efforts are mostly directed to the disabled but rarely target the caregivers. Perception of caregiver burden and depression among individuals with visual impairment varies based on socioeconomic and cultural backgrounds. This study aimed to evaluate the degree of burden and the risk of depression among caregivers of individuals with visual impairment living in a community of Thailand. Caregivers were considered unpaid family members for individuals whose sole impairment was vision. One hundred fourteen caregivers (average age 43.5±8.8 years) of individuals with visual impairment, either in blindness or low visual acuity conditions, were evaluated the degree of burden and the risk of depression by using Thai versions of self-reported Zarit Caregiver Burden Scale (Zarit-CBS) and Center for Epidemiologic Studies Depression Scale (CES-D), respectively. The Zarit-CBS score of 20 or less indicates little or no burden (Cummings et al., 2002). The CES-D score of 22 or more is considered to reflect the need for further assessment and evaluation for depression (Trangkasombat et al., 1997). Descriptive statistics were applied to analyze the data. The average scores of Zarit-CBS and CES-D were 7.3±5.5 and 4.9±3.5 points, respectively. Of 114 caregivers, five (4.4%) expressed mild to moderate burden (Zarit-CBS = 22-29). Only one caregiver (0.9%) felt depressed (CES-D = 33). Most of Thai caregivers reported low degrees of burden and risk of depression in caring for their relatives with visual impairment. However, the findings could be underestimated due to the sociocultural background. As family is a central value for Asian societies, Thai caregivers may not reveal the real burden because of the belief that taking care of parents and spouse is an inevitable duty. Incorporating a care plan that includes caregiver burden and depression assessments should be useful to the disabled and caregivers. Cummings JL, et al. Am Fam Physician 2002; 65(11): 263-72.; Trangkasombat U, et al. J Psychiatr Assoc Thailand 1997; 42(1): 2-13. Thematic track: Psychology Health
Hallucinations are a pathognomonic symptom of schizophrenia and other severe psychotic disorders. Despite being the source of many severe personal and socio-economic problems, providing an effective, efficient and ethically-informed treatment is still one of the main unresolved issues in psychiatry and psychology, according to the National Institute for Health and Care Excellence. In our opinion, this might be partially due to certain long-standing inconsistencies in the definition of the notion of "hallucination" itself, which could in turn mislead our attempts to provide an effective treatment. Therefore, our main purpose was to examine the current standard conceptualization of hallucinations and to track its historical roots in order to determine its conceptual architecture as well as to explore alternative conceptualizations. We conducted a historical review of the concept of hallucination, focusing our research in the works of 19th and early to mid-20th century authors such as Esquirol, Baillarger, Tamburini, Bleuler, Jaspers, Kraepelin, Ey and others. Specifically, our analysis aimed at determining the different axes that had structured the historical debate on the concept of hallucinations. We distinguished two main themes of debate: the first one regarding the natural ontology and aetiology of hallucinations, and the second one regarding its alleged semantical content. As to the first one, we distinguished between cognitive-driven conceptualizations (i.e., hallucinations conceived as "perceptual delusions") and sensory-driven conceptualizations (i.e., hallucinations conceived as "sensorimotor disturbances"). Among the second, we distinguished between meaningful-driven approaches (i.e., those that grant hallucinations with personal history-related content) and meaningless-driven approaches (i.e., those that do not grant hallucinations with any kind of semantic content). We believe that this historical review provides a certain clarification of the different ways in which hallucinations have been conceived throughout their nosological history. This might in turn serve as a starting point for further conceptual analyses aimed at establishing the logical validity and philosophical commitments of each conceptual model. Finally, this could allow clinical psychologists and other practitioners to better operationally define these phenomena and consequently determine the best way to deal with them in the least invasive and most efficient way possible.
SELF-KNOWLEDGE OF SUBJECTS OF TRAINING

Elena Sorokoumova
Moscow State Pedagogical University (Moscow, Russia)

In a rapidly changing world, education must also change — a thesis that no one doubts. But what should be the direction of changes in modern education, so that it corresponds to the increasingly complex conditions and the life and work of modern people? And what is the role of psychology in bringing about these changes? The answers to these questions are given by the psychology of self—knowledge—one of the new directions of pedagogical psychology, where for the first time theoretically and experimentally proved the possibility and necessity of self-knowledge at the initial stage of training. Specially organized training opens wide opportunities in development of self-knowledge of subjects of training on the basis of development of personal-semantic and cognitive aspects of understanding as the psychological mechanism of self-knowledge. An innovative approach to the psychological nature of understanding and its role and importance in learning allows us to consider understanding, on the one hand, as a process, and on the other—as a result generation, finding and interpretation of personal meanings of subjects of interaction and communication. On the basis of empirical data, the levels of depth of understanding as an integrative criterion of self-knowledge are identified. The conceptual model of self-knowledge is the basis of a number of scientific studies.

AUTOMATED COMPUTER SYSTEM FOR THE FORMATION OF THE DIAGNOSTIC SKILLS OF THE PSYCHOLOGIST

Elena Sorokoumova
Alexandr Anufriev
Moscow State Pedagogical University (Moscow, Russia)

Currently, in a number of countries (Australia, England, Germany, USA, etc.) automated computer diagnostic systems in the field of psychodiagnostics have been developed, which are intended to optimize the diagnostic cycle (L.V. Kan., Yu.M. Kuznetsova, N.V.Chudova, 2010). A similar system was created in Russia (Yu.M. Zabrodin, V.E. Pahalyan, 2011). The report is devoted to the description of a new automated computer system developed on a theoretical basis of the concept of solving diagnostic problems of the author (A.F. Anufriev, 2012) and real cases from psychodiagnostic practice. It belongs to the class of developing automated systems and is intended for the formation of the diagnostic skills of a psychologist in solving causal diagnostic tasks, as well as for assessing his diagnostic capabilities. Its difference from other similar systems is that it does not give prompts in the process of solving diagnostic problems, but creates the conditions for their solution in dialogue with the system. The automated system provides for the formation of diagnostic skills in a psychologist at the expense of his own activity by solving a enough number of diagnostic tasks. This system can be used in the educational process for the training of psychologists, the professional development of employees of psychological services, as well as for conducting cognitive research to study the psychological laws of functioning and the formation of diagnostic thinking.
CAREER ORIENTATION AND SELF-EFFICACY OF FUTURE SPECIALISTS IN THE FIELD OF PSYCHOLOGICAL PRACTICE

Elena Sorokoumova
Elena Puchkova
Moscow State Pedagogical University (Moscow, Russia)

The key purpose of education in the University is the employment of the graduate on speciality received profile. To date, the professional activity in the field of psychological practice is diverse and contains a high specialist competency requirements. In today's competitive job market, you should pay great attention to the establishment of adequate career orientations and career skills, self-efficacy of students in training. As a result, polls revealed that professional success and personal self-realization modern students associated with building a career in their chosen field of practice. In this regard, the existence of well-established technology graduates of career self-efficacy will have an impact on the psychological well-being of future specialists.

COGNITIVE STRATEGIES AND THEIR USE FOR PEOPLE WITH LEARNING DIFFICULTIES

Elena Sorokoumova
Shaza Darvish Syria
Moscow State Pedagogical University (Moscow, Russia)

Cognitive strategy is one of the directions of mental development. They are used in various areas: in the field of educational psychology, teaching methods in general, cognitive psychology. In the latter case, cognitive strategies are used in the study of memory, thinking, innovation, problem solving. This article describes some of the cognitive strategies and principles that are used when working with learning difficulties, as well as the methods used by the teacher and student to achieve optimal results in the learning process.
VERBAL INTERACTION ANALYSIS OF THE INTERVENTION TO AN ADULT WITH SEVERE BEHAVIORAL PROBLEMS

Jesús Alonso-Vega
Alejandra Álvarez-Iglesias
Imanol Campo
Isabel Ávila
Maria Xesús Froxán-Parga
Universidad Autónoma de Madrid (Madrid, Spain)

The psychological interventions are the verbal context in which the basic processes of behavioral change are set in motion. The analysis of verbal behavior interaction in clinical contexts may allow us to understand the psychological interventions outcomes. This knowledge will be useful to improve the psychological services for different kind of problems. However, we are so far to the complete understanding of the verbal interaction processes. The purpose of this study is to analyze the verbal interaction between the clinician and a person with severe behavioral problems. Therapy sessions with a borderline personality disorder diagnosed adult were recorded. This intervention was delivered in a center of the public network of social care for people with disabilities. The Verbal Behavior Categorization System for Severe and Persistent Mental Illnesses (VB-CS-SPMI) have been used to register the therapist verbal behavior and the patient verbal behavior. Once the results were obtained, they were analyzed through a sequential analysis. This study allow us to analyze moment by moment the changes in the interaction between the clinician and the person who present severe behavioral problems. We describe the distribution of all clinician verbalizations in functional terms. Also, the sequential analysis helped us to analyze the contingencies between specific verbalizations of the client and the practitioner. The founded results are useful to describe how the verbal relationship was set up in this case. This study was an empirical one but no experimental. Despite this, the analysis of the whole verbal interaction of a complete case gives us an overview of the therapeutic process and gives us the opportunity to make new questions about verbal interaction in psychological interventions.
THE RELATION OF PHYSICAL ACTIVITY, COGNITION AND PSYCHOLOGICAL WELL-BEING IN OLDER OLDEST PEOPLE OVER 80 YEARS

Petra Jansen
Jitka Veldema
University of Regensburg (Regensburg, Germany)

According to estimation, the number of persons aged 80 or over will be tripled in 2050. Because of this it is even more important to investigate those factors, which relate to psychological wellbeing in people at this age. Therefore, it is the main goal of this study to investigate the relation between physical activity, cognition and emotional status in people over 80 years old. At our best knowledge there are only two studies which integrated only elderly people who are over 80 years old and live independently. Both studies did not use the measurement of executive functions and resilience. 41 independently living persons only over 80 years were enrolled. Physical activities (German Physical Activity Questionnaire 50+), balance (One leg stand), psychological wellbeing (Resilience Scale short form 11, General depressions scale – short version), cognitive abilities (Eriksen Flanker Task, Mental rotation, Number connection test), as well as the influence of gender and education level were evaluated. Correlation analysis and independent sample t-tests were performed to assess the relationships between the parameters mentioned above. Findings: Higher physical activity correlates with higher resilience (r=.375, p=.020), but there were no significant correlations between physical activity and cognition. Persons with higher education, t(36.374)=2.394, p=.022 and men t(32.78)=-3.46, p=.002 show better values on the depression scale. Better mental rotation ability could be reported in persons with higher education, t(37)=-2.509, p=.017. This was the first study investigating the relation of cognitive abilities, psychological wellbeing, physical ability and balance in people over 80 years. It demonstrates the importance of education and physical activity for different aspects of psychological wellbeing. Due to the aim of investigating participants only over 80 years living independently the sample size is small so the study should be further enlarged.
PERSONALITY PSYCHOLOGY FACING THE LIQUID MODERNITY

Irina Mironenko
St.Petersburg State University (St.Petersburg, Russia)

Personality is an individual who has mastered human culture through socialization and thus, “...has no “nature” — no simple or homogeneous being.” (https://archive.org/stream/ErnstCassirer). Cultural context determines human mind and living. Meanwhile, significant changes of human life of the last decades remain underestimated by psychologists, though in sociology radical changes of the very subject of their science are largely discussed. The 21c brought us the reality of “global flows, mobilities, and uncertainties” (Lash, 2009:185), the liquid modernity (Bauman, 2000). Sociologists claim that earlier theories are unsuitable for its analysis, as the world now is dramatically different from the one assessed by those. The fact that in psychology such ideas are hardly conceived, may be the result of our science still being mainly oriented to comprehend the “perpetual nature” of the human. As repeatedly has been noted in the literature, the 20th century mainstream psychology developed on the ground of assessments of a human belonging to contemporary Western culture. Psychological characteristics acquired the status of universality in mainstream psychology. Remaining trapped by the old theories and methodology, psychology is doomed to turn up questions, conforming to the latter, staying blind to the new reality. A number of acute problems are apparent, scientific elaboration of which without the participation of psychologists seems hardly possible, but the participation is not enough. Socio-humanitarian sciences are discussing a radically new type of relationship between personality and culture, which does not allow to consider socialization as assimilation of cultural patterns. In the field of natural and technical sciences, acute problems are posed by the transhumanistic movement, the plea for possible “enchantment” of human nature. These questions, pushing the usual boundaries of comprehension of “personality”, are directly relating to the practices of education, medicine, etc. They focus on the problem of what personality is. Psychological theories of the 20th century focused on the analysis of human existence in the world. The main question that psychology has to answer today is what is human? The anthropological problem becomes the main problem of the present stage of the development of psychology.
MOTIVES OF THE CRIMINAL BEHAVIOR OF THE JUVENILE DELINQUENTS, THE VICTIMS OF DOMESTIC VIOLENCE

Liubov Kotlyarova
Russian State University of Justice (Moscow, Russia)

Alexandr Usachev
Kutafin Moscow State Law University (Moscow, Russia)

The victims of the family tyrant are adults as well as underage members of their families (Rybalskaya, 1998; Sitkovskaya, 2000; Dozortseva, 2004; Luneev, 2015). The research aim is studying the motives of criminal behavior of underage males who had been the victims of the domestic violence previously and who committed the crime against the family tyrant, other family members or the third persons. The empirical base of the research is more than 400 criminal cases and judicial decisions collected in the courts of Moscow, Moscow region and Irkutsk region considering the violent crimes committed by the juvenile offenders who were previously the victims of domestic violence themselves. In the course of the analysis of the procedural documents the motives of the crimes were defined and their frequency was calculated, resulting in compiling their rating. The most frequent motives of the criminal offences of the juvenile offenders against the family tyrant are:

- The wish to cause suffering;
- Urge to protect themselves or other family members;
- To cause material damage.

The criminal offences were committed the ways similar to those that had been used against the adolescent but had a crueler character. In the structure of the motives of the crimes against the family members and immediate relatives, the motives of self-affirmation dominate. The juvenile offenders provoked the outbreak and development of a conflict. The violent offences did not have a cruel character, although the modus operandi used previously by the family tyrant against the adolescent was reproduced. In the structure of the motives of the criminal behaviour against other persons the motives caused by the need to vent the accumulated nervous-psychic pressure dominate. The character of the criminal offences was defined by the criminal situation and the actions had an impulsive character.
THE VIRTUOUS AND EVIL IN CHINESE CULTURE: PERSONALITY STRUCTURE AND CONNOTATION

Liying Jiao
Ying Yang
Yan Xu
Beijing Normal University (Beijing, China)

The idea of virtuous and evil characteristics has a long history in Chinese language and culture, there are abundant descriptions of virtuous and evil characteristics in human nature. However, the specific structures of virtuous and evil concepts have not yet been clearly delineated, and detailed studies of these concepts are limited. It is important to carefully define the content of virtuous or evil personality, and understand the psychological structure of the two concepts. A lexical approach was applied to understand what constitutes a virtuous or evil personality in Chinese culture. In study 1, a set of 3,240 virtuous and evil personality descriptors was selected from a Chinese dictionary (The Contemporary Chinese Dictionary) as well as daily-life expressions. After evaluated and selected by 12 psychological graduates, the list was condensed into 62 virtuous and 65 evil items. In study 2, we explored the dimensions of virtuous personality using exploratory factor analysis (EFA) with sample 1 (n = 313) and confirmatory factor analysis (CFA) with sample 2 (n = 518). Results showed that the virtuous personality contained 4 dimensions: Conscientiousness and integrity, Altruism and dedication, Benevolence and amicability, Tolerance and magnanimity. Finally, we got a refined, 4 — dimensions Virtuous Personality Lexical Rating Scale (VPRS) which contained 27 items. In study 3, we used the same method as the study 2 to explore the structure of evil personality (EFA: sample 1 n = 367; CFA: sample 2, n = 269). Results showed that the evil personality also contained 4 dimensions: Atrociousness and mercilessness, Mendacity and hypocrisy, Calumniation and circumvention, Faithlessness and treacherousness. And we got a 28-item Evil Personality Lexical Rating Scale (EPRS). The internal consistency reliability and criterion-related validity of these two scales were verified. In China, Confucius regards benevolence as the highest moral principle for a person. Therefore, virtuous and evil traits are naturally embedded in the personality structure of Chinese people. Understanding the structure of virtuous and evil are useful for researchers who are interested in Chinese culture as well as the studies in Chinese indigenous psychology.
THE INVESTIGATION OF THE RELATIONSHIPS BETWEEN SOMATIZATION, ALEXITHYMIA, AND MENTAL PROBLEMS IN ADOLESCENTS

Ozlem Kok
Burcu Erdur
Istanbul Aydin University (Istanbul, Turkey)

Mesut Yavuz
Istanbul French Lape Hospital / Istanbul Aydin University (Istanbul, Turkey)

To investigate the effect of alexithymic personality characteristics, and associated mental problems on somatization in adolescents.

Methods: This research was conducted on 340 students (49% female, s=168) aged between 11 and 14. The students were recruited from one primary school in İstanbul. DSM-5 Level 2 Somatic Symptom Scale Child Form, 20 item Toronto Alexithymia Scale (TAS-20), and Strengths And Difficulties Questionnaire (SDQ) self-report form were used as measures. The correlations between the scales were analyzed with Pearson’s product moment correlation test. The predictability of total scores of TAS-20 and SDQ, and SDQ subscale scores on somatization scores was evaluated with multivariate linear regression analysis. Somatization scores were positively correlated with alexithymia, SDQ emotional problems, behavior problems, inattention/hyperactivity, and peer relation problems scores, significantly. The results of regression analysis indicated that alexithymia, emotional problems, behavior problems and age significantly predict the somatization levels. It is suggested that therapeutic interventions aiming to improve of emotional identification and expressions, depression symptoms and anxiety levels and behavioral problems may help us to increase the success of somatization treatment in adolescents.

FIGURATIVELY SYMBOLIC LANGUAGE OF PAINTING AND ITS UNDERSTANDING

Valērijs Makarevičs
Daugavpils University (Latvia)

It is important for the author of a painting to convey his thoughts and feelings to the viewer. Here there is a problem. The author uses the language of the image and symbol, which the viewer needs to decipher. Psychology of art offers two main options for solving this problem. The essence of the first option is the ability of the painter to directing the viewer’s look. It was called the Dutch approach. The second option was called the Italian approach. In this case it is important to understand the symbolism and knowledge of history, as well as the biography of the painter. We will focus on the second approach in our report and illustrate it with examples from the work of the Russian painter I. Repin. The young Repin was respected for his talent and go of good breeding. In the Academy of art in Saint Petersburg he met the artist Kramskoy who taught him the need for artist to understand the tendencies of the social life and the ability to interpret them in the works. Interest in social events and their interpretation remain throughout the life of the artist. To express his views, he uses The most interesting works, in our opinion, are two. What a space ! - waiting for change. And belated understanding that changes can be associated with death and destruction: Manifestation of October 17. 1905. The symbolic analysis of numerous portraits gives the viewer additional information about the character and destiny of personas.

Key words: painting, symbolic language, Repin’s work, color in painting
DISCRIMINATION, HOMOPHOBIA, AND MENTAL HEALTH: COMPARISON OF RUSSIAN AND US LGB POPULATIONS

Inna Fatkins  
The Chicago School of Professional Psychology  
(Chicago, USA)

The Russian LGB community is one of the most oppressed communities in the world and the oppression is reinforced on a federal level with laws that violate the human rights of LGB individuals in Russia. This study examined the level of perceived discrimination, internalized homonegativity, and the level of mental health symptoms, including the symptoms of depression and anxiety, in a sample of 100 LGB individuals residing in Russia in comparison to a sample of 78 LGB individuals residing in the United States. The present research utilized a case control cross-sectional design. The group of LGB individuals from Russia was compared to the group of U.S. LGB controls over one assessment session. Measures included State Trait Anxiety Inventory, Center for Epidemiological Studies of Depression Scale, Experiences of Discrimination, and Reactions to Homosexuality Additive Scale. Independent samples t tests were conducted in order to compare U.S. and Russian LGB groups on such measures as Level of Perceived Discrimination, Level of Mental Health Symptoms, and Internalized Homonegativity. Additional correlation analysis had been conducted across the variables. The results indicated that Russian residents did not have significantly higher symptoms of depression and anxiety, perceived discrimination, and internalized homonegativity. Correlation analysis indicated no positive correlation between internalized homonegativity and mental health symptoms in Russian LGB individuals in contrast to U.S. LGB individuals. As homophobia has been normalized in Russia, many LGB individuals who display homophobic feelings may avoid stress and mental health issues. It is likely that they are less “out” as compared to their U.S. counterparts. This study demonstrated that the results of LGB oppression have similar effects on mental health in both Russia and the US. However, the Russian LGB individuals understood oppression, discrimination, and the need for human rights activism differently than the U.S. LGB participants. The approaches to the treatment of anxiety and depression in the Russian and U.S. LGB communities might be similar, but clinicians must be sensitive to a Russian cultural difference in their perception of this topic.
The purpose of the research is to study the emotional characteristics of adolescents of different ethnic groups in the northeast of Russia. Study materials and methods: the survey involved 826 adolescents of Magadan Region both boys and girls aged 15-17. Among them were 445 girls and 381 boys. The adolescents were divided into three groups: the 1st group were Aborigines (Koryaks and Evenes) in the town of Evensk in Magadan Region (154 girls and 108 boys); group 2 were Caucasians born in the region in the 1-2 generations living in the settlement of Evensk of Magadan Region (113 girls and 105 boys); and the 3rd group were Caucasians born in the region and residing in the city of Magadan (178 girls and 168 boys). Subjects of groups 1 and 2 were students of the boarding school in the settlement of Evensk of Magadan Region. In the city of Magadan students from grades 9-11 of three gymnasiums were surveyed. We used standard methods of psycho-diagnostics. Data statistical processing was performed with Statistica 6.0. software package. Our study has showed that the formation of the adolescents’ emotional sphere in the North is undoubtedly influenced not only by the climatic and socio-economic environmental factors but also by ethnic features. It has been proved that signs of Neuro Psychic Adaptation disturbances were registered in more than 40% of the examined girls and in 15% — 20% of the young male subjects. The highest Social Frustration was revealed in the examined girls of Magadan. There are intergroup differences in the aggressiveness profile of older adolescents living in the remote settlement vs. the regional center. It is shown that high school students in the remote settlement of Evensk, compared to their peers in Magadan, regardless of gender and ethnicity, are characterized by more pronounced hostile and auto-aggressive reactions. In adolescents of the Aboriginal population, as compared with their age mate Caucasians, the indicators of impairment in the field of Neuro Psychic Adaptation, Situational and Personal Anxiety, and Social Frustration are significantly more pronounced.
THE EFFECTIVENESS OF VARIOUS TYPES OF PSYCHOLOGICAL CORRECTION OF ANXIETY IN PRIMARY SCHOOL

Olga Bartosh
Tatyana Bartosh
Scientific-Research Center "Arktika" (Magadan, Russia)

At various stages of development and education of children, there are psycho-emotional difficulties that create prerequisites for impairment of the development of the child's personality. The purpose of our study is to determine the effectiveness of various types of psychocorrection measures: social and psychological training, a method of biological feedback and Art therapy for the indicators of childhood anxiety among younger schoolchildren. The study was conducted in the school of Magadan (9-10 year old students, n = 43). We used a standardized method of Multidimensional Evaluation of Child Anxiety (MECA) which included 10 scales: 1 — general anxiety; 2 — anxiety in relationships with age mates; 3 — anxiety in connection with the assessment of others; 4 — anxiety in relationships with teachers; 5 — anxiety associated with success in studying; 6 — anxiety arising in situations of self-expression; 7 — anxiety arising in situations of testing knowledge; 8 — a decrease in mental activity associated with anxiety; 9 — anxiety increase in autonomic reactivity. The correction methods were used: socio-psychological training (SPT), biofeedback method (BFB), individual and group Sandplay and Art Therapy. Students of group I (n = 12) participated only in the SPT. Students of group II (n = 11) participated in the SPT and underwent a course of training in self-regulation using the BFB method. In correction work with the students of group III (n = 20), the SPT, BFB, individual and group Art Therapy were used. In group I, after the correction activities, a significant decrease in anxiety was observed in 3 of 10 scales, that was 2, 6, and 7 (p <0.05). In group II it was seen in 5 scales (1, 3, 6, 7, 8; p <0.05). In group III, a significant improvements took place in 7 scales (1, 2, 5, 6, 7, 9, 10) after the correction measures (p <0.01–p <0.05). The present study has shown the different efficacy of applying the remedial techniques separately and in combination. The use of methods in the complex enhances the impact on the types of the child anxiety.

FLOW AS A MEDIATOR IN THE RELATIONSHIP BETWEEN PASSION AND VISUAL ART CREATIVITY OF PRIMARY SCHOOL STUDENTS IN TAIWAN

Pei-Yun Liu
National Dong Hwa University (Hualien, Taiwan)

Creativity is a critical factor that decides the quality of 21st century human resources and raises national competitiveness. The purpose of this study was to investigate the relationships among passion, flow, and creativity on visual arts in primary school. Questionnaire survey has been conducted to 557 grade 4 and grade 5 students in 2018. The survey tool included two self-report scales — the passion scale and the flow scale; and a teacher evaluation on visual arts. Researchers employed these tools to examine the mediating effect of flow in the relationship between passion and visual art creativity. The research results indicated that positive correlations among pupils’ harmonious passion, obsessive passion, flow, and creativity on visual arts were identified. Passion and flow positively predicted creativity on visual arts. Flow served as a partial mediator role between harmonious passion and creativity on visual arts. Flow also served as a full mediator role between obsessive passion and creativity on visual arts.
EFFECTS OF TEXT STRUCTURES IDENTIFICATION ON 3TH GRADERS' TO 6TH GRADERS' READING COMPREHENSION

Pei-Yun Liu
National Dong Hwa University (Hualien, Taiwan)

Because reading is the stepping stone of learning, it is critical to build up the foundation of reading literacy during the period of elementary school. Earlier research indicates that text structure guides readers to organize the macrostructure and identify important information of the text which enhance reading comprehension. This is why we study the development of text structure awareness of the middle and senior grades elementary school students, the difference of development and further explore the relationship between text structure and reading comprehension. Subjects of this research are 659 grade three to grade six students. Data is collected through implementation of structure identification test and reading comprehension test. The research result indicates that text structure can positively predict reading comprehension. Other results include that grade and structure awareness interact with each other on influencing reading comprehension, grade three to grade six students perform better in identifying the structure of narrative text than exposition text, the structure awareness and reading comprehension grow as grade level advances and the higher level structure recognizers perform better than the lower level structure recognizers.
POSITIVE FEELINGS IN THE FAMILY AND THEIR EXPRESSION AMONG MOTHERS AND FATHERS

Mikhail Basimov
Rossiyskiy gosudarstvennyy socialnyy universitet (Moscow, Russia)

Elena Padurina
Kurgan State University (Kurgan, Russia)

Positive parental feelings is a system of feelings of the parent characterised by a combination of the positive maintenance and the positive social importance, representing an orientation on the parent, on the child, on the spouse as apparent, and on the parenthood in whole. In the report the method of multiple comparison (M. Basimov) for a data set, divided into groups on external criteria, based on pair comparisons and revealing of authentic differences between all categorized pairs «group – psychological parameter» is offered. The relationship between the concepts "motherhood" and "fatherhood" was studied through the multiple comparisons of 10 groups formed on the external factors. Let's alternately analyze components of positive parental feelings system among fathers and mothers. For the component "Positive feelings for self as the parent" a comparative weightiness of mother’s group is equal to (+86), while the comparative weightiness of the group of fathers is equal to (-372). A similar pattern is observed for indicators: "Positive feelings for self as the parent"; mother’s (comparative weightiness=+37); fathers (comparative weightiness=-300). "Positive feelings for parenthood"; mother’s (comparative weightiness=+99); fathers (comparative weightiness=-425). "Positive feelings for a child based on unconditional acceptance"; mother’s (comparative weightiness=+98); fathers (comparative weightiness=-267). "Parental love"; mother’s (comparative weightiness=+114); fathers (comparative weightiness=-332). "Feelings that arise in interaction with a child"; mother’s (comparative weightiness=+46); fathers (comparative weightiness=-439). "The predominant emotional background of interaction"; mother’s (comparative weightiness=+7); fathers (comparative weightiness=-185). "Positive feelings for the spouse as for a parent" not so significantly different than for other indicators: mother’s (comparative weightiness=+48); fathers (comparative weightiness=-38). "Cognitive component of positive parental feelings"; mother’s (comparative weightiness=+99); fathers (comparative weightiness=-298). "The ability to perceive the state of the child"; mother’s (comparative weightiness=+172); fathers (comparative weightiness=-465). "Understanding the causes of the child's condition"; mother’s (comparative weightiness=+36); fathers (comparative weightiness=-167). "The ability to empathize"; mother’s (comparative weightiness=+51); fathers (comparative weightiness=-409). For the indicator "Positive feelings for a child due to his/her advantages and achievements"; mother’s (comparative weightiness=+159); fathers (comparative weightiness=-112) the result does not fit the known position of E. Fromm on the unconditional nature of maternal love and the conditional nature of paternal love.
COPING STRATEGIES AND PERSONALITY PROFILE CHARACTERISTICS OF PEOPLE WHOSE PARENTS WERE ALCOHOL ADDICTS

Anna Lutsenko
Lomonosov Moscow State University (Moscow, Russia)

The relevance of the study is due to the wide prevalence of addictive behavior in Russian population and insufficient knowledge of the resource factors of the patient's family system. People whose parents were alcohol addicts have a tendency to co-dependent, addictive and suicidal behavior, reject their own problems, low self-esteem, difficulties in establishing close relationships with other people. Most of the research on this topic was conducted either on mentally ill people, or on individuals who suffered from alcohol or other addictions. The aim of our research was to investigate the coping strategies of people whose parents were alcohol addicts and to make the recommendations for psychological counseling for these people. The sample consisted of 52 subjects (11 men and 41 women), they were participants in a 12-step program for adult people whose parents were alcohol addicts, and 50 controls (15 men and 35 women). We investigated that there are significant differences between the coping strategies of people whose parents were alcohol addicts versus adult people from healthy families. We used the two groups of methods: quantitative methods for evaluating the coping strategies used by participants (“coping strategies” (Lazarus, Folkman) and questionnaire COPE) and qualitative methods (phenomenological analysis of the transcripts of the public meetings 12-step recovery program). The results of the questionnaires were processed in the SPSS program (the non-parametric Mann-Whitney test was used to determine the differences between the samples). People whose parents were alcohol addicts more often used disclaiming (p=0.043) and escape-avoidance (p=0.032) coping strategies than people from healthy families. Qualitative methods showed that as a result of participating in a rehabilitation program, in addition to avoiding and disclaiming their problems, participants are able to formulate other coping strategies such as focus on emotions and their active expression in the rehabilitation program, search for emotional support from friends and psychologists. People whose parents were alcohol addicts have a tendency to disclaim the difficulties of their family. In the rehabilitation process, they learn to use a variety of coping strategies and to use the emotional support from friends and psychologists.
A CROSS-CULTURAL COMPARATIVE STUDY OF THE DARK TRIAD AND THE FIVE FACTOR PERSONALITY MODEL IN RELATION TO AGGRESSION AND PREJUDICE

Elena Artamonova
Manchester Metropolitan University (Manchester, United Kingdom)

When examining socially malevolent outcomes in the form of prejudice and aggression, previous research in the area of the dark triad and the five-factor personality model has failed to consider sufficiently cross-cultural comparisons. A deeper understanding and an assessment of cross-cultural comparisons is necessary since prejudice and aggression represent important social problems. Previous research in this area has established preliminary relationships between the dark triad and the big five, and how these relationships influence prejudice and aggression. The current research consists of two phases. The first phase examines interrelationships between dark triad traits and big five personality variables. Analysis considers a cross-cultural comparison of UK and Russian samples. The second phase uses the results from the first phase to inform the baseline of a predictive model, which is extended and tested in relation to outcomes of prejudice and aggression. Both phases use cross-sectional designs and correlation-based methods of analysis (e.g., confirmatory factor analysis, structural equation modelling). Each phase uses a large sample, incorporating a range of backgrounds and ages. Approximate sample number is 1900 Russian participants and 700 British participants for phase one. For phase two approximate sample number is 1900 Russian participants and 700 British participants. We predict that results will identify the percentage of contribution from dark triad and big five personality model to overall variance in prejudice and aggression. As well as, we predict that statistical difference between Russian and UK sample will be due to culture. Further results will be discussed at the conference. Analysis for phase 1 and 2 are completed via AMOS.
PERSONALITY CHANGES IN CHRONIC MENTAL ILLNESS

Hristo Yordanov
DCMDA (Sandanski, Bulgaria)

The report focuses on a little-studied aspect of the clinical psychology — the psychological characteristics and the experiences of people with chronic mental illness. It clarifies the essence of the concept of "safeguards", its basic parameters and characteristics. It presents the findings of a psychological study of the beneficiaries of social service Day Centre and outlines their mental and behavioral characteristics. By results of TAT (Murray) the attention is drawn to the form of stories by IL, i.e. the various dimensions of discourse which reflect the manifestations of safeguards, as manifest in the known psychopathological structures, such as schizophrenic-leading mental illness such as prevalence, importance and the strong expression of symptoms. A disease in which there is a tendency to chronic course and growing disintegration of the psyche. The leading feature is increased harassment of the brain activity — the biggest weakness of the nervous system. All of this is correlated with the results of the "Self-Assessment Questionnaire" LSI_Def_118, connected to the theoretical mechanisms of protection developed by Robert Plutchik co-authored with D. Kellerman and H. Kontom in 1979, adapted by P. Randev by comparing prevailing safeguards obtained as results of this methodology with those of TAT of Murray. Thus establishes which types of protective mechanisms are best used by people with chronic mental illnesses, such as the beneficiaries of the day center. Test "F.P.I." — it is a multidimensional personality questionnaire for diagnosing personality in a wide range — from the dynamics of neural processes in hidden impulses and features of the emotional sphere to general ability of self-regulation and interpersonal behavior. It also establishes the most common inefficient models (coping strategies) to address. The test was piloted by several teams here. The typical of all chronic mental disorders is that they are accompanied with serious personality changes. By the values of the various scales of the test it is expected to reveal the trends to peculiar degradation of personality.
THE PSYCHOMETRIC DEVELOPMENT OF THE LEADERSHIP BEHAVIOURAL SCALE (LBS)

Amos Engelbrecht
Charné Brynard
Stellenbosch University (Cape Town, South Africa)

Inspirational leadership becomes more important since the effective and ethical management of organisations turns out to be more challenging and essential to sustain organisational competitiveness and growth. Although several leadership scales exist, none of them measures the concept comprehensively enough given the volatility, uncertainty and complexity of the current business environment. The primary aim was to develop a new Leadership Behavioural Scale (LBS), based on a thorough analysis and integration of leadership behaviours inherent to task-, relationship-, change-, strategic- and ethical leadership. A second aim was to test the preliminary construct validity of the LBS by examining the relationships among inspirational leadership, trust in leaders and leader effectiveness. The quantitative study used a sample of 210 employees from various South African organisations. A structural model depicting the relationships among the latent variables was developed and various hypotheses were formulated. The LBS was tested for reliability, exploratory (EFA) and confirmatory factor analysis (CFA) were utilised to test the construct validity. The reliability of all the dimensions of the LBS was good, with alpha values ranging from .90 to .97. All the subscales produced item-total correlations above .30. The EFA demonstrated unidimensionality for the subscales, with factor loadings varying between .52 and .92. The CFA revealed that acceptable and close fit was achieved for the measurement model of the LBS. The two ancillary scales, the Leader Trust Scale (LTS) and the Leader Effectiveness Questionnaire (LEQ), achieved excellent Cronbach alpha values. The LTS and the LEQ also demonstrated acceptable model fit. The results of structural equation modelling (SEM), using LISREL, demonstrated acceptable and close fit for the structural model (RMSEA = .0526; P-value for test of close fit = .382). Furthermore, the results revealed that inspirational leadership had a positive effect on trust in the leader, as well as on leader effectiveness. In turn, trust in the leader had a positive effect on leader effectiveness. The LBS could be a valuable tool for identifying and developing inspirational leaders who, as role models, could drive organisational change initiatives towards mutual trust, ethical culture and organisational effectiveness.
GOAL ORIENTATION PREDICTS LEARNING

Miriam Romero
Cristina Casadevante
José Manuel Hernández
José Santacreu
Universidad Autónoma de Madrid (Madrid, Spain)

Achievement motivation theory states that people can show two different orientations: mastery and performance orientation. Mastery-oriented people try to learn and develop their own competence facing a specific task. Performance-oriented people try to obtain the best outcome minimizing costs and endeavoring to overcome other people in the task. Several studies have pointed out that Goal orientation variable is related to learning and that, as theory describes, mastery-oriented people tend to achieve higher learning. We have developed an objective instrument to assess goal orientation: Mastery-Performance Goal Orientation Test (MP-GOT). In this study, we check its reliability. In addition, we check if goal orientation predicts scores in a learning task. We administrated MP-GOT test and a learning task to 50 undergraduate students. Cronbach alpha was 0.98 for the Goal orientation variable and 0.78 for the learning variable. Correlation between these variables was 0.75. Goal Orientation explained 56% of the variance of the learning variable. The Goal Orientation Test (MP-GOT) shows high reliability and predictive validity. It might be a useful instrument to assess achievement motivations and to predict the level of learning.

HOW TO CREATE A PSYCHOLOGIST CHATBOT

Miriam Romero
Cristina Casadevante
José Santacreu
Universidad Autónoma de Madrid (Madrid, Spain)

A Chatbot is a computer program that can have a conversation with a user. The first Chatbot of computational history was ELIZA, a psychotherapist that encouraged people to talk about themselves. Since then, different companies, especially in the commercial sector, have developed an enormous amount of conversational bots. The most popular ones are Google Assistant and Siri. However, we only have a little number of bots with functions related to psychology. Sentinobot is a conversational agent that creates a psychological profile by administrating a personality test. Woe-bot is a Chatbot based in cognitive behavioral theory and helps people with anxiety and depressive symptoms. We have not found a conversational agent designed to assess clinical variables beyond personality. In this study, we describe the most important tools needed to program a Chatbot. In addition, we define basic concepts needed to use these tools: dialog, intents and entities. Finally, we discuss its potential utility.
THE EFFECTS OF THE INCLINATION OF THE HEAD AND FOCAL LENGTH ON PSYCHOLOGICAL AND PHYSIOLOGICAL STATES

Tomohiro Suzuki  
Hidetoshi Maie  
Tokyo Future University (Tokyo, Japan)

Shinji Yamaguchi  
Graduate School of Juntendo University (Chiba, Japan)

Yujiro Kawata  
Juntendo University (Chiba, Japan)

Previous studies have found the relationship between one’s posture and his or her psychological as well as physiological states. Although several studies treat the inclination of the head as one component of posture related to psychological and physiological states and note that the upward inclination causes positive emotion whereas the downward inclination negative emotion, empirical studies examining the relationship are still limited. Furthermore, previous studies have not considered focal length coinciding with the inclination of the head. Therefore, this study empirically investigates the effects of not only the inclination of the head but also focal length on psychological and physiological states. Twenty participants (6 males and 14 females, mean age = 19.85, SD = 1.04) were consecutively participated in four conditions: two focal-length conditions (long or short) X two inclination-of-the head conditions (upward or downward). The participants completed a visual analogue scale assessing valence and arousal, and their saliva was examined for amylase level to assess their physiological state after each condition. Each condition was counterbalanced. Two-way ANOVA showed that: 1) although the main effect of focal length on valence was significant, that of the inclination of the head and the interaction between focal length and the inclination of the head on valence were not; 2) the main effect of focal length on arousal was marginally significant, but that of the inclination of the head and the interaction between focal length and the inclination of the head on arousal were not; and 3) the interaction between focal length and the inclination of the head on amylase level was marginally significant though the main effect of focal length and that of the inclination of the head on amylase level were not. Thus, this experiment implies that it is focal length that primarily affects psychological and physiological states rather than the inclination of the head. Moreover, it is suggested that the effect of the inclination of the head on psychological state found in previous studies is a spurious relationship, and that the spurious relationship is caused by focal length coinciding with the inclination of the head.
Even when the romantic experience brings pleasant sensations to the individual, losing the loved one brings feelings of pain, despair and anger at the disappointment of facing a reality, in which the expectations that had been placed on the former partner were not possible (Argyle & Furnham, 1983). During the romantic grief, the individual can live under the torment of the hope of return and therefore, the constant reactivation of painful emotions (Zaragoza Toscano, 2007). Likewise, during this process there is a greater difficulty of elaboration (Sandoval, 1990; Ibarra & Emery, 2005) since the person who has been terminated by his partner (passive) tends to reflect exhaustively on the situation, his feelings and the relationship itself in order to understand the break. This can generate ruminant thinking that, in most cases, favors the negative emotional experience (Short, 2014). On the other hand, resilience has worked as a personal resource that predicts less depression in people who have recently ended their relationship (Bonanno et al., 2002). Coupled with these two personal characteristics, the reception of support plays a central role during moments of stress (Murray-Parkes & Prigerson, 2010) as is the romantic breakup. Based on this, the purpose of this research was to know the impact of rumination and resilience in the experience of love mourning as well as to compare these variables based on the reception of support after the break. To this end, we worked with a sample of 317 women and 299 passive men between 15 and 50 years of age, whose minimum schooling was high school. After performing some correlation analysis, it was generally found that more ruminant thinking and less resilience, more negative emotions, disappointment, longing, search for negotiation, hostile reactions towards the former and others, suspicion, depression, disorganization of the self same and negation. Subsequently, Student t tests were carried out, which showed that when there is support in the grieving process, there is greater readaptation, hostile reactions towards the former ex partner, disappointment, longing, negative emotions and depression that when support was not received.
Learning strategies by which learners actively regulate their own cognitive processes are conceptualized as metacognitive strategies. Metacognitive strategy regulates individuals’ cognitive processes and general learning behaviors (Corno, 1986). In particular, we can predict that self-efficacy mediates between metacognitive strategies and general learning behaviors (Bandura & Schunk, 1981). The purpose of this study was to examine the effects of metacognitive strategies on self-regulated learning processes, focusing on the mediating effects of self-efficacy. The participants were 105 Japanese undergraduates (42 males), with an average age of 19.77 (SD=0.84). The questionnaires, distributed during a personality psychology course in December 2016 and January 2017, measured metacognitive strategies (e.g., planning strategy and monitoring strategy), self-efficacy, general learning behaviors (e.g., behavioral engagement and persistence, and cognitive strategies (e.g., writing-repetition strategy and deep-processing strategy). First, cross-lagged structure equation modeling revealed that the use of planning strategy enhanced self-efficacy. Then, we performed path analysis to examine the relationships among metacognitive strategies, self-efficacy, general learning behaviors, and cognitive strategies. In the path analysis, we set directed paths from metacognitive strategies to general learning behaviors and cognitive strategies, in addition to mediated paths via self-efficacy, in order to examine both: (a) mediating effects of self-efficacy; and (b) direct effects without it. A cross-lagged effect model analysis showed that the planning strategy promotes self-efficacy. Then, a path analysis indicated important relationships between metacognitive strategy use, general learning behaviors, and cognitive strategy use. First, metacognitive strategies enhanced behavioral engagement and persistence, mediated by self-efficacy. Past research has long shown the relationships between metacognitive strategies and general learning behaviors, but did not explain the underlying mechanism. This study located self-efficacy as a mediating factor between them and indicated that metacognitive strategy use leads to general learning behaviors by inducing self-efficacy. In contrast, it was shown that the monitoring strategy use directly promoted deep-processing and the use of writing strategies. All in all, the current study reveals that general learning behaviors and cognitive strategies involve two different processes starting from metacognitive strategies.
PERSONAL CHARACTERISTICS OF ADOLESCENT ARCTIC ABORIGENS WITH ALCOHOL CONSUMPTION

Vera Lobova
Yugorskiy gosudarstvenny universitet (Hanty-Mansiysk, Russia)

Features of the premorbid personality structure play an important role in the formation of alcoholism among the aboriginal peoples of the Arctic. The objective of our work was to determine the psychological characteristics of the personality among aboriginal adolescents who have experience in alcohol consumption. The sample consisted of 58 children, 48.3% girls and 51.7% boys, aged between 12 and 16 years old (M = 14.50; SD = .98), recruited from public boarding school of Nyda, in which representatives of the indigenous population of the Arctic study. The duration of alcohol consumption for boys and girls was different (M = 3.00, SD = .50 boys, M = 1.79, SD = .22 girls) (p = .021). We used Self Rating Depression (SDS), State-Trait Anxiety Inventory (STAI), Eysenck Personality Inventory (EPI), Buss-Durkee Inventory (BDI), and the socio-hygienic method (questionnaire, survey). 3.9% of aboriginal adolescents consumed hard liquor, 27.5% — light liquor (wine), 78.4% — beer. 46% of young men and 7% of girls consumed alcohol once a week or daily. The dominant motive for alcohol consumption among adolescents from the aboriginal population is the need to remove various kinds of barriers in socializing. We determined depression in 24% of aboriginal population with alcohol consumption. We also recorded high personal anxiety in 42% of boys and in 63% of girls with alcohol consumption. High neuroticism was noted in 25% of boys and 60% of girls. Aggression in adolescents with alcohol consumption was more often manifested in boys than in girls (32% of boys and 27% of girls.) In alcoholising girls, we observe intensification of oppositional behaviour patterns, what contradicts the previously obtained data, since representatives of the ethnic group in study are more likely to manifest typologically weak features of the hypothetical structure (sensitivity, anxiety, dependence). The results of the study may be useful for the development and implementation of preventive anti-alcohol programs for students from the aboriginal population in the educational environment, as well as early diagnosis of alcohol consumption in adolescents and young people.
SPEED OF PROCESSING AND PERSONALITY: THE INFLUENCE OF PERSONALITY AND EXTRINSIC FEEDBACK ON PERFORMANCE OF COGNITIVE TASKS

Ming Yu Claudia Wong
Hong Kong Baptist University (Hong Kong, Hongkong)

Objectives Feedback is considered as an effective means of motivating, guiding and reinforcing desired behaviours. However, the ways to interpret external feedback may be different among individuals in different personalities. Therefore, personality traits may influence the effects of feedback on performance. In this study, the moderating effects of personality on different styles of feedback on cognitive task performance were examined.

Methods A within-subject exploratory research was conducted. In total, 70 participants, with average age at 31.2 years old, were involved in the experiment. Participants were given 3 Stroop tasks, being a dependent variable to test a person's speed of processing information after receiving feedback; and 2 Trail Making Task, being an independent variable for researchers providing feedback. Also, a personality test (The International Personality Item Pool Presentation of the NEO PI-R (IPIP-NEO 120) were given to record the personality traits of each participant. The focused results were done through a correlation analysis to prove the relationship between personality, demographic variables, experimenter and feedback. Corresponding to the correlation results, both linear regression and binary logistic regression have been shown and interpreted, at the same time, acting as a tool to verify the validity of the sample data. Results The statistical analysis indicated that performance from those with higher levels of conscientiousness were more likely facilitated by negative feedback and Extraversions were less decrement towards negative feedback as well. The results of Extraversions were further proven by the significance of the correlation with the median response time of both neutral and positive feedback differences ($r=0.205$, $p=0.044$); as well as neutral and negative feedback differences ($r=0.201$, $p=0.047$). Also, it demonstrated the moderating effect of personality and feedback, affirming that individual differences do alter a person's information interpretation and performance.

Conclusions Owing to the narrow demographic background of participants, experimenter effect and limitation of the sample may have reduced the research representativeness. Nonetheless, there should be more potential influencing factors need to be included; and further research is needed to explore the relating factors that might influence the effectiveness of feedback for particular individuals.
ANXIETY, DEPRESSION AND AGGRESSION IN ADOLESCENTS WITH VEGETATIVE-VASCULAR DYSTONIA IN THE ARCTIC REGION

Vera Lobova
Andrew Mironov
Sergei Gilmanov
Vladimir Mishchenko
Yugorskiy gosudarstvenny universitet (Hanty-Mansiysk, Russia)

Living on the territory of the Arctic region with a harsh climate, short daylight hours and sudden changes in temperature adversely affect the health and mental state of adolescents. There is an increase in chronic functional diseases in adolescents, among the initial presentations of which are anxiety, aggression and depression. We examined 52 adolescents with vegetative-vascular dystonia, residents of the Arctic region, whose average age was 13.6 years. The results were compared with data obtained from 52 healthy adolescents, similar in sex, age, and length of stay in the Arctic region. The adolescents with vegetative-vascular dystonia and healthy adolescents were examined in the conditions of medical and educational institutions on the territory of Yamal in the Arctic climate zone. For the study of depression, anxiety and aggression, we used Self Rating Depression (SDS), Taylor Manifest Anxiety Scale (TMAS), Buss-Durkee Inventory (BDI). High anxiety, depression and aggression are presentations of emotional disorders in adolescents with vegetative-vascular dystonia. Half (58.6%) of the examined adolescents with vegetative-vascular dystonia manifested high anxiety, measured using TMAS. The study found that the anxiety level as per TMAS in female adolescents with vegetative-vascular dystonia is higher than in healthy girls (p <.01). There were no differences in the level of anxiety between male adolescents with vegetative-vascular dystonia and healthy boys. Depression indices in adolescents with vegetative-vascular dystonia were higher compared with healthy adolescents (p <.0001). Gender differences between boys and girls with vegetative-vascular dystonia were not fixed for depression. The aggression index obtained using BDI is higher in adolescents with vegetative-vascular dystonia (p <.0001), and the hostility index is lower than in healthy adolescents. Adolescents with vegetative-vascular dystonia have higher indices of physical aggression, auto-aggression and sense of guilt than healthy adolescents. Timely diagnosis using personality questionnaires may be important for early preventive measures. It is necessary to create new organizational approaches that could ensure the continuity of primary psychological and medical (general and specialized) assistance to adolescents in the Arctic region.
ANXIETY IN ADOLESCENTS OF THE ARCTIC REGION IN THE CONTEXT OF SOCIAL AND DEMOGRAPHIC FACTORS

Vera Lobova
Vladimir Mishchenko
Andrew Mironov
Sergei Gilmanov
Yugorskiy gosudarstvenny universitet (Hanty-Mansiysk, Russia)

The study of anxiety in adolescents of the Arctic region is determined by the complex effect of adverse natural, social and hygienic factors on the mental state of children. The sample was composed of 770 adolescents, 48% girls (n = 370) and 52% boys (n = 400) at the age of 12-14 years old (M = 13.39, SD = .61), recruited from 7 public schools of Arctic. We used Taylor Manifest Anxiety Scale (TMAS), Adolescent of rodicich (ADOR) Inventory. The objectives of this work were to determine the frequency of cases of high anxiety depending on family composition (two-parent/single-parent families), the presence/absence of risk factors for chronic non-communicable diseases (smoking, low physical activity) and to study the correlation between anxiety and the educational attitudes of mother and father. The anxiety of girls correlates with hostility, aloofness, suspicion on the part of the mother (r = .234). In addition, we obtained girls correlations between anxiety and such educational attitudes of the father as ascendancy (r = .507, p = .008) and inconsistency, unpredictability (r = .207). We obtained boys correlations between anxiety and pressure from an authoritarian mother (r = .357, p = .052). Also, boys have correlations between anxiety and father educational attitude, such as autonomy and despotism (r = .218). Low physical activity in adolescents was 40.2%. High anxiety in adolescents with low physical activity was recorded in 53% of cases. 20.4% of adolescents reported tobacco consumption, high anxiety was recorded in 62% of cases. 79% of adolescents grow up in two-parent families, and 21% of adolescents grow up in single-parent families. Highly anxious adolescents are 5 times more in single-parent families, compared with two-parent families. For adolescents who arrived in the Arctic region relatively recently, the frequency of high anxiety is 8 times lower (9%) than for adolescents born in the Arctic region (74%). At risk are adolescents from single-parent families and adolescents born in the Arctic region, what creates the need to introduce new preventive approaches into practice using measures for the early correction of anxiety in adolescents.
The psychological consequences of a perinatal loss can be serious and lasting. Parents can develop complicated grief disorder, depression, anxiety and Post-Traumatic Stress Disorder. In particular, women are at greater risk of psychiatric diseases and hospitalizations, even thirty-five years after the loss (1). Our longitudinal study on the perinatal loss’s consequences and the therapeutic support studied 29 persons met three times, every three months. We designed a descriptive study with the Inventory of Complicated Grief, to assess the risk of grieving affective disorder, and the General Health Questionnaire-28, a global self-assessment questionnaire for health disorders. The twenty-nine bereaved parents are 21 women (72%) and 8 men (28%), with a mean of 31.4 years. They lost 21 females and 11 males (three participants lost twins). The maximum time between the child’s death and the first meeting is almost ten months, while the minimum is twenty-two days. 44% of deaths occurred due to medical problems and 35% to a late termination of pregnancy. Only 22% of children lived (up to a maximum of 96 days) and 79% died in utero. The results of the questionnaires were compared to therapeutic support, participation in support groups and active participation in social networks (considered by parents as therapeutic groups). The data showed that for those who are at risk of developing a complicated grief disorder (mean=49), support groups are essential (p<0.5). There were no significant differences compared to psychotherapy and Internet groups. Therefore, interviews’ analysis pointed out that active participation on social networks may be a risk for a possible development of depressive disorder in women (p=0.6). The data show how the support group is an important protective factor for perinatal loss. Contrary to the expectations of the parents, who consider the use of internet as an alternative source of comfort and comparison, it does not replace therapeutic action or social support and recognition, which are fundamental for accepting the loss and completing the work of mourning. 1. Li J, Precht DH, Mortensen PB, Olsen J. Mortality in parents after death of a child in Denmark: a nationwide follow-up study. The Lancet. 2003 Feb 1;361(9355):363–7.
A PROFILE OF AN ADDICT AT ADMISSION INTO TREATMENT: DIFFERENCES BETWEEN GENDERS

Tânia Caetano  
Eduardo Ramadas  
Villa Ramadas International Treatment Centre (Leiria, Portugal)

Jessica Lopes  
Villa Ramadas International Treatment Centre (Vila Franca de Xira, Portugal)

Regarding addiction, from its prevalence to its evolution and clinical expression, gender is an essential variable to consider. Understanding the differences at admission into treatment, could inform how treatment itself should be tailored to each gender to improve the change of recovery. The objective of this study was to explore both quantitative and qualitative differences between genders at admission into Villa Ramadas International Treatment Centre. The study design was cross-section, considering that only one measure for each participant. A clinical sample was used. The sample was composed of patients who were admitted into treatment from January and October 2018 at Villa Ramadas International Treatment Centre. Participants completed both a sociodemographic questionnaire and the following measurements: Alcohol Use Disorders Identification Test (AUDIT), Beck’s Depression Inventory II (BDI-II), Suicide Ideation Questionnaire (SIQ), and State-Trait Anxiety Inventory (STAI). Descriptive statistics were used to explore the data from the sociodemographic questionnaire. Independent samples t-test was used to test for statistically significant mean differences between genders. Results included 65 (45 male and 20 female) patients and age varied between 16 and 64 (M = 35.32; SD = 11.69). Men reported higher frequency of use and present a higher incidence of poly drug use. On the other hand, women present a higher incidence of the existence of a previous overdose, reported obsessive thoughts and a history of nonsuicidal self-injurious behaviors. Age, alcohol consumption, state anxiety and age of first drug use were not different between genders. As expected, women presented significantly higher levels of depressive symptomatology, suicide ideation and state anxiety. Some results lend support to already well-researched literature, such as the presence of higher levels of depressive symptomatology, suicide ideation and state anxiety in women. However, other less studied observations could offer an important insight into fundamental differences between genders, and inform about gender-specific vulnerabilities that should be taken into account when a patient is admitted into treatment for addiction.
For most of the past 200 years, the average life expectancy has risen. At the moment, there is no indication that the pace will decelerate. Longer longevity is expected to prolong the work stage and diversify, but there is no clear answer yet as to what kind of change will occur specifically in individual career choice. My research was to model the diversification of carriers and to clarify what kind of choice individuals are making at the branch points of carriers. This study was conducted using TEA*. As a result of interviewing five subjects, I found three stages in various carriers. The first one is to become a professional in the organization. (Passive carrier phase) The second is the stage that is active as a professional in the organization. (Active carrier phase) The third is to leave the organization and build a diverse career as a professional. (Autonomous carrier phase) And I also revealed the signs that influence the branch points of each stage. In this poster presentation, I will focus on the signs that influences the branch point entering the third stage and report on how the sign affects individual choice, using TEM diagram. *1) TEA is a triarchic construction in cultural psychology which consists of three sub-components. These are the Three Layer Model of Genesis (TLMG), Historically Structured Sampling (HSS) and Trajectory Equifinality Model (TEM). Sato, T., Yasuda, Y., Kanzaki, M., & Valsiner, J.(2014)From Describing to Reconstructing Life Trajectories: How the TEA (Trajectory Equifinality Approach) expalciates context-dependent human phenomena. Wagoner B., Chaudhary, N. & Hviid, P.(Eds.). Culture Psychology and its Future: Complementarity in a new key
PRELIMINARY IDENTIFICATION OF COGNITIVE DECLINE, THE INCIDENCE IN PROVINCE OF ENNA

Tommaso Careri
S.C.S. Neuropsychological Clinic (Enna, Italy)

Our work stems from the need to have a point of reference for those families that can not find significant supports in the territory. Our research aims to investigate and measure the incidence of cognitive impairment in a sample of men and women over 55 age who attend pharmacies in the Province of Enna, the latter considered one of the territories with an aging index among the highest in Italy. The survey was carried out through an ad hoc neuropsychological screening, aimed at detecting signs of cognitive impairment in the population with relative restitution of the data, thus contributing to spread the culture of prevention in health. 389 people over 55 took part, 163 mens and 226 womens, who were given the specific intervention of preliminary neuropsychological evaluation while to raise awareness among family members/caregivers, about 2500, a brochure has been distributed with useful information and advice. The subjects mainly coming from the province of Enna had been warned, registered and selected by the pharmacists following the pre-established directives in the protocol signed with Federfarma Enna. A battery of neuropsychological tests, created ad hoc, was administered to provide a preliminary assessment of global cognitive functioning and, after data processing, a preliminary representation on the presence/absence of symptoms related to cognitive impairment. The tools used were: anamnestic report on the evaluation protocol; Symptoms of Dementia Screener; Memory Assessment Clinics-Questionnaire; Mini Mental State Examination; Clock Drawing Test; Trail Making Test. Results: from the survey we found 148 peoples, the 38% of the screened, showed signs of cognitive impairment in their respective percentages: 62% Normal — 12% Borderline — 16% Mild — 19% Medium. It follows: 22% between 55/60 age — 30% between 61/65 age — 36% between 66/70 age 40% between 71/75 age — 49% between 76/80 age 61% between 81/90age. There is a complementary growth of cognitive impairment in age groups. Discussion: the intervention structured by us has shown to have positive effects not only on the assessment and awareness of the cognitive functioning of those who underwent screening but provided valid references to the family/caregiver, creating a greater knowledge of the disease.
THE EXPERIENCE AND PARENT-CHILD RELATIONSHIP OF THE CHILD OF INFIDELITY

Yu-Ching Lo
Shu-Chu Chao
National Changhua University of Education (Changhua County, Taiwan)

While most studies of infidelity focused on the experiences of the couple and the third party, little attention was paid to the child of infidelity. The purpose of this study is two-fold: (a) to understand the experiences of the child of infidelity; (b) to understand the changing process of the parent-child relationship after infidelity. With the narrative analysis method, two female and one male adult children of infidelity were interviewed and the results are as follows: Most of the children feel resentment not only at the betrayers but also at the affective unreasonable reactions of the betrayed parents. In addition, seeing conflicts between parents, being emotional blackmailed, being asked to do wrongful things, being involved in the triangulation, becoming a scapegoat or lacking parents’ attention often causes the feeling of discomfort, scare, grievance, self-blame, helplessness, or loss. Feeling powerless about the parental conflicts, the children of infidelity try to avoid conflicts by different ways and seek emotional attachments outside. When they are developing intimate relationships in their adulthood, they are extremely hesitant and cautious about not making the same mistakes as their parents. By analyzing with the Structural Family Theory of Minuchin, this study finds that most of the parental subsystem boundaries change as soon as the parental infidelities are revealed. The children might become the Parental Child who either replaces the absent parent or becomes the caretaker of the betrayed side. The coalitions between parents and children might cause tension among family members. Furthermore, as this study focuses on the changing process of the parent-child relationship, the boundary shifting of the three participants’ parental subsystems is described. Finally, this study discusses the differences between the viewpoints of children and adults in the frame of culture and gender. Along with the suggestions for further researches, school counselors and practitioners, the researcher’s reflections on this study are included.
INFLUENCE OF FAMILIARITY AND COGNITIVE FLEXIBILITY ON PERFORMANCE IN A CONSENSUS GAME

Naohiro Obata
Hokusei Gakuen University (Sapporo, Japan)

It is essential for our daily life to face and solve many problems. It is required for problem solving to consider a variety of alternatives. This skill is described cognitive flexibility. In this study, we focused on familiarity and social sensitivity of group member, and we investigated how they affected performance a consensus game. A consensus game is one of communication game. Its purpose is to solve some problems by group discussion. In this experiment, we used the consensus game called “If you have distress in the desert?” Its task is to list 12 items in order of importance for survival. 187 students participated in this experiment. They were divided into groups of 4-6 people. They were told to list the items alone. After that, they were told to list them by discussion in the group. Then, they answered the questionnaire cognitive flexibility inventory (CFI) to measure their cognitive flexibility. Finally, they were asked to answer their familiarity. Effect of cognitive flexibility (High, Low) and familiarity (High and Low) were analyzed using ANOVA. In the analysis of personal score, there were no difference between the participants of High and Low cognitive flexibility. On the other hand, in the analysis of group’s score, the ANOVA revealed main effect for cognitive flexibility $[F(1, 183) = 8.81, p < .01]$, main effect for familiarity $[F(1, 183) = 9.98, p < .01]$, and interaction of cognitive flexibility and familiarity $[F(1, 183) = 11.06, p < .01]$. These results indicated that Low cognitive flexibility and High familiarity group was higher than the other groups. That is cognitive flexibility had an opposite effect on group decision making. This result can be explained by failure to reach consensus among group members because High cognitive flexibility people have too many opinions. It is important for group decision making not only to provide ideas but also to compromise to reach consensus. These findings suggest that it is necessary for group decision making to create a good environment enough to exchange ideas and information freely.

FORMATION OF LEADER PERSONALITY AS A SUBJECT OF INNOVATIVE ACTIVITY

Alexei Ponukalin
Saratovskiy natsionalny issledovatelskiy gosudarstvenny universitet im. N.G. Chernychevskogo (Saratov, Russia)

Russia’s innovative scenario of development means a new economic structure leading to growth in life quality, with intellect and innovative potential of an expert as the main factor in growth of national competitiveness. With this idea in mind, we are developing a psychological theory of individual innovational activity as a specific type of human activity. We look at what motivates this activity, as well as at the content of actions and operations within the situations that lead to problems. Psychology of innovation is closely connected with social characteristics of a person; therefore, its structure is formed in due a significant period of a person’s life. As a consequence, the subject of innovational activity is a person with well-formed and adequate to this innovational activity personal qualities. Practical goals of training a leader as a subject of innovational activity stem from characterological model of an innovator, in all of its structural complexity. In the context of the above said we have created the psychological portrait of an innovative person, described the selected methods of diagnostics and the program of specialized training for future professionals. We have also formulated the objective of influencing the population and its consciousness though presenting innovational activity as an important priority.
Interdisciplinary hands-on learning focuses on preparing students to work in a interdisciplinary team and to understand and experience the problem-solving process, thus better preparing graduates to enter the workplace (Schwartz & Dunkin, 2000). The aim of the present study were to assessment of student motivation, learning interest, and skills development in hands-on courses, and we were focused on differences between interdisciplinary and non-interdisciplinary groups. Data for this study were collected during one semester from 486 undergraduate and post-graduate students constituted the sample frame, with a interdisciplinary and non-interdisciplinary learning group proportion of 75.7% and 19.8% respectively. The questionnaire was administered to all the students. Students completed course-choice motivation inventory (CERE-NTNU, 2007; including intrinsic and extrinsic motivation), learning interest inventory, and skills development inventory (including learning by doing, collaborative problem solving, and interdisciplinary learning). The inventory were 26-item measure on 5-point Likert scale. The results of t-test showed the groups differences for the variables. As indicated, compared to non-interdisciplinary group (n=368), interdisciplinary group (n=96) displayed higher levels of intrinsic motivation of course-choice (t = -6.632, p < .05), learning interests (t = -6.330, p < .05), learning by doing (t = -5.732, p < .05), collaborative problem solving (t = -4.879, p < .05), and interdisciplinary ability (t = -5.691, p < .05). The results of regression indicated that learning interest mediated the relationship between intrinsic motivation of course-choice (β = .714, p < .05), learning by doing (β = .278, p < .05) and interdisciplinary ability (β = .230, p < .05) in non-interdisciplinary learning group. In interdisciplinary learning group, learning interest mediated the relationship between intrinsic motivation of course-choice (β = .588, p < .05), learning by doing (β = .315, p < .05), collaborative problem solving (β = .248, p < .05) and interdisciplinary ability (β = .284, p < .05). The findings highlight the interdisciplinary group learned significantly more than non-interdisciplinary group. Students’ intrinsic motivation of course-choice through the learning interest are to develop learning by doing and interdisciplinary ability, but only intrinsic and extrinsic motivation of course-choice direct effected collaborative problem solving in interdisciplinary group.
SOCIOCULTURAL DIFFERENCES IN SELF-CONSCIOUSNESS BETWEEN AZERBAIJANIAN STUDENTS LEARNING IN RUSSIAN AND AZERBAIJANI LANGUAGES

Anna Vizgina  
Maria Dzherelievskaya  
Lomonosov Moscow State University (Moscow, Russia)

Our study is based on the assumption that the language of the learning environment can be considered an independent sociocultural factor influencing the intensity of individualistic or collectivistic features of self-consciousness. The theoretical foundation lies in the following idea: being embodied in the language, the sociocultural developmental context integrates the communal rating system, norms, and rules and thus reproduces the specifics of adaptation reflected in one's self-consciousness. Our work is directed at identifying the culturally specific characteristics of self-consciousness related to the constructs of independent self (individualism) and interdependent self (collectivism) in two groups of respondents studying in their native (Azerbaijani) and foreign (Russian) languages. The sample includes 100 Azerbaijani students from Baku colleges and universities. The participants are divided equally into groups according to the language of tuition, with an average age of 19.5 years old. The data was collected in the form of free-response self-descriptions. Then we identified text indicators using content analysis and expert assessment, and calculated correlations (Spearman's rho) between them for each group. In the case of the learning in Russian respondents the optimism correlates with positive self-attitude and excessive self-praise; self-justification is combined with the external perspective of self-description. In the Azerbaijani-speaking group, there is a significant correlation between the parameters of pessimism and self-criticism; self-justification correlates with self-criticism, pessimism, external and internal perspectives of self-description. Such results suggest that the respondents studying in Russian tend to increase their self-esteem in the form of a positive self-representation (by applying self-improvement strategy, characteristic of independent self). While the second group students prefer to avoid negative self-esteem in the form of self-justification. The latter acts as a dominant tendency of self-consciousness and can be related to the self-defense strategy typical of interdependent self. The second group's data also shows significant correlations between parameters: self-criticism and the external perspective of self-description; optimism and normativity, interpersonal relations and self-acceptance. So this group is comparatively more focused on social and interpersonal relations. The identified differences in self-consciousness can be partially attributed to the two types of self-construals: independent and interdependent self, pertaining to individualistic and collectivistic cultures.
TRANSITION AS DYNAMIC SEMIOSIS: THE AUTOETHNOGRAPHIC APPROACH AND TRAJECTORY EQUIFINALITY MODELING

Teppei Tsuchimoto
Tatsuya Sato
Ritsumeikan University (Kyoto, Japan)

This research clarifies the transformational process of transitions in career decision-making for a graduate student who wanted to be a teacher. The study attempts an autoethnographic approach, that is, an ethnographic study about a researcher’s culture, to describe the life trajectories of the experiences of the transition. People are beginning to experience more transitions than ever before because of the complexity of contemporary society. This situation calls for the opportunity to reconsider our views of transition. Transitions occur accidentally, personally, and under the sociocultural context. Therefore, in this study, we regard transition as a dynamic semiosis. In other words, individuals develop their career throughout transitions by getting over “ruptures” that require them to reconstruct the “dominant signs” they believed before. This study focuses on the sociocultural context of the first author’s transition, and more specifically, the period of receiving informal career counseling as a graduate student. Although the local sociocultural contexts of such aspects of the transition are difficult to observe, they often have a significant effect on career development. By adopting the trajectory equifinality modeling method into autoethnographic research, we clarified the dynamic semiosis on the transition, including an interaction between the individual and society. In conclusion, this study suggests that when transitions are regarded as a semiotic dynamic process, they can provide a deeper understanding of how a transition changes the direction of an individual’s goal of career development. This autoethnographic approach contributes to the development of transition research. Further studies could identify more effective methods to describe the dialog on career counseling during transitions.
EXISTENTIAL OVERCOMING OF CATEGORICAL OPPOSITION IN PSYCHOLOGY RESEARCH

Valery Gert
Ural State Pedagogical University (Ekaterinburg, Russia)

The use of the abstract concept of “subject” or the use of the concept of “I” in research can be the main problem of psychology. With the help of concepts — “I” or “subject” — a person is deprived of ontological differences. As a result, the ascent from the abstract to the specific existence (being) of a person does not work, and it cannot happen, because changes in the person himself are not recorded in the ontologization processes and they are rather attributed to the “subject” or “I”. Also, when an individual is opposed to the world or society, he can maintain an interest in the theory of reflection in scientific knowledge, maintain the focus on the gnoseological basis of human development in the processes of self-knowledge, or on the dominance of the processes from society to the individual as socialization (adaptation). The development of the co-being paradigm in the study of human individuality creates an existential perspective on solving methodological problems of psychology.

This was necessary for two reasons. The first is that consciousness, thinking cannot act as an independent structure of relationship with being. The second is that the unity of one person with another destroys the limitations of the individual person and provides him with the exit “beyond” his limits. Attitude to oneself is mediated by the objective attitude of the other towards me, and vice versa. The processes directed “inside” and “outside” of individuality constitute a single process of individualization. Consciousness is not opposed to being, but enters as a structural component in co-being. The processes of interrelation of the main structural components within the integrity of an individual being as a co-being (co-knowledge, co-communication, co-feeling, co-action, co-behavior) generate similar properties among individuals. The alike is generated by the alike. Co-being is that elementary integrity, which is capable of generating an individualized human sociality. In the cyclic processes of co-being, categorical confrontations of consciousness and being, unique and universal, individual and social, as well as confrontation between the “external” and “internal” of the individuality itself are overcome.
POST-MIGRATION LIVING DIFFICULTIES AND MENTAL HEALTH IN REFUGEES AND ASYLUM SEEKERS IN SERBIA

Irena Stojadinović
EFPA Board of Promotion and Prevention; Psychosocial Innovation Network Board Member; (Belgrade, Serbia)

Jovana Bjekić
Institute of Medical Research, University of Belgrade (Belgrade, Serbia)

Maša Vukčević Marković
Psychosocial Innovation Network; University of Belgrade (Belgrade, Serbia)

The risk factors for mental difficulties among refugees and asylum seekers are usually divided into the ones experienced before migration (pre-migration), during migration and after resettlement in the host country (post-migration). Still, as refugees may spend even years in receiving camps or transit countries, the line between transit and permanent host country is blurred. Serbia is generally perceived as a transit country, but many refugees spend several years in this limbo. Thus, this study explores the presence of postmigration living difficulties and their relationships with mental health status among refugees and asylum seekers who have been staying in Serbia for six to 36 months. Total of 306 participants completed Refugee Health Screener 15 (RHS-15) and Post-Migration Living Questionnaire (LDQ), alongside basic socio-demographic questionnaire. The results showed high screen-positive rate (88.4%) in regards to mental health difficulties. The most prevalent postmigration living difficulties are poverty, lack of work permit, isolation and boredom, separation from family and worries about family back home. Furthermore, the majority of living difficulties tend to be more pronounced in those who screened positive on the initial mental health assessment, e.g. little welfare help from either government (r = .30, p < .01) or charities (r = .32, p < .01), fears of being sent home (r = .24, p < .01), poor access to counselling (r = .25, p < .01), etc. Overall, the results imply the need for improved living conditions for refugees, asylum seekers and migrants in recipient countries, regardless of the duration of their stay, in order to protect their mental health and psychological well-being.

BY ACTING SLOWLY, YOU WILL LEARN QUICKLY

Cristina Casadevante
Miriam Romero
Jose Santacreu
José Manuel Hernández
Universidad Autónoma de Madrid (Madrid, Spain)

Casadevante et al. (in press) showed that the response speed while solving a task can be determinant for learning. In their study, children who acted quickly learned less. This study aims at elucidate whether introducing a speed limit can encourage the overall learning level to increase. Therefore, we assessed 183 adult participants using two versions of the Category Learning Test (CLT): a first group (N=86) undertook the original CLT and a second group (n=97) faced the CLT with a speed limitation that did not allow more than one click per second. Then, we compared the results of both groups. As expected, the group that performed the test
with the speed limitation acted slower and obtained a higher average level of learning than their peers obtained. In this way, the response speed while solving a task appears to be a determining variable in the category learning. We believe that teaching students to self-regulate their speed could lead to better academic results.

THE ROLE OF THE SIZE OF THE SMALL GROUP AND INFORMAL SUBGROUPS IN INTRAGROUP CONFLICTS

Andrey Sidorenkov
Southern Federal University (Rostov-on-Don, Russia)
(Rostov-na-Donu, Russia)

This study examines the relationship between (a) the size of groups and the number of informal subgroups in them with conflicts in the context of the group, and (b) the size of the informal subgroups with conflicts in the context of the subgroup. A multidimensional model of intragroup conflict was used, which includes two dimensions: five levels of conflict (i.e., interpersonal (individual–individual), micro-group (individual–subgroup), group (individual–group), subgroup–subgroup, and subgroup–group) and two types (i.e., activity-oriented and subject-oriented). Each level of conflict contains two types. Method: Forty-one work groups — small-size enterprises and units in medium-size and large organizations, with the total sample of 323 workers — took part in the study. Questionnaire of interpersonal conflicts in a group and the questionnaire of micro-group and group conflicts were used. For data processing the regression analysis was used. In the group as a whole, both the size of the group and the number of informal subgroups in it, have a positive relationship with the subgroup–subgroup conflict in both types and subgroup–group subject-oriented conflict, and have a negative connection with the micro-group subject-oriented conflict. In addition, the size of the group is positively related to the subgroup–group activity-oriented conflict, and the number of subgroups is negatively related to the group activity-oriented conflict. In turn, the size of the subgroup is positively associated with the two types of subgroup–group conflict and negatively connected with the two types of micro-group conflict, as well as with the interpersonal activity-oriented conflict at the level of the informal subgroup. The quantitative characteristics of groups and subgroups are predictors of many levels of conflict for two or one type in the context of a group and a subgroup. The multidimensional model of the conflict on which this study was based expands our understanding of this phenomenon and its dependence on the quantitative characteristics of groups and subgroups. Based on this model and research results practitioners (administrators, consultants, etc) can more effectively manage intragroup conflicts by manipulating the size of groups.
HEALTH MANAGEMENT FOR MUNICIPAL AND STATE OFFICIALS IN GERMANY

Stefan Hollenberg
University of Applied Sciences for Public Administration and Management of North Rhine-Westphalia (Köln, Germany)

Health management for municipal and state officials in Germany is an important matter due to the demographic development already now, but will be even more important in the near future. The empirical background (e.g. age distribution, sick leave percentage), theoretical implications and legal conditions of this problem are presented as well as the results of a recent study called “Promoting health management to improve recruiting results in a medium size town public administration in North Rhine Westphalia”. A basic health management concept is discussed within the study. Three pillars of health management seem to be most important: health promoting activities, employee-friendly working conditions and reintegration; last but not least the leadership culture in the organisation has to be appropriate.

ACADEMIC SKILLS OF POLICE COMMISSIONER CANDIDATES IN NORTH RHINE-WESTPHALIA

PRACTICAL TASKS OF AVIATION AND SPACE PSYCHOLOGY IN RUSSIA

Elena Lyssakova
Nikolay Lyssakov
Moscow Aviation Institute (National Research University) (Moscow, Russia)

In Russia, aviation and space psychology is traditionally based on a methodology which combines the natural sciences and the humanities. Technological advances in the aerospace industry are aimed at a continuous build-up of speed, altitude, and trust-to-weight ratio in the conditions of digital technology, the automated control systems (ACS), and new composite materials in the construction of aircraft and spacecraft. The 21st century challenges aviation psychology with both theoretical and practical tasks connected with a new methodology of training the flying staff to use highly-automated planes (Bodrov V.A., 2001; Strelkov Yu.K., 2001; Golikov Yu.Ya., 2003; Ponomarenko V.A., 2007; Gander D.V., 2017; Kozlov V.V., 2018; Ponomarenko V.A., Vorona A.A., 2018). One of the purposes of aviation and space psychology is to make both the “man-machine-environment” system and flight operating reliable and safe. In the paper, we offer historical and methodological analysis of aviation and space psychology in Russia. Now aviation profession takes the setting of “pilot-aircraft-aerospace system”. The combined aerospace system exists in a complex information environment which dynamically changes. Computer systems successfully solve the tasks of piloting and navigation. In modern aircraft the flight control system automatically provides required characteristics of stability and controllability in all range of operational flight modes; it displays main flight-navigation parameters signaling about its state and giving team-requirements for operator actions. However, if a dangerous situation suddenly occurs, a human being will take responsible decisions. Therefore, the personnel should have a high level of such qualities as courage, creativity and responsibility, that is, to combine the best psychological qualities of a cosmonaut, a test pilot. The practical tasks of aviation and space psychology are as follows: working out techniques of balanced training using simulators and in the real flight; development of modern methods of developing the ability to make decisions in emergencies; introduction of psychological selection which helps to assess the prospects for personal development in professional aviation; study of professionally important qualities in ground service specialists; preparation and implementation of long-term space travel; determination of important trends of integrating aviation psychology with space psychology.
MIGRANTS AND NO MIGRANTS: A STUDY OF ACCULTURATION AND SOCIAL WELL-BEING

Paulina Robalino
Natyely Pereda
María José Rifo
Daniela Poveda
Universidad Argentina de la Empresa (Caba, Argentina)

In Argentina, 4.6% of the population is foreign. Until August 2018, 100,604 residence permits were granted. Acculturation is a process of resocialization that involves psychological components and obtaining new skills and social norms. Castro Solano (2011) states that for a person to function effectively in a culture, it is necessary to have five cultural competences: Openness, Autonomy, Acceptance, Emotional instability and Relationships. Furthermore, the process of acculturation involves both the migrant group and the natives thus all involved develop more or less acculturative skills. On the other hand, Keyes (1998) defines social well-being as the assessment that individuals make about their conditions and activities within society. The aim was to analyze the relationship between acculturation and social well-being and to determine the differences between these variables according to the sociodemographic characteristics of Argentinians and migrants residing in Argentina. A convenient sample of 1782 participants migrants (n=442) and Argentinian (n=1340), both genders (62% Female, Meanage= 31.38 years; SD= 11.11). 92% of the migrants were born in American countries (Meanresidence= 7.86 years). Inclusion criteria were aged 18 years or over, born and living in Argentina or have a residence greater than four months in Argentina. The design was quantitative, correlational, cross-sectional and non-experimental. Measures: sociodemographic questionnaire, Inventory of Cultural Competence (Castro Solano, 2012) and Social well-being scale from Keyes (1998) adapted to Spanish by Blanco and Díaz (2005). There are positive correlations (p<.001) between Social well-being and Openness (r=.320), Autonomy (r=.108), Acceptance (r=.319), and Relationships (r=.444) competences. The Emotional Instability correlates negatively with social well-being (r=-.423; p<.001). The results indicate that there are significant differences in Openness (t(1780)= -6.157; p<.001), Autonomy (t(1780)=3.850; p<.001), Acceptance (t(1780)=3.483; p<.01), and Relationships (t(1780)=2.013; p<.05) competences between Argentines and migrants. Migrants have higher acculturative competences than Argentines. There are no differences in Emotional Instability. We found differences in the acculturation competences according to sociodemographic characteristics (sex and age) of migrants and Argentines. Findings are consistent with previous studies (Castro Solano, 2011; Alvarez & Vall, 2013). Limitations and theoretical-practical implications will be discussed.
EFFECTS OF SOCIAL CUES ON METACOGNITIVE MONITORING AND CONTROL — EVIDENCE FROM EYE-MOVEMENT STUDIES

Ning Jia
Zhijie Zhang
College of Education, Hebei Normal University (Shijiazhuang, China)

People make choices and judge their choices on the basis of the information provided by perceptual cues as well as the information from social cues. However, previous researches are mainly focused on perceptual cues, our research paid much attention to study the effect of social cues. In this research, the learning materials consist of pairs of a Russian word and a relative picture, and the “majority-selected situation” serves as social cues. This study imports an innovative research paradigm of judgment of confidence, and uses eye-tracking technology to obtain the implicit data of metacognition. The maximum of fixation time during presentation of a confidence slide as a measure for the implicit monitoring; and measured the implicit control by fixation time allocation during recognition on different items. Then we compared these implicit data collected by eye-tracking with the explicit data of monitoring and control from oral report to analyze the influence of social cues on metacognitive monitoring, metacognitive control and their interrelation. And the study concluded: (1) Metacognitive monitoring is strongly affected by social cues, which appears as ‘believing others’. The trend of explicit monitoring data is coherent with the implicit data, and the implicit monitoring data is more accurate. (2) Social cues have little influence on metacognitive control, which appears as ‘believing oneself’. The trend of explicit control data is coherent with the implicit data. (3) Under the influence of social cues, the interrelation of metacognitive monitoring and control acts in this way: the level of confidence affects the subsequent behaviors, and whether changing the choice or not in turn serves the level of confidence.
Smoking and gambling are often pointed to as examples of problems of self-control and impulsiveness. In the research area of operant conditioning, self-control has been defined as a choice of larger-later gain and impulsiveness has been defined as the opposite of self-control (a choice of smaller-sooner gain). Self-control and impulsiveness have been investigated with both human and nonhuman animals, and many studies have found that adult humans showed self-control in laboratories. Because many adult humans show impulsiveness in daily life (e.g., smoking and gambling), the self-control choice situation based on the traditional self-control choice paradigm might not necessarily correspond to that in daily life. Katayama & Saeki (2018) proposed a new self-control choice paradigm including loss of rewards to measure self-control and impulsiveness choice more accurately. In the present study with 30 adult males and females, we investigated a relationship among choice proportion for the self-control alternative measured by the new paradigm, the scores on self-control or impulsiveness scales that have been used in previous studies (e.g., BIS-11, BSCS), the degree of delay discounting which has been used for an explanation of self-control in previous studies, and the degree of self-reported smoking and gambling behaviors. As a result, choice proportion for the self-control alternative was significantly lower in participants who have smoked for over 20 years than in participants who have smoked for less than 20 years. This result suggests that the new paradigm is valid as a measure of self-control choice. On the other hand, there was no difference in choice proportion for the self-control alternative by the degree of gambling pathology. This result might be caused by relatively lower degree of gambling pathology in this study than in previous studies.
A STUDY ON EXERCISE HABITS OF JAPANESE MOTHERS WITH PRESCHOOL CHILDREN: THE DIFFERENCES IN THE AMOUNTS OF EXERCISE AND EXERCISE SELF-EFFICACY BY THE DURATION OF EXERCISE PLAY WITH CHILDREN

Chihiro Kemuriyama
Gifu Shotoku Gakuen University (Gifu, Japan)

Mitsuhieo Amazaki
Aichi University (Toyohashi, Japan)

The mental health status of mothers who have young children exerts a major influence on the growth of their children. Therefore, it is important for mothers to maintain their own well-being. Regular exercise is assists in relieving stress, reducing depression, improving mood, and alleviating negative emotions. However, women with young children are less likely to engage in adequate exercise than women without children. Self-efficacy is an individual's belief in performing an action, and if a person's sense of self-efficacy in an activity is high, the frequency of undertaking such actions also increases. The purpose of this study is to examine the differences in the amounts of exercise and the exercise self-efficacy scores of mothers with preschool children by the duration of exercise play with the children. A total of 504 Japanese mothers with preschool children (Mage = 34.32 years, SD = ±4.516) completed four questionnaires: a face sheet, the amount of exercise, log of the duration of exercise plays with their children each day, and an exercise self-efficacy scale. Independent sample t-tests were conducted to investigate the differences in the amounts of exercise and exercise self-efficacy by the duration of physical play with their children. The results of the t-tests revealed that the scores of exercise amounts (t[502] = −1.830, p < .10, effect size d = .16), recovery self-efficacy (t[502] = −2.767, p < .01, effect size d = .25) and coping self-efficacy (t[502] = −2.575, p < .05, effect size d = .23) were significantly higher in mothers who were the long-duration exercise play group than the short-duration exercise play group. The obtained results suggest that mothers who spend a longer time in exercise play with their children accomplish more general exercises and achieve higher exercise self-efficacy scores. In particular, the conviction that exercise can be resumed even when exercising is interrupted, and the confidence of coping with barriers and implementing physical exercises are highly demonstrated in such mothers. Future research should consider investigating the relationship between the exercise self-efficacy of children and exercise play with their mothers.
INSTANT EXCLUSION OF THE INTRA-GROUP INTERACTION SETTINGS: STAGES OF DEVELOPMENT

Akhmetzyanova Anna

Being a mandatory component of all people’s activities, their interaction with each other turns out to be a prerequisite for adequate cognition of reality, for the formation of an attitude towards it and behavioral responses based on it. The purpose of the article is the theoretical justification and calculation of the psychometric indicators of the author’s method of express diagnostics of intra-group interaction mindsets. The regulatory function of a social mindset is provided through the functions of adaptation, information, and implementation. The psychodiagnostic resource of method of express diagnostics of intra-group interaction mindsets includes indicators of mindsets for leadership; mindsets for dissociation; mindsets for cooperation; mindsets for rivalry; constructive and demonstrative mindsets organized by continual principle. When defining the basic methodological concept of method of diagnostics of intra-group interaction mindsets, it was decided to use the reflective logic of its development, in which the tempo-dynamic criterion is implemented through the instruction, according to which the task is performed at a fast pace, and the reflective criterion itself was introduced through the organization of the figurative action. Express diagnostics of intra-group interaction mindsets results in the assessment of a mindset focus on cooperation or rivalry in the group as a whole, as well as in the assessment of the system of individual installations of intra-group interaction according to such parameters as constructiveness-demonstration parameters and leadership-distancing.

Keywords: intra-group interaction mindsets, psychometric assessment of the method
SOCIAL STATUS DOMINATES ATTENTION: UNDERSTANDING THE LOW DOMINANCE BIAS OF NON-SPATIAL ATTENTION

Ashton Roberts
Troy Visser
Romina Palermo
The University of Western Australia (Perth, Australia)

The ubiquitous nature, and influence, of social status indicates humans have a subconscious predisposition to navigate these hierarchies. Status is attained through either the evolutionary inherent pathway of dominance (coercion and intimidation) or the human specific pathway of prestige (skill and respect). Individuals who possess greater traits in each pathway are known to more readily attract eye gaze and social attention compared to lower-status peers. However previous research by the authors found that at comparatively early processing stages, when non-spatial attention to status competes with additional stimuli, our allocation of attention is biased to physical features associated with low dominance. Given this unique finding in the social status literature, the current studies aimed to understand why non-spatial attention is biased towards low dominance individuals. The studies had undergraduate students complete modified versions of the attentional blink (AB) paradigm. Study 1 (N = 44) explored the effect of stereotypicality — people initially attend to individuals who differ from the typical stereotype of the group — with dominance manipulated with female faces varying in dominance as the second of two targets (T2) in the AB. Stereotypicality was not supported as T2 accuracy was greater for high and low female dominance. Study 2 (N = 47) explored attention capture and holding — low dominance captures attention fleetingly but high dominance holds attention — using male faces varying in facial dominance as the first target (T1) and randomised numbers as T2. Study 2 supported this theory — at the height of the attentional blink T2 accuracy was significantly reduced for targets that followed high dominance faces, indicating non-spatial attention was significantly held by high dominance. These results demonstrate that although the workings of comparatively early processing stages are tuned to low dominance, high dominance individuals have a greater ability at holding our attention in the face of competition — therefore extending our understanding of how people view and interact with social hierarchies. Further research focuses on exploring the nature of the low dominance attentional bias in individuals with inherent social functioning deficits.
COMPONENTS OF SOCIAL STATUS IN CONTEMPORARY RUSSIAN SOCIETY

Social status refers to the person’s position in society determined by a number of objective and subjective indicators in different scientific knowledge areas. However, different criteria are defined in the conceptions: education, position, income, property, prestige, and others. Analyzing the society’s structure throughout the mankind’s history, L. Johnson noted that the status and criteria underlying it are related to the values shared in society. In order to identify the criteria specific to the Russian society, and to analyze the process of a stranger’s social status perception, we conducted a study consisting of two stages. At the first stage (n=121) we identified social representations about social status to determine the significant components of this phenomenon. At the second stage (n=98) the relationships between the social status (both social-economic and perceived) and the characteristics selected in the first stage were analyzed. According to the representations, the important characteristics were education, profession, wealth, accuracy, and others. 12 videos were selected for data collection at the second stage. For selecting videos, we used the following criteria: gender, age, speaker’s social status. Respondents were offered to watch 3 videos, after each video they were asked to evaluate the speaker on a certain set of 5-point scales which were identified on the first stage, as well as to determine the profession and give a brief description of the speaker. First, there is a correlation between social-economic and perceived status (r=0.41; p=0.01). We found general significant correlations of the perceived and social-economic status with the scales “education”, “wealth”, “confidence”, and others. Characteristics were found with which connections were not established in both cases: “lazy”, “civilized”. Unlike social-economic status, the perceived social status has significant correlations with the category “weakness”, and has no correlations with the characteristics “employed”, “indifferent”. We can conclude that a stranger’s perception is determined by his social-economic status, as well as a number of characteristics related to it. Social status’s significant characteristics are: intelligence, confidence, achievements, sadness, and others. Hereinafter, we plan to expand the sample and conduct a cross-cultural study to compare the social status components and their role in stranger’s perception.
COGNITIVE STATES AND MENTAL MECHANISMS OF THEIR REGULATION

Mark Yusupov
Alexander Prokhorov
Albert Chernov
Kazan (Volga region) Federal University (Kazan, Russia)

The study of mental states arising in problem situations related to the solution of various problems (from social, life to mathematical and technical) in different activities (educational, creative, industrial) led us to the conclusion about the need to highlight the states connected with the process of cognition and cognitive sphere of a person. While studying structural and functional organization of cognitive states we found that cognitive states are manifested as functional structures, including subsystems of metacognitive regulation, emotional activation of cognitive activity, intrapsychic activity and emotional and personal regulation of mental processes. Obtained significant data allow us to believe that the functions of cognitive states are connected with the actualization of cognitive activity, the development of the cognitive sphere, metacognitive regulation, as well as with the change of the person’s attitude to the subject activity and society. Manifestations of these functions in the mental whole and the life of the subject, in our opinion, is determined by the mental regulation of cognitive states. The latter is determined by the influence of semantic structures of consciousness (personal meaning, values, etc.), motivation, reflection, orientation, experiences of the subject, categorical structures of consciousness, mental representations included in the structure of knowledge, as well as the subjective mental experience of a person, whose reproduction in problem situations of life is manifested in the actualization of a certain cognitive state. It can be assumed that the central component of the integral mental regulatory system affecting the actualization, intensity, duration, and other characteristics of cognitive states is the system of “Self” of the subject, the dispositions of which determine the “partiality” and cognitive activity in human life. The system-forming factor of actualization of states is a subjectively significant goal, which is formed under the influence of the functional complex of mental structures’ components, namely, motives of activity and semantic structures of consciousness, reflection, experiences, categorical structures, mental representations, subjective experience and system of the subject. The latter determines the involvement of mental structures in the actualization of cognitive states and their manifestations.
PLACEBO AND NOCEBO EFFECTS IN VISUAL ATTENTION

Carina Höfler
Anne Schienle
University of Graz (Graz, Austria)

Placebos are sham interventions that provoke beneficial cognitive, somatic or affective effects, whereas nocebos, as the opposite phenomenon, induce harmful effects. Recent findings indicate that placebos as well as nocebos are able to alter primary and secondary visual cortex activation and modulate basic visual attentional processes. However, the association between placebo and nocebo effects are poorly understood and discussed controversially until now. In the present eye-tracking investigation effects of placebos and nocebos on visual attention were directly compared in a healthy sample. A sham transcranial magnetic stimulation was administered along with the verbal suggestion that the treatment would either increase (placebo) or decrease (nocebo) left-sided visual attention. Forty participants performed a visual search task once with and once without the placebo or nocebo. Contrary to the suggestion, the nocebo increased left-sided attention in participants reporting left-sided attention deficits, whereas the placebo had no effects. Limits and possibilities of placebo and paradoxical nocebo interventions are discussed.

A JOINT EFFECT OF PERCEIVED ORGANIZATIONAL STIGMA AND ORGANIZATIONAL IDENTIFICATION ON SELF-ESTEEM AND WORK BEHAVIOR: EMPIRICAL EVIDENCES FROM TAIWAN

Hsi-Fang Lai
Institute of Resource Management and Decision Science, National Defense University (Taipei, Taiwan)

Shu-Cheng Steve Chi
National Taiwan University (Taipei, Taiwan)

There is growing attention on organizational stigma in recent years (e.g., Barlow, Verhaal, & Hoskins, 2018; Tracey & Phillips, 2016). However, to date, we do not understand clearly why and when perceived organizational stigma (POSTIG) affects work behavior. We propose that POSTIG undermines self-esteem, reducing organizational citizenship behaviors and increasing deviant behavior. However, we expect this effect to occur more strongly for those with high (versus low) organizational identification. The image and reputation of an organization means more to members who identify more highly with it. When high identification members perceive the organization as stigmatized by the public, they would react more strongly to that stigma and be disturbed by it, leading to a lower self-esteem than those lower in organizational identification, and lower work outcomes. In the study, we developed and tested the validity of a new Perceived Organizational Stigma scale. We tested our hypotheses using a three-wave sample of 310 respondents from a northern army unit in Taiwan, with one month separating each wave. The results of our study provide support of the hypotheses and shows that higher organizational identification enhances the negative personal and work effects of perceived organizational stigma. Mental illness remains a significant contributor to the global burden of disease in many communities worldwide. A survey of the literature has shown that there is little information on knowledge and attitudes regarding mental illness in rural communities. In this paper, the results of a study that sought to investigate a rural community’s knowledge and attitude of mental illness are presented. A cross-sectional survey was conducted in GaDikgale community in Limpopo Province, South Africa. A total sample of 249 participants (female = 187; male = 62) were randomly selected and requested to participate in the study. Data was collected using the Mental Attitude Knowledge Scale (MAKS) and the Attitude Scale of Mental Illness (ASMI). The results reported that there is a significant difference in the level of knowledge towards mental illness by members of the GaDikgale community, based on gender. Male participants were more knowledgeable on mental illness when compared to female participants. With regard to attitudes of mental illness, it was revealed that social distance is prevalent in females than in male participants. However, there were no significant differences reported on age and gender on the stereotyping, restrictiveness, benevolence, pessimistic and stigmatization scales of the ASMI. These results confirm that mental illness can be a burden for the family, contributing to isolation and poor access to adequate treatment. Reintegration after treatment and positive recovery is difficult based on the lack of knowledge and negative attitudes towards individuals diagnosed with mental illness.
THE DIAGNOSTIC VALUE OF THE SUBJECTIVE EVALUATIONS ON THE RORSCHACH: RE-ANALYSIS

Munechika Ito
Gifu University (Gifu, Japan)

The aim of the study was to re-examine our previous findings. Ito, M. & Hattori, S. (2014) had tested whether the subjective evaluations of the participants to their responses were useful for the differential diagnosis on the Rorschach. The previous data was used for the re-examination. 18 psychotic and 22 non-psychotic patients were administered the Rorschach as the daily clinical works in a hospital. And the administration were added to the period after the inquiry, which were asked the subjective evaluation (on the preference or liking) for each of their own responses by ten-point scales. But the examiners were not informed the purpose of the study. The administration and the coding were conducted by the Kataguchi system (most popular in Japan). After that, the codes were translated to those of the Comprehensive system for the statistical analysis. Dealing with the indices (Xu%, X-%, S-% and SE%: the averages of the subjective evaluations, Popular, special scores level 1 & 2) which could be sensitive to reality testing, they were calculated statistically. Logistic regression model indicated that 7 variables (see the above) were most fitted and differentiated psychotics from non-psychotics (Log likelihood = -20.34, chi2 = .044). But the odds ratio of SE% (.79, p = .37) was not significant. Rather, that of Xu% (7.85, p = .02) and Popular (1.60, p = .08) was significant or marginally significant. In this study, we could not demonstrate any differential effects of the SE. But, it is noteworthy that Xu% and SE% is highly correlative only in the psychotic groups (r[psychotics] = -.48, p = .045). These variables may have some diagnostic values even if the special scores and X-% are ineffective. The further research is expected and we will try to do that by more improved approach. References Ito, M. & Hattori, S. 2014 The role of the subjective evaluations on the Rorschach. 19th Congress of the International Society of Rorschach and projective Methods (Istanbul)
ANTECEDENTS OF CONFLICT STYLES IN INTERCULTURAL CONFLICTS: A STUDY IN GERMANY AND RUSSIA

Anastasia Batkhina
National Research University Higher School of Economics (Moscow, Russia)

Based on the socioecological approach to intercultural communication and on the contextual model of interethnic communication (Kim, 2005), the aim of the present research was to examine the predictors of behavioral attitudes in an intercultural conflict at the interpersonal dimensions (values) and at the interethnic dimensions (ICA) in order to form holistic insights about this phenomenon. We conducted similar studies in two countries Russia and Germany wanted to take into account the macro sociocultural context as well. However, we did not implement our study in the classic cross-cultural paradigm as we varied the research conditions across countries based on the actual social situation. We view our research as an emic analysis with elements of etic conceptualization for the systematic identification of behavioral patterns in an intercultural conflict. We conducted a socio-psychological survey using Rahim Conflict Inventory-2 in the modification by Oetzel for intercultural conflicts, Schwartz’s Personal Values Questionnaire-Revised (PVQ-R), and the intercultural communication apprehension scale by Neuliep and McCrosky. The total sample comprised 455 participants including 221 Germans and 234 ethnic Russians.

We used the following statistical procedures: confirmatory factor analysis, partial correlation analysis, hierarchical regression analysis, and multigroup analysis. As can be seen from the findings of the analysis, for the preference of each style one or two values have the greatest explanatory ability whereas the rest one do not have any significant links with the style at all. Despite the statistical differences of the model being tested in two counties, we could draw a number of repetitive in both studies patterns. The self-transcendence values were positively associated with the preference for a style of collaborating. Self-enhancement values were positively associated with the preference for a style of dominating, and conservation values with the preference for a style of avoiding. The high level of intercultural communication apprehension was an obstacle to the choice of collaborating style. These findings were discussed concerning the historical and sociocultural context of the two countries.

LIFE SATISFACTION OF YOUNG STAYERS (WITH AND WITHOUT INTENTION TO MIGRATE) AND RETURNEES AND THE ROLE OF OCCUPATION IN EUROPEAN COUNTRIES

Antonio Jose Rojas Tejada
Jorge L Ordoñez-Carrasco
Andrea Blanc Molina
Laura Piedra Muñoz
Pablo Pumares Fernández
University of Almería (Almería, Spain)

In an increasingly globalized world, migratory movements continue to have a great importance in the defining of European society. Migration experience is characterized by complex processes which involve the interaction of different economic, social, environmental and psychological factors. Many studies have found the relevance of life satisfaction not only as a strong predictor of the migration intention, but also as a mediator between that intention and individual socioeconomic variables and macroeconomic conditions. The aim of this work is to provide empirical evidence of the relationship between life satisfaction and relevant variables for young’s people mobility: stayers (with/without intention to migrate)/returnees and their occupation (Students, Employed and Non-Employed young people). The sample for this study is composed of 17566 persons (18-35 years and 49% women) in nine different European countries (UK, Sweden, Italy, Slovakia, Ireland, Spain, Romania, Germany, Latvia). A questionnaire (using Satisfaction with Life Scale-SWLS-) framed in the EU H2020 project YMOBILITY was delivered by a large-scale panel survey in these countries. A two-way ANCOVA (one per country) was conducted to try to find differences between stayers (with/without intention to migrate)/returnees and occupation in SWLS scores (using age, gender and level of education as covariates). The results indicate, country by country, that both variables have principal effects in SWLS scores, and there is not a statistically significant interaction effect. In all countries, the highest values of Life Satisfaction fit to returned people and stayers without intention to migrate, except in Spain, where only stayers (without) have these high values. In all countries, the highest values of Life Satisfaction match to students and full-time employed people, except in Spain and Italy, where only students have these high values. In all countries, the lowest values of Life Satisfaction belong to unemployed people. These results reinforce the importance of including life satisfaction in migration studies, especially when considering the intention to migrate and occupation in different European countries.
ANALYSIS OF AIR CRASH ACCIDENT: ROOT CAUSE ANALYSIS OF IRANAIR AIRLINES FLIGHT 1974- IR-277

Aliasghar Kazemiafshar
Derya Azık
Türker Özkan
Middle East Technical University (Ankara, Turkey)

Root cause analysis is a tool that helps in identifying what, how and why the accident happened in detail and could provide valuable recommendations for preventing future negative events (Rooney & Heuvel, 2004). Similar to other transportation modes, managing risk and safety is crucial factors for aviation safety that could be managed by the investigation of previous incidents. Therefore, the aim of this study is to investigate the flight IR-277 accident by root cause analysis to understand the main causes (especially human-related causes) of the accident of IranAir Flight 277 in 2011. By the time of this research, the official report has not published. So, the information related to the accident was gathered from interview of survived passengers and unofficial CVR and FDR data report from some pilot’s reliable websites. In the analysis part, the problems were detected by timeline and information mapping technique and determined as "Miss approach at first try", "Wrong decision from cockpit crew after Miss-approach", and "Weak crew management and communication". After determining main problems, in order to find root causes behind these problems, root cause analysis (5 Why Technique) were used. The results showed that human-related factors and bad weather condition are the main contributors. Therefore, at the end of this study based on the root cause analysis results, it is recommended that in order to improve crew response in emergency situation and improve the crew compunction and manager during, flight, organizational culture should be carefully examined and inappropriate applications should be carefully identified that could affect the behaviors and reactions of both ground and flying crew.
AGENCY CRITERIA IN EDUCATIONAL CRISSES OVERCOMING

Elena Leonova
Tsiolkovskiy Kaluga State University (Kaluga, Russia)

The problem of students’ adaptation to new educational level (normative educational crises overcoming, according to Slobodchikov, 2008). Unlike previous re-searches (Barber & Olsen, 2004; Akçınar, 2013; Nisskaya, 2018) we explored this problem from the standpoint of human agency becoming, as well all categories of students have been studied in order to determine the general patterns of the normative educational crises overcoming. The study aimed to explore the general criteria of agency — capacity to use one’s psychological resources to solve problems and achieve goals — during the normative educational crises (crises of adaptation to the new learning conditions) overcoming. 383 students age of 7-18 (81 first-graders, 84 fifth-graders, 110 tenth-graders and 108 freshmen) took part in the study. Students’ agency and psychological re-sources were surveyed at the beginning of the first academic year at the new educational level. Adaptation criteria (informational, behavioral and affective) were estimated at the end of the academic year. By using the k-means method of cluster analysis, each category of students was divided into clusters with similar agency indicators; further we compared agency indicators, abilities, and personal traits in these clusters by U-test and explore correlation links between the psychological resources and adaptation criteria indicators in each cluster by Spearman’s rank correlation coefficient. In each category of students we have found a lot of significant correlation links between the psychological resources and adaptation criteria indicators only in the cluster of students with high agency level. On the other hand, we have found only isolated correlation links (or absence of links) between the psychological resources and adaptation criteria indicators in the clusters of students with low agency level. This confirms our hypothesis that only students with a high level of agency use their psychological resources to successful overcoming of normative educational crises. Students with low agency level don’t use their resources in full: they have negative emotional state as well as problems in learning and behavior despite capacities. Thus, without human agency qualities, both the intellectual and personal resources of students can remain unused during the period of adaptation and further training, the results of the study demonstrated.
OLDER ADULTS’ PERCEPTION OF PSYCHOTHERAPY AND WILLINGNESS TO SEEK PSYCHOLOGICAL HELP

Ioanna Katsounari
Frederick University (Nicosia, Cyprus)

This study aimed to explore older peoples’ attitudes towards, and understanding of, psychotherapy and their willingness to seek out psychological services for themselves. A total of 20 older adults, 10 women and 10 men, aged from 65 to 89 years, participated in semi-structured interviews which were guided by a set of open-ended questions. Thematic analysis identified three themes: the GP as the primary but problematic access point; unfamiliar terminology/familiar concept; and changing attitudes/lingering stigma. Lack of enquiry by GPs, short consultation times and unfamiliarity with psychological terminology were considered barriers for accessing treatment. Participants mostly held positive and accepting views of psychotherapy but a lingering stigma, based on historical values of stoicism and self-reliance, was evident. Reductions in societal stigma were attributed to increased exposure to mental health information via the media, however, participants appeared to confuse psychological services with counselling as this was a term that most were familiar with. Therefore, information communicated mostly through the media should focus on making this distinction clearer.

HUMAN AGENCY AS THE MAIN FACTOR OF LEGAL PSYCHOLOGY STUDENTS’ PSYCHOLOGICAL READINESS FOR PROFESSIONAL ACTIVITY

Elena Leonova
Vali Engalychev
Katya Nikulicheva
Irina Eremina
Irina Sedenkova
Tsiolkovskiy Kaluga State University (Kaluga, Russia)

Readiness for professional activity includes a certain set of knowledge and skills, as well as a person’s comprehension of his goals, motivation, intellectual efforts, responsibility, etc. But school and university education is focused primarily on the transfer of knowledge. We consider the psychological aspect of readiness for professional activity from the standpoint of the concept of agency. Skills required to be forensic psychology experts include strong personality and decision-making capability. Only experts with a high level of agency fully use their psychological resources in order to solve deontological and moral problems in their professional activity. It is impossible to become a true professional in forensic activity without agency qualities, even while having all the other important professional qualities. Second-year (N=30) and fourth-year (N=30) students of Tsiolkovskiy Kaluga State University took part in the survey. The Russian versions of Purpose-in-Life Test (Crumbaugh, Maholick, Leontiev) and Ways of Coping Questionnaire (Folkman, Lazarus, Kryukova) were used to assess agency indicators. We analyzed the results of PLT and WCQ in samples of students. The statistical analysis of the differences in second-year and fourth-year students (U-test) shows that there are statistically significant differences only between the samples of students by the scale Result (U = 316, p = 0.04). But we have found a lot of differences in the relationship between coping strategies and meaningfulness of life scales in these samples. Coping refers to ways of handling...
stressful and troublesome circumstances. It also includes expelling effort to resolve problems and to deal with problematic situations. Problem-focused coping, emotion-focused coping and seeking social support are some of the common coping strategies one may use to deal with stressful situations. There are a lot of stressful situations in forensic psychologists’ professional activity. And their readiness for agency qualities use in stressful situations of moral choice is very important. The results of the studies confirmed that agency is an important factor of the readiness for professional activity. On one hand, high level of agency determines the effectiveness of training activities and readiness for innovation. On the other hand, agency is the fundamental basis for responsible decision-making.

ON THE NATURE OF FORESIGHT: ON THE EXAMPLE OF THE ANALYSIS OF NAPOLEON BONAPARTE’S ACTIVITY

Diana Bogoyavlenskaya  
Psychological Institute RAE (Moscow, Russia)  
Natalya Khakhlacheva  
Moscow Pedagogical State University (Moscow, Russia)

The goal is to outline the first approaches to its (forecast) studying. The next step is an aim of a special research”— writes B.M.Teplov [1]. Method. The Creative Field Method [2] imitates the development of the activity corresponding to the levels of cognition defined by Hegel. On the level of a "unit" a testee masters a new activity staying in its frames. This is the stimulus-productive level, the activity is stimulated from the outside. On the level of "particular"— the heuristic level — the testee analyses the whole system of the activity by his/her initiative and finds out general regularities. On the level of "universal" the defined regularities are explained.

Building up a theory provides the cognition of the essence of an object. But having cognized the essence of a phenomenon it is possible to forecast the qualitative leaps in its development and that fact defines the prognostic abilities of a person. This is the highest level of creativity.

During the Italian campaign of 1796-1797 Napoleon is characterized by a thorough analysis of the situation. By in all his glory it is still the stimulus-productive level. The Marengo battle of 1800 is a result of a comparative analysis of the strategies of the previous battles leads to the discovery of a new strategy reflecting his transfer to the heuristic level. In the Ulm operation of 1805 Napoleon reaches the creative level. Reconsidering a new strategy and then including the whole experience practically leads to building up the theory, defining the strategy; provides the foresight of the enemy’s behaviour to "win a battle by the marches only" and reaches his height and scope in Austerlitz. The analysis of Napoleon’s activity shows that his mind in its structure is identical to the mind of a great scientist and the phenomenon of forecast is possible only at the highest level of cognition.

FACTORS ASSOCIATED WITH A SENSE OF WELL-BEING IN JAPANESE OLD AGE

Toshiko Obokata
Teikyo Heisei University (Tokyo, Japan)

This study examined the factors associated with a sense of well-being among elderly individuals and identified the contributors to good health and longevity by analyzing the life stories of health five women aged 71-88, and nine men aged 65-81 in Japanese. Japan is a super-aging society, and it has estimated that more than 80% of elderly individuals will be in good health in the future. However, good health and longevity are not the only important factors related to aging; it is also important that our elders experience a sense of well-being. The life stories of the participants in this study were elicited using semi-structured interviews. According to the results, all elderlies told that they were happy. This results seemed to be due to the way of the interview. It may have functioned as reminiscence method. For all elder men, the most important aspect of their lives was the work to which they devoted, and the other hand, for women, the relationship with their family. All elderly individuals with a sense of well-being did not fear and accepted their own death, and have not spare any efforts to live at the present time, adapting their physical conditions, with thanks around them.

COGNITIVE PERSONALITY SCHEMES IN COLLEGE STUDENTS

Rocio Tron
Xochitl Torres
Cristina Bravo
Israel Abelleyra
Universidad Nacional Autónoma de México (México, Mexico)

To describe the cognitive schemes of personality among the students of the National Autonomous University of Mexico (Spanish: Universidad Nacional Autónoma de México, abbreviated as UNAM). Our sample for our non-probability sampling was obtained from 662 UNAM students (429 women and 233 men). The total sample was gathered from 6 different departments. The Personality Belief Questionnaire (PBQ), a 126-item assessment instrument that measures beliefs associated with different personality disorders (Avoidance, Dependency, Passive-Aggressive, Obsessive-compulsive, Antisocial, Narcissistic, Histrionic, Schizoid and Paranoid). The questionnaire was applied to a group of students from six different UNAM Departments. Students were explained the purpose of the study and their cooperation was requested, but not without pointing out that their participation should be totally voluntary and if wanted, they could choose not to answer the questionnaire. In case they choose to participate, it was ensured to them that the information gathered would remain anonymous. At the time of comparing the average z scores from the total sample, it could be observed that the students (ME=1.45) are way over the z score criteria for people with psychiatric diagnostic in the antisocial scheme (z=.31), this represented 79% of the students. In the Obsessive-compulsive scheme it’s found that 39% of the sample is above the score criteria for people with a psychiatric diagnosis (z=.31), 31% fit the Narcissist profile, 28% in the Paranoid profile, 9% in the Borderline profile, 7% in the Avoidant profile and only 5% in the Dependent profile. The most striking element from the results is the large amount of students with a high score at the antisocial scheme. The main
strategies correspond to the manipulation, deceit, combativeness, predation and exploitation (Beck, et al., 2005). This result could be related to the current Mexican social context, with high levels of insecurity, violence and intolerance (where it seems to apply the concept “survival of the fittest”). That’s why the strategies previously described could be used to face a difficult daily life.

STRUCTURAL AND INSTITUTIONAL VIOLENCE TOWARDS RURAL MIXTEC WOMEN THROUGH THE “PROSPERA” PROGRAM

Xochitl Torres
Rocio Tron
Olivia Tena
Universidad Nacional Autónoma de México (México, Mexico)

Through “PROSPERA”, which is a Mexican Conditional Transfer Program, the Mexican State imposes women, because of their gender condition, tasks that are extensions of the domestic ones to remain as beneficiaries of this Program. The main objective of this study is to explore, based on their own experience, the way Mixtec women from the community of the State of Guerrero, Mexico, experience their relation with “PROSPERA”. And analyze the possible existence of structural violence towards them as well as the pressure that the activities required by the program may put on them. The research was done from a qualitative perspective, 10 women were interviewed, and direct observations were made in the community. Based on these women’s narration of their experiences, it could be observed that the State of Guerrero, through this program, exerts structural violence. Exerted by those in charge of carrying out the program in the community this violence ranges from the discourse of “poverty” to direct violence, perceived by the women as “mistreatments”. Even when the official documents states that the “PROSPERA” program was designed with gender perspective, knowing these women’s experiences allowed us to identify a different perspective. Since in their stories conditions of local, institutional and structural violence they are put through were identified, it reproduce the role that has kept them at a disadvantage, vulnerable, unequal and generates tension between what they want and what’s imposed to them.
Parents employ strategies to regulate children’s behavior to protect them from excessive internet use. However, as children enter adolescence, they begin to fortify privacy boundaries with parents, and feel less obligated to disclose risk behavior. This study hypothesized that maternal mediation of adolescent internet use might be perceived as the privacy invasion by adolescents, which further provoke defensive behaviors (e.g. disclose the information of internet use), and such defensive behaviors would increase the risk of internet use such as exposure to online risk and internet addiction. Data were drawn from a 2-year longitudinal study of adolescent internet use (ages from 13~16 years old). 678 adolescents and their mothers had completed two waves of data. The variables were mothers’ report of mediation strategies (restriction mediation, α=.80; co-using mediation, α=.91; active mediation, α=.88) at W1, adolescent report of exposure to online risks at W1 (α=.65) and W2 (α=.69), internet addiction at W1 (α=.84) and W2 (α=.94), perceived privacy invasion at W2 (α=.87), and adolescent defensive behavior at W2 (α=.91). Structural equation modeling was used to analyze the proposed model, and the results indicated a good model fit ($\chi^2$ (988)= 2198.15, CFI = .92, TLI=.91, RMSEA = .043 (90% CI = 0.41-.046), SRMR = .054). By controlling online risk at W1 and internet risk at W1, mothers’ report of restriction mediation at W1 was positively correlated with adolescent report of privacy invasion at W2 ($\beta = .18$, $p < .01$), which further correlated with adolescent defense behavior at W2 ($\beta = .66$, $p < .001$). Furthermore, adolescent defense behaviors positively correlated with online risk at W2 ($\beta = .14$, $p < .01$) and internet addiction at W2 ($\beta = .22$, $p < .001$). Compared to co-using and active maternal mediation, restrictive mediation was more likely to be seen as the invasion of privacy by adolescents. When adolescents perceived the privacy boundaries were violated, they tend to use defensive behaviors by disclosing information about internet use, and this would increase the risk of online risk and internet addiction.
MARITAL RELATIONSHIP OF WIVES SUFFERING BIPOLAR DISORDER: DYADIC PERSPECTIVES

Shuchu Chao  
National Changhua University of Education (Changhua, Taiwan)

Chun-Chi Hsu  
New Taipei Municipal Pengfu Elementary School (Taipei, Taiwan)

The purpose of this study was to understand couple relationship with wives suffering bipolar disorder. Most research concerning emotional disorder only included individual data, and most of them focused on depression. Bipolar disorder and dyadic perspectives were rarely as research focus. Narrative approach was used, and two couples were interviewed. The first couple (Snow and Rain) was married for 12-years. The second couple (Cherry and Grass) was married for 4-years. Data were not only analyzed at individual level, but integrated at dyadic level also. The major results could be summarized as the following: 1. The process of marital interaction during the wife's emotional change depressive and manic mood was described. Both husbands knew their wives’ bi-polar disorder before married, but not really understood how the disorder might influence their relationship. During depressive mood, husbands would take the responsibility for caring wives, and wives would express their appreciation and gratitude. However, during manic mood, conflict would be increased, and isolation as well as keeping distance was frequently used as revolution strategies. In this later situation, wife’s family of origin would involve and serve as comforting effect. 2. Both couples struggled with ambiguous extra-marital affairs on the husbands’ side. Snow found out Rain’s suspicious affairs after miscarriage, which had a huge impact on Snow’s emotional stability and their relationship. Grass kept contact with his ex-girlfriend until Cherry had a serious manic episode. 3. As for conflict resolution strategies, when tension increased, Rain would withdraw at first, and then show caring and support to comfort Snow. On the other hand, Cherry and Grass did not withdraw from the tension, and then Cherry would go back to her parents’ home to cool down the conflict. Separation seemed to be a consensus strategy for this couple. In addition to the process of dyadic conflict and revolution strategies, this study also found the support from wife’s family of origin was a crucial factor to maintain marital relationship. The implications for marital therapy when working with wives suffering bipolar disorder couples in Taiwan would be discussed.
The purpose of this study was to investigate family interaction of child with bulimia nervosa. While eating disorder is a wild concern issue in Taiwan, most research focus on anorexia nervosa rather than bulimia nervosa. There are four major themes in current research area in Taiwan. First theme is to explore risk factors for eating disorder. Second one is to investigate the process of psychological recovery. The next one is to evaluate the effects of intervention and treatment. Final one is to discuss social influence on women’s body image. However, regardless the importance of family relationship for child of eating disorder has been documented in family therapy literature, data were often collected from single family member. Without multiple family members’ perspectives, it is difficult to understand eating disorder within relational context. This study employed a narrative inquiry and interviewed two pairs of sisters from two families. Individual participants were interviewed but data were analyzed at both individual level and dyadic level. Finding: The major results are as follows: 1. Characteristics of family with bulimia nervosa children: (1) Inconsistency of family interaction between within and outside of the family: presenting intimacy images outside of the family but among family members, stress and conflict were avoided. (2) The bulimia nervosa child suffered from dilemma of being independent and being intimated with parents. 2. The impact of bulimia nervosa on family interaction at different family level: (1) Couple subsystem: Spouses relationships were transformed from being distant to being close; (2) Parental subsystem: Parents were more tolerant the bulimia nervosa daughter, and allied with the child who functioned better; (3) Parent-child subsystem: Children were close to their mother and took care of father’s emotions; (4) Siblings subsystem: The sister relationships were changed from competing for family resources to being understanding and supportive for each other. Implications for future studies on bulimia nervosa and family therapy would be discussed.
THE CHANGE TENDENCY OF PERSONALITY IN STRESS RESPONSE DURING PERSONALITY RATING

Emi Sato
Tokyo Fuji University (Tokyo, Japan)

Kouhei Matsuda
Tohoku Bunkyo College (Yamagata, Japan)

Reaction Time (RT) is indicative of it is a consciously time voluntary reaction to stimulation sense from giving stimulation to taking place of the reaction. In some performance behaviors, their personality behavior appears in behavior and biological response. In the case of performance as personality rating, it is various behaviors such as thinking your daily life, showing fast response to items, and showing defense reaction, getting lost to Yes/No. And these behaviors may cause some biological reactions. Hypothesis: there is a specific personality traits which becomes a stress factor during of personality rating. In methods, the personality self-rating on the PC was set as three conditions, after that the participants performed questionnaire BIS/BAS (Gray1981) and Big5 personality inventory. During these procedure, we measured HEG, EEG, HR and RT. The salivary amylase values was measured as the stress responses before and after rating by the questionnaire and PC. Non-hierarchical cluster analysis was performed with salivary amylase by k-means method. The participants were 21 university students, 13 males and 8 females. As a result, the following three clusters were obtained.

Cluster-1 (N=6): Amylase before personality rating was high, decreases after rating. Cluster-2 (N =11): Amylase was low and there was no change before and after rating. Cluster-3 (N=4): Amylase before personality rating is low, increase after rating. In the three clusters, questionnaire and HEG were analyzed by 1-way ANOVA. The ANOVA obtained significant differences in the Drive in BIS/BAS (F(2,20)=2.47, p<.10), Extraversion (F(2,20)=5.93, p<.01) and Agreeableness(F(2,20)= 2.20, p<.10) in Big5. Moreover, a significant difference was observed in the variation rate of RT at PC condition rating (F(2,20)=2.37, p<.10). This result showed that Extraversion, Agreeableness and Drive in BIS/BAS, influence biological reactions of the RT due to stress reaction at the time of personality rating. In addition, traits show individual differences in the RT and the HEG. However, because of were few participants in this experiment, there were some traits which has differences that did not lead to a significant. Nonetheless, depending on certain personality traits, it was suggested that it becomes a stress factor when conducting personality ratings.
THE CLASSIFICATION OF PARTICIPANTS BASED ON REACTION TIME INCREASE-DECREASE RATE MODEL ON THE PERSONALITY TRAITS WORD

Kouhei Matsuda
Tohoku Bunkyo Collage (Yamagata, Japan)

Emi Sato
Tokyo Fuji University (Tokyo, Japan)

The reaction time (RT) is the psychological index and indicator of performance that showed the amount and complexity of psychological processing. However, since RT has a certain tendency within individuals depending on the tasks, its variation rate becomes an indicator of individuals. It is difficult to extract individual differences using simple RT. Therefore, we focused on the individual difference in RT by the Dondeis’s subtraction method was extended to the Sternberg’s addition method based on the simple RT of each individual. And the RT increase-decrease rate (sRT) was obtained by the following formula. sRT=(RT-mRT)/mRT. (mRT is an average within participants for each personality trait words of simple RT.) That was the increase-decrease model as an index representing variation with respect to the same stimulus word in the subject. We investigated whether individual personality traits could be classified by sRT. The stimulus word for RT measurement was each four words of five factors from the Big-Five personality inventory, the total was 20=5×4. This experiment consisted of two sessions. In Session 1 was simple matching of audio and visual presentation, in which each traits word 12 trials were performed, total was 240=20×12. In session 2 reacted whether the trait word matches participant’s personality with the Yes key and the No key, in which each traits word 12 trials were performed, total was 200=20×10. The sRT of 20 traits words in session 2 was calculated for based on each average of RT within participant for 20 traits words in Session 1. The participants were 21 university students, 13 males and 8 females. Those 21 participants were classified by hierarchical cluster analysis based on Ward method using sRT obtained from 20 traits words. The index of the distance between the participants was the squared Euclidean distance. As a result, participants were classified into two major clusters. The significant differences were observed in conscientiousness (t(19)=1.97, p.<.05), and in saliva amylase after the task (t(19)=2.33, p.<.05). Those who seriously performed on the task showed a stable tendency with little stress response even after the completion of the task.
FROM FAMILY TO WORKPLACE: HOW THE ADULT ATTACHMENT STYLES AFFECT LEADER-SUBORDINATE RELATIONAL IDENTITY?

Sung-Chun Tsai  
National Taipei University of Education (Taipei, Taiwan)

The demands of successful leader-subordinate relationship in organizations had increased due to technological advances and global economic changes in today's work environments (Gilley, McMillan, & Gilley, 2009), which was an important suggestion that the effectiveness of organizational functioning depends on the effectiveness of these relationships. So the issue of how relational identity of leader-subordinate relationship affects behavior of both parties is getting more and more attentions in recent years. Tsai, Cheng, & Chou (2015) took perspective of social cognitive schema with special focus on the cognition structure and category content of the vertical leader-subordinate relationship. They adopted viewpoint of social cognitive schema to define "relational dyadic role" and by using the two dimensions of "equal/unequal" and "close/distant", the contents of the leader-subordinate relational identity (LSRI) could be classified into four categories: communal affection relationship (equal and close), instrumental exchange relationship (equal but distant), care-repay relationship (unequal but close), and authority-obedience relationship (unequal and distant). They constructed a model of leader-subordinate relational identity. The present study thus chose communal affection relationship (CARI) and care-repay relationship (CRRI) proposes to probe this critical issue. First, the study will explore how the adult attachment styles effect the CARI and CRRI. Second, it will explore if the relationship between the adult attachment styles and CARI/CRRI is mediated by stimulus generalization. It purpose was to understand why the adult attachment styles with parents can transfer to leaders with the perspective of pan-familism. To clarify the relationship between family and the workplace of the two fields. Using 166 employees as sample in Taiwan, the results of regression analysis showed: The secure attachment was positively associated with CARI; the avoidant attachment was negatively associated with CARI and CRRI; the anxious attachment was positively associated with CARI and CRRI. The results of bootstrap method analysis showed: Stimulus generalization plays the full mediator role for the prediction from the secure attachment to CARI and CRRI. The finding supported the LSRI model and pan-familism theory. Theoretical and practical implications for organizations and for the model of LSRI and attachment theory were discussed.
ON THE IMPORTANCE OF UNDERSTANDING AND CONTROLLING PUBLISHING BIAS: A PRISMA SYSTEMATIC REVIEW AND META-ANALYSIS OF RANDOMIZED TRIALS

Julia-Isabel Pritz-Mirtakis
Birgit U. Stetina
Sigmund Freud University Vienna (Vienna, Austria)

The conclusion of several reviews of meta-analytic evidence is that well-developed psychological treatments generally have significant positive effects on the outcome variables. However, several intervention studies show methodological limitations. In addition, one could assume a strong publication bias in the field. The aim of this systematic review is to systematically identify and synthesize relevant studies to answer specific clinical questions about the efficacy and replicability of psychological treatment and the influence of publishing bias and a way to control them. Publication bias has been a topic of much discussion in the last decade. Preferably publishing papers with significant results leads to the false assumption that a certain treatment or method is more effective than it actually is, but realizing this can be hard if the unpublished results are not available. The present review followed the preferred items for systematic review and meta-analysis (PRISMA) Checklist 2009. We researched Papers from January 2014-September 2018 using the following databases: PsycInfo, PsyARTICLES, PsycNET, PubMed, Google Scholar. With a PRISMA aided search through PubMed and Ebscohost, 17 papers show that the problem of publication bias in the field of psychology have been found and reviewed. Findings: 7 published papers are meta-analysis, reviews and trials to show that publication bias actually is a problem in the field of psychological research, ten studies provide possible solutions. Including the Bayesian method, beta-weight density models, reading of p-curves, individual mathematical approaches to diminish publication bias in studies with problematic sample sizes, and an experimental approach of blinding the peer-reviewers to the results of the studies. In conclusion, the results of our review show that publication bias is a problem that still needs a solution everybody can apply and agree on. The present results suggest that it is necessary to understand and control publishing bias. Publication bias in clinical trials has a direct impact on patients’ and populations’ health and there are a number of steps that may be taken to identify and reduce the risk of publication bias. Additional implications and benefits for research and clinical practice are discussed.
EMOTIONAL REGULATION OF PROFESSIONAL SUCCESS FOR SOCIONOMICAL AND SOCIOTECHNICAL REPRESENTATIVES

Olga Dotsenko
Irina Bondarenko
Psychological Institute of Russian Academy of Education (Moscow, Russia)

The focus of this study is the role of emotional processes as regulators of professional activity. We used B&B theory (Fredrickson, 2001), three dimensional model of work engagement (Schaufeli&Bakker, 2004) and JD-R model (Demerouti et. al. 2001, Schaufeli&Bakker, 2004), the concept of emotional orientation of a person (EO) (Dodonov, 1978) as theoretical basics of research. The sample group was composed by representatives of socionomical (N=338) (doctors, teachers, managers) and sociotechnical (N=162) (power engineering specialists, programmers) jobs. To gather empirical data a methodic complex was worked out aimed at diagnostics of emotional sphere, personal characteristics, indices of professional activity positive phenomena and burnout. The novelty of the approach presented in the study lies in the diagnostics of a complex element: emotion related to personal value and experienced in the certain context- professional activity. Cluster analysis revealed profiles of EO typical for successful and unsuccessful performance of socionomical and sociotechnical jobs’ representatives. We conclude that workers’ EO can be seen as an universal personal source of resistance to burnout regardless of profession. An emotionally motivational functional block was singled out for sociotechnical workers. It includes EO with motives of professional activity and temperamental characteristics. As a stable element, it actively regulates professional activity increasing successfulness and satisfaction and at the same time decreasing burnout. For socionomical jobs’ representatives there were singled out positive correlations between emotional orientation, emotional intellect, intrinsic motivation, work engagement, satisfaction job and successful professional activity self-esteem, negative correlations were tied with indices of burnout. We used discriminant analysis to distinguish four empirical types for this group of specialists, which differ in indices of the emotional sphere and positive phenomenon of professional activity. Results achieved by structural modeling allow us to speak of altruistic EO and “personal understanding emotions” emotional intellect index as vitality and professional activity successfulness predictors. The results of the study revealed the mechanism for keeping intrinsic motivation and work engagement at high level by means of emotional regulation. The role of emotion regulation in increasing subjective professional successfulness, precautions, corrections and decreasing burnout for sample groups is defined.
POWER OF IMAGINATION: A SHORT-INTERVENTION TO REDUCE EXPLICIT AND IMPLICIT STIGMA ABOUT DEPRESSION WITH IMAGINED SCENARIO

Jennifer Schuhl
Eric Lambert
CeRCA (Center of Research in Cognition and Learning) Poitiers University and CNRS (Poitiers, France)
Armand Chatard
CeRCA (Center of Research in Cognition and Learning) & Henri Laborit Psychiatry Hospital, Poitiers University and CNRS Hospital (Poitiers, France)

Evidence suggests that stigma is cause of concern for people with depression (McNair et al, 2002). There have been many studies of stigma associated with mental disorders. Only a few focused on the possibility of reducing stigmatization of depressed people. This study extends previously conducted research by testing the contact hypothesis (Pettigrew & Tropp, 2006) using imagined contact intervention (Miles & Crisp, 2014) to reduce depression stigma. It has been shown that, imagining a positive interaction with an outgroup member can improve physiological reactions and behaviors towards outgroup members, intergroup tolerance and reduce the explicit but also implicit attitudes (Crisp & Turner, 2009). Imagined contact appears to be a simple strategy to reduce prejudice. Only one study tested the effects of imagined contact on depression stigma (Na & Chasteen, 2016) and to our knowledge, none tested this procedure to reduce implicit prejudice about depression. An explicit change in attitudes might not translate into implicit attitudes and all effects about other outgroups may not necessarily impact the major depression stigma. Research is needed to examine whether imagined contact can reduce prejudice towards depression on explicit and implicit attitudes. We predicted that a 5-minutes imagined contact intervention could reduce explicit and implicit prejudice towards people with depression. We adapted an imagined contact intervention (West, Holmes, & Hewstone, 2011). We asked the participants (N = 62) to imagine a positive interaction with depressed (imagined contact condition) or non-depressed person (control condition). Explicit measures (Wright, Aron, McLaughlin-Volpe & Ropp, 1997) and implicit semantic priming subliminal test (Spruyt, Gast, & Moors, 2014) were completed before and after the imagined task. Participants filled a visualization abilities questionnaire (Marks, 1973) at the beginning. Negative attitudes towards depression were less negative amongst the group who imagined interacting with depressed person versus the control group, independently of the initial measures, on explicit and implicit attitudes. Visualization abilities did not moderate these effects. Imagined contact can reduce explicit and implicit prejudice towards depression. These findings have important practical implications to reduce prejudice, when people have little opportunity for real contacts or amongst social groups with a long history of conflict.
THE RELATIONSHIP BETWEEN CONSCIOUS SELF-REGULATION AND SUBJECTIVE WELL-BEING OF SCHOOLCHILDREN: A LONGITUDINAL CROSS-LAGGED ANALYSIS

Tatiana Fomina
Varvara Morosanova
Psychological Institute of the Russian Academy of Education (Moscow, Russia)

Recent studies show the importance of self-regulation in providing a person’s subjective well-being (SWB) (Elliot, et al., 2011; Hofer, et al., 2011). However, there is not enough data on the dynamics of this relationship across time and self-regulation significance in predicting the optimal level of students’ SWB. Present study tried to explore the longitudinal relationship between self-regulation and SWB. We assumed that conscious self-regulation plays a significant role in predicting the pupils’ SWB during their transition from primary to secondary school. Two-wave longitudinal panel design was used to obtain the data on the pupils’ self-regulation and SWB. T1 data were collected on a sample of 4th grade pupils (N=156), T2 data were collected 7 months later, when they moved to grade 5 (N=188). In Russia, grade 4 is the end of elementary school and grade 5 is the beginning of the secondary level. 118 pupils (46% boys, 54% girls) completed T1 and T2 questionnaires. The average participants’ age was 10.31 years (SD = 0.47) at Time 1 and 10.81 years (SD = 0.42) at Time 2. Morosanova’s Self-Regulation Profile Questionnaire — Junior (Morosanova, Bondarenko, 2015) consists of 7 self-assessment scales: Planning goals, Modeling significant conditions, Programming activity, Evaluating results, Flexibility, Independence, and Responsibility. SR general level is estimated by summing up the scores. Multidimensional Students Life Satisfaction Scale (MSLSS) (Huebner, 2001, Russian adaptation by Gordeeva, Osin, 2007) was used to assess satisfaction of schoolchildren in important life domains, including family, school, self. We used AMOS 4 with maximum likelihood estimation to test and compare a series of nested cross-lagged panel models. The cross-lagged pathway from Self-Regulation at T1 to Subjective Well-being at T2 was significant. The fit statistics for this model: $\chi^2(14) = 14.69$, df = 22, GFI = .97, CFI = 1.00, RMSEA = .00, PCLOSE=0.97. Thus, the cross-lagged path modeling analyses demonstrated that pupils’ self-regulation features are a significant factor in predicting the level of their subjective well-being. Higher development of regulatory abilities of the 4th grade pupils predicts their subjective well-being in grade 5. The reported study was funded by RFBR, research project № 17-36-00037.
GOOD ONLINE PRACTICES TO COMBAT BULLYING

Gabriella Scaduto  
Riccardo Bettiga  
Lombardy Regional Board of Psychologists Project  
(Milano, Italy)

Luca Bernardo  
Casa Pediatrica of Fatebenefratelli Sacco Hospital  
(Milano, Italy)

Francesca Maisano  
Fatebenefratelli Sacco Hospital (Milano, Italy)

Fabio Sbattella  
Università Cattolica del Sacro Cuore di Milano (Milano, Italy)

As part of a project titled “Psychology in support of children’s and adolescents rights” implemented by the Lombard Board of Psychologists, a study has been carried out on bullying and cyber bullying in collaboration with the Casa Pediatrica, a paediatric service run by the Fatebenefratelli Sacco hospital, the first hospital in Italy that offers a full service to both victims and bullies. The research aims at providing an overall picture of the perception Italian minors have nowadays with regard to the extent of bullying and cyber bullying in schools and on social networking sites. The sample examined was recruited from among the 1200 minors residing in Lombardy who have requested help from the Paediatric Services. 312 questionnaires were distributed to the sample, consisting of 155 respondents aged between 6 and 10 years (49.7% females, 50.3% males) and 157 respondents aged 14-18 (48.4% females and 51.6% males). The data were collected personally by three researchers in the form of a structured questionnaire, requiring open-ended answers.

49.7% of the children say they have witnessed "others engaged in acts of bullying" and 36.1% state that they "have been bullied themselves"; only 13.5% admits to "having bullied others". 36.8% of respondents also declare that they "own a Smartphone". 31% of the children making up the sample state that they have received "verbal abuse, insults, mockery, threats, extortion or inappropriate proposals on social networking sites". As far as adolescents are concerned, 84.1% of the sample say they own a Smartphone. 46.5% of adolescents declare that they have witnessed "acts of bullying by others", 35.7% say they have "been bullied" themselves. Only 17.8% of the sample admit to "having been a bully". So, on an overall basis, 60% of the minors questioned declare that there have been episodes of bullying in their schools. 47.7% of the children and 57.3% of the adolescents report having received verbal abuse, insults, threats, mockery, extortion or inappropriate proposals on social networking sites. The percentage of cyber bullying victims is higher among girls in both age groups.
IDENTIFICATION OF THREE-DIMENSIONAL MOLECULES BY EXPERTS AND STUDENTS IN CHEMISTRY AREA

Yulia Ishmuratova
Psychological Institute of the Russian Academy of Education (Moscow, Russia)

Irina Blinnikova
Moscow State University (Moscow, Russia)

The research was aimed to identify the features of solving representative tasks at different levels of professional experience. In this study, we compared eye movement characteristics of experts against students in chemistry area while solving chemical test tasks. Participants in the study were 42 chemists with two different levels of professional experience: 21 chemistry experts, 21 students. The stimulus was an image of molecules on the left side of the screen and the answers on the right side of the screen. Participants had to identify the molecule and click on the answer they consider correct. Two types of tasks were designed: the first type included the answers in the form of chemical formulas, the second — in the form of verbal designation. 32 test tasks were developed. Time was unlimited. Stimuli were presented on a 23-inch screen with a 1920x1080 pixel resolution, using the software SMI Experiment Center. The eye movement data were recorded with an SMI iViewX Hi-Speed 1250 tracker with head support. Students were significantly faster in solving tasks if the answers were formula-presented. For experts there are no differences in time of finding the right answer among formulas or among verbal designations. Two areas of interest (AOI) were selected: the first AOI — a graphic representation of the molecule, the second AOI — answers. Significant differences between groups in both AOI were found: students had longer average fixations on AOI «answers», experts — on AOI «molecule’s image». It was also found that students’ gaze was significantly longer in the AOI «answers», the gaze of experts — in the AOI «molecule’s image». Significant differences in revisits were found: students made more returns in each of the AOIs. Two different strategies for solving chemical tasks were discovered. Experts identifying molecule, recognize what substance is that, and then look for its designation in the list of answers. They spend more time on area of molecule’s image. Students prefer repeatedly compare the molecule with the designations presented, they spend more time on answers-area. Apparently, for students, area of answers had more information than molecule’s image. The study was sponsored by the RFBR research grant №18-013-01240.
RELATIONS OF INFORMATION PROCESSING SPEED TO INTELLIGENCE AND PERSONALITY CHARACTERISTICS IN HIGH ABILITY SCHOOL STUDENTS

Elena Shcheblanova
Psychological Institute of the Russian Academy of Education (Moscow, Russia)

The literature regarding speed of information processing in relations to cognitive and non-cognitive characteristics in high ability children is limited and inconsistent. Our study aimed to examine the interrelations of information processing speed to intelligence, creativity, self-concept, and emotional peculiarities in secondary school children with average and high intellectual abilities. A total 120 students (equally boys and girls) were investigated two times: in grades 9 (14-16 years) and 11 (16-18 years). They were divided into two groups. The control group included 60 ordinary (unselected) students, and the gifted group included 60 students preliminary selected according to the teachers’ ratings and testing of abilities (the top ten percent). We used the following methods: the Number-Connection-Test by Oswald; the Cognitive Ability tests (verbal, mathematical, nonverbal, and general abilities); the Tests of Creativity "Unusual Uses"; the Questionnaires on Anxiety and Self-concept; learning achievements. The results showed a significant growth of the speed processing with age in both student groups, but at the same time, the gifted students significantly exceeded the control group students on these variables both in the grades 9 and 11. The correlation analysis demonstrated high stability of processing speed and its significant positive interrelations to mathematical, nonverbal, and general intellectual abilities. The correlations of processing speed with variables of verbal abilities, academic self-concept, and achievement were lower but also meaningful. In contrast, the significant correlations between processing speed and the manifestations of anxiety were low and negative. The results of analyses of variance (ANOVAs) showed the influence of the level of information processing speed on the mathematical, nonverbal, and general intellectual abilities both in grades 9 and 11. We did not observe gender differences in speed of information processing at these ages. Overall, the findings support the usefulness of the measure of information processing speed as one of the components in identifying of the intellectually gifted secondary students.
IDENTIFYING CULTURAL MARKERS ON GERMAN AND CHINESE E-COMMERCE WEBSITES

Sandra Bendler
Leibniz University Hannover (Hannover, Germany)

During the last decades the World Wide Web became one of the most popular instruments of communication, advertising and leisure activities. Websites can be seen and used by people from different cultural backgrounds. Therefore, the interface should be constructed appropriate to the cultural target groups and their preferences in order to facilitate usability and to enhance trust, satisfaction and E-loyalty among different users (Cyr, Kindra & Dash, 2008). This process is called localisation, and is built on cultural markers. Based on the work of Cyr and Trevor Smith (2004), this study suggests a method to find and evaluate these cultural markers and to test this method by comparing German and Chinese shopping websites. Considered design elements include language, layout, symbols, content and structure, navigation, multimedia and colours. Different characteristics of these elements have been operationalized in order to compare 50 German and 50 Chinese shopping websites more easily. Links to these websites will be randomly selected from different web archives and rankings of shopping websites. Expectations about the resulting differences derive from Hofstede’s (1980) investigations on cultural dimensions, Hall’s (1990) high/low-context dimensions and previous research in the area of localisation and website design (e.g. Cyr & Trevor-Smith, 2004). The survey instrument and the corresponding manual were repeatedly tested and improved, to guarantee a high level of understanding and objectivity. The aim is to enable people to use this survey in order to compare typical website patterns from different countries. Parts of this comparison will be automatized through a cooperation with an institute of computer science. As a result, evaluation of different markers is expected to become far easier and more efficient. This will allow cultural psychology and usability research a deeper insight into existing cultural website differences. References: Cyr, D., Kindra, G. S., & Dash, S. (2008). WORLD CULTURAL HERITAGE AS A STARTING POINT FOR SUSTAINABLE EDUCATION

Sandra Bendler
Joachim Grabowski
Leibniz University Hannover (Hannover, Germany)

For a long time culture was the “invisible dimension” in the field of sustainability (Sorgo, 2011). However, culture provides opportunity to debate, critically reflect and stimulate how we think, believe, and behave. Moreover, culture creates a surrounding where values and attitudes can be developed, changed, questioned or expanded, which may in turn affect our understanding of the past, the present and the future. Under these premises, culture and cultural education significantly contributes to our efforts to create a society that values sustainability and acts according to this principle. To reach this goal we have to think about how cultural information and processes can and should be taught in different educational systems. This project tries to fill this gap by investigating the interests, values and conceptions of young people concerning world cultural heritage. Based on the results of a previous, explorative and qualitative part of our project, we created a teaching unit. This unit entails material-based discussions, individual tasks and group work. The structure follows the model of value creation by Meyer (2014). It is used to design the main topics: expectations about characteristics, criteria of UNESCO, the red list and local and international consequences of destruction of heritage sites. We examined different dimensions of interest, knowledge and attitudes towards world cultural heritage at three different measurement points. These measures and the teaching unit were conducted in 8 classes ranging from 9th to 11th grade from different urban comprehensive schools. First results show that students know very little about world cultural heritage, but display a lot of interest. This project offers ways to integrate and evaluate the subject of “culture” in the education system. The unit offers a framework for teachers and other professionals that can be flexibly used in different school subjects. Furthermore, the collected qualitative and quantitative data will provide a profound understanding of the examined knowledge and attitudes of students towards cultural heritage. References Meyer, C. (2014): Kulturbewusstsein als Schlüsselkonzept für (geographische) Bildung. In: Meyer, C. (Hrsg.): Kulturbewusstsein als Schlüsselkonzept für Bildung und Identität. Frankfurt: Peter Lang. Sorgo, G. (2011): Die Unsichtbare Dimension. In: Sorgo, G. (Hrsg.): Die unsichtbare Dimension. Bildung für nachhaltige Entwicklung im kulturellen Prozess. Wien: FORUM Umweltbildung.
The visual system is sensitive to both 2D mirror- and 2D rotational-symmetry. It has been shown that the human visual system is also sensitive to 3D mirror-symmetry and 3D mirror-symmetry is a critical a priori constraint for perceiving a 3D shape of an object veridically (Pizlo, Sawada, Li, & Steinman, 2014). These effects of 3D mirror-symmetry can be explained by geometrical properties of 3D mirror-symmetry. Note that 3D rotational-symmetry also has geometrical properties similar to those of 3D mirror-symmetry (Sawada & Zaidi, 2018). We studied perception of 3D mirror- and 3D rotational-symmetry from single 2D images in a psychophysical experiment. Human performance in discrimination of 3D symmetric pairs of contours from 3D asymmetric pairs of contours was tested using the method of signal detection. The performance for detecting 3D mirror- and 3D rotational-symmetry was tested in separate blocks. The 3D asymmetric pairs of contours were generated by adding 3 levels of distortion to the 3D symmetric pairs of contours. The experiment consisted of 6 blocks (2 types of 3D symmetry x 3 levels of the distortion) and each block consisted of 2 sets of 100 trials (3D symmetric and 3D asymmetric pairs of contours). The performance was evaluated by the discriminability measure d-prime in each block. Four participants, including the two authors, participated the experiment. The results of this experiment show that human performance in the discrimination was reliable only with the 3D mirror-symmetric pairs of contours (d-prime = 0.9) but was almost at chance level with the 3D rotational-symmetric pairs of contours (d-prime = 0.1). The performance becomes better with higher levels of the distortion (F(2,18) = 4.807, p = 0.02). We found a significant difference of discrimination performance between the two types of 3D symmetry (F(1,18) = 14.597, p = 0.001). This result suggests that the visual system processes these two types of symmetry very differently while they have similar geometrical properties.
The Draw-Your-Family-as-an-Animal Test (DFA) is one of the drawing tests in which the individual is instructed to draw his/her family as an animal. We administered the DFA and the Specific Adjectives Scale for impression-evaluation to 90 Japanese students, to investigate their images of their selves, father, and mother. The results indicated that (1) animals representing the self included cats, rabbits, dogs, and squirrels drawn most often by female students, and cats, turtles, and dogs drawn most often by male students. Dogs, lions, elephants, and bears were drawn most often as animals representing the father, whereas cats, dogs, lions, and birds were drawn most often as animals representing the mother. (2) The cases where the animal representing the self coincided with their favorite animal were 31.3%, and those coinciding with a hated animal were 2.2%, and in such cases the animals were not drawn facing the front. (3) Factor analysis showed that the Specific Adjectives Scale yielded three factors: extroversion, agreeableness, and conscientiousness. The impressions about mother were the most positive with high scores on the three factors, and the impressions about self were the most negative with low scores on the three factors. Moreover, negative impressions of the self, father, and mother occurred when cats were frequently drawn as the representative animal, and positive impressions of father and mother occurred when lions were frequently drawn as the representative animal. The results suggested that cats were the most often drawn animal representing self and mother, and that students who had negative impressions about self, father, and mother depicted cats as the representative animal. For these students, the most negative impressions reported were about the self and the least negative impressions were about their mother. These results will be valuable DFA data for use in clinical situations. Further cross-cultural comparison with Malaysian samples will be conducted in order to understand the DFA internationally.
Upon entering college, students have a greater chance of sharing a grade-level with other students younger and elder than themselves. Such age differences have the potential to greatly influence students’ level of interaction. Moreover, hierarchical factors, such as differences in age and social status, are especially likely to be considered by people in Korea during social interaction. For this reason, it is expected that differences would be found between Japanese and Korean college students regarding the influence of hierarchical factors on relationship formation. In the environment of a school where the grade that becomes the standard of the hierarchical relation is decided, the consciousness of the hierarchical relationship will become strong. It is also assumed that the level of involvement between students would change depending on the circumstance in which they meet. In this paper, questionnaire surveys focusing on both ideal and actual situations of student interaction were administered to a sample population of Japanese and Korean college students to identify how setting and hierarchical factors may affect relationship formation among students of different ages who are in the same grade-level. The findings comprised three distinct cases, (1) on-campus relationships with elder students from the same university, (2) off-campus relationships with elder students from the same university, (3) off-campus relationships with elder students from another university. In each of these three cases, the responses of the Korean students significantly differed from those of the Japanese students for all question items. The Korean respondents had higher scores than the Japanese respondents, suggesting that Korean college students are more motivated to be equality relationship and give less importance to hierarchical factors, such as age differences, than Japanese college students. Within the university environment in Korea, it is possible that the way students think about relationships with people of or near their same age differs from the conventional one.
THE ROLE OF EMOTIONAL/PHYSICAL ABUSE AND PARENTAL STYLES ON EMOTIONAL INTELLIGENCE IN A MIDDLE CHILDHOOD SAMPLE

Fatih Bayraktar
Eastern Mediterranean University (Famagusta, Cyprus, Turkey)

Salovey and Mayer (1990) described emotional intelligence as the attend to, ability to, understand and regulate emotions to lead thought and behavior. Model of Emotional Intelligence (Mayer and Salovey, 1997) includes four different mental skills; perception of emotion, use of emotion to simplify thought, understanding of emotion and management of emotion. Studying emotional intelligence in middle childhood can be particularly important because it was consistently stated that a few dimensions of emotional functioning such as the skills to perceive, express and regulate emotions and to sympathize and empathize influence children’s competence in social settings (Hubbard & Coie, 1994; Mavroveli, Petrides, Sangareau & Furnham, 2009). On the other hand abusive environments were especially found to be harmful in the development of emotion perception, understanding and regulation of emotions (Maughan & Cicchetti , 2002; Pollak, Cicchetti, Hornung, & Reed, 2000; Shipman & Zeman, 1999). Relatedly efficient/inefficient parenting is important for intellectual, physical, social and emotional development of children (Phillips, Conners & Curtner-Smith, 2017). Also self-esteem as an indicator of psychological well-being was found to be associated with higher emotional intelligence (Ciarrochi, Chan, & Bajgar, 2001; Ciarrochi, Chan, & Caputi, 2000; Dong, Urista, & Gundrum, 2008). Based on this theoretical background we hypothesized that perceived physical/emotional abuse and neglect, and perceived authoritarian parenting style would be related with lower emotional intelligence while self-esteem and perceived authoritative parenting style would be related with higher emotional intelligence. A total of 250 students were recruited from eleven public primary schools of Northern Cyprus. All measurement tools were reliable with Cronbach Alphas between .72 and .91. A hierarchical regression analysis with four steps was conducted. In the first step age, gender and the education of parents was entered as control variables. Self-esteem, parental styles and physical/emotional abuse and neglect was entered in the following steps respectively. The findings indicated that self-esteem ($\beta = .164, p < .05$), authoritarian parenting ($\beta = -.208, p = .006$) and emotional abuse ($\beta = -.195, p < .01$) predicted emotional intelligence. These findings imply that harsh parenting with abuse of emotions is a threat for a positive emotional development while self-esteem still seems to be a protective factor.
PSYCHOLOGICAL AND SOCIOCULTURAL ADJUSTMENT OF YOUNG NATIVES AND SECOND-GENERATION IMMIGRANTS IN SPAIN

Antonio Jose Rojas Tejada
Andrea Blanc Molina
Maria Sanchez-Castello
Jorge L. Ordoñez-Carrasco
Marisol Navas Luque
University of Almeria (Almeria, Spain)

Europe has become one of the main destinations for immigrants from different parts of the world, but the studies about psychological and sociocultural adjustment of young immigrants living in European countries are still scarce and their results are inconsistent. Some studies show that immigrants have a worse adjustment (psychological or sociocultural) than natives, while others studies found opposite results or no differences between both groups. Because, second-generation immigrants have spent the most important years of their development exposed to two different cultures and negotiating between two different identities, this study aims to compare the psychological and sociocultural adjustment of these youth living in Spain with the adjustment of young natives. The study is framed in I+D+i National Project Prejudiced attitudes, acculturation process and adjustment of immigrant and native adolescents founded by the Spanish Ministry of Economy, Industry and Competitiveness (PSI2016-80123-P). The sample consists of 1651 students (M = 14.99; SD = 1.42), of which 1114 were native and 537 were immigrants of second-generation from three ethno-cultural groups in Spain (286 Moroccans, 152 Ecuadorians and 99 Romanians). Participants filled out a self-report questionnaire regarding their life satisfaction (an indicator of psychological adjustment), their school adjustment (an indicator of sociocultural adjustment) and their socioeconomic status. A two one-way ANCOVA using the two indicators of adjustment as dependent variables (and socioeconomic status and age using as covariates) was conducted. Results show that there are not statistically significant differences between natives and Moroccans, and natives and Romanians in life satisfaction, but these differences appear in school adjustment. Young natives have a worse school adjustment than the other groups mentioned. Regarding the comparison between natives and young Ecuadorians, statistically significant differences were not found in none of the two indicators. We could conclude that second-generation immigrants do not seem to have a worse adjustment (psychological or sociocultural) than their native peers. In fact, depending of the ethno-cultural origin, some second-generation immigrants (Moroccans and Romanians) show a better sociocultural adjustment than natives.
FAMILY’S INFLUENCE ON THE ACCULTURATION PROCESS OF MOROCCAN ADOLESCENTS IN SPAIN

Antonio Jose Rojas Tejada
Andrea Blanc Molina
Maria Sanchez-Castello
Jorge L. Ordoñez-Carrasco
Marisol Navas Luque
University of Almeria (Almeria, Spain)

Acculturation is a very complex process that is influenced by numerous variables. Several studies have found that family variables such as perceived social support from family, familial ethnic socialization, and parent-adolescent communication have a significant impact on the process of acculturation of different ethnocultural minority groups. The aim of this study was to analyze the relationship of these family variables with the acculturation variables in Moroccan adolescents in Spain. The study is framed in I+D+i National Project Prejudicial attitudes, acculturation process and adaptation of immigrant and native adolescents founded by the Spanish Ministry of Economy, Industry and Competitiveness (PSI2016-80123-P). Three hundred and fifty eight Moroccan adolescents (58.7% female), ranging in age from 12 to 19 years (M = 15.16; SD = 1.36), were selected by incidental sampling in 17 Spanish public high schools. They completed a questionnaire that included sociodemographic variables, measures of perceived family support, family ethnic socialization, parent-adolescent communication, and indicators of acculturation perceptions and preferences (maintenance and adoption) according to the Relative Acculturation Extended Model (RAEM; Navas et al., 2005; Navas & Rojas, 2010). The Pearson coefficients correlations show that Moroccan adolescents that prefer to maintain and perceive to maintain their culture of origin have higher perceived family support, higher family ethnic socialization, and better communication with their parents than those who do not prefer to maintain and do not perceive maintain their culture of origin. The mediation analyses indicate that family ethnic socialization and mother-adolescent communication mediate the relationships between perceived family support and maintenance perceptions and preferences. Finally, the Pearson coefficients correlations show that adoption perceptions and preferences (Moroccan adolescents that prefer to adopt and perceive to adopt the host culture) are significantly positively correlated with perceived family support, and adoption perceptions are significantly positively correlated with parent-adolescent communication, but these correlations are small. It is concluded that family variables have a stronger impact on the maintenance of the culture of origin (home culture) than on the adoption of the host culture in Moroccan adolescents living in Spain.
The contribution of individual psychological features to the determination of the phenomenon of work alienation in the “person—person” professions type

Anastasiia Kozhina
Leonid Vinokurov
Herzen State Pedagogical University of Russia (St.-Peterburg, Russia)

Work alienation is a subjectively experienced state associated with the destruction of interpersonal communications, expressed in the perception by employees of powerlessness, meaninglessness, self-estrangement. Specialists have found links between work alienation and decreased work efficiency, increased alcoholism and destructive behaviors (Chiaburu et al., 2014), which indicates the high importance of this problem. Meanwhile, the question of psychological predictors of construct was studied fragmentary and inconsistently (especially in the Russian-language sample). In our study, we tried to identify the connection of work alienation with certain personal characteristics of employees. Based on the Self-Determination-Theory (Deci & Ryan, 2000), we assumed that the intensity of the phenomenon is determined by the level of satisfaction of basic psychological needs at work. Using the questionnaire method, 92 employees of the “person—person” professions type were surveyed. Work alienation was measured by “Questionnaire of work alienation — concrete job” (Aigner et al., 2015); adapted by Vinokurov and Kozhina. Personal characteristics were studied using the Freiburger Persönlichkeitsinventar (FPI) in adaptation of Krylov and Ronginskaya (2000). The scale of satisfaction of basic psychological needs at work was also applied (Osin, 2009). The results of the study showed a moderate association between work alienation and such personal characteristics as depression (r=0.373, p <0.001), shyness (r=0.373, p <0.001), introversion (r = 0.346, p <0.001), emotional lability (r = 0.382, p <0.001), reactive aggressiveness (r = 0.325, p <0.001), sociability (r = -0.428, p <0.001). The results of the regression analysis confirmed the influence effect of satisfaction of basic psychological needs at work on work alienation: the need for autonomy (R² = 0.289, p <0.001), the need for competence (R² = 0.296, p <0.001), the need for relatedness (R² = 0.311, p <0.001). The study proved that work alienation is a relatively flexible construct for changes in the workplace that relate to autonomy, competence and social relations. The results of the research can be used as an empirical justification of the model of the phenomenon and in the development of a differentiated approach to the prevention and intervention of work alienation, depending on the personality characteristics of employees.
Changes proposed to the substance use disorders (SUD) in the Diagnostic and Statistical Manual of Mental Disorders, 5th edition (DSM-5) (American Psychiatric Association, 2014) include the addition of craving as a new criterion. Craving, defined as the intense desire or desire to re-experience the effects of a substance, plays a relevant role in both the maintenance of dependence and in relapse in substance users (Reske, and Paulus, 2008, Marhe et al., 2013, Charles et al., 2015). The varied conceptualizations of craving (Heishman et al., 2001) have yielded inconsistent approaches to measurement. Most of the studies carried out in the field of addictions use single-items questions for the evaluation of craving, showing these measures limitations in the multidimensional evaluation of craving. The Marijuana Craving Questionnaire (Heishman, Singleton, & Liguori, 2001) is the first instrument developed to evaluate the different components of craving in marijuana users. Both the original version of 47 items and the MCQ Short Form (Heishman et al., 2009) with 12 items, have shown good psychometric results. This paper presents the preliminary results of the adaptation to Spanish of the MCQ-12. Methods: 87 patients in treatment for cannabis use disorder were recruited from the Provincial Drug Dependency Service of Huelva and three Therapeutic Communities of Huelva and Seville (Spain). The MCQ-12 was administered, in addition to the Visual Analog Scale of perceived craving (EVA) and the Substance Dependency Severity Scale (SDSS). The item-scale correlations ranged between .43 and .78. Internal consistency, estimated from Cronbach’s alpha, for each factor was: Compulsivity (alpha = .62), Emotionality (alpha = .70), Expectancy (alpha = .72) and Purposefulness (alpha = .66). In terms of evidence based on the relationship with other variables, the MCQ-12 correlates positively with the EVA scale (r = .50 p <.001) and with the SDSS (r=.34 p = .006). These preliminary results show that the adaptation to Spanish of the MCQ-12 presents an adequate internal consistency, with results similar to those obtained in the English version (Heishman et al., 2009). Association with related constructs provide convergent validity evidences of the instrument.
Emotional disorders (e.g. depression and anxiety), characterized by a marked affective alteration (Watson, Clark and Stasik, 2011), are a problem of high social, clinical and care relevance. For some authors, the categorical diagnostic approaches (including DSM and CIE taxonomies) used to date may be contributing to overestimate the high rates of comorbidity between disorders (Dell’Osso and Pini, 2012; Krueger and Markon, 2011). New dimensional models such as the Hierarchical Taxonomy of Psychopathology (HiTOP; Kotov et al., 2017) provides a classification based on quantitative dimensions with a hierarchical structure. Authors proposing this model, recommend several assessment instruments for continue research on internalizing disorders, according to this new approach. Among these instruments, the Inventory of Depression and Anxiety Symptoms (IDAS, Watson et al., 2007), and the extended version IDAS-II (Watson et al., 2012) have shown both good psychometric results and useful information provided to extend research in this field. The aim of this study is to assess the psychometrics properties of the Spanish version of the Inventory of Depression and Anxiety Symptoms II in a Spanish students’ sample. A total of 513 college students (94 men, 419 women) completed the Spanish version of the IDAS-II and other measures that asses the same constructs (BDI, HCL-32, OCI-R and PTSD). Internal consistency and convergence validity was studied on the whole sample. 1 week retest reliability was studied on a subgroup of 101 students. The Spanish version of the IDAS-II was found to have adequate internal consistency. Cronbach’s alpha ranged between .71 y .91, except for the scale of traumatic intrusions whose internal consistency was .64. Short term stability of scales showed correlations ranged .47 (appetite loss) to .88 (suicidality). Correlations between subscales of IDAS-II and congruent BDI scales ranged .30 (appetite gain) to .83 (dysphoria). Lower correlations were found with HCLR-32 for both mania and euphoria scales (r = .227 and .263 respectively). The results obtained replicate those obtained by the original study (Watson et al., 2007; Watson et al., 2012; Watson & O’Hara, 2017). Results should be replicated in community and clinical samples.
This is the first study of the professional identity of psychologists in Russian science carried out in the framework of an international project — www.psychologyidentity.com In the pilot study, two goals were set: — To study the ideas of Russian psychologists about their professional identity; — To conduct cross-cultural research, i.e. compare the results obtained in Russia and in Portugal. The questionnaire included three open-ended questions with the following content: What is the exclusive goal of psychological intervention that makes it unique when compared to any other profession or form of intervention? In your opinion, what functions are exclusively performed by psychologists? In your opinion, what functions performed by psychologists may be performed by other professionals who are not psychologists? Questions were also asked about age, sex, professional experience and the specialization of psychologists. The main method of analyzing the data was content analysis. In the answer to the first question, no consensus was found, which can be explained by the fragmentation of psychology into different schools and directions. This coincides with the results of a Portuguese study. However, both samples tend to assume that the main goal of psychology is to help people achieve their well-being. In the answer to the second question, the data in Russia and Portugal differ significantly. If in Portugal the majority called the exclusive function of psychologists — assessment, then in Russia the range of exceptional functions is a wider range. In the third question, parents and friends are listed as “substitutes” for psychologists, which is not typical for the Portuguese sample, as well as teachers (in circles and sections) and teachers offering creative projects (in high school). In addition to these, journalists, analysts and writers who change people’s image of the world are able to actively influence people’s consciousness, i.e. make the intervention. A pilot study on a sample of members of the Moscow branch of the Russian Psychological Society suggests that the ideas of professional identity vary from country to country. The reasons for such discrepancies should be clarified in future studies. We assume that they are explained by differences in cultural — historical types.
DIFFERENT COLLEGE ENTRANCE CHANNELS, ACADEMIC MAJOR SATISFACTION, AND REGRET- A SELF-DETERMINATION THEORY PERSPECTIVE

Yawen Hsu
National Chiayi University (Chiaui, Taiwan)

Literature has suggested that student-athletes demonstrate greater identity foreclosure as compared to non-athlete students. Similarly, some students, such as students majoring in arts and music, may also have tremendous commitments and identity investments to their talent and skill development since they were very young. In such case, a single and exclusive identity may inhibit career exploration and limit their career choices which, in turn, may yield in negative effects such as regrets for their early choices. In Taiwan, there were several innovations in the college entrance system in recent years. In the present study, college students’ entrance channels, academic major satisfaction and regret were explored and discussed with the Self-Determination Theory perspective. A total of 768 college students participated in this study, including 190 students majoring in physical education or sports, 176 students majoring in arts, 202 students majoring in music, and 200 other-major students. Participants completed a survey collecting their background information, college entrance channels, intrinsic and extrinsic motivations, and the satisfaction with and regret for their academic majors. Especially, the mediating effect of different types of motivation on the relationship between entrance channels and satisfaction/regret was examined. The research results showed that students in different majors had different motivation profiles. However, in contrast to the hypothesis, students majoring in sports, arts, and music did not have higher level of regret as compared to the sample of general college students. In general, those students with more intrinsic motivation and identified regulation reported better satisfaction with their majors and less major-choice regret. On the other hand, students with higher introjected regulation and external regulation had the worse thoughts about their college majors. Furthermore, autonomous motivation partially mediated the relationship between entrance channels and the regret for academic majors. To sum, the findings of the present research demonstrated the influence of different kinds of entrance channels on college students’ learning motivation and their satisfaction with/regret for academic majors.
WHAT DO THEY LEARN? PSYCHOMETRIC PROPERTIES OF A QUESTIONNAIRE OF PROFESSIONAL COMPETENCES AND SOCIAL SKILLS

Paulina Robalino  
Universidad Argentina de la Empresa (Caba, Argentina)

Carla Quesada-Pallarés  
Universitat Autònoma de Barcelona (Barcelona, Spain)

Montserrat Pedreira  
UVic-Universitat Central de Catalunya (Manresa, Spain)

Jordi Cantons  
Universitat d’Andorra (Andorra la Vella, Andorra)

Some of the desirable and essential competencies in future teachers are difficult to promote and evaluate from the segmented subject structure of the teaching plan. This study analyzes the psychometric properties of a questionnaire of professional competencies and social skills in students of the program of Integrating Actions (AIs) of the Early Childhood Education degree of the UVic-UCC during the year 2017—2018. 74 students with ages between 8 and 34 years (M= 21.28; DS= 2.87) who participated in the AIs program of the Early Childhood Education degree (UVic-UCC) during a year 2017-2018. A pool of 60 items based in three previous scales (Caballo, 1993; Camargo & Pardo, 2008; Serrano Rodríguez & Pontes Pedrajas, 2017) was reviewed by experts and tested in a pilot sample. The items were adapted and translated following the Standards for Educational and Psychological Testing (2014) and ITC (2010). Finally, those 40 items (20 that evaluate competencies and 20 that evaluate social skills) that best represented both aspects of the competences and social skills were included. They were rated on a scale ranging from 1 (strongly disagree) to 5 (strongly agree). In addition, a Catalan adapted version of the Robalino & Musso (2018) self-efficacy at work scale was implemented. A t test was conducted for independent samples using the recoded variables as grouping variables and selecting groups 1 (low) and 4 (high) to analyze the discriminatory power of the items. The results indicate that there are statistical differences in the averages of such groups (p <.001) all discriminated satisfactorily. The results show high reliability for professional competencies (α= .88), social skills (α=.92) and general self-efficacy (α= .89). In addition, for each self-efficacy subscale, alphas between .74 and .87 were obtained. Self-efficacy shows a positive and significant correlation with competencies (r=.337; p<.01) and social skills (r=.388; p<.01). Findings suggest that this instrument could be very useful in practical applications in the Catalan population. However, future studies are needed to confirm the predictive and convergent-discriminant validity of this instrument. Limitations and new hypotheses are suggested for future studies.
THE STUDY ON THE ADHD CHILDREN’S FAMILY RELATIONSHIP AND THE CHANGING PROCESS OF THE FAMILY THERAPY IN TAIWAN

Wu Jen-Yi
Kao Yuan University (Tainan, Taiwan)

This research was based on the theory of the structural family therapy, with a total of four families with the ADHD children as the exploring participants. First, the observing, qualitative co-interview and Interpersonal Process Record method were applied to understand the family relationship of the ADHD children. Second, each participating family went on six sessions of the family therapy in the structural family therapy treatment intervention. After each therapy, the researcher continued to individually interview the participating parents by giving the interviews, to explore the changing process of the ADHD children families in the family therapy. The results were explained as follows: 1. Both parents of the participating family presented the unresolved conflicts or contradictions between couple, and the couple’s rigid boundary was contributed to impossibility of their cooperation to educate their children. 2. The participating parents often pulled their ADHD children into their battlefields in their conflicts. 3. The participating families presented the intergenerational alliance or alliance between one parent and the ADHD child, while the other parent was alienated. 4. The family therapy restarted the participating parents’ communication platform, and rebuilt the channel of the couple communication. 5. The adjustment from one side of the participating parents in therapy, always led to the change of the other parent. 6. The participating parents with the problems of power competition are able to renegotiate the power of marriage in therapy, but the changing process in the family therapy presented an unstable state. 7. The marriage of participating parents was on the verge of collapse, so the changing process in the family therapy was very slow, and both sides needed more time for the adjustment. In conclusion, the symptoms or behavioral problems of the ADHD children were characterized by the conflicting relationships between the couples of parents, and the children were often involved in their conflicts by their parents. The family therapy restarted the parents’ communication and negotiation platform, in the face of the conflicts between each other, and then improved the relationship between couple and parental work. Therefore, the symptoms or behavior problems of the ADHD children would also have been alleviated.
SPECIFICITY IN PERCEPTION OF FAMILIAR AND UNFAMILIAR FACES IN HUMANS

Anastasia Petrakova
Humboldt-University in Berlin (Berlin, Germany)

Yuri Mikadze
Lomonosov Moscow State University (Moscow, Russia), Pirogov Russian National Research Medical University (Moscow, Russia)

Face perception has been defined as the ability to perceive the face as a gestalt, along with all of its parts and the relations between them. This face specific strategy has been called configural processing. At the same time, there are debates about the influence of configural processing on perception of familiar and perception of unfamiliar faces. It is possible to assume more concise processing of familiar faces because early reconciliation with long-term memory codes, activation of semantic information, name codes. Unfamiliar faces can be perceived as the physical objects relating with the analytical strategy. We investigated the configural processing within perception of familiar and unfamiliar faces using of the part-whole recognition paradigm in a healthy group and brain damaged patients. 30 healthy persons and 12 patients with tumors in the posterior right or left hemispheres of the brain completed “Sequential matching of part-whole unfamiliar faces” and “Sequential matching of part-whole famous faces”; the tasks base on the classical “part–whole recognition paradigm”, developed by Tanaka and Farah (1993). Results showed a substantial holistic effect for famous faces, measured as the superiority in performance accuracy and lower RTs during presentations of face details within the context of the whole face in comparison to isolated presentations of face features. In contrast, for the perception of unfamiliar faces there was a reverse effect: details of faces were recognized better, when they were presented isolated from the context of the whole face. Interestingly, these effects were similar in healthy and brain-damaged persons, while general efficiency (reaction time, error rates) of patients was lower. The present work provides evidence for configural processing within perception of familiar faces but not unfamiliar faces and thus, exciting background for the future research. Interestingly, the similar picture was observed also in brain-damaged persons.
EMOTIONAL RESPONSES, SEXUAL AROUSAL, AND PUPIL DILATION TO MALE VERSUS FEMALE SEXUAL PERPETRATION: AN EYETRACKING STUDY

Joana Carvalho
Daniela Gonçalves
Daniela Mogo
Teresa Gaspar
Pedro Rosa
Universidade Lusófona (Lisbon, Portugal)

Despite the strong scientific focus on sexual offending behavior, very little is known about people’s appraisal of sexual aggression. Yet, such appraisal may influence the way individuals behave in cases of sexual violence, which can result in the blaming of the victim, or in a leniency bias toward the sexual offender. Indeed, this bias is frequently seen in cases of sexual aggression against men, where the offender was a woman. Studies on individuals’ perceptions have revealed that people appraise female sexual offenders as being “romantic” or “less violent”, while male victims are believed to have “enjoyed” being sexually coerced. Against this background, the aim of this study was to test individuals’ emotional responses to rape, varying as a function of the victim and the offender’s gender. Findings are expected to add to the literature on perceptions about sexual violence, by focusing on people’s emotions, and using psychophysiological rather than just self-report measures. Thirty-six men and 48 women voluntarily exposed to a scene displaying a man raping a woman (male perpetration), and a scene displaying a group of women raping a man (female perpetration; from commercially available movies). Participants’ emotional responses to the film-scenes were measured psychophysiological (i.e., pupil diameter, using a Tobii eye tracker) and subjectively (i.e., self-report ratings on emotions and sexual arousal). Statistical analysis using mix-factor ANOVAs (including, repeated-measures) revealed that while female perpetration yielded more negative self-reported emotions (e.g., disgust, nervousness), male perpetration induced increased pupil dilation (i.e., higher emotional activation). Also, men reported feeling calmer, while each gender mostly disdained the rape scene which the victim matched the participant’s gender. Findings showed that despite participants reported more negative emotions to the female perpetration scene, they actually presented increased emotional activation to the prototypical scene, i.e., the male perpetration scene. Is worth noting that while self-report measures can yield socially desirable responses, pupil dilation cannot be voluntarily controlled. Accordingly, individuals may be at prone of responding more strongly to stereotyped rape situations, which may help to explain why non-prototypical sexual violence is often regarded as “less serious”, leading to a leniency bias toward the non-prototypical sexual offender.
THE COURSE OF ANXIETY IN WOMEN RECEIVING A CAESAREAN SECTION AND THE INFLUENCE OF EXPERIENCE

Nora Schaal
Institute for Experimental Psychology (Düsseldorf, Germany)

Philip Hepp
Clinic for Gynecology and Obstetrics, HELIOS University Clinic, Wuppertal, University Witten/Herdecke (Wuppertal, Germany)

Around 30% of births are through caesarean section and repetition rates for receiving a caesarean section are high. The aim of the prospective study was to compare the course of anxiety in women undergoing their first caesarean section and women experiencing a repeated caesarean section. Participants: 304 women with an indication for a planned caesarean section took part. 155 received their first caesarean section and 149 received a repeated caesarean section. In order to measure the course of anxiety on the day of the caesarean section subjective anxiety levels were measured and saliva samples for cortisol determination were taken at admission, during skin closure and two hours after the surgery. Blood pressure and heart rate were documented at skin incision and skin closure. Women experiencing their first caesarean section displayed significantly higher anxiety levels compared to women with a repeated caesarean section. Scores of the STAI-State and visual analogue scale for anxiety differed significantly at admission (p = .006 and p < .001) and heart rate and alpha amylase levels were significantly higher at skin closure (p = .027 and p = .029). The results show that previous experience with a caesarean section has a soothing effect. The study aims to sensitize surgeons, anesthetists, nurses and midwives when treating women receiving a caesarean section and encourage them to incorporate soothing interventions, especially for women receiving their first caesarean section to reduce anxiety levels and consequently improve postoperative recovery and patients’ satisfaction.
RAPE MYTHS, PERSONALITY DIMENSIONS, AND SEXUAL SELF-SCHEMAS AS CORRELATES OF INDIVIDUALS’ EMOTIONS AND PUPIL DILATION TO SEXUAL VIOLENCE SCENES

Joana Carvalho
Daniela Gonçalves
Daniela Mogo
Teresa Gaspar
Pedro Rosa

Universidade Lusófona (Lisbon, Portugal)

Studies on individuals’ appraisal of sexual violence have been focusing on the perceptions people endorse about sexual offending behavior. While such studies have revealed people’s reactions and intended behaviors to hypothetical scenarios of sexual violence, including rape, little is known about individuals’ psychological dimensions involved in those reactions. Accordingly, this study was aimed at testing the relationship between psychological dimensions and individuals’ emotional responses to rape. More specifically, we were interested at testing the relationship between factors previously found to be involved in sexual offending behavior (i.e., rape myths, Big Five personality dimensions, and sexual self-schemas), and participants’ emotions toward rape. Thirty-six men and 48 women were voluntarily exposed to male and female perpetration rape scenes (from commercially available movies). A Tobii eye tracker was used to measure participants’ pupil dilation (a proxy of emotional activation); furthermore, participants reported on their discrete emotions to the scenes, as well as on their level of sexual arousal to each film-clip. Participants further completed a set of self-report questionnaires measuring rape myths, Big Five personality dimensions, and sexual self-schemas. Pearson-product moment correlations were performed between the psychological dimensions and the markers of emotional response, by gender, and for each condition (male versus female perpetration). Findings revealed that several rape myths (e.g., stereotyped representation of rape, false allegations, victim provoking) were significantly associated with more positive (e.g., calm, interest), and less negative emotions (e.g., confusion, shame) toward the rape scenes. Furthermore, personality traits such as agreeableness and conscientiousness related to more negative emotions (e.g., anger, disgust), while openness to experience related to more positive feelings toward the film-clips (e.g., joy). Likewise, the sexual self-schema powerful/direct (men) and rape myths (women) related to more sexual arousal toward the rape scenes. Also, decreased pupil dilation was associated with being more sexually liberal (men), higher neuroticism, less extroversion and less agreeableness (women). Data suggest that cognitive and trait psychological dimensions may be involved on how individuals react to sexual violence. Future studies are thus expected to test the mediating role of emotions, on the relationship between these dimensions and the likelihood of sexual offending behavior.
Pornography consumption has increased over the past years. Accordingly, there has been increasing interest on the dynamics behind pornography consumption, with a special focus on the consequences of pornography exposure. Despite the growing body of studies in this field, little is known about the factors underpinning individuals’ appraisal of visual sexual contents, and particularly in women. As such, this study was aimed at targeting psychological dimensions behind women’s appraisal of pornography. More specifically, we aimed at assessing if women’s sexual self-perception predicted their subjective responses to sexually explicit stimuli (i.e., pictures displaying sexual intercourse between heterosexual couples). Eighty heterosexual women (aged 18-77 years old) were exposed to a set of 20 sexually explicit pictures in a laboratorial context. After watching each picture, women reported on their emotional valence, general and subjective sexual arousal toward the picture. Women further reported on the level of sexual content they attributed to each picture. Additionally, women completed self-report questionnaires capturing women’s perception about themselves as sexual beings: sexual-self schemas (i.e., how women perceive themselves as sexual beings), sexual-esteem (i.e., self-esteem regarding sexual aspects of the self), and sociosexuality (acceptance of casual sex without a committed relationship). Regression analyses (Enter method) revealed that the sexual self-schema “Open-arousable” (i.e., feeling arousable, stimulating, open-minded, or uninhibited) significantly predicted a more positive emotional valence, as well as more general and sexual arousal toward the pictures. On the other hand, the sexual self-schema “Cautious” (i.e., feeling prudent, outspoken, self-conscious) negatively predicted general and sexual arousal to this set of pictures. Also, women’s sexual-esteem (i.e., the tendency to positively evaluate one’s capacity to relate sexually to others) and the sexual self-schema “Open-arousable” predicted the attribution of higher sexual content to the pictures. Findings suggest that the way women appraise pornography may be partially explained by the way they feel about themselves as sexual beings. More specifically, positive sexual self-perceptions predicted positive appraisals of sexual stimuli. Future studies are thus expected to focus on the role of the interaction between psychological factors and cultural influences, on women’s patterns of pornography consumption.
THE PREVALENCE AND PATTERNS OF DIAGNOSTIC TRANSITIONS IN A CHILD AND ADOLESCENT MENTAL HEALTH CASE REGISTER

Cliodhna O’connor
University College Dublin (Dublin, Ireland)

Community-based epidemiological studies show transitions between psychiatric diagnoses are common over child development. However, little research has explored the prevalence or patterns of the diagnostic transitions that occur in child and adolescent mental health services (CAMHS). Understanding diagnostic trajectories is necessary to inform theory development in developmental psychopathology and clinical judgements regarding risk and prognosis. Data from CAMHS clinical records was extracted from a British mental health case register (N=12,543). Analysis calculated the proportion of children whose clinical records showed a longitudinal diagnostic transition (i.e. addition of a subsequent diagnosis of a different diagnostic class, at >30 days’ distance from their first diagnosis). Regression analyses investigated typical diagnostic sequences and their relationships with socio-demographic variables, service use and standardised measures of mental health. 19.3% of CAMHS attendees had undergone a longitudinal diagnostic transition. Ethnicity, diagnostic class and symptom profiles significantly influenced the likelihood of a diagnostic transition. Affective and anxiety/stress-related disorders longitudinally predicted each other, as did hyperkinetic and conduct disorders, and hyperkinetic and pervasive developmental disorders. Approximately one in five young service-users have their original psychiatric diagnosis revised or supplemented during their time in CAMHS. By revealing the most common diagnostic sequences, this study enables policy-makers to anticipate future service needs and clinicians to make informed projections about their patients’ likely trajectories. Further research is required to understand how young people experience diagnostic transitions and their psychological and pragmatic implications.
ANXIETY, DEPRESSION, DYADIC ADJUSTMENT AND ATTACHMENT TO THE FETUS IN PREGNANCY: ACTOR-PARTNER INTERDEPENDENCE MEDIATION ANALYSIS

Tânia Brandão
Rute Brites
Mónica Pires
João Hipólito
Odete Nunes
Universidade Autónoma de Lisboa Luís de Camões (Lisbon, Portugal)

Perinatal research has focused essentially on maternal outcomes leaving paternal outcomes unexplored. This cross-sectional study aimed to explore the intrapersonal and interpersonal effects of mothers' and fathers' anxiety and depressive symptoms on their own and their partners' antenatal attachment to the fetus. Additionally, it aimed to explore the mediating role of dyadic adjustment on these associations. Participants, 320 pregnant women and their partners, completed the Hospital Anxiety and Depression Scale, the Dyadic Adjustment Scale and the Maternal and Paternal Antenatal Attachment Scale. Data were analyzed using the actor-partner interdependence mediation model. Mothers' ($\beta = -.16, p < .01$) and fathers' depressive symptoms ($\beta = -.38, p < .001$) were associated with their levels of antenatal attachment to the fetus. These relationships, however, were mediated by levels of dyadic adjustment ($\beta = -.08, p < .05; \beta = -.09, p < .05$, respectively). Fathers' anxiety symptoms were associated with their levels of antenatal attachment to the fetus ($\beta = .16, p < .05$). This relationship was partially mediated by their levels of dyadic adjustment ($\beta = -.05, p < .05$). Finally, fathers' depressive symptoms were associated with mothers' levels of antenatal attachment to the fetus through the mothers' dyadic adjustment levels ($\beta = -.06, p < .05$). Results indicated that anxiety and depressive symptoms as well as lower levels of dyadic adjustment during pregnancy seem to negatively impact the levels of antenatal attachment to the fetus, especially for fathers. Results highlight the need to adopt a dyadic perspective to understand mothers' and fathers' outcomes during pregnancy.
EXCHANGE STUDENTS’ ADAPTATION PROCESSES IN PSYCHO-SOCIAL DEVELOPMENT

Yuko Sakaki
Chikushi Jogakuen University (Dazaifu, Japan)

In Japan, a plan for 300000 exchange students has been processed since 2008. According this new plan, many universities facilitated several international projects and accepted exchange students as many as possible. They provide not only regular course in undergraduate and graduate school, but also many flexible short term exchange programs. Nowadays, exchange students could choice their desired course among many options in Japanese universities.

Some universities face problems how they can fully support exchange students to adapt Japanese life or cultures. The present study explored exchange students’ adaptation processes in psycho-social development so that to give some useful hints to construct support system in universities. Longitudinal study was adopted to measure how exchange students spend and look back on new Japanese school life or culture. Participants were from Asian countries, China, Taiwan and Korea. They could choose 6 month program or 1 year program and they were relatively fluent in Japanese. They were assigned to answer two questionnaires. One was the General Health Questionnaire 30 (GHQ) in Japanese version to assess physical and mental health, the other was College Adjustment Scales (CAS) to measure psycho—social problems. These questionnaires were carried out in the beginning and end of each semester so students in 6 month program joined two times and one year— students answered 4 times in total. General Health Questionnaire consisted of 6 sub scales, e.g. somatic symptoms, social dysfunction, anxiety, severe depression. On the other hand, College Adjustment Scales were consisted of 9 sub scales, e.g. substance abuse, suicidal ideation, self-esteem problems, interpersonal problems, family problems, academic problems, and career problems. The data was collected from the above sub scales in each questionnaires and statistically analyzed. The results were discussed in terms of the staying period, timing of survey and score of sub scales in two questionnaires. As the end of staying, students could be more adopted in Japanese life as expected, and tendency of adopted process differed depending on the contents of sub scales.
SUICIDAL IDEATION IN YOUNG SPANISH ADULTS: EMPIRICAL EVIDENCES OF THE THREE-STEP THEORY (3ST)

Antonio Jose Rojas Tejada
Jorge L Ordoñez-Carrasco
Andrea Blanc Molina
Maria Sanchez-Castello
Isabel Cuadrado Guirado
University of Almeria (Almeria, Spain)

The three-step theory -3ST- is one of the most relevant and current contributions in the field of suicide. The first two steps of model refer to how suicidal ideation (SI) is shaped and developed. The first step suggests that perceiving psychological pain and hopelessness will generate modest/passive SI. The second step suggests that SI will be strong/active when the psychological pain exceeds the degree of connectedness of the person. The objective of the study is to show empirical evidence of both steps. The incidental sample consisted of 234 young adults aged 18 to 34 years who performed different tests. To test the first step of 3ST, we evaluated the interaction between psychological pain and hopelessness in the prediction of SI through multiple regression. The main effects for both variables were statistically significant. In addition, the interaction of both variables was significant and contributed an increase in the variance explained to the model (2% more). According to the theory of 3ST, people with a high score in psychological pain and hopelessness should have more SI than people with a high score in only one of the two variables or low score in both. To verify this assumption, the sample was divided into three subgroups: low hopelessness/low psychological pain, high hopelessness/low psychological pain or vice versa and high hopelessness/high psychological pain. A nonparametric ANOVA between the subgroups showed significant differences in SI. In pairwise comparison, statistically significant differences were found in the SI between subgroup of high hopelessness/high psychological pain and the rest of subgroups. To verify the second step of the 3ST, the INQ subscale referring to the degree of thwarted belongingness was used as an indication of disconnection. The group of high hopelessness/high psychological pain was divided into two subgroups: greater disconnection than psychological pain and greater psychological pain than disconnection. The Mann-Whitney U test showed statistically significant differences between both subgroups, greater disconnection than psychological pain and greater psychological pain than disconnection. In conclusion, the results are consistent with the two assumptions of 3ST and provide empirical evidence to the model.
CULTURAL HISTORICAL ANALYSIS OF EVALUATING LEARNING WITH RUBRICS

Natalia Collings
Central Michigan University (Michigan, USA)

In line with conference theme, the main purpose of this presentation is to engage the audience in productive dialogue about psychological aspects of evaluating learning with rubrics. Rubrics are lists of criteria for various students’ performances that often include gradations of their quality. The platform for this dialogue will be my analysis of psychological theories that inform various types of rubrics and practices of implementing them. Using Vygotskian theories as a basis, I developed a perspective on rubrics as a cultural and historical tool. My extensive experience of teaching graduate courses in educational psychology and assessment at a large university in the United States of America served as the empirical basis for analysis. Using the method of autoethnography, I explored this personal experience supported by documentation of students’ reports of selecting, designing and using rubrics in their teaching. My graduate students are usually practicing educators from various backgrounds, including early childhood professionals, elementary, middle, and high schools teachers, college instructors and adult trainers. Reports of these students on evaluating learning with rubrics provided me with culturally rich and diverse account of this practice. Because I have been teaching these courses for over 10 years, I situated trends I have observed during this time in the context of a broader historical analysis that I developed based on literature review. In summary, my findings indicate that rubrics have becomes one of the most common ways of evaluation and that US teachers from various backgrounds appreciate their potential for supporting students’ learning. At the same time, teachers’ use of rubrics is highly inconsistent and unsatisfactory even to themselves, mainly due to voids in understanding key theoretical concepts that inform rubrics and due to approaching rubrics as a neutral and universally effective remedy, instead of as a cultural and historical tool of educational psychology. This autoethnographic research informed the next step in my scholarly agenda as developing tools for informing the use of rubrics. My presentation serves as an invitation for creating this better future of the rubrics (and, in a broader sense, psychologically informed evaluation of learning) together, for exchanging expertise and information.
LIFE MODELS OF YOUTH: HOW TO EXPLORE INTERGENERATIONAL TRANSMISSION?

Elena Zinovyeva
Natalia Moskvicheva
Svetlana Kostromina
Natalia Grishina
St. Petersburg State University (St. Petersburg, Russia)

Nowadays, the studies of designing the life scenario by young people, with the emphasis on the “authorship” of their own life are the focus of researchers. It is associated with reducing the role of traditional cultural patterns offered by society and the emergence of new patterns associated with an ever-greater immersion in the “digital world”. The aim of study was to investigate students’ life models – representations, concrete choices and the events in a certain area of life in conjunction with students’ representations of these aspects of their parents’ life. Life models in selected areas (profession, close relationship and personal development) are considered as parts of a person life scenario. The proposed “life model” concept allows removing theoretical contradictions in definitions of a life scenario, combining different components and using it as basis for empirical studies (Kostromina et al., 2018). The sample consists of 100 SPBU students (average age 21.02 ± 1.11). The interview of 82 questions aimed at identifying the variants of designing the life models by young people was developed. It covered the parameters: interest, status and material well-being (profession); need for relationships, character of relations, living space (relationship); involvement, self-efficacy and “investment” in life (personal sphere). The interview contained questions aimed at determining the identification of young people with their generation, and the closeness with parents’ generation. Methods of qualitative and quantitative analysis were used. Factor analysis revealed: the factor that unites indicators of active involvement in life, the factor of orientation to the peers’ generation, the factor of the intimacy need and family support, and the factor of self-confidence (the incoming variables weight 0.7984 – 0.4). An intergenerational (parental) influence on some students’ representations about future family and close relationships was found, whereas the closeness with parents is not related to the construction of a professional life model. Dispersion analysis revealed the influence of the residence in St. Petersburg. The pilot study allowed verifying the theoretical concept and testing the methodological tools on the youth group representatives. To refine the data next stage will include representatives of different generations within the same family. Funded by RFBR, 18-013-00599.
Speculative bubbles occur in international markets with some frequency despite government efforts to regulate these episodes of high optimism in the world economy. For this reason, it is necessary to be aware of the importance that personal judgment has in making investment decisions in order to develop effective policies during speculative periods. In this context, a systematic literature review has been carried out to study the effect that these psychological factors have on the manifestation of economic crises. Economic decisions are made in an environment of uncertainty, where possible scenarios are foreseen but their probabilities are unknown. Consequently, in order to make investment decisions, individuals introduce subjective personal assessments in this process. These personal assessments were called ‘animal spirits’ by John Maynard Keynes. In all episodes of economic crisis, the psychology of the investor repeatedly manifests in the form of common ‘animal spirits’. In addition to the phenomenon called monetary illusion, one of the main causes is the high degree of speculation due to increased wealth brought on by the rise in the prices of goods. People often make incorrect economic decisions because they do not account for inflation. Another common denominator in all crises and bubbles throughout history is the high degree of optimism present among individuals, which, moreover, is closely linked to the high degree of investor leverage. When ‘animal spirits’ invade markets, the bubble explodes and the system collapses. Therefore, in the absence of perfect knowledge of the future benefits of an investment, investors base their decisions not only on the mathematical methods of evaluation but also on qualitative and psychological variables of difficult quantification: the ‘animal spirits’. Thus, the study of ‘animal spirits’ or the psychological factor of the individual, as another qualitative variable in the economic crisis analysis, is necessary to understand the true origin of optimism and speculation and to implement policies that combat these negative effects.
Metacognitive Awareness Inventory (MAI; Schraw & Dennison, 1994) is one of the most used self-report inventories to identify the level of students’ knowledge about cognition and regulation of cognition. Metacognition is a key component for successful learning processes in educational context. The empirical evidence shows that students who are able to develop metacognitive awareness and regulation report higher academic achievement (Harrison & Vallin, 2017). The present study is aimed to examine the psychometric properties of the Spanish version of MAI (Huertas, Vesga, & Galindo, 2014) in a sample of Spanish adolescent students. Some of the items of the adapted version by Huertas et al. (2014) for Colombian students were reformulated to ensure a more familiar and simple expression in our cultural context. The new scale was applied to a sample of 739 adolescent students enrolled in various secondary schools, ranging in age from 12 to 16 years. The internal consistency of subscales and items within each subscale, the item–subscale correlation and the correlation between subscales (Cronbach’s alpha and Pearson correlation coefficient, respectively) were examined. In order to analyze construct validity of the scale, the same procedure previously used by Schraw and Dennison (1994) with the original version of the scale was applied. We carried out various unrestricted and restricted exploratory factorial analyzes, following the orthogonal and the oblique rotation method. The instrument reliability was comparable to the original and Colombian versions ($\alpha=.88$). Correlations among subscales ranged from .56 to .89. The findings of exploratory analysis showed that the data collected don’t support the two-factor model neither eight-factor model, which is in line with the results obtained in other studies (Harrison & Vallin, 2017). It was concluded that in future reviews of the Spanish version of scale should rephrase or eliminate those items with inadequate psychometric properties.
DEVELOPMENT PSYCHOLOGICAL SKILLS INVENTORY FOR FOOTBALL PLAYERS

Irina Simonenkova  
Russian State University of Physical Education, Sport, Youth and Tourism (Moscow, Russia)

An inventory for testing psychological skills of football players was developed based on the analysis of theoretical sources on psychological skills in sports. The project consisted of two phases. First, expert interviews with Latvian Football Federation representatives, Latvian Higher League coaches and experienced football players enabled the researchers to identify 11 most essential psychological skills. The following skills were selected: self-motivation, decision making, goal setting, communication, emotion control, relaxation, imagery, self-talking, concentration, activation and automaticity. These skills were identified as essential for being effective (successful) in football game. A questionnaire including 91 statements has been worked out to measure the intensity of these skills in football players. The empirical research sample included 90 male football players, aged 18-35, with good speaking and/or comprehension skills in Russian - from six Latvian Higher League teams. To measure a football player’s efficiency, the method of expert assessment was applied. At the end of the play season, the efficiency of each footballer-participant was confidentially rated by each of nine experts. Decision making, communication, emotion control, attention concentration and automaticity skills have demonstrated a strong statistically significant correlation with game efficiency of highly qualified football players. These findings were used for producing a final version of the questionnaire in the second phase of the project. The final version includes 50 statements (10 statements for each psychological skill), out of which 33 are direct and 17 are reverse-scored items. The psychological skills inventory for football players was tested on a sample group of Latvian Olympic and National team football players. Psychometric analysis has proved the method’s validity for assessing psychological skills of football players.
The objectives of the current research were to examine the role of self-compassion and self-criticism on the eating disorder symptoms, and the association between self-compassion, self-criticism, eating disorder symptoms and well-being in the general population. A community sample of adults (195) completed a self-reporting questionnaire concerning measures of eating disorder symptoms, self-compassion, self-criticism, and well-being. Hierarchical regression results indicated that self-criticism was found to be a stronger predictor of eating disorder symptoms. Furthermore, the presence of clinically significant eating disorder symptoms in individuals can be a marker of reduced well-being. Lastly, self-compassion and self-criticism appeared to be stronger variables than eating symptoms in the prediction of well-being. This study highlighted the importance of self-criticism in the context of eating disorder symptoms, emphasising the relevance of targeting self-criticism. Furthermore, professionals may also focus on self-compassion and self-criticism in order to promote the well-being of individuals suffering from eating pathology in the treatment process.

AFOP®: A NEW METHOD FOR TREATING OCD

The AFOP® method was developed to provide a more effective therapy for OCD, and in this pilot study we studied the AFOP® method efficacy. The AFOP® method is a new treatment for OCD with an analytical-experiential orientation. The treatment lasts between 6 months and two years and is based on Jungian and Ethological theories. It differs from other treatment methods in its approach. There is no direct exposure to the symptoms or the fears nor are there attempts to change the obsessive symptoms with cognitive techniques. The treatment is personalized. However, every treatment shares common elements: •Sessions which focus on resolving life situations which generate fear. •Sessions involve both talk therapy as well as physical and symbolical exercises. •Intense physical activities outside of the sessions. •Monthly 8-hour group therapy. •Increasing assertiveness, creative expression and life skills. Our hypothesis is that the AFOP® method will be able to reduce the level of anxiety (state anxiety) clients experience, as well as to eliminate more firmly installed traits of anxiety which cause the obsessive symptoms. We measured the efficacy of the AFOP® method through a repeated measures design (N=15) pre-treatment and 3-6 months into treatment (M1). We used the STAI questionnaire (Y-Form) to evaluate both the level of anxiety as well as the trait anxiety. A repeated measures ANOVA showed a significant effect of the treatment on trait anxiety, [F(1.13)= 23.31, p < 0.001]. No significant effect was found for state anxiety, [F(1.13)= 1.96, p < 0.19]. In future research with a bigger N size we expect both measurements to show significant results. Also, we want to include measurements of the later treatment phases and follow-up results as well as more questionnaires (Y-BOCS, BDI-II, etc).
Traditional Economics uses models in which it is assumed that decision-makers are rational. This assumption implies that they process relevant information in an efficient unbiased manner, and that their decisions are consistent with utility maximization. Nevertheless, it has been observed empirically that decision-makers do not always behave in the way traditional models predict they should. That is, their behavior is sometimes biased showing, i.e., overconfidence, problems of impatience or lack of self-control, preference reversals, etc. In this framework, Behavioral Economics appears as a branch of Economics that incorporates insights from human Psychology into models of economic behavior. It is used to help us understand why our models may not make the predictions we think they should, in some cases. In this paper, we analyze some important phenomena identified by behavioral economists and psychologists –like framing effects in consumer choice, biases in behavior in choice under uncertainty or biases in behavior in intertemporal choice– where psychological aspects have an influence in the behavior of economic decision-makers. Additionally, we investigate some applications of Behavioral Economics in real life, as for example, the Behavioural Insights Team (BIT), in United Kingdom, with the objective of enabling people to make ‘better choices for themselves’. As a conclusion, we think people can use the findings of Behavioral Economics in order to know where they can make mistakes and be able to anticipate to their own behavior, and avoid these mistakes. Even Governments, can use these findings to nudge people and help them to take better decisions (i.e. savings decisions or decisions related to health).
WHY DO WE WATCH? THE ROLE OF EMOTIONAL, COGNITIVE AND SOCIAL GRATIFICATIONS IN PREDICTING MOVIE RECOMMENDATION, REWATCHABILITY AND GENRE PREFERENCES

Patricia Arriaga
Joana Alexandre
CIS-IUL, ISCTE-Instituto Universitário de Lisboa (Lisbon, Portugal)

Octavian Postolache
ISCTE-Instituto Universitário de Lisboa (Lisbon, Portugal)

Manuel J. Fonseca
Teresa Chambel
LASIGE, Faculdade de Ciências, Universidade de Lisboa (Lisbon, Portugal)

According to the emotional gratification model (Bartsch, 2012), both hedonic experiences and satisfaction of social and eudaimonic needs are important to explain intrinsic gratifications from entertainment experience. The primary aim of the study was to determine the factors that predict movie recommendation to friends, rewatchability and genre preferences. To a better understanding of these factors we first tested the latent structure of an intrinsic gratifications scale (Bartsch, 2012) from movie experience in a Portuguese sample. Secondly, we examined the role of individual differences (i.e., need for cognition, need for affect, and extraversion) in predicting gratification experiences from movies, while controlling for gender and age. Finally, we examined which intrinsic gratifications from entertainment experience predict individuals’ movie recommendation to a friend, interest in repeating the movie experience, and movie preferred genre type. Using a sample of 318 participants, six main dimensions of emotional gratifications from movies were identified (hedonic fun, thrill, empathic sadness, and vicarious release of emotions, social sharing of emotions, and eudaimonic contemplative experiences). Hierarchical regression analyses indicated that extroversion was a significant predictor of the hedonic experiences of fun and thrill, need for affect accounted for contemplative experiences and thrill, whereas need for cognition only predicted the eudaimonic contemplative experiences. Individuals’ movie recommendation was explained by feelings of thrill and contemplative experiences, whereas interest in repeating the movie experience was predicted by both thrill and social sharing of emotions, after accounting for all the above individual differences. Finally, we found that movie preferred genre type also varied as a function of the different emotional gratifications. This study highlights the importance of taking into account the different cognitive, emotional and social gratifications that individuals experience from watching movies.
Perceived value has gained much attention in psychology and marketing research because of the important role it plays in predicting consumer behavior and achieving sustainable competitive advantage. The dynamic nature of perceived value has been widely recognized in the literature (e.g., Holbrook, 1999; Chen & Dubinsky, 2000). However, few studies have addressed this dynamicity. This paper proposes a causal model that seeks to explain the existence of sequentiality in value dimensions and, consequently, in their influence on satisfaction and loyalty. Using an exploratory approach, the concatenation of effects is tested for four intrinsic dimensions of value (entertainment, aesthetics, ethics and spirituality), which are experiential (Holbrook, 1999), and therefore, less studied. Using a structured questionnaire, the experiences of 285 hotel guests were analyzed with Partial Least Squares (PLS). Empirical evidence is provided for the influence of reactive (aesthetics and escapism) on active dimensions (play and ethics). It is also shown that the effects of value dimensions on satisfaction and loyalty are concatenated and not simultaneous, as more usually described, which sheds light on research in value co-creation processes. A STUDY OF CONSTRUCT AND ANALYSIS THE EFFECTS OF “PARENT-CHILD COOKING” ON ATTACHMENT IN ADOPTIVE FAMILIES

Li-Yun Wu
National University of Tainan (Tainan, Taiwan)

This study is on the basis of Landreth's filial therapy training model. It attempted to combine two specialized fields: life application and psychotherapy, in the hope of developing a 10-week “Parent-Child Cooking” program to promote attachment and parenting skills in adoptive families. The purpose of this study was to construct a “Parent-Child Cooking” program and explore the effect, patterns, and meanings of interaction between parents and adopted children in “Parent-Child Cooking” therapy. One-group pretest-posttest and Consensual Qualitative Research were used in this study. Three adoptive families with adopted children aged from 7 to 9 years old, via 10 hours (1Hr/week) “Parent-Child Cooking” with video recording. In addition, the program would be facilitated by a counselor. The counselor provides supervision for parents about interaction in “Parent-Child Cooking” 10 hour (1Hr/week). As the result of paired-sample t test and process analyze were used to the Parent-Child Play Interaction Relationship Scale, Parental Skills Checklist and “Parent-Child Cooking” video. 1. The relation between parents and children had significant rising tendency which mean the “Parent-Child Cooking” program had strong relation with the parent-child interaction, and the immediate effect was provide. 2. It had significant rising tendency which the intervention had strong relation with the appropriate Parental Skills, and the immediate effect was provide. 3. Several items had significant correlation ratio for attachment relationship: tracking, facilitate free and creating, convey understanding, express interesting, body position, help fluency, give responsibility. 4. Interaction patterns in parent-child cooking sessions: (1) Parents learned to reduce the “parent-dominated cooking” pattern. (2) Following the supervise, parents were aware of their parent-child interaction patterns and parents increasingly let children dominate cooking to Semi-child-centric pattern. Both parents and children showed great interest and willingness to cook together. (1) “Parent-Child Cooking” provided enjoyable, undefended ways of interaction; (2) “Parent-Child Cooking” provided family members with special ways of interacting and understanding each other. “Parent-child cooking” promoted positive attachment between parents and children. 3. Following the progress of the “Parent-Child Cooking” program. Three families appeared Child-centric cooking pattern.
CHANGING NEGATIVE ATTITUDES TOWARD FOREIGN PRODUCTS: THE ROLE OF AFFINITY AND PERCEIVED VALUE IN CONSUMER BEHAVIOUR

Laura Piedra Muñoz
María del Mar Serrano-Arcos
Raquel Sánchez-Fernández
Juan C. Pérez-Mesa
Emilio Galdeano-Gómez
University of Almería (Almería, Spain)

Anti-consumption is a relevant phenomenon in the study of consumer behaviour. Although anti-consumption attitudes take many forms, most researches have approached the study of negative attitudes towards foreign products. However, changing consumers’ negative attitudes toward foreign products may be a difficult task. Recently, consumer affinity has emerged in the international marketing literature as an important construct that explains positive attitudes toward a specific foreign country. Accordingly, there is a lack of studies that analyse how affinity can mitigate negative attitudes and behaviours, especially in the consumption experience of foreign products. Therefore, it is necessary to understand the psychological variables that motivate and/or mitigate consumer intention to buy or avoid foreign products. Particularly, the analysis of consumers’ reluctance to buy foreign products as a consequence of consumer affinity is virtually unexplored. Thus, the purpose is to contribute to the literature by investigating the formation of non-consumption responses to products of specific foreign origins. This research provides an insight into the underlying sources of consumer affinity and its behavioural impact on anti-consumption decisions. Additionally, this study includes two possible mitigating variables of anti-consumption (consumer affinity and perceived value) to show the importance of this phenomenon in the construction of consumer behaviour. This paper also contributes to existing literature by integrating the concepts of ethnocentrism, product-country image and perceived risk in a conceptual framework and in a set of propositions describing consumer preference for - or resistance to buy foreign products. Spanish horticultural sector has been chosen as a setting for this research. This sector has suffered the effects of recurring crises. These crises together with the raising of environmental consciousness and consumers’ food safety concern have damaged its perceived image. To accomplish such objectives, a causal cross-sectional research will be designed through a survey aimed at consumers in the main destination markets (Germany, The Netherlands and United kingdom), using a structural equations methodology. From a managerial point of view, it is essential to be informed about underlying attitudes that explain why local consumers will not make an investment in foreign products.
IMPULSIVITY, AUTOREGULATION AND SOCIOECONOMIC INEQUALITY:
SEXUAL AND REPRODUCTIVE DECISION-MAKING IN URUGUAYAN ADOLESCENTS

Alejandra López
Nicolas Brunet
Gabriela Fernández
Universidad de la República (Montevideo, Uruguay)

The study considered the importance of sexual and reproductive health in adolescents as a key determinant of the process of social inequality and the potential of this period of life as a second window of opportunity. Based on the perspective of Judgment and Decision Making and in the "dual" models of cognitive development, the project aims to analyze the role of impulsivity, self-regulation and socio-economic inequality in the process of sexual and reproductive decision-making in a representative sample of adolescents between 15 and 19 years-old living in Montevideo, the capital of Uruguay. The survey was carried out through the application of five behavioral tasks (Tower of London, Bart Analogue Risk Task, Stoplight Game, Game of Dice Task, Wechsler Abbreviation Scale of Intelligence / Matrix Reasoning-WASI); two scales (Consideration of Future Consequences Scale and Resistance to Peer Influence) and a questionnaire of sociodemographic information, socioeconomic level and sexual experience and behaviors. The experimental tasks and the scales were programmed by the research team in PsychoPy and the questionnaire in HTML. For the field survey, a computer assisted self-interview system (CASI) adapted to portable computers of the Department of Psychology were used, which allows for automatic data collection and storage and designed to preserve the anonymity and privacy of the interviewees. The CASI system was developed by our research team between May and December 2017 for the first pilot phase of the study and its subsequent use in the data collection corresponding to phase 1 of the project in Montevideo, between June and November 2018. For the analysis of the data, a set of statistical models were adjusted, using linear and non-linear regression techniques, such as event history, sequence analysis and modeling of structural equations. The study was approved by the Ethical Research Committee of the Department of Psychology. We will present results related to the imbalance impulsivity-self-regulation differences by socioeconomic level and family characteristics; and the transitions and affective-sexual trajectories and risk taking in sexual behaviors differences by socioeconomic level and family characteristics.
SELF-REGULATION OF ACADEMIC GOALS AND ACADEMIC ACHIEVEMENT IN SPANISH ADOLESCENTS

Zeltia Martínez-López
Lorena Francisco
Maria Luisa Meijón
Carolina Tinajero
University of Santiago de Compostela (Santiago de Compostela, Spain)

In the last years, within the field of Educational Psychology, the process of affective-motivational self-regulation has begun to generate interest as a determining factor in the educational success of students. From social cognitive theory, different researches claim that the proper management of motivation (e.g. self-direct the goals for learning) foster greater involvement and effort in the learning process and more use of appropriate learning strategies (Suárez & Fernández, 2013). In the present study, we examine the relationship of self-regulation of academic goals strategies and performance (GPA; grade point average). A sample of 740 adolescents (391 female and 349 male) enrolled in various secondary schools, with a mean age of 13.67 (SD=1.18) years, was recruited. The strategies of self-regulation of academic goals were measured with one of the subscales of Escalas de Estrategias Motivacionales del Aprendizaje-Versión Secundaria (EEMA-VS; Suárez & Fernández, 2011). Students GPA were obtained from official high school records. Data were collected during the first semester of the academic year. Linear regression analyses were conducted in order to test the effect of different types of achievement goals in GPA scores of students. Gender was included in the first step as a control variable. The result of regression of analyses was significant. The model accounted for 17% of the variance (F (3, 712) = 49.571, p < .001) of academic achievement. The strategies of performance and avoidance goals had a statistically significant standardized beta weight (β = .104, p < .001 and β= -.323, p < .001, respectively), but the strategies referring to the remaining types of goals did not. In sum, these findings substantiate the assumption that successful academic depends on motivational self-regulation strategies used by the students.
STUDENTS’ BELIEFS ABOUT PEER BULLYING: EXPLORATIVE AND SOCIAL-DEMOGRAPHIC PERSPECTIVE

Jasmina Pekić
Ilija Milovanović
Jasmina Kodžopeljić
University of Novi Sad (Novi Sad, Serbia)

Bullying is unwanted, repetitive aggressive behavior among school-aged children which includes a real or perceived disproportion of power. Peer bullying is a phenomenon which occurs in schools throughout the world. According to the UNICEF Serbia reports, approximately 65% of Serbian students experienced peer violence at least one time and around 22% endure constant exposure to it. However, only a small part of peer bullying is identified and dealt with, due to the fact that students, both victims and bystanders, report bullying incidents on rare occasions. The main objective of this study was to determine predominant types of students’ personal beliefs about peer bullying, since the previous studies emphasize their significant impact on reaction to the violence. Other than that, the study aimed to investigate the relations between students’ personal beliefs about peer bullying and different social-demographic characteristics such as gender, school success, birth order and family size. The survey was conducted on a sample of 255 students, who attended final grades of the primary school. They responded to the 20-item Bullying-Related Beliefs Scale (B-RBS), designed by the authors themselves. The results indicate the presence of three different, yet mutually related types of students’ beliefs: 1) bullying is a personal matter that shouldn’t concern other students; 2) intervening during bullying situation requires special conflict resolution skills; 3) victims are responsible for being assaulted. Despite the well-established gender differences in the use of direct and indirect or physical and psychological forms of bullying, this research show that girls and boys have very similar personal beliefs about this phenomenon, in all three aspects. Birth order, as well as family size, cannot be considered as significant factors which influence the way students think about bullying. When it comes to school success, this variable is negatively correlated only with the belief that bullying is a personal matter that shouldn’t concern other students. The research findings can be used in development of bullying prevention and intervention programs through reinforcing those kinds of beliefs that increase the individual’s willingness to intervene in bullying situations.
PSYCHOLOGICAL SUPPORT FOR AN ELITE ATHLETE EXHIBITING POOR PERFORMANCE: A CASE STUDY FROM A JAPANESE UNIVERSITY

Olivia Ogawa
University of the Ryukyus (Urasoe, Japan)

This study explores the characteristics of an elite university athlete manifesting poor performance and discusses how to support their performance and mental health during and after university education. Elite university athletes sometimes betray their poor mental health through their sports performances. This occurrence likely results not only from athletes’ physical traits, but also from internal desires to reconstruct family relationships that include parents, surrogates, and other family members. This research discusses an athlete who had these psychological characteristics during and after university. This is the case of an approximately 3-year support process for an elite Japanese university athlete who had been playing sports since elementary school. Throughout the support process, the athlete attended 23 sessions of psychological counseling. From the perspectives of Marcia (1964) and Ogawa (2013), data from counseling were analyzed for the athlete’s psychological characteristics. We found that the athlete was categorized as ‘foreclosure’ (Marcia, 1964), and ‘Invaded’ and ‘Emotionally Unguided’ Ogawa (2013), types that display psychological immaturity and family dependency. In this case, the psychological safety was often interfered with by the sister and left unguarded by the parents. Lack of protection by the parents from the sister’s interference caused the athlete to display frequent fails in sports. Providing psychological support focused on family relationships was effective for the athlete. We conclude that considering codependency between athletes and family members is essential and that reconstructing family relationships should be the main focus for assisting athletes.
THE MEDIATING ROLE OF “FEAR OF MISSING OUT” BETWEEN LONELINESS AND SOCIAL NETWORKING SITE ADDICTION TENDENCIES

Ayano Yoshida
Tohoku Fukushi University (Sendai, Japan)

Previous studies have suggested that psychological factors such as loneliness are related to excessive use of the Internet. Social networking sites (SNSs) are currently one of the most popular applications of internet use. As SNS usage becomes endemic among young adults, there has been increasing interest in the relationship between SNS addiction tendency and psychological factors such as self-esteem, loneliness, and depression. In this study, we examined the mediating role of “fear of missing out” (FoMO) between loneliness and social networking site (SNS) addiction tendencies. FoMO defined as a pervasive apprehension that others might be having rewarding experiences from which one is absent; it is characterized by the desire to stay continually connected with what others are doing. We hypothesized that the relationship between loneliness and SNS addiction tendency is mediated by FoMO.

Participants comprised 116 Japanese undergraduates. They completed the UCLA loneliness scale-Japanese version, the FoMO scale, and the SNS addiction tendency scale. Using mediation analysis, it was found that loneliness was positively linked to SNS addiction tendency (.17, p = .06). Furthermore, when controlling for FoMO, that relationship was not confirmed (-.05, p = .55). Loneliness was positively linked to FoMO (.37, p = .00), and FoMO was positively linked to SNS addiction tendency (.60, p = .00). Thus, a mediating effect of FoMO between loneliness and SNS addiction tendency was suggested. The results reveal implications for what hinders healthy SNS use and the importance of including psychological traits and motivation of SNS use patterns to disentangle the causes of SNS addiction.

THE EFFECT OF EMOTIONAL FILMS AND SUBTITLES ON OVERT ATTENTION: AN EYE TRACKING STUDY

Ming-Chou Ho
Yun-Jhen Lu
Yi-Chun Kuo
Yi-Ting Chen
Chung-Shan Medical University (Taichung City, Taiwan)

In Taiwan, the use of subtitle is common in many TV programs and movies. Many have shown that the use of subtitles can benefit learning of foreign language. However, very few studies address how subtitle types and films of different emotion types affect the participants’ eye movements on subtitles. In the current study, participants watched a short clip (neutral, angry or fearful) with different subtitle types (standard Mandarin, distracting or no subtitle). All clips are dubbed with Mandarin. Nepali is served as a distracting subtitle. Participants’ eye movement patterns while watch the film and post-film self-reported questionnaire are measured. Regardless of emotion types, participants may have more dwell time and fixations on the standard subtitle than the distracting subtitle and no subtitle conditions. This may indicate that watching a meaningful, standard subtitle may be an automatic behavior. Also, participants may have less dwell time and fixations on the standard subtitle when watching anger film than neutral and fearful films. This may suggest that angry faces or sounds in the anger film may attract attention faster than neutral or fearful faces.
HOW MANY DAYS DO RESEARCHERS HAVE TO WAIT FOR THEIR PAPERS TO BE PUBLISHED?

Maaya Ooue
Tokai University (Kanagawa, Japan)

This study aimed to calculate the time lapse between the submission of a manuscript to a journal and its acceptance, and to ascertain the factors that influence this duration. Most graduate schools require doctoral candidates to publish articles in peer-reviewed academic journals before the Ph.D is conferred on them. In addition, it is useful for scholars to know how long it takes to publish a paper because they must evince a number of published papers to successfully search for a job and to build a career in academia. In total, four publications were selected for this study. The Japanese Journal of Educational Psychology, Cognitive Studies, and the Japanese Journal of Personality recorded the highest Impact Factors (IFs) among Japanese psychological journals in 2010 (Kato et al., 2015). Psychological bulletin registered the second highest global IF in its domain in 2010 (Scimago, 2018). The data for the investigation included the dates of receipt and acceptance of original manuscripts in the above journals between 2008 and 2017. The annual aggregate of original articles published during the same period was also computed. Japanese journals averaged 350 days (n = 503, SD = 191) and the Psychological Bulletin took 366 days (n = 396, SD = 170) on average from the date of receipt to the date of acceptance in the decade for which the data were studied. There was no significant difference between the Japanese journals and the international publication. The combined data for all four journals were used to correlate the annual average time lapse with the number of papers published in that year (r = .524, p = .0005, CI=[.259, .903]). Researchers must wait a year for their papers to be published in the selected journals. The results of this investigation did not conform to Sakamoto’s assertion (2013) that English Journal articles tend to be reviewed faster than Japanese. This investigation did not consider acceptance rates. Further studies should scrutinize the acceptance rates, collect data over a larger span of time, and explore other psychological journals.

THE EFFECT OF SUBTITLES ON EYE MOVEMENTS

Ming-Chou Ho
Yun-Jhen Lu
Yi-Chun Kuo
Yi-Ting Chen
Chung-Shan Medical University (Taichung City, Taiwan)

In Taiwan, subtitle is usually a default setting when watching movies and TV programs. We examined how subtitle types, cognitive load, and lecture topics (math or English) affect the participants’ tendency to watch subtitles and learning outcomes. Participants watched one 5-min lecture film (math or English with high or low cognitive load) with three different subtitle conditions (standard, distracting, or no subtitle). We measured participants’ eye movement patterns, cognitive load, and their comprehension test after the film. We report that in regardless of lecture topics, participants may have more dwell time and fixations on subtitle area in standard subtitle condition, comparing to distracting subtitle and no subtitle conditions. Participants may have more dwell time and fixations on the subtitle when watching English film than match film. Watching standard subtitle can benefit performance of comprehension test.
THE RELATIONSHIP AMONG SELF-FORGIVENESS, DIALECTICAL THINKING, AND EMOTION REGULATION DIFFICULTY IN PROFESSIONAL HELPERS: A PILOT STUDY

Hsinping Hsu
TzuShan Lin
National Cheng Kung University (Tainan, Taiwan)

According to a meta-analytic review study, "self-forgiveness robustly predicted psychological well-being, as well as other mental health correlates." Besides, dialectical thinking based on Asian philosophy is found to be related to coping flexibility, which implies its effects on emotion regulation and adjustment. In the society based on Confucianism, it has always emphasized and praised the dedication of job responsibilities. Hence, it can reasonably be predicted that the potential stress of professionals who work in the mental health related settings is very heavy, leading to an important health issue of concern. The main purpose of this study was to examine the hypothesized relationships among self-forgiveness, dialectical thinking and emotion regulation difficulty in professional helpers in Taiwan. Participants were 196 professional helpers (39 male and 157 female). The mean age was 31.79 (SD = 7.90); the mean seniority was 6.28 (SD = 5.93). They gave the informed consent and completed the "State Self-Forgiveness Scale (SSFS)", the "Dialectical Self Scale (DSS)", and the "Difficulties in Emotion Regulation Scale (DERS) ". The social desirability was controlled. The National Cheng Kung University Human Research Ethics Committee reviewed and approved the study's protocols. The data was analyzed by using descriptive statistics, correlation, and hierarchical regression. The main findings reveal that there was a significant negative correlation between SSFS and DSS (r = -.34, p < .01), and significant negative correlation with DERS (r = -.71, p < .01). Besides, DSS was positive correlated to DERS (r = .36, p < .01); self-forgiveness has a statistically significant main effect on predicting the helpers' difficulties in emotion regulation (β = -.63, p <.001). Results revealed an interesting finding that dialectical thinking may not be a useful coping cognition as we thought for Asian professional helpers, but their state of self-forgiveness did reveal a potential effect on reducing the difficulties in emotion regulation. Further research, therefore, is needed to provide more empirical validation.
SCHOOL DISENGAGEMENT OF HIGH SCHOOL STUDENTS WITH RESIDENTIAL CARE IN JAPAN

Eiji Ozawa  
Kyushu University (Fukuoka, Japan)

Yutaro Hirata  
Kagoshima University (Kagoshima, Japan)

Rumi Fukudome  
Fukuoka Jo Gakuin University (Fukuoka, Japan)

More than half of the children who need out-of-home care are provided residential care settings under the Japanese child welfare system. Previous studies indicated the challenges the residential care youth face regarding their social adaptation and career trajectories after leaving the care facilities. School disengagement should be focused on to improve their adaptation after residential care. This is true especially for high school, which is the period just before leaving the residential care setting. The purpose of this study is to reveal the risk factor for dropping out of high school among residential care youth in Japan. Eighty-nine residential care facilities completed a questionnaire focused on the characteristics of high school students in their facilities, including the statement of continuing school, experiences of maltreatment before entering institutions, diagnosis of disorders, and the time of admission to the facilities. The data of 773 young people were analyzed. Multiple logistic regression analysis was used to determine the risk factors for dropping out. The ratio of dropping out from high school among youth in residential care was 19.3% (n = 149) higher than the ratio of all youth in Japan (1.3%). There was no significant effect of gender, maltreatment experience, or diagnosis of disorders on dropping out. On the other hand, the time of admission had a significant effect on dropping out. The risk of youth admitted at junior high school age were significantly higher than those admitted at the preschool age (odds ratio = 1.87; 95% confident interval: 1.21-2.87). These results generally demonstrated that residential care youth have a high risk of not adapting to high school. Youth receiving long-term care showed better conditions with high school continuances. In this respect, the quality of care in residential care facilities can affect the level of social adaptation. This indicates the importance of psychological treatment and educational support for youth who entered child-care settings in a later period.
ABOUT THE WAYS OF DISCOVERY

Danila Makarov
Psychological Institute of Russian Academy of Education (Moscow, Russia)

A clear example of attempts to solve the problem of ingenuity and discovery is G.S. Altshuller theory of solving ingenuity problems (TSIP). From 1946 to 1971, G.S. Altshuller examined 40,000 patents, classified the solutions that he found in five levels, detected general algorithms and forty standard methods that were used by the inventors. Later, the author studied the biographies of prominent figures of science and art and proposed the concept of life strategy of a creative personality (LSCP), having identified the personality characteristics necessary for its realization: 1. Socially useful purpose 2. A set of plans to achieve the purpose 3. High performance 4. Good problem solving technique 5. Ability to defend one’s ideas 6. Productivity. G.S. Altshuller assumed that together these characteristics allow one to correctly respond to life circumstances that oppose creativity. That is the way to realize the LSCP [1]. Today TSIP is gaining popularity among teachers and businessmen. The International Association of TSIP includes regional public organizations from Russia, Ukraine, Belarus, the USA, Japan, Estonia, France, Israel, Italy and other countries. However, criticism of TSIP is also widespread. Despite the fact that TSIP offers a high-quality description of the conditions and algorithms of discoveries, this concept does not reveal their mechanism. There is a theory that allows one to reveal this mechanism. It is the theory of creativity of D.B. Bogoyavlenskaya. In D.B. Bogoyavlenskaya theory creativity is understood as activity’s development realized by a person on his or her own initiative. This happens when activity develops outside of the frame of situation requirements. Going beyond the frame of situation requirements is explained by the cognitive motivation dominance in the structure of personality. The “Creative Field” method, which is developed within the framework of D.B. Bogoyavlenskaya theory, allows one not only to diagnose creative abilities, but also to predict the possibilities of innovative achievements [2].

The purpose of the present research aims to explore the impact of sandtray integrating discrimination model on supervision relationship and supervision efficacy. The study recruited six paired counseling supervisors and interns from three university counseling centers in Taiwan. Before conducting clinical sandtray supervision, the supervisors received professional training on sandtay therapy for two days, discrimination supervision model for two days, and sandtray integrating discrimination supervision model for two days, with a total of six days. Then, the supervisor conducted individual sandtray supervision to the paired supervisee weekly, with a total of 12 supervision sessions. The sandtray supervision is conducted following a 7 step-by-step supervision model. In addition, the supervisors complete the Sandtray Supervision Self-Evaluation Form after conducting sandtray supervision, while the supervisees fill out the Anticipatory Supervisee Anxiety Scale before receiving sandtray supervision. To investigate the supervision relationship more deeply, each research participant is interviewed individually with a semi-structured interview guide once a month, with a total of three times. All interview data is audio-taped and then conduct as verbatim transcription. Grounded-theory approach is utilized for qualitative data analysis. All instrument data is analyzed using SPSS software to determine supervision efficacy and supervisee’s anxiety level. Based on the results, it is expecting to acknowledge the impact and efficacy of the sandtray supervision model and its application. It is also expecting to establish the fundamental research for future expressive individual supervision model. Based on this study and its results, the present study contributes to the research area on clinical supervision and its application.
SOCIAL REPRESENTATION AND DEHUMANIZATION: A MEDIA STUDY ON THE INVOLUNTARY IMMIGRANT

Andréa Barbará S. Bousfield
Andréia Isabel Giacomozzi
Caroliny Duarte da Silva
Maiara Leandro
Mariana Luiza Becker da Silva
Federal University of Santa Catarina (Florinaópolis, Brazil)

Dehumanization has been a theme of interest for social psychology, especially in the last decade. Recent studies tend to explore phenomena of a more subtle, everyday nature. From such perspective, diverse targeted groups are seen as victims of dehumanization, particularly involuntary immigrants, who often suffer dehumanizing treatments—implicitly or explicitly—in the countries they choose to migrate to. Regarding the Brazilian context, it is estimated that the country received 126,102 applications for refugee status between 2011 and 2017. Media such as the internet, magazines, and newspapers routinely feature stories on voluntary or involuntary immigration, and the immigrants’ life histories, in Brazil and worldwide, are broadcasted. Thus the ways the media portray and convey information on involuntary immigrants—the focus of this work—through social stereotypes, can contribute to the formation of social representations. Social representations are theories of common sense created by groups so as to make sense of reality, and may predict behavior. The concepts of stereotype and social representation are interconnected, referring to the images that a society builds regarding the other, and stereotyped social representations can sustain social discrimination practices. This research aims at identifying the social representation of the immigrant disseminated by media in Brazil, employing a documental study. Data were collected from the digital archives of Veja magazine and Folha de São Paulo newspaper in the internet, covering the publications from January 2013 to December 2018. All content in the magazine’s and newspaper’s reports that dealt specifically with themes related to immigrants/involuntary immigration were selected. The resulting textual material was submitted to a descending hierarchical analysis (DHA) through IRaMuTeQ software, which helped to identify the content of social representations about the immigrants, as well as the stereotypes circulated by the printed media. The preliminary results point that the main themes connected to the immigrants are: precarious health and housing, unemployment, and physical and psychological violence, which they suffer when they arrive in the new country.
SUSTAINABLE TRANSITION IN ITALY: CONTRIBUTIONS FROM SOCIETAL PSYCHOLOGY

Mauro Sarrica
Alessandra Rimano
Eleonora Alecci
Paola Passafaro
Sapienza University of Rome (Roma, Italy)

Sonia Brondi
University of Bologna (Bologna, Italy)

The current transition towards low-carbon energy systems involves a deep socio-technical shift, which affects technological, political, cultural and individual levels. Environmental psychology has largely contributed to understand the relationships between values, beliefs, norms, affects, and pro-environmental behaviours. However, the on-going transition also involves deep cultural changes. Cultural and constructivist psychological approach suggest that these transformations interact and should be seen as a constitutive part of the individual mind. However, further research is still needed for understanding these symbolic processes and for promoting social change effectively. We suggested that Social Representations Theory – and its links with cultural approaches – may be used as an overarching framework to overcome psychological reductionism and structural determinisms, as well as to re-connect technical and human, social and individual accounts of sustainable transitions (Sarrica et al., 2016). Drawing on such a societal psychology perspective, this contribution presents a line of research aimed at assessing social representations which foster or hinder sustainable energy and cycling (as a key path to sustainable urban mobility) in Italy. Data were collected at national (i.e. press, political debates, visual data), situated (i.e. local press, semi-structured interviews with key people, ethnographic data), and individual (i.e. self-reports, photos, focus-groups) levels. A mixed-method approach (including quantitative analysis, lexico-metric, hermeneutic and content analyses) was adopted to exploit the data. The results exemplify encounters and tensions between co-existing representations, which have relevant implications for policy makers and communication campaigns. Political and press discourses foster stereotypical views of citizens, based on their lack of agency and/or environmental consciousness. Cycling is also represented by the national press as something ‘other’ from the ‘normal’ transportation modes, and limited to leisure or infancy. At situated and individual level, however, alternate representations emerge which are anchored to locally meaningful practices and self-positioning (as consumers, daydreamers or activists). Local communities and sub-groups resist, negotiate and transform societal representations, giving raise to more active views of citizens involved in sustainable energy transitions and sustainable urban mobility.
THE EFFECTS OF EMOTION ON INTERPRETATION BIAS OF COLLEGE STUDENTS WITH TRAIT ANGER

Yuan Jiang
Si Chen
Beijing Sport University (Beijing, China)

Studies have shown that trait anger is the individual trait anger in a situation of trait anger stimulates manifestation of anger. For individual trait anger, different emotional state will cause the individual interpretation bias, fuzzy information tends to be interpreted as a threat, thus in a passive state. In order to understand the students’ trait anger in a different emotional state of interpretation bias, to guide students to better control the emotional trait anger in daily life situations. The research adopts questionnaire method and experimental method, study of high, low trait anger of college students in the positive, neutral and negative emotional state to explain individual differences. Study of 200 college students from a university, at the age of 18-22, half of men and women, Using self-rating Anger Scale (trait anger subscale) screening, the selection of high and low trait anger group of each 60 people, half of men and women, a total of 120 people, randomly divided into positive, neutral and negative emotion group, complete interpretation bias test. The results of the study found: (1) High and low trait anger among college students in different emotional states have obvious explanation bias, Tend to explain the information ready to accept either course as threatening meaning; (2) In negative emotional state, high and low trait anger ‘interpretation bias than positive emotion and neutral emotion is more obvious; (3) Explain the male and female college students' trait anger under different emotional states tend to have no significant difference. Research proposals: To improve the students’ emotional attention trait anger, especially anger under the condition of interpretation bias, in order to avoid violation of social rules and deviant behavior.
ARE THEY COMPULSIONS OR MALADAPTIVE EMOTION REGULATION STRATEGIES?

Fatma Oktay
Süleyman Demirel University (Isparta, Turkey)

Emotion regulation (ER) is associated with the way of people’s descriptions of their emotional experiences and responds to these emotional experiences (Diefenbach, Tolin, Meunier & Worhunsky, 2008). It is described as the ability of smoothing and managing these experiences to enhance adaptation and psychological functionality (Jacob, Morelen, Suveg, Brown Jacobsen & Whiteside, 2012). It is shown that deficiencies in ER are seen in various psychiatric disorders (Berking & Wupperman, 2012). One of these disorders is obsessive-compulsive disorder (OCD). People with OCD experience excessive anxiety when they encounter disorder-related stimulus. They feel they have to do compulsions to decrease the anxiety that accompanies obsessions. On the other hand, they are aware of irrationality of their compulsive rituals. However, they cannot resist these behaviors because they experience overwhelming anxiety. Having regard to this information, it is thought the excessive anxiety related to disorder-related stimulus could be associated with impairment of ER mechanisms. It is also thought compulsions actually could be maladaptive ER strategies. In this study, the position of compulsions among maladaptive ER strategies is argued. Reviewed studies were reached by searching “obsessive compulsive disorder” and “emotion regulation” keywords in Web of Science database. Master and doctoral dissertations were excluded. 102 articles were reached and the 20 of them were included because of the study’s aim and their relevance degree. Reviewed studies remarked the relation between OCD symptomatology and the ineffective use of ER strategies. From this point of view, opinions about how the ER components could be included in OCD therapies were reported. As a result, the use of components for the development of ER skills in OCD treatments was considered to increase the efficiency from the treatments.
DO WE REALLY PRIME SELF-CONSTRUALS? EXAMINING THE EFFECTIVENESS OF TWO COMMON PRIMING PROCEDURES

Nihan Selin Soylu
İ. Mert Teközel
Ege University (İzmir, Turkey)

The concept of self-construal refers to the construction of self based on the social relations. Past research have categorized and well established two main orientations for regulating the self and behaviors: Independent self-construal (e.g. separation oriented) and interdependent self-construal (e.g. relationship oriented). Although these two orientations acquired early in life and highly stable (Markus & Kitayama, 1991), there is evidence that it is possible to prime a certain self-construal. In the literature, there are certain techniques triggering or priming independent or interdependent self-construal (Oyserman & Lee, 2008). Similarities and Differences with Family and Friends task (SDFF) (Tramifow, Triandis & Goto, 1991) and Pronoun Circling (PC) task (Gardner, Gabrielle & Lee, 1999) are two of the most commonly used priming procedures (Oyserman & Lee, 2008). In this study, we examined the effects of these two priming procedures on self-construals. SDFF and PC tasks were used to prime the participants’ (N = 98) self-construal. In order to find out the effects of these two tasks on self-construal, we used Autonomy and Relatedness Scale (ARS) (Kağıtçıbaşı, 2006) and drawing task (Masuda et al., 2008) as dependent measures. Results showed that any of the priming procedures (namely SDFF and PC tasks) didn’t have an effect on neither ARS score nor drawing task measure in statistically significant level. This study was conducted to examine whether priming the independent or interdependent self constructions increase the accessibility of relevant self-construals. Consistent with the claim that self-construals are trait-like and long standing constructions, our findings demonstrated that the most frequently used priming procedures might not always manipulate the self-construals expectedly (Levine et al., 2003).
PASSENGERS’ SAFETY CULTURE ON THE RUSSIAN RAILWAYS

Yulia Bessonova
Alexander Oboznov
Institute of Psychology, Russian Academy of Sciences (Moscow, Russia)

The critical role of the human factor in safety transportation is designed for risk reduction through transition to the pro-active approach forwarded planning and anticipatory of accidents and based on pre-emptive mapping of risks, analysis of trends and removing incidents background. The paradigm shifts from technocratic approach to humanistic approach and from measurement by number of accidents to comprehensive assessment of mentality and behavior.

The notable trend for recent years is a marked expand safety culture subject involving all possible participants to conceptual field particularly for end users. Purpose of the study was to verify the existence of safety problems and to evaluate the passengers’ safety culture.

Method: Safety Culture Questionnaire (Oboznov et al., 2014) included assessment of cognitive, affective, conative, value components basing on the case method. Participants: N=86 passengers. Some contradictions were found between user attitudes and disproportional high rates of their violations of safety. The passengers’ key feature is the lack of safety-specific training, which entails the unformed safety culture. Neither real knowledge and skills in an emergency nor awareness of potential risks are the necessary condition for emergency response capacity. However, the level of awareness plays the key role in allocation of responsibility in emergency and non-emergency situations. The railway staff sees the passengers as full partners in maintaining security, while passengers take the passive role of consumers of transport services. The shift of responsibility is interlinked with different types of passengers’ non-safety behavior, attitudes. The first cluster of passengers is potentially capable of passive and selfish-hedonic wrongdoing correlated to transferring the responsibility to staff and sense of own impunity. Readiness to act determined by comfort level maintenance. The second cluster is more prone to active wrongdoing correlated with illusions of self-esteem, overconfidence in the technique and safety system. The effective ways of improving safety culture related to two approaches with diverse effectiveness to these groups: enlarging range and radius of their autonomous adequate operation through all inner safety culture components; external factors development primarily control and automation.

The study was funded by Federal Agency for Scientific Organizations according to the research project № 0159-2019-0001.
VIOLANCE AND COPING FOR WOMEN IN STREET SITUATION

Andreia Giacomozzi
Andrea Bousfield
Mariana Becker da Silva
Maiara Leandro
Caroliny Duarte da Silva
UFSC – Universidade Federal de Santa Catarina
(Florianópolis, Brazil)

Although the number of women on the street is lower than men, the probability of rights violations increases because they are more vulnerable in this context. For this, women use different coping strategies, considered as a set of self-regulatory efforts that adjust the individual's responses to coping with stressful situations, according to the Coping Motivational Theory (CMT). With this, this research aimed to understand how women in street situation perceive violences and which coping strategies they use. This is a study with a qualitative approach. Semi-structured interviews were conducted with 17 women in street situation, older than 18 years, occupying the streets of a southern region of Brazil. For the analysis of the data, a categorial content analysis was used. The results pointed out four categories of analysis: Violence in daily life; Explanations and influences; Consequences of violence; and Coping, according to the categories pre-defined by CMT, the most recurrent clashes were: isolation, self-confidence, opposition and search for support, demonstrating the use of both adaptive and bad adaptive strategies. The contents showed beliefs, representations, life histories and their daily lives permeated by violent situations that occur in different forms (physical, psychological and sexual violence), and by different authors (civilian population, police, State and other street people). In addition, the participants made several attributions of causality to the violence, which tend to negatively affect their lives, requiring the use of coping. In addition, there were reflections on gender, being recurrent the feeling of fear associated to the insecurity of being alone in the streets. For this, some women reported having a companion as a coping strategy. At the same time, there have been speeches that deconstruct the stereotypes of fragile and dependent, as they demonstrate strategies of opposition as well, illustrating violence as constitutive of street life. It is concluded that the violence experienced by street women is different and must be reflected in its complexity.
THE DIAGNOSIS OF JUNIOR MIDDLE SCHOOL MATHEMATICS LEARNING DISABILITY: BASED ON THE COGNITIVE DIAGNOSIS THEORY

Ping Fang  
Capital Normal University (Beijing, China)

Chao Wang  
Institute of Psychology, Chinese Academy of Sciences (Beijing, China)

Yuan Jiang  
Beijing Sport University (Beijing, China)

How to make accurate diagnosis for the mathematics learning disability has been the focus of psychology and education field for many years. The common diagnosis methods (including The Grade-Level Inconsistent Model (GLIM), DN: CAS assessment, ERP technology and so on) could not take both accuracy and efficiency into account, therefore, we try to use Cognitive Diagnosis Theory to improve the diagnosis accuracy and efficiency. In this study, we analysed the literature in existing databases at home and abroad by Citespace1.0, then we compiled an exam questionnaire, gave its Q matrix for the subsequent diagnostic tests and Model Fit Analysis and tested 282 students, at last we got 227 available questionnaires. The data analysis tools are R and Spss20.0. The attribute hierarchy model of junior middle school mathematics learning difficulty which was preliminarily established through literature analysis and expert evaluation method is reasonable fit (RMSEA=0.054). Based on the cognitive diagnosis theory, the diagnosis of students with mathematics learning disability in middle school is basically in line with the expectation and the diagnostic accuracy is good (> 70%). In this study, children with mathematics learning difficulty can be divided into 9 types, the diagnosis of the mathematics learning disability children’s show that their metacognitive ability deficit is mainly about insufficient strategy using. The result indicates that the subsequent remedial teaching should be mainly about metacognitive strategy training. The study also shows that it is feasible to use the cognitive diagnostic theory to establish diagnostic tests for children with difficulty in math learning. To sum up, this study is a useful attempt to Cognitive Diagnosis Theory applies.
A PROPOSED MODEL OF CROSS-CULTURAL COMPETENCE, EMOTION REGULATION, INTERCULTURAL ADJUSTMENT AND ETHNIC OUTGROUP AGGRESSION

Snezana Stupar-Rutenfrans  
Jedidja Van Boven  
University College Roosevelt (Middelburg, Netherlands)

The idea that intergroup anxiety and susceptibility to persuasion can lead to higher ethnic outgroup aggression has been referred to many times in recent history. This is not surprising as research shows that an increment in anxiety and high susceptibility to persuasion are significantly related to aggressive behaviors (Berkowitz, 1990; Stupar-Rutenfrans et.al., in preparation). Consequently, the ‘Not In My Back Yard’ effect, referring to negative attitudes towards migrants based on perceived cultural threat (Craig et al., 2013), is evident when citizens complain about new refugee camps in their area. Importantly, the degree to which individuals choose to adapt during an intercultural encounter is guided by emotion regulation (ER); individuals who rarely suppress emotions are less likely to adapt (Matsumoto et al., 2005), which may lead to higher ethnic outgroup aggression. In our previous research, conducted among 2,482 mainstreamers in 10 countries (Stupar-Rutenfrans et.al., in preparation), we found support for our earlier model in which in all mainstream groups’ emotion regulation, nationalistic attitudes and national identification mediate the relation between intergroup anxiety, susceptibility to persuasion, and contact with ethnic outgroups as antecedents, and ethnic outgroup aggression as outcome ($\chi^2 = 1028.071$, $p < .001$; $\chi^2/df = 1.955$, CFI = .938, RMSEA = .02). High intergroup anxiety toward ethnic outgroups and susceptibility were associated with low ethnic outgroup aggression when ER was taken into account. We now expand the previously tested model by speculating that cross-cultural competence (CCC) is a predictor of intergroup anxiety and susceptibility to persuasion (the higher the CCC, the lower the intergroup anxiety and susceptibility to persuasion). Thereby, ER can be seen as a mediator of the CCC-intercultural adjustment relationship. Notably, higher intercultural adjustment will lead to lower ethnic outgroup aggression and better well-being. Because of the lack of literature on the CCC-ER-intercultural adjustment-ethnic outgroup aggression relationship (including the role of intergroup anxiety and susceptibility to persuasion), more extensive research is needed to prevent increased ethnic outgroup aggression. Moreover, understanding the predictors of aggression toward ethnic outgroups can contribute to an inclusive society where everyone feels valued and where diversity is seen as a strength.
EMPIRICAL RESEARCH ON SOCIOCULTURAL AND PSYCHOLOGICAL CHARACTERISTICS OF GENERATION Z
