PERINATAL AND REPRODUCTIVE PSYCHOLOGY: ACTUAL PROBLEMS OF PSYCHOLOGY OF REPRODUCTIVE HEALTH

Galina Filippova  
Institute of Perinatal and Reproductive Psychology  
(Moscow, Russia)

Svetlana Grigorieva  
Center for Speech Development (Odessa, Ukraine)

Elena Zakharova  
Lomonosov Moscow State University (Moscow, Russia)

Margarita Richardson  
University Paris Diderot (Sorbonne) (Paris, France)

Yuliya Shupliuk (Minsk, Belarus)  
«LODE» ltd., Medical multipurpose center (Minsk, Belarus)

Abstract body. The symposium covers modern trends of science and practice in perinatal and reproductive psychology. Main themes are dedicated to changes in motivation of having children, psychological factors of reproductive health disorders, psychological problems of assisted reproductive technologies. Discussion of latest scientific studies and practice of working with childbirth and parenthood problems in Russia and European countries will help to identify modern trends in family reproductive function worldwide and specifics of changes in different regions.

Press paragraph. Top specialists from Russia, Ukraine, Belarus and France will take part in the symposium on actual problems of modern perinatal and reproductive psychology. Speakers of the symposium are leading specialists in research, education and practical work related to reproductive problems of the family and the specifics of these changes in different regions. They will present research results of psychological factors of infertility, the need and effectiveness of psychological assistance in assisted reproductive technologies (ART), studies of the psychological features of children and problems of parenting after IVF treatments, as well as psychological problems of families with children with developmental disorders.

General summary of the Symposium. The speakers of the symposium are leading specialists and organizers of research and practical work related to reproductive problems of the family, developers and heads of educational programs for psychologists and physicians in their regions. Symposium provides international platform to discuss latest trends in motivation of having children in the modern society, psychological factors of infertility, psychological problems of assisted reproductive technologies (ART) and upbringing of children with developmental disorders. Discussion of Russian and European experience will reveal common worldwide trends for changes in the reproductive function of the family and the specifics of these changes in different regions, as well as summarize the experience of studying psychological factors of infertility and opportunities for psychotherapy of reproductive disorders.
PERINATAL AND REPRODUCTIVE PSYCHOLOGY: HISTORY AND MODERN PROBLEMS OF THEORY AND PRACTICE

Galina Filippova
Institute of Perinatal and Reproductive Psychology
(Moscow, Russia)

Perinatal and reproductive psychology is currently an independent area having its own field of application, methodological foundation, theoretical justification and methodological support. The genesis and development of perinatal and reproductive psychology dates back to classical psychoanalysis and its modern trends, which focus on the influence of early experience on the development of the human psyche. Dyadic approach, the theory of functional systems and the psychology of the reproductive sphere are their methodological foundation. There are three main areas: psychology and psychotherapy of an early personality development, organization and correction of the environment of this development (starting from preparing for conception up to the ending of dyadic relationship); psychology and psychotherapy of male and female’s reproductive sphere; psychology and psychotherapy of adult perinatal problems. Therapeutic practice uses the integrative approach. The main achievements of modern perinatal and reproductive psychology: ideas about of the development of the psyche and basic personality formations in prenatal, perinatal and early postnatal periods of development, theoretical insights in the field of reproductive psychology, the psychology of motherhood and fatherhood; development and implementation of psycho-diagnostic methods and techniques and approaches of practical consulting, correction and therapeutic work aimed at an individual client, as well as the dyad and the dyad-father system at different stages of the reproductive cycle; development of training programs for specialists in the field of perinatal and reproductive psychology. The prospective tasks are: the integration of knowledge and experience of scientists and practitioners from different areas, ensuring complex work of specialists and training of specialists in basic educational institutions.
RESEARCHING THE DYNAMICS OF ATTACHMENT IN FAMILIES WITH CHILDREN HAVING CEREBRAL PROBLEMS

Svetlana Grigorieva
Center for Speech Development “Speech team” (Odessa, Ukraine)

Our attention was caught by the problem of attachment in families having children with infantile cerebral paralysis. We have discovered some regularity in the intergenerational transmission of family system defections. During our research conducted with the help of G.G. Filippova’s questionnaire “Ontogenesis of motherhood” 154 families were observed, including 102 families with children having infantile cerebral paralysis, and 52 with healthy children. “All that is suppressed within the first generation, the second carries within their own bodies”, — this citation of F. Dolto accurately displays the main idea of our research. We describe the dynamic development of relationships inside a family — from the symbiotic connection in the dyad “Woman and her mother” to the absolute attachment in the second dyad “Mother and her child with infantile cerebral paralysis”. We analyzed the personality profiles of women who have children with infantile cerebral paralysis and the stages of their own growing up including relationships and attachments inside the family, the family structure up to the 3rd generation, adolescent period and the specific features of separation from mother, shaping of woman identity, readiness to motherhood, period of pregnancy and attitude towards a child during a postnatal period, psychological defenses and so on. At a certain age relationships between a mother-to-be and her own mother looked like ideal — based on friendship, closeness and coordination. 80% of girls were raised in full families. However, having a closer look, we could notice mother’s hypercontrol, her total leading role and lack of daughter’s initiative. A woman suppressed by her mother and unquestionably executing her mother’s will behave likewise towards her own child: overprotectively, authoritatively, leaving a child no right for initiative (which takes “natural forms of realization” whilst caring after a child with infantile cerebral paralysis). In traditional medicine a diseased child, not his mother, is being the main and sometimes the only one subject. As for us, we offer to make an accent on a reason, not on the consequence, and work with the family system in a whole.
MENTAL FEATURES OF CHILDREN BORN AS A RESULT OF IVF

Elena Zaharova
Lomonosov Moscow State University (Moscow, Russia)

One of the most effective ways to treat infertility is the procedure of in vitro fertilization. This method is becoming increasingly popular, despite the fact that it contains serious risk factors for the development of the child. In this connection, the question arises of the characteristics of the development of a child born with the help of this procedure. The purpose of this study was to determine the level of mental development of children, the psychological characteristics of behavior that distinguish them from children born as a result of spontaneously occurring pregnancy. The sample consisted of 47 infants aged 5 to 12 months, 23 of whom were born as a result of IVF. Methods of research were: the method of diagnosing the level of mental development of Denver II, the questionnaire revealing the features of the emotional side of mother-child interaction, the analysis of video materials of child-parent interaction. The results of the study showed that the development of infants born with IVF is generally consistent with the age norm. Children find predominantly the average norm social skills, speech development, development of fine motor skills and locomotion. They demonstrated a strong desire for physical contact with the mother and reduced initiative of behavior. Thus, infants of the IVF group also tend to approach the mother more often than infants of the SB group ($u=332.00, p=0.010$). Behavior of infants of the SB group is more active and more initiative ($u=106.500, p=0.002$). Analysis of the characteristics of mothers interaction showed that women of the IVF group experience pleasure from contact with the child, often touch it than in the SB group ($u=02; p=0.000$). At the same time, they are not inclined to support the initiative of the child, to encourage him with a word or gesture ($u=256; p=0.033$). Thus, the results of the study allow us to state that these features of the development of children are due not so much to the method of pregnancy as to the parent position of their mothers.

PSYCHOLOGICAL SUPPORT AS A TOOL TO IMPROVE THE EFFICIENCY OF THE IVF PROTOCOL

Margarita Richardson
Universitet Didro (Sorbonna) (Paris, France)

Based on the actual level of mental functioning of the individual in a problem situation, you can build a patient-centered approach in providing psychological support. Planning reduces the level of anxiety and stress that often accompanies the patient in the protocol. Within the framework of the research project of doctoral studies at the University of Diderot (Sorbona), the Mariinsky Hospital, the ART department, was used to conduct psychodiagnostics using the Rorschach method. The study involved 47 women, age from 27 to 43 years. Meeting in life with problem situations, the individual more or less involves emotional ways of making a decision. The following styles were singled out: The introvertive decision-making style of 19.4% An extensive 8.51% Ambident 10.63% Restrictively introverted 17.02% Restrictive-extraneous 21.27% Restrictive — the ambident 23.4% Motivational and situational levels of cognitive tension were distributed in the group of subjects, respectively, 44.6% and 55.4% The following emotional features of the problem-solving style are revealed: Flexible extra-intensive 10.63% Steady intense 27.65% The flexible introversion is 38.29% A stiff introvertive 23.4% The received data testify that psychological testing at the planning stage of the IVF protocol allows to reveal the styles of decision-making in problem situations and to develop an individual plan of psychological preparation and accompaniment of patients in the IVF program.
PSYCHOLOGICAL ASPECTS OF FAMILY PLANNING AND REPRODUCTIVE HEALTH IN THE REPUBLIC OF BELARUS

Yuliya Shuplyuk
OOO «LODE» Mnogoprofilnyy medicinskiy center (Minsk, Belarus)

The problem of infertility is very relevant in the republic of Belarus. The number of infertile couples reaches 16%. Causes of non-occurrence of pregnancy as a presence of medical problems and environmental influences (Chernobyl disaster, 1986). Also there is a great importance of psychological components in the way of overcoming infertility. Nowadays there are 5 private centers and 2 state centers specializing in IVF and ART in Belarus. Each regional city has one perinatal center where patients with infertility are assisted. Psychologists work both in the women’s polyclinics and in the state perinatal centers. The problem of psychological assistance in private centers is still open. Patients of family planning centers and especially of IVF centers need psychological correction of their state of mind. There are about 3000 cycles of IVF per year in Belarus and only about 30-40% of them will be successful and will lead to pregnancy. Only about 25% of couples will wait for the birth of the baby. The remaining ones are supposed to re-enter the IVF in the next few years. It is obvious that emotional state, fears, anxiety of 75% of couples remain unprocessed, which lead to a decrease in the effectiveness of new ART programs.

Thus, it is necessary to pay great attention to psycho-prophylaxis and psycho-correction of the psychological health of infertile couples. There is an active position of the government towards psychological work on family planning and reproductive health. At the same time, the algorithm for psychological assistance to a couple who gets ART treatment is not developed enough in our country. Therefore, in the subject of psychological health of such categories of citizens, it is expedient to use the active position and experience of colleagues from the CIS countries, especially from Russia. Long-term developments and methods of work of colleagues in this industry can become popular with our specialists working with infertile couples in the republic of Belarus. Paying a wide-ranging (both medical and psychological) professional attention to couples with infertility, we have a chance for a more favorable outcome of ART treatment.
IRENOLOGY AND CONFLICTOLOGY:
PROBLEMS OF PEACE AND CONFLICTS

Nikolai Leonov
Udmurt State University (Izhevsk, Russia)

César Augusto Solano Gálvis
University of Granada (Melilla, Spain)

Alena Kárpava
University of Granada (Granada, Spain)

Mergalyas Kashapov
P.G. Demidov Yaroslavl State University (Yaroslavl, Russia)

Abstract body. The main purpose of the symposium is to discuss topical issues of modern irenology (science about peace) and conflictology in a changing world. In the field of peace and conflict, within the framework of the science of irenology, the concept of intercultural peace is proposed, which focuses on the study of problems of intercultural relations, based on dialogue; respect for cultural diversity; acceptance, instead of “tolerance”; integration; equality in diversity; conflict prevention, instead of its resolution. Mediation in conflict resolution.

Press paragraph. In 1959 J. Galtung laid the foundations of the International peace research Institute, and he proposed and developed a certain concept of “peace”. His teaching marked the beginning of the theory of “Three generations of the world”. The University of Granada consistently implements Galtung’s ideas and develops a new direction — “irenology”, the science of peace. The Symposium will present an analysis of international research in the field of “intercultural”, which is the basis of the theoretical and empirical model of the Intercultural World, the purpose of which is to create spaces of positive interaction of cultures. The theoretical typology of the World (the work of Spanish researchers in the field of Irenology, members of the Institute of peace and conflict of the University of Granada, the International Institute of Peace, Conflict and Mediation (MIM Kim) of Russia), as well as the practice of intercultural interaction is proposed. The development of a structural and functional interdisciplinary model for conflict prevention and resolution is planned as a future projection.

General summary of the Symposium. The Main Themes of the Symposium 1. The theoretical and methodological foundations of the study of human interaction with the world and in the world are considered. Are available to consider possible theoretical grounds and approaches in the study of the world: a holistic approach, possibilism, pragmatic approach of the reformist approach, the mediation approach. Actively developing modern conflictology is a system of more or less related scientific paradigms, each of which explains certain sides of the conflict. This is a vivid example of pluralism in science, where conflict is seen as a form of human interaction with the world. The author’s concepts are actively declared, ideas and programs are implemented taking into account both the world experience and the Russian mentality. 2. The psychology of conflict, uncertainty and coping is proposed for consideration. The author’s definitions of the conflict based on the logic of the system approach and based on the space-time model of the conflict, which includes: “variables — space — time”. 3. Human resource capabilities in the changing world are revealed: in the conditions of uncertainty, conflict and adaptation to other cultural conditions. 4. Irenology (the science of peace) and the problem of teaching peace in the world are considered. The definition of the world, the role of Galtung and his theory of the Triangle of violence in the development of Irenology — the science of peace is defined; the Intercultural world is considered as a part of the theory of the Three generations of the world. Educational programs, models, technologies are offered for consideration. 5. The possibilities and limitations of mediation as a technology in conflict resolution are discussed. Empirical studies of the development of conflict and conflictological competence are presented. The effectiveness of the implementation of training programmes for mediators.
THE INFLUENCE OF IDENTITY FEATURES ON ADOLESCENT RADICALIZATION

Nikolai Leonov
Udmurt State University (Izhevsk, Russia)

Kiril Zlokazov
Ural State Pedagogical University (Ekaterinburg, Russia)

The article discusses the problem of counteracting teenagers’ radicalization. It’s assumed that radical attitudes in teenagers’ environment negatively effect the formation and development of society. It’s underlined the growing desire to involve teenagers and youth in carrying out extremist and terrorist acts. Also there are considered modern theoretical concepts of radicalization, their specific essence. It’s noted that all concepts take into account the role of disturbed or hampered social relationship as a latent factor of radicalization. On this basis we made the assumption about the influence of one’s representations about oneself on radicalization. A hypothesis is advanced about the influence of the certainty of identity on the manifestation of radical fanatical and nationalist convictions. Then the purpose, methods and procedure of empirical investigation of the certainty of self-identity and social identity are described, the sample of the study included 140 teenagers of 12 to 14 ages, 49% — male. It’s estimated the influence of the variables a) the certainty of self-identity; b) the certainty of social identity on the variables c) the fanatical attitude and d) the nationalistic attitude. One-way ANOVA is used as the main method. The results show that the uncertainty of self-identity reduces teenagers’ fanatical beliefs, and the certainty of social identity raises them. The parameters of the identity have no effect on the nationalist beliefs. The main methodological result was the understanding of the possibility of predicting teenagers’ radicalization by studying the certainty of self and social identity. From a psycho-correctional point of view, the results can be used in reducing the level of radicalization through changing teenagers’ perceptions of self-identity. This study was prepared under support of Russian Science Foundation (RSF) grant, project 17-18-01278.
FEATURES OF FACIAL EXPRESSION RECOGNITION BY RUSSIAN AND VIETNAMESE STUDENTS

Natalia Karabushchenko
Peoples’ Friendship University of Russia (Moscow, Russia)

Socio-political instability in the world and migration processes give rise to problem situations in modern society. The value of social perception and social intelligence increases significantly, contributing to better mutual understanding and readiness for interaction between representatives of different cultures. The theoretical and methodological basis of the research consists of theories (F. E. Vernon, J. Guilford, M. O’Sullivan, N. Cantor, J. F. Kihlstrom, D. V. Ushakov and others). The following methodological tools were used in the empirical research: 1) the test “Social Intelligence” by J. P. Guilford, aimed at the study of the social and intellectual abilities of the individual; 2) MSFDE (Montreal Set of Facial Displays of Emotion), aimed at studying the ability to recognize facial expression on the faces of our own and other ethnophors. The methods of mathematical statistics were used: Spearman’s correlation analysis and comparative analysis using the Mann-Whitney U test. The sample included 123 Russian students and 110 Vietnamese students, whose average age was 24 years. The study revealed that the success of the facial expression recognition by Russian subjects is related to their greater openness and communication experience, and for Vietnamese subjects to their greater femininity and tendency to seek social support. Thus, it was revealed that a high level of ability to predict the completion of a situation and read non-verbal emotions allows students from Russia to recognize facial expression more successfully, and students from Vietnam, due to their propensity to seek social support, realized through anticipation and flash-forward of actions are equally successful, as well as students from Asian countries recognize facial expression on people of Asian descent. The theoretical and empirical research was carried out with the financial support of the Russian Foundation for Basic Research, grant No. 17-06-00834 “Intellectual bases for the recognition of emotions by representatives of different cultures.”
The goal is to study the resource component of conflict competence. The author’s methods were used in the study: 1. The questionnaire “Diagnostics of the leading type of response” developed by Kashapov M.M. and Kiseleva T.G.. 2. Methods to determine the level of forecasting in problem situations (Serafimovich I.V., Kashapov M.M.). 3. The methodology “Conflict competence” (M.V. Bashkin, V.A. Gorshkova, A.M. Voskresensky). It is substantiated that conflict competence (CC) as a competence in the field of interpersonal relations is a type of communicative competence. The psychological regularities and mechanisms of functioning of CC are determined. The structural and functional model of CC is developed. CC is an integrative quality of personality, characterized by the presence in its structure of cognitive, motivational, regulatory components. These components of non-additive form a holistic structure of conflict competence, which has preventive, predictive, constructive, reflexive and correctional functions that ensure the implementation of preventive measures in interpersonal interaction, as well as adequate recognition and constructive resolution of conflicts by the person. CC becomes a resource when the subject endows it with meaning and connects it with the expectation of positive achievements. The leading cognitive education conflict competence is resource thinking as the intellectual ability of a person to find various ways to creatively resolve conflict problems in various spheres of life. This type of thinking is manifested in the ability to adequately recognize the emergence and development of contradictions that form the core of a conflict situation. CC is characterized by a high level of communicative culture.

Information literacy, ICT user skills are recognized among the leading soft skills by all researchers. The authors of this article share this position, while believing that skills related to the ability to plan and manage finances should be included among the leading soft skills. The authors analyze the terms of «financial competence», «financial literacy», putting forward the thesis that nowadays this concept passed from the category of hard skills to the category of soft skills. A lack of financial competence causes a number of exacerbations: social conflicts caused by the rejection or misunderstanding of economics’ laws; intra-family conflicts associated with the inability to plan the family budget; intrapersonal conflicts caused by unsuccessful purchases and financial losses. The authors diagnosed some components of financial literacy and received subjective assessments of young people, university students in relation to their level of financial literacy. The authors suggest a number of educational technologies that they use in the process of teaching students, for the formation of financial competence; it is a technology of the liberal club and the training of social skills. The systematic use of these technologies in the educational process gives stable positive results in the formation of financial competence among students.
In psychotherapy, work with patients is built around the identified internal conflict. The authors denote it as an intrapersonal, basic, actual, intrapsychic conflict. In positive psychotherapy there are 4 spheres of conflict resolution: body, activity, contacts, fantasies. For patients with psychosomatic disorders are significant all 4 areas: "body" as a fixation of the state of the patient’s physicality; activity as sublimation of insoluble contradictions in the work; contacts as a way of compensation or escape from communication; imagination as a manifestation of the existing alexithymia. In Logotherapy, A. Längle examines the integrity of the relationship of the individual with the world and presents all the dimensions of its existence: physical, social, psychological and spiritual. The first task is the actualization of the basic negative suppressed emotion and the patient’s awareness of its connection with his physiological state. The patient should feel how the internal conflict makes him react to a certain part of the body. The second direction of work: 1) overcoming the conflict with the situation and gaining confidence in people; 2) acceptance of the world as it is, to live in it with joy; 3) accepting yourself and achieving authenticity; 4) finding your meaning of life in this world, overcoming the patient’s existential conflict. Example: A patient suffering from atopic dermatitis and bronchial asthma. The result of the diagnostic situation is the patient’s awareness of the internal conflict between his natural emotionality inherited from his father and the need to restrain subconscious aggression in situations with which he can’t, but is forced to put up with because of good breeding and a certain danger of national traits in the Russian environment. The conflict forced the patient to "react with the skin”and” hold his breath".
BEHAVIORAL STRATEGIES IN DISPUTED AND STRESSFUL SITUATIONS 
AND METACOGNITIVE MANIFESTATIONS OF SUPRA-SITUATIONAL 
THINKING AMONG SALES CLERKS OF DIFFERENT SPHERES

Irina Serafimovich
Education Development Institute of Yaroslavl Region
(Yaroslavl, Russia)

The ongoing social and economic transformations in Russia determine a high level of service as a crucial factor in improvement of the effectiveness and competitive ability among the organizations conducting trade (V.A.Bodrov, T.N.Kriukova). According to various research thinking and personal interaction in sales clerks’ activities are interrelated and interdependent (R. Lazarus, S. Folkman, G.G. Scott, V.A.Bodrov, V.V.Znakov, T.N.Kriukova). M.M.Kashapov. Y.V.Poshekhnova proved that metacognitive knowledge and metacognitive activity of a subject help to resolve professional problematic situations effectively. The article presents some research results on personal and contextual determinants of choosing certain behavioral strategies in conflict or stressful situations using metacognitive approach. More than 80 sales clerks of different spheres (furniture, food, clothes, wholesale) have participated in the research. It has been proved, that sales clerks in food stores more often use escape behavior in comparison to other groups (clothes: t = 5,744 p ≤ 0,01, wholesale: t = 5,401, p ≤ 0,01). The analysis of probable determinants of choosing certain strategy has been made. In particular, one of the probable explanations might be the following: escape behavior in stressful situations may be optimal and adaptive in the situations, which are either poorly controlled and highly dependent on intrinsic factors, or when mentioned above behavior prevents destructive relationships (E. Frydenberg, 2002). There is a relation between cognitive qualities and behavioral strategies in conflict situations: the depth is positively related to compromise strategy (r = 0, 350, p < 0,01), operational efficiency is positively related to rivalry (r = 0, 271, p < 0,05) and negatively to adaptability (r = -0, 257, p < 0,05). It has been determined, that generally supra-situational thinking in resolving problematic situations demands temporary efforts and reduces efficiency of choosing a behavioral strategy in stressful situations. The author has proposed the possibility of implementing obtained results in professional support and development of sales clerks of different spheres.
IMPACT OF SPECIALIZATION ON TYPES OF CONFLICT PERMISSION AT YOUNG DOCTORS

Lyudmila Savelyeva
Mergalyas Kashapov
P.G. Demidov Yaroslavl State University (Yaroslavl, Russia)

As a result of the process of social transformation, a person is a participant in many different social groups whose requirements may contradict each other. One of the personal resources is conflict competence, the cognitive component of which is associated with the choice of the optimal type of response in a conflict. To investigate the leading types of conflict response in the first-year residents of various specialties. In total, 73 residents of the Yaroslavl Medical University (35 internists and 38 surgeons) and 14 teachers of Yaroslavl city (Russia) as a control group took part in the study. The survey was conducted on the questionnaire "Diagnostics of the leading type of response" developed by Kashapov M.M. and Kiseleva T.G. The prevailing method of resolving a conflict situation for all residents, as well as for teachers, was the "Solution". The dominance of the "SAvAg" ("Solution", "Avoidance", "Aggression") type of response was found among internists and surgeons with a predominance of average severity indicators compared with teachers. "SAgAv" type of response, as the most productive, prevailed among teachers compared with surgeons and internists. The identified types of response depend on the medical specialization. It can be attributed to the dynamic characteristics, which opens up the possibility of a constructive influence on their development from the mentors responsible for working with the residents.
PERSONALITY INDIVIDUAL COMMUNICATIVE ACTIVITY

Svetlana Vasyura
Udmurt State University (Izhevsk, Russia)

With a rapid growth of communications modern society requires changes of personality communicative activity that contradicts their desire to keep individual personality. In terms of current changes, it is crucial to study personality’s communicative activity. The research aims to provide theoretical and methodological basis and experimental study on personality’s communicative activity.

The theoretical basis rests on L.Ya. Dorfman’s concept of meta-individual world, V.S. Merlin’s integral personality and V.N. Panferov’s ideas of functions of communicators. Based on methodological principles, the research is systemically planned and applies diverse methods, procedures, research methods and SPSS. Cross-sectional research and comparative method are used. To validate statistics, SPSS 17 for Windows are used for descriptive statics, Student t-test, Mann–Whitney U test, Pearson correlation coefficient, factor analysis of communicative activity. Ten-year research engaged 1745 individuals, aged between 14 and 40, from different backgrounds: university and secondary school students, teachers, travel managers, economists.

Individual-psychological traits of personality were identified as determinants of communicative activity. Intra-individual subsystem is attributable to newrodynamic, psychodynamic, personal (communicative, emotional, intellectual), social-psychological traits. Whereas extra-individual subsystem involves psychodynamic, personal (communicative, emotional), social-psychological characteristics.

It is stated that communicative activity has specifics related to age ranges and professional activities. Communicative activity in adolescence and emerging adulthood is determined by psychological traits (newrodynamic, psychodynamic, individual, social-psychological). Common basis of communicative activity for these ages are personality traits (sociability, dominance, diplomacy, courage).

Communicative activity of personality performs certain functions at and professional activities. It provides framework for adolescents and socio-economic professions as it influences personality composition, shaping quality distinctness related to communicative activity levels. Communicative activity of primary school teachers perform meta-individual functions. Comparative analysis of pupils’ personality traits shows that those, who are in class of teachers with high communicative activity, are more sociable, dominant, courageous, gentle.

Communicative activity performs adaptive functions in adolescence: adolescents with different communicative activities demonstrate different cognitive, emotional, behavioural coping-strategies. Communicative activity provides harmony in adolescence: adolescents with high communicative activity show higher values and communicative accessibility. Due to high communicative activity intrapersonal conflicts are minimized.
EXPLORING VARIOUS ASPECTS OF FUTURIZATION

Anna Sircova
Time Perspective Network External (Copenhagen, Denmark)

Chris Crespo
Nordea Behavioural Economist (Copenhagen, Denmark)

Elisabeth Schilling
Göttingen Diversity Research Institute (Göttingen, Germany)

Alejandro Vásquez-Echeverría
University of the Republic (Montevideo, Uruguay)

Olga Strizhitskaya
Saint Petersburg State University (Saint-Petersburg, Russia)

Abstract body. In this cross-disciplinary symposium we are looking into the emerging concept of ‘futurization’ (of thinking, behavior, politics, etc.) and the image of the future from the perspectives of psychology, behavioral economics and sociology. We explore multiple facets of ‘futurization’ in relation to personal identity level, but also on societal level and linking it to diversity, migration, sustainability and human nature and development in general. Decisions made today can have far-reaching consequences for individuals, societies, and ecosystems in the future. Yet far too often, present feelings are so powerful that considerations of future events are neglected: individual interests in the present become fulfilled at the expense of the common interest for the future and the generations to come. We discuss novel solutions that psychology, behavioral economics and sociology have to offer to this classical temporal dilemma — a temporal conflict between short-term and long-term interests.

Press paragraph. This symposium covers the novel concept of ‘futurization’, providing an empirical definition from various perspectives. Dr. Anna Sircova, Head of the Board, Time Perspective Network, Denmark introduces the emerging field of research and applications ‘futurization of thinking and behavior’ in the context of sustainability. Chris Crespo, Chief Digital Strategist, Nordea, Denmark looks at futurization through the economists’ lens and talks about the skills we will need in the near future. Prof. Elisabeth Schilling of Göttingen Diversity Research Institute, Germany discusses the role of subjective time concepts as part of the cultural capital, influencing individual’s biographies, feelings of belonging, and successful integration of migrants. Alejandro Vásquez-Echeverría, Associate Professor at University of the Republic in Uruguay raises an important issue of the socio-economic status that plays a huge role in how parents talk and structure interactive situations with their children, showing that parents’ time perspective affects the development of cognitive, episodic foresight in their children. Finally, Dr. Olga Strizhitskaya, Associate Professor at Saint Petersburg State University, Russia raises an important methodological issue of how to best measure the concept of time perspective in this context and proposes various alternative methods to the wide-spread Zimbardo Time Perspective Inventory.

General summary of the Symposium. This symposium explores various aspects of the novel concept of ‘futurization’. Authors of the symposium believe that the importance of being able to think about the future in light of the past and the present is important for a number of disciplines and as such calls for a clear and more rigorous definition of the term. We start out with the working definition of futurization developed by Sircova (2018): ‘Futurization as incorporation of the future orientation / consideration of future into the process of thinking and in the acts of
behaviour in the present. ‘As if’ perspective—having future in the focus of attention; considering how this particular action will echo in the future globally and adjusting own behaviour locally”. The symposium group combines the fields of psychology, sociology and economics. We also look at the developmental aspects and the methodological measurement issues. Research (Wittmann, Sircova, 2018) shows that individuals differ in their emphasis on present and future dimensions, and psychological time is an essential variable in understanding how people make decisions. A stronger future orientation and a mindful present orientation are positive predictors of sustainable behavior; hedonistic and impulsive present orientations are negative predictors. Therefore we look closely into the various aspects of psychological time of an individual and that of a group. We are interested in how we can ‘futurize’, what skills and cognitive abilities we need to have for that, how does that develop over time and what role does the parenting play. We are interested in how the images of the future play a role in sustainability behaviours, saving behaviours, and developing sense of belonging and successful integration and creation of a healthy multicultural society. Our research further explores the potential benefits for transformations towards sustainability of a conscious approach to long-term thinking and behaving.

FUTURIZATION OF THINKING AND BEHAVIOR: DEVELOPING THE EMPIRICAL DEFINITION OF THE CONCEPT

Anna Sircova
Time Perspective Network External (Copenhagen, Denmark)

Päivinen Pinja
Scharf Angela
Kennedy Molly
Nordea Behavioural Economist (Copenhagen, Denmark)

This research explores the image of the future that citizens or laypeople have. What concepts and imagery do they associate with the term ‘futurization’? What are the expressed and unexpressed hopes, dreams, fears and anxieties? We believe it is important to explore those since they will be attached and reflected in the public opinion creating largely unpredictable emotional responses and perceptions, when the term ‘futurisation’ is used in different contexts, such as policy making. Research shows that individuals differ in their emphasis on present and future dimensions, and psychological time is an essential variable in understanding how people make decisions. A stronger future orientation and a mindful present orientation are positive predictors of sustainable behavior; hedonistic and impulsive present orientations are negative predictors. Our project aims to identify opportunities to foster long-term thinking in individuals or explore the ‘futurization of thinking and behaviour’. This research explores, for example, the potential benefits for transformations towards sustainability of a conscious approach to long-term thinking and behaving. The project links research perspectives on future challenges and sustainable actions in daily life of an individual. We are aiming to provide insight on: What are the mechanisms we can use to see the possible futures? How can we bring these desired futures closer and turn them into reality? In our first pilot study of the concept we have noticed that people tend to shift the discussion from ‘futurisation’ to ‘future’ as a familiar concept. Therefore, in the next steps we plan to look more in detail into both concepts and contextual ideas attached to them, in order to clarify the definition of ‘futurisation’ and separate it from ‘future’. If futurisation is the act of making what we think will happen in the future a reality, then the future is going to be very technology-driven, operated by robots or men in mostly colorless environments, yet we still feel curious and optimistic about it.
DIVERSITY OF FUTURE PERSPECTIVES — PERSPECTIVES ON FUTURE DIVERSITY

Elisabeth Schilling  
Göttingen Diversity Research Institute (Göttingen, Germany)

Tianna Loose  
University of Nantes (Nantes, France)

This paper aims to show subjective time concepts as a part of the cultural capital, which influences the individual’s chances, biographies and the feelings of belonging. Further it shows the meaning of the time perspective for a successful integration of migrants. Currently there are many different migrant groups in Europe; the existing diversity could be described with the terms of time and time perspectives. This temporal description might be less discriminative and more neutral, which could help to create educational and integrational programs for the newcomers and promote equality of different cultural origins and diversity of the life styles. Theoretically this paper leans on the concept of time-collage (Schilling, 2005) describing the diversity of time approaches and possibilities to learn a transcultural time approach. It is argued that cultural contacts between the migrants and the local and the established population produce diversity in every area of life. One of these areas is the subjective understanding of time or of „the language of time” (Hall, 1983), including punctuality, effectivity or planning concepts, which are crucial for the successful integration of migrants, e.g. for their success in an educational system or in the job. The paper investigates a possibility to access high-quality data about migration and adjustment to the host society. We propose to conceptualize time as an informative frame for social movements and changes. Asking in narrative interviews about the time issues allows to access both: complex sense structures of the individual life world and the interpersonal, social, transferable structures of time use. Furthermore, speaking with the respondents about time alleviates the access to delicate or painful issues and helps to verbalize implicit or unclear contexts. During the presentation we would like to reflect on the process and the outcome of the data gathering. How and whom should we ask about the time perspective in order to get much complex background information about the life perspective? This would be the main point for the further discussion.
PARENTAL TIME PERSPECTIVE AND SOCIOECONOMIC STATUS ARE RELATED TO THE DEVELOPMENT OF EPISODIC FORESIGHT IN PRESCHOOL CHILDREN

Alejandro Vásquez-Echeverría
University of the Republic (Montevideo, Uruguay)
*****************************************************************************

Many cognitive and affective processes are subject to intergenerational transmission from parents to their offspring. But the extent to which there is an intergenerational transmission of temporal psychology constructs is unclear. Also, when exploring these effects, it is crucial to consider the socioeconomic status (SES), that was posited to be provoking some specific temporal orientations. We explore this issue in two studies relating temporal psychology constructs in adults (consideration of future consequences and time perspective) with their children episodic foresight (or episodic future thinking), i.e.: the extent humans are capable to project the self to the future. Dyads were formed by the child most knowable person (usually the mother) and their preschool aged children. In the first study, carried out in Uruguay, we used the considerations of future consequences scale (CFCS) in adults and two tasks to assess episodic foresight in children. We found significant correlations between CFCS-immediate subscale scores and child foresight score, but also significant differences in measures given family-SES. In the regression model, this significant effect vanished as we introduced the maternal education as covariate. In the second study (in Portugal), we used in the Zimbardo Time perspective Inventory (ZTPI) as time-invariant predictor of episodic foresight, assessed in a repeated measures design. We found a significant correlation between parental ZTPI present fatalism subscale scores and child episodic foresight scores. Using a hierarchical linear model, controlling by parental education, this effects only holds as predictor of the intercept (emergence) of episodic foresight in the children. Taken together, our results suggest the parents time perspective affects the development of cognitive, episodic foresight in their children, by means of how parents talk and structure interactive situations. But also, our results suggest that these processes are both SES-related. We propose that the effect of parental time perspective over the development of episodic foresight could be better explained by a mediation model.
ALTERNATIVE APPROACHES TO EMPIRICAL STUDY OF TIME PERSPECTIVE

Olga Strizhitskaya
Saint Petersburg State University (Saint-Petersburg, Russia)

In the recent years solid body of research was focused on Time Perspective (TP). TP was associated with motivation, psychological well-being, and the variety of objective and subjective outcomes. Surprisingly, in this important and intensively studied field just few methods are used. Probably, most well-known and widely applied method would be Zimbardo Time Perspective Inventory (ZTPI; 1999). Being most widely used it also received some critique. Particularly, the design of the questionnaire includes different amount of scales for different modules of time (past, present, future). The inventory had also some connotations with cultural specifics, most pronounces between Eastern and Western cultures. In the present study we would like to consider alternative methods to study TP: semantic differential, emotional attitude to TP and life events analysis. Semantic differential (Wasserman et.al., 2009) is based on cognitive estimation of past, present and future. It is associated with such characteristics as activity, strength of time and shows consistent correlations with different behavioral characteristics such as coping strategies, self-regulation strategies etc. Emotional attitude to TP is based on a relatively sincere evaluation of emotions induced by past, present and future on a scale from 1 to 10. This clear and simple method shows consistent correlations with self-esteem and self-attitude, particularly it was shown (Strizhitskaya, 2006) that past was significantly associated with self-esteem while future — with self-attitude. Most complicated method among mentioned above would be life analysis. This approach uses qualitative analysis of the events one had, has and might have in the future. This method gives a broad range of information about TP, life patterns, and is probably most close to one’s real life. All the methods mentioned above, including ZTPI, cover some particular area of the TP. At the contemporary stage of research and scientific science in the field of TP there is a need to approach it from a more comprehensive perspective, combining these methods instead of concentrating on promoting only one.
DARK FUTURE AND THE ATTITUDES TOWARD GLOBAL RISKS

Timofei Nestik
Institute of psychology, Russian Academy of Sciences
(Moscow, Russia)

This project presents an empirical study of Russian students’ attitudes regarding global risks (N = 547). The socio-psychological predictors of person’s attitudes toward global risks and relationship between future anxiety and beliefs about the world were analyzed using SEM. Results indicate that the anxiety about the future is associated with low social trust and a sense of injustice. It raises anxiety about global risks, but does not affect a person’s readiness to act to prevent them. Three groups of beliefs were identified that perform different psychological functions when coping with information about global threats. The first one has a protective function in the conditions of lack of social resources: conviction in the injustice of society, distrust to social institutions, as well as the conviction in predetermined destiny, block participation in collective actions to prevent risks, increase apocalypticism and increase orientation to radical decisions. The second group has a stabilizing function, contributes to coping with anxiety before global threats through increasing adherence to group norms: religiosity, orientation toward respect for authority, purity and sanctity in moral evaluations reinforce the conviction of the need to return to traditional values and tighter control over citizens to prevent catastrophe. Conservative beliefs help to increase manageability and mobilize society in the face of disaster, but at the same time they shift public consciousness to “restrictive” measures, which may not be enough. For example, the merely restrictive approach to the prevention of man-made risks weakens social trust and makes it difficult for the public to enter a dialogue to develop rules for using the new technologies. Third group of beliefs functions as pre-adaptation to the threats of the future through increased tolerance for uncertainty: beliefs in a person’s ability to determine their present and future, an orientation towards justice and caring for people, a belief in social complexity, the presence of various solutions in the same situation, and a belief in the justice of the world support an orientation towards forecasting and preventing global threats through cooperation. These beliefs help people to resist the temptation of simplified, populist, radical solutions. Perspectives of further research are proposed.
PERSONAL IDENTITY IN THE CONDITIONS OF MULTI-VECTOR CHANGES IN SOCIETY

Asya Berberyank
Russian-Armenian (Slavonic) University (Yerevan, Armenia)

Galina Gorskaya

Oksana Tuchin
Kuban State University (Krasnodar, Russia)

Viktoryia Egorova
Art Academy GoceDelchev University (Stip, Macedonia)

Abstract body. Socio-cultural transitivity within the circumstances of modern existence calls for the necessity to reconsider the problems of personal identity and peculiarities of its determination by fluctuating modernity (Z. Bauman). The identity of a personality is determined by general trends of these fluctuations: information dominance in society, its active political reconstruction, postmodernity of social ideology (world view), growing virtualization of existence, etc. Information dominance has expanded variability of replaceable social images; philosophy of postmodernism has legitimized the right of every individual to be different from other individuals; virtualization of existence has reduced the danger of disapproval. The influence of the above-mentioned processes on personality self-identification is discernible in different ethnocultural spaces. The papers submitted to the Symposium analyze the specifics of personality self-identification in multinational border territories of neighbouring states. National identity and the specificity of its dependence on historic experience at the age of globalization are also dealt with.

Press paragraph. Personal identity is one of the key concepts in psychology. Its status and interpretation in scientific discourse are conditioned by general trends in social development: transitivity and overall dynamic growth, active political reconstruction, postmodernism of social outlook, growing virtualization, etc. Under new circumstances of our existence, the role of the subjective (author’s) position in self-identifying is increasing. The humanistic, existential traditions in psychology, the subject-existential approach to the analysis of personality problems create theoretical grounds for analyzing the natural links between the characteristics of the «fluid modernity» and the self-identification of the cultural spaces of existence are actualized differently. Personality involvement in political and economic changes that make it over-identify and transform its self-identification is also diverse. The papers presented at the Symposium are research results of Russian, Ukrainian and Armenian scientists well-known for their work in the sphere of personal identity problems and social processes that condition its transformation. The said papers analyze the specificity of personality self-identification in multinational border territories; national identity and the specificity of its dependence on historic experience at the age of globalization are also dealt with. Much attention is paid to the specifics of personality self-identification within the context of increasing virtualization of existence. To create a common future, it is necessary to help all and each find their place and role within this common movement.

General summary of the Symposium. Personal identity is one of the key concepts in psychology and related sciences. Its status and interpretation in scientific discourse are conditioned by general trends in social development: transitivity and overall dynamic growth, active political reconstruction, postmodernism of social outlook, growing virtualization, etc. Under new circumstances of our existence, the role of the subjective (author’s) position in self-identifying is increasing. The humanistic, existential traditions in psychology, the subject-existential approach to the analysis of personality problems create theoretical grounds for analyzing the natural links between the characteristics of the «fluid modernity» and the self-identification of the
PERSONAL IDENTITY IN THE CONDITIONS OF EXISTENCE VIRTUALIZATION

Zinaida Ryabikina
Katharine Bogomolova
Kuban State University (Krasnodar, Russia)

The emergence of the Internet has led to the expansion of the communicative field of the personality, has changed the nature of communication, provoked the accompanying effects. The subject-existence approach to the personality realized in our research focuses on the intensity and quality of the activity of the individual in the virtual space of existence. The research involved 132 people aged from 19 to 25 years. The author’s questionnaire and the FIRO-B method (U. Schutz) was used to assess the respondent’s own behavior and partner’s behavior in three areas of interpersonal needs: inclusion, control, affect. The research showed that the main reasons for the activity of the individual in the virtual space are the motives of communication, affiliation and self-affirmation. Individuals need to confirm their identity in relations with another person and it is achieved more easily in terms of virtual communication. A person in virtual reality dispenses self-opening, creates the desired impression of himself, i.e. manipulates the creation of identity. The study revealed a high focus of the subjects of virtual communication on their own activity in the field of inclusion and control. Exactly the ability to be a subject “for two” (for yourself and for a partner in virtual communication) in the area of inclusion and control makes it more achievable to receive the necessary identity for the individual to confirm his identity in relations with the other person. Thus, the virtualization of the relationship of the individual increases the risk of simulation and distortion of the process of self-identification due to the lack of a true dialogue with a partner. The research highlighted two categories of users. Those whose life in virtual reality is organically combined with life offline, creating additional resources that increase the possibilities for self-realization and adequate self-identification. And others who “hang up” in the virtual space, to whom segregation of a separate aspect of existence (virtual existence) is inherent, when communication in virtual space from an instrument, facility that expands the possibilities of a person’s real life, turns into an unsaturated need subjugating a person, making an individual dependent on false self-identification.
Gender-based identity is a primary personality characteristic being developed through gender-sensitive social engagement. From an early age a person takes over previously preset behavioral strategy. Though the present-day world enables building up variable behavior within actualization of gender-based identity. Bipolar and androgynous models of gender-sensitive social engagement are prevailing, though social and cultural back up of a person’s social engagement is increasing in terms of multi-polar gender-based identity model. It is typical for the multi-polar model not male turns into female or female turns into male but that the general idea of the male and female concept is changing. A personality takes on an opportunity to fill themselves with subject matter as male or female. Therefore it becomes more difficult for a personality to actualize the gender-based identity that presents steady self-awareness as male or female and provides an opportunity to be themselves, to preserve authentic being. This internal process being complicated by external ever changing samples of male and female, by social and cultural transformations in community, provides the groundwork for crisis of a person’s gender-based identity, for the loss of integrity of life, of self-perception as male and female. In case studies of gender-based identity crisis experience among women, they mark: a role conflict, fear of being successful, various types of depression (inferiority feeling, a housewives symptom, learned helplessness and others); excessive affiliation feeling; fear of losing femininity. Gender-based identity crisis among men is manifested by: achievement need; keeping hierarchical masculine community; mental spend on homo-sociality, experiencing consequences of aggressive behaviour and violence, backing up the myth of outsized masculine sexuality, fear of gaining femininity. A person’s gender-based identity crisis is a simultaneous or consecutive discrepancy of internal gender-based identity components and with external gender-based extents. By means of filling their gender-based perceptions with new personal content, by going through positive gender-based self-esteem, a personality enlarges their gender role repertoire and achieves, actualizes and confirms their gender-based identity in various gender extents: environment extent, that of body and activities. Crisis of gender-based identity enables a personality to find new resources and principles of their being.
SELF-DEVELOPMENT OF PERSONALITY AS A PROBLEM OF MODERN SOCIETY

Natalya Lupenko
Kuban State University (Krasnodar, Russia)

Self-development of personality as a problem of modern society. Lupenko N. N. Modern society dictates its conditions for the development of the individual. In the context of the theory of K. Rogers, the trend of self-development is the process of implementation of the human throughout the life of their capacity with the aim of becoming a fully functioning person. From the first days the person is engaged in self-development, complicating and developing in various directions. Self-development is a necessary condition to maintain a professional shape in such professions as teacher, psychologist, tutor, coach etc. the Modern market of services in excess of offers different products trainings, library, video, audio courses, by which the person taught, by Express method. However, the excessive over-saturation of the services offered, the high load allows us to talk about self-knowledge as a problem. In a society where a person develops additional skills in a short time, there is a danger to work at the limit of their capabilities, leaving no time for rest and assimilation of the experience. Hence the identity is a violation of physiological and psychological balance. There is a psychological saturation, which has already been mentioned, foreign researchers (K. Levine, A. Karsten) and domestic scholars (I. Soloviev and later T. V. Hramina). Psychological saturation is a psychological state of reduced efficiency, loss of interest in work, an active desire to change it, characterized by a sense of irritation. Today, psychological saturation acquires new facets, increasing relevance and the need to adapt to new conditions. Before the person becomes a new challenge in choosing the means that will fully be able to meet the need for self-knowledge, to preserve psychological health.
MOTIVATION IDENTIFICATION IN VIRTUAL SPACE: THE PERSONALITY PREDICTORS AND CORRELATES

Bela Yasko
Vladimir Pokul
Kuban State University (Krasnodar, Russia)

In the new century, the relevance of scientific justification of objective markers of the process of personal identification is due to the fact that, thanks to the development of web 2.0 technologies, in particular, social media, the subject actively integrates its real life into the online environment. The analysis of these processes shows that only some aspects of identification of the person on the Internet are identical to those in real life, and some are not explained by the classical models of personal identity developed in the world psychological science of the previous century. To conduct the study was applied a specially designed instrument — questionnaire “Motivation for online activity.” The obtained data were complemented with indicators of the questionnaire of R. Cattell 16 PF (Form C). In the process of the study included 188 respondents (all of them are users of social media). The sample was divided into two age groups: 18-25 years (group I; 108 people, including 66 women and 42 men) and 26-35 years (group II; 80 people, including 52 women and 28 men). For data processing we used multiple regression analysis (MRA) and Pearson linear correlation method. In the theoretical part of the study, based on the analysis of a wide range of sources, four types of motives for online activity of the individual are identified: "obtaining information"; "entertainment"; "social interaction"; "personal identification". These motives in the form of the main scales are incorporated in the questionnaire “Motivation of online activity”. We present data that allow us to identify psychological predictors and correlations of motivation "personal identification" and factors by Kettell in the respondents of both groups. In young women (18-25 years) predictor of this type of motivation is openness, attention to people, willingness to cooperate (a+). Correlations were found with internal tension (Q4); sensuality, dreaminess (l+), practicality (M-), anxiety (O+). The motive of personal identification in young men is related to the qualities: independence, self-confidence, originality, firmness (E+), as well as refinement, ambition (N+).
HISTORICAL EXPERIENCE AND NATIONAL IDENTITY IN THE ERA OF GLOBALIZATION

Asya Berberyan
Oksana Tuchina
Russian-Armenian (Slavonic) University (Erevan, Armenia)

The influence of globalization is associated with the danger of losing national traditions, the destruction of the traditional value system. At the same time, the processes of globalization open new opportunities for revealing the creative potential of historical and cultural traditions in the realities of the modern world. The study of the historical experience of youth in the context of globalization allows identifying the main vectors of the transformation of the value-semantic content of national identity, which makes the civil community a single people. Historical experience includes not only knowledge of historical events, but also the living of the subject in them within the framework of one’s own idea about this historical event, which determines its own psychological content.

Comprehending the past, one encounters an existential problem, in the solution of which he tries to find the meaning of a certain historical event for the community to which he attributes himself, and for himself personally as a representative of this community. Thus, historical experience is an integral component of the existential experience of the individual and, turning to the past, a person gets the opportunity to go beyond his biographical extremity, to comprehend his life as a link in the chain connecting the past and the future, which generates feelings and experiences like nostalgia, pride, pain, shame. The “points of crystallization” of the historical experience of the individual and the group are not only historical events, but also historical personalities that personify the people. The presence in the mass consciousness of stereotyped images of symbols and widespread images of national real and fictional heroes, as well as a clearly formed concise image of the representation of one’s people as a single, integral characteristic, the unity on the basis of common heroism and conquests determines the significance of historical experience in the formation of the national self-consciousness of the individual.
ADOLESCENTS PERSONAL IDENTITY FORMATION UNDER CONDITION OF SINGLE CRITERIA OF INTERPERSONAL COMPARISON

Galina Gorskaya
Kuban State University (Krasnodar, Russia)

Victoria Egorova
Art Academy GoceDelchev University (Stip, Macedonia)

Self-realization in specified type of activity depends on person’s psychological maturity. Its sufficient indicator is developed personal identity. Developed personal identity manifestation is full consciousness of personal traits, abilities, interrelation with social environment. Adolescent involvement in professional learning of activity that is directed to maximum results achievement (sport, ballet) evokes onset of single criterion of interpersonal comparison: success in learned activity. Mono-criterion of interpersonal comparison and constraints of social experience acquisition connected with involvement in professional and school learning cause narrowing of adolescent self-consciousness, personal development complication. The aim of investigation is revealing degree of self-concept narrowing in adolescents involved in sport and ballet professional development. Resources of prevention of adolescents self-concept narrowing were also investigated. Participants of investigation were 442 adolescents 12-15 years of age: 190 school children that were not involved in early professionalization, 162 athletes, 90 students of ballet school. Level of adolescents’ self-presentation was registered by means of “Who am I” method.

Program of psychological support of adolescents’ self-concept development was worked out. Investigation results shows that athletes and ballet school students demonstrate lower level of self-presentation then school children that were not involved in early professionalization. Athletes demonstrate lower level of self-presentation then ballet students. Formative experiment directed to self-consciousness development conducted in group of athletes with low level of self-presentation results in increase of athletes’ self-presentation level. Investigation results demonstrate possibility of adolescent athletes and ballet students’ self-presentation narrowing prevention. In is important for prevention of professional retirement crisis prevention.
UNCONFIRMED IDENTITY AS AN INDICATOR OF SOCIAL FAILURE OF PERSONALITY

Yuliya Makarevskaya  
Sochi State University (Sochi, Russia)

Zinaida Ryabikina  
Kuban State University (Krasnodar, Russia)

At modern speed of social changes, the risks of their invasion of identity increase, so the options for preserving the internal integrity of the person, focus and constancy become the subject of psychological researches. In the conditions of the rapid transformations of social spheres today it is possible to highlight socially successful and socially unsuccessful people. Thus that a person’s need for success is the basic source of activity and the desire to express oneself, the experience of social failure has a negative effect on personal identity. Is the result of self-identification of socially unsuccessful people is unshakeable confidence in their own reality and identity? In the first stage of the study, 163 people aged from 18 to 28 years took part in determining the structure of identity. It was determined that in the structure of personal identity 5 categories can be highlighted as categories describing the self-identification characteristics of a person: person’s character, individual style of activity, orientation, behavior, temporal vector of features. Further, on the basis of the data obtained, factor analysis was carried, using the method of principal components with rotation using the varimax method. As a result, 3 factors were obtained, which explains 66.9% of the research data of the experimental group (198 people). The analysis of the selected factors leaves external / internal self-identification features and a dynamic, temporary factor. We refer the character and orientation of the personality to the internal features of the identity, the individual style of activity and the behavioral characteristics of the personality to the external. The temporary factor is “cross-cutting”, that is, each of the features mentioned above can manifest itself in a person in the past, present, and future. The methods of mathematical statistics (t-Student's criterion, single-factor dispersion analysis, N = 100 people) made it possible to determine that in terms of prolonged social failure, the temporal vector. With long-term experience of social failure, a person does not identify himself through the categories of “plans for the future”, his personal life plan is broken.
FOUR-FACTOR MODEL OF PERSONALITY: SUBJECTIVE
EXISTENTIALISTIC

Svetlana Petrosyan
Sochi State University (Sochi, Russia)

Zinaida Ryabikina
Kuban State University (Krasnodar, Russia)

The subjective existentialistic approach to personality, as a specific type of existential approach, allows to reconsider the issue of personality development and becoming, taking into account the integral character of such duality as Personality (Subject) and its Existence (World). The meta position of Personality-Existence allows to interpret the child’s development as expansion of personal beingness in the relations: Me-World, Me-You, Me-Them, giving the grounds for distinguishing ontogenetically forming types of co-existence as positions in co-existential dyad relations. We have developed and tested a questionnaire diagnosing the specific features of dispositional reaction. The method uses a multiscale questionnaire (18 reaction positions) with results presented in an individual dispositional reaction profile, containing 232 questions grouped into scales corresponding to co-existential positional dichotomies, e.g.: Basic aggression — Basic fear of destruction, Power — Submission, Might — Incapability etc. Validation of the method demonstrated a sufficient level of basic psychometric reliability and validity indices: Cronbach’s alpha internal consistency of the questionnaire in general— 0,93, test-retest reliability — 0,85. The empirical validity of every single scale of the questionnaire varies between 0,7 and 0,83. Factor analysis followed, based on the resulting data obtained.

Being factor models of personality often based on lexicographical approach (e.g. five-factor personality model by P. Costa and R. McCrae), our model bases itself on the dispositional reaction formed ontogenetically in co-existential dyad relations (Child-Mother). One reacting position is identified with the person, and the other pole is projected into the outside (e.g. Power-Submission co-existential dyad). The factor analysis of reacting positions manifestation degree resulted in obtaining four statistical populations which explain 67,2% of the research data of the experimental group (219 people). The factor analysis involved: SPSS software, version 17,0, dominant component analysis with varimax rotation. The highlighted factors allowed determining certain step-by-step trends in utilizing the positions in co-existential dyad relations. Diagnosing the dispositional reactions manifestation degree allows interpreting and forecasting personal behavior, planning psychological support in situations of crisis.
Abstract body. The symposium will focus on the issues and prospects of professional development in the “third age” period. The theme of the symposium is of particular relevance due to the recent pension reform that increased the official retirement age in the Russian Federation. Although the reform entails a gradual increase in the retirement age, it does not suggest any additional psychological support, despite the fact that 63% of the older-age population do not intend to continue their professional activity. The “Psychological and psycho-physiological aspects of professional development in the third age” symposium aims to consider the complex of the cognitive functions, psycho-physiological, and psycho-social parameters that determine professional activity in late age. The symposium will address the following issues: • psychological and physiological aspects of aging; • predictors of professional development in the third age; • psychological barriers to professional development in the third age; • compensatory mechanisms for cognitive decline of the third age professional; • cognitive technologies for the prevention of psycho-physiological and psychological changes in the “third age”; • university of the third age as a factor in psychological longevity; • professional activity as a factor in psychological well-being in the third age; • professional development prospects in the third age.

Press paragraph. The process of ageing raises a number of questions in economic, political and social spheres of life: increase in generation gap, conservative electorate, and decrease in professional and social activity. All these lead to an important question of professional development and longevity in advanced age.

Symposium “Psychological and psychophysiological aspects of professional development in the third age” is aimed at complex investigation into cognitive functions, psychophysiological and psychosocial parameters that define professional activity in the advanced age. Throughout the Symposium the following questions will be discussed: predictors and perspectives of professional development in the third age; psychological barriers of professional development in the third age. The following people are to take part in the Symposium: experts in the field of psychology of professional development whose interests are in the field of third age professional development; gerontologists from Russia and Switzerland who can give a profound characteristic to the third age both from the point of view of negative and positive changes; experts in professional health psychology will explain what allows to keep psychological and somatic health; psychophysiologists will speak about the norm and pathology of involution processes.

General summary of the Symposium. The population aging causes a number of social, political and economic problems. The social problem manifests itself in the disintegration of the society due to the huge social distance between the elderly and the other age groups, which is determined by the well-established negative attitude towards the elderly. The political problem is that the elderly age group is becoming a significant share of the electorate, aimed not at progress and development, but at conservatism and consumption. The economic aspect of the problem is manifested in the burden that old-age people impose on the state economy. Various attempts to solve these problems are being made both at the legislative level and at the level of social policy. In connection with the pension reform implemented by the Government of the Russian Federation that aims to increase the retirement age, studies focusing on the psychology of the third age have becomes relevant. The core focus of these studies is the social and professional capabilities of working pensioners, overcoming the ideas of old age as
the age of decline in social and professional activity, intellectual abilities, disorganization of value orientations and other destructive development trends. The symposium will discuss the following issues: psychological and psychophysiological aspects of aging; predictors of professional development in the third age; psychological barriers to professional development in the third age; compensatory mechanisms of cognitive decline in the professional activity of the third age professional; cognitive technologies for the prevention of psycho-physiological and psychological changes in the third age; University of the third age as a factor in psychological longevity; professional activity as a factor in psychological well-being in the third age; professional development prospects in the third age. The symposium will discuss the psychological and psychophysiological aspects of aging, reduced functional capabilities of mental processes, their strength and mobility: difficulty in finding information, reduced vocabulary, reduced pace of mental activity and other undesirable but inevitable deformations of mental activity due to age-related changes. The social situation at a later age is characterized by a greater variability of individual development, due to the state of health, marital status, and economic support; living conditions, value orientations, social and professional involvement, social stereotypes of past experience, changes in cognitive processes and subjective life styles. The multidimensionality of the social situation of elderly and old people makes it difficult to determine the psychological structure of their personality. The systematic factor in arranging the social situation is the prevailing activity. At the same time, the influence of negative social factors on the psyche of the elderly should be emphasized: the deterioration of the financial situation, social loneliness, loss of social and professional identity, loss of loved ones, and costs of social well-being. These factors exacerbate the decline in the ability to adapt and the full social functioning of the third-age person caused by the involutional processes. The psychological distinctiveness of the late age is due to changes in the social situation of development and the nature of the prevailing activity, which in turn leads to the restructuring of the third-age individual’s personality. Based on the personality structure by K.Platonov, which includes the following substructures: biopsychic properties, mental processes, experience and orientation, the structural changes in the personality at this age are characterized. Numerous studies of psycho-gerontologists have noted changes in the psycho-physiological processes associated with the weakening of general health, as well as the appearance of signs of pathology. These changes require special analysis, but in general, people of this age who are overall healthy do not undergo a serious restructuring of this personality substructure. The second substructure of personality — features of mental processes — undergoes major changes. Emotional-volitional processes are accompanied by a sense of psychological discomfort, increased anxiety, and decreased volitional self-regulation. Mental processes slow down due to the involution of the central nervous system: the functions of the sensory and psychomotor systems, and memory are reduced. The decrease in the brain activity of a late-age professional affects both cognitive processes and sensory abilities. There is a decline in the sensitivity of visual and auditory perception. In addition, at older age, the functioning of perception is significantly influenced by sensory deprivation. I.Davydovsky emphasized that changes in the type of adaptation processes in late age, the rapid transition from an open system to a closed one, is due to the influence of sensory deprivation. The “closed system” implies adaptation mechanisms that come from life and professional experience, but such mechanisms in many respects try to replace the deficient cognitive functions of the elderly (memory, attention, etc.), which accelerates their regression. Life and professional experience play a special role in the restructuring of the personality. If life experience has a positive effect on the elderly people’s life, the significance of professional experience depends on the person’s employment, the content of their past profession, their socio-professional role and value-meaning orientations of the individual. Preservation of social and professional experience is often accompanied by the development of negative personality traits: the loss of the social and professional role and status “generates the disharmony of own own “I”; the stagnation of
personal development leads to inadequate relationships with other people; adherence to previous ways of implementing activities and behaviours leads to stereotyping and reduces the ability to adapt to innovations. The greatest changes in the personality structure of elderly and old people occur in the orientation substructure: value-meaning and need-motivation spheres that determine the activity and style of life. The most significant transformation of orientation includes the disagreement of value orientations between people of late age, the youth and the mature: the strengthening of intergenerational conflicts, cognitive dissonance and ageism. The decline in socially and professionally significant achievements initiates the development of learned personal helplessness – the habit of living without constructively resisting failures, adversities and difficulties. The narrowing of social contacts and the reduction of communicative activity result in social loneliness and forced autonomy. Thus, a theoretical analysis of the personality restructuring in the third age necessitates the discussion of changes in the social development situation and the content of the prevailing activity. First of all, these structural changes affect the substructure of orientation and experience, the processes of higher mental functions change and slow down, the psycho-physiological properties deteriorate. These changes lead to the development of destructive psychological formations that negatively affect the elderly people’s quality of life. Along with the acknowledging the negative trends of aging, the researchers point out some positive aspects: the mental development continues throughout life, has no age restrictions and does not exhaust the potential possibilities of self-realization in old age. The approach to the late age as a period of development appeared in the last quarter of the 20th century (M. Alexandrova, L.Antsyyferova; T.Karsaevskaya; O.Krasnova; A. Liders ; V. Slobodchikov, E.Isaev, P. Baltes, D. Bromley, D. Kausler, K. Shaii, K. Riff, V. Sullivan, etc.). These researchers of late age emphasize that the aging process is not a systematic decay of an individual’s psychological functions; it is a process of alternating periods of losses and gains. For example, involutional changes in vitality, decline in mental abilities are compensated by the development of positive formations to overcome destructive age-related phenomena: actualization of self-regulation, development of social and labour activity, the emergence of new positive values, finding new life-affirming meanings, etc. The reflection of positive significant events of the past life has a positive effect on the individual’s emotional well-being and positive self-esteem. The above formations can act as predictors of professional development in the third age, as personality traits that determine the presence of the professional path at this life stage. In the context of the professional path the symposium will discuss the issues of psychological barriers, which significantly hinder or complicate professional activity in the third age. According to M. Markova, barriers to professional development arise under the influence of various processes of aging, professional deformation, professional fatigue, prolonged mental stress caused by difficult working conditions, as well as professional development crises. Professional development barriers are multifunctional. From E.Zeer’s point of view, in some cases they have a negative effect on professional development: they disorganize professional consciousness, promote maladjustment, stagnation, and deformations; in others, on the contrary, they stimulate productive personality development. The barriers can be both internal and external. External barriers are unfavourable socio-economic conditions, difficulties in the implementation of activities, deterioration of interpersonal relations and psychological climate in the group, which may be related to age. Internal psychological barriers of the third age professionals are: professional crisis, when the professional requirements subjectively do not correspond to the professional's abilities and capabilities; crystallization of professional experience and acquired professional destructions. These barriers make it difficult to adapt to professional activities, which leads to a decline in social and professional activity, a loss of meaning and professional prospects. In the context of psycho-physiological changes, it is also worth considering the issue of compensatory mechanisms of cognitive declines in professional activity of third age professionals. According to national studies, the psychological
organization in the third age is restructured, which affects the whole system of a person’s self-regulation. At the same time, compensatory mechanisms are capable of ensuring normal cognitive functioning at this stage of cognitive adaptation, which are determined by both a qualitative change in the intellect and a change in its structural organization. The manifestation of compensatory mechanisms is observed in the speed of performing operations, since in the process of aging the speed of information processing, information retrieval, and operating images decreases. But in this context, it is interesting to study the ratio of the speed of work of young typists and their colleagues of the third age, since in the experiment both groups of subjects showed the same speed of work. The reason for these results was that the typists of the third age compensated for the decrease in the reaction speed by looking at the text in advance and keeping it in memory longer. It should be noted that compensatory mechanisms are formed by applying the acquired professional experience, as well as verbal skills that do not change with aging. This raises the question about the methods and technologies for the prevention of psychological and psychophysiological changes in the third age, since the success of professional activity at this age stage depends on the state of cognitive processes. A promising direction in addressing this issue is cognitive technologies. Characterizing cognitive technologies in a wide context, G. Malinetsky understands them as “methods and algorithms for achieving the subjects’ objectives, based on the information about the processes of cognition, training, communication, information processing by humans and animals, on the concepts of neuroscience, on the theory of self-organization, computer information technologies, mathematical modeling of the elements of consciousness, a number of other research areas that were recently related to the field of fundamental science”. Cognitive technologies are one of the main trends and drivers of the modern IT sphere. Cognitive technologies in the field of IT involve the development of calculations based on cognitive models that are able to cope with a large amount of unstructured data. We can say that machines have become capable of “thinking”, learning and assessing. For the third age requirements, the developments in the field of virtual and augmented reality are promising, since simulators that can be based on these technologies will allow for training deficient cognitive functions, and various types of applications, assistant devices will help cope with tasks requiring operating new information, as well as monitor cognitive loads and the state of cognitive functions. Another area of cognitive technology is learning technologies. French scientists E. Loarer and M. Yuto describe “cognitive learning” as one of the areas of research in psychology and one of the trends of pedagogy. The main objective of education is developing the entire complex of mental abilities and strategies that allow for implementing the learning process and adapting to new conditions. In the context of cognitive mastery, the emphasis is not on absorbing certain information, but on building links between phenomena, encouraging participants to dialogue, research thinking, and enhancing cognitive activity. With this approach to learning, rational activity is associated with serious cognitive work, which contributes to the growth of mental activity. Additional education in the third age, which may be a condition of psycho-aging longevity, requires studying. This age category is engaged in the university of the third age. According to T.Gnante, institutions of this type are focused primarily on intergenerational interaction, maintaining activity and developing the third age individual’s personality. Universities of the third age are not aimed at providing higher education and profession: it is rather a kind of pastime for a person of the third age. The courses in educational institutions of this type teach both specific practical skills, such as ‘computer literacy’, and courses that provide knowledge in the field of psychology, culture, history and economics. The learning process itself is different from the usual one, here the basis is the personal activity of the participants, who are in close contact with teachers and choose what they want to do. The process of learning at the university of the third age allows for preserving and maintaining the cognitive processes in the third age. The skills that people of the third age acquire in the process of education at the university of the third age can be useful not only in everyday life, but also in continuing their...
professional activities. Since the continuation of professional activity does not imply that a person remains in their previous position and profession, there may be qualitative changes, for example, mastering computer skills will allow a person of the third age to work in an office. In general, the third age is characterized by a number of negative changes, both psychological and personal, but this age is given a different characteristic. P. Lasslet characterizes the third age as the culmination or even as the prime of human life, a time of complete personal self-realization, in a sense this is the period of achievement of "acme". So the third age is seen as a psychologically successful period of life, but this is at odds with reality. As a result, the question arises of what determines psychological well-being in the third age. There are many approaches and types of well-being (R. Ryan, E. Daisy, N. Bredburn, E. Diener, etc.). The most common is the concept of K.Riff, in which psychological well-being is understood as a basic subjective construct that reflects the perception and evaluation of its functioning from the position of the maximum potential abilities of a person. In K. Riff's opinion, well-being implies the realization of a wide range of psychological possibilities. Psychological well-being is a multidimensional process, not a state. The influence of professional activity on the psychological well-being of third age people is of interest, since it can affect psychological well-being both positively and negatively. The complex of all the above issues and aspects should allow for determining the prospects for professional development in the third age. It is obvious that professional activity does not end when a person reaches the retirement age, but the image of a working person of the third age is either unattractive or poorly discernible. The consideration of psycho-physiological, psychological, personal and social aspects, strengths and weaknesses of the age, problem areas of functioning and ways to stimulate or compensate for them, the impact of professional activity on well-being, additional education will create an image of a third-age working person and also suggest ways to solve existing problems.
PERSONAL FACTORS TO ACHIEVE PSYCHOLOGICAL WELL-BEING OF PEOPLE OF THE "THIRD AGE"

Elvira Symanyuk
Borisov George
Ural Federal University (Ekaterinburg, Russia)

In connection with the number of elderly and need in improving the quality of life, there is a need to find resources to ensure successful aging. One of the significant personal and psychological characteristics reflecting the process of successful aging is psychological well-being. Psychological well-being in psychological science has a different interpretation (N. Bredburn, R. Ryan, E. Daisy, E. Diener, K Riff), but the most popular theory in domestic studies is the approach of T. Shevelenkova and P. Fesenko. The methodological bases of the research are the theory of subjective self-realization, the study of the psychological content of the development of a person's subjectivity at the stages of old age, scientific concepts of age-related personality changes in old age, the theories of positive psychology. The study has a descriptive design. The study involved 50 people aged from 56 to 75 years: 11 men and 39 women. The representativeness of the sample is ensured by applying a randomization procedure. The research methods: • C. Ryff's Psychological Well-Being Scales (In adaptation Shevelenkova and Fesenko) • Revised NEO Personality Inventory (In adaptation Khromov) • Coping Strategy Indicator (In adaptation Sirota and Yaltonski) • Hardiness Survey (In adaptation Osin and Rasskazova) • Diagnostic of type of behavioral activity Wasserman and Humenyuk • Life Orientation Test (In adaptation Gordeeva, Sychev, Osin) • «Who am I ?» devised by M. Kuhn, T. McPartland (In adaptation V.Yurchenko) • Questionnaire to determine the socio-professional qualities of the subjects Empirical data processing was carried out using the maximum likelihood method using Varimax rotation. As a result of the empirical research, five factors were discovered to achieve psychological well-being by people of the "third age": "Subjectivity", "Attitude to the world", "Strategy for adaptation to old age", "Meaning of life", "Value". The obtained factors can be represented as a model for the attainment of psychological well-being by people of the "third age". A further perspective of our research is the study of the psychological well-being of elderly people in the context of professional activity. Another perspective is the validation of the model we obtained to achieve psychological well-being in old age. The reported study was funded by RFBR according to the research project № 19-013-00431 "Personal Mobility As a Means of Predicting and Maintaining Professional Health in Old Age".
THE READINESS FOR MASTERING AGE-TIME CHANGES AND LIFE SATISFACTION IN THE PROFESSIONAL EMPLOYMENT CONTEXT OF PENSIONERS

Elvira Symanyuk
Sergeeva Tamara
Ural Federal University (Ekaterinburg, Russia)

The pedagogical activity is an area with traditionally high professional safety. This raises a number of scientific and practical issues related to the role of professional activity in lives of retirement age teachers, in solving their normative age tasks. To study the readiness for mastering age-time changes and life satisfaction in the professional employment context of pensioners. The Readiness is viewed as an integrative mental education that determines the individual's awareness of the fact of self-aging, tolerant attitude towards it and as manifested in the active search for productive strategies for adapting to this process. The design of the study suggested a comparison of two independent samples of working and non-working pensioners. The study involved 98 people of retirement age (from 55 to 67 years old)—teachers of secondary educational institutions of Yekaterinburg (Russia). Standardized questionnaires were used to collect empirical data—the "Life Satisfaction Index" technique in N.V. Panina’s adaptation and the copyright questionnaire "The readiness for mastering age-time changes" of N.S. Glukhanyuk, T.B. Sergeeva (Gershkovich) [1]. The non-parametric Mann-Whitney U-test was used for comparative analysis. The results of the study demonstrated the complex, ambiguous role of professional activity in the retirement age. The level of life satisfaction among working teachers who are retired is significantly higher than that of non-working ones. The general level of psychological readiness for mastering the age and the severity of individual components (cognitive, affective, motivational) are lower among working pensioners. For working pensioners, a higher level of life satisfaction indicates the positive role of labor activity in formation the socio-emotional well-being of an elderly person. The continuation of pedagogical activity gives the "young" retiree an opportunity to maintain his usual way of life. Non-working teachers of retirement age better understand the naturalness of manifestations of aging and plan their lives in the conditions of future transformations. For working pensioners, psychological readiness for mastering the age is much lower—they push aside thoughts about old age and treat it more negatively. 1. Glukhanyuk N.S., Sergeeva T.B. (Gershkovich T.B.). Late age and strategies for its development. Moscow, 2003. The reported study was funded by RFBR according to the research project № 19-013-00431 "Personal Mobility As a Means of Predicting and Maintaining Professional Health in Old Age"
ACTIVITY OF THE PERSONALITY AS A PREDICTOR OF PROFESSIONAL DEVELOPMENT AT "THE THIRD AGE"

Elvira Symanyuk
Berdnikova Daria
Ural Federal University (Ekaterinburg, Russia)

Now in connection with raising the retirement age in Russia relevant is a problem of studying of predictors of professional development at late age, that is those factors which not only allow the person to compensate negative age changes, but also act as the potential of development. The analysis of the literature shows that among the main predictors of professional development at late age authors consider professional and personal activity. On the one hand, many scientists emphasize that the activity at late age is directed to formation of effective ways of overcoming changes in work of the highest mental functions. The professional activity promotes safety of verbal, memory and intellectual functions, especially those which acted as the leading factor of activity. On the other hand, the activity allows not only compensate to age "losses", but also is one of the most important factors of development of the person at late age. So many authors emphasize that professional and personal activity contribute to the progressive development of intelligence at late age, to forming of a transpektiva of own life on the basis of which such new growths of an old age as wisdom and a gerotransendsentnost, to finding of new senses and purposes of professional activity, forming of new strategy of professional and personal development on the basis of systematization of the experience gained during life. Thus, the activity of the personality at "the third age" is considered as the effective compensatory mechanism allowing to overcome negative age changes and as development potential. At the same time, there are no empirical researches of activity, its specifics and dynamics, therefore we can say that the problem of activity at late age is studied insufficiently. Also it is necessary to create effective technologies of increase in activity of the person at late age what will promote increase in efficiency of performance of professional activity and in general to professional and personal development.
TRANSPROFESSIONALISM AS PREDICTOR OF ADAPTATION TO THE PROFESSIONAL FUTURE OF THE PERSONALITY

Elvira Symanyuk
Ural Federal University (Ekaterinburg, Russia)

Zeer Evald
Russian State Vocational Pedagogical University (Ekaterinburg, Russia)

In the post-industrial society, the world of professions was transformed: it became more dynamic, uncertain, unpredictable. In the vocational studies, a new term “trans-professia” is approved as a type of labor activity realized on the basis of the synthesis and convergence of professional competencies, which target different specialized fields. The thematic core of transfections is transprofessionalism — the ability to perform a wide range of specialized activities. Socio-humanitarian technologies cause the professionalism of the socionomic group of the profession, the thematic core of which are soft skills (flexible, social competences): adaptability, communication, tolerance for uncertainty, etc. Fundamental changes in the sociocultural and technological environment of vocational school encourage us to look for a fundamentally new methodology of vocational education focused on designing a person of the future.

Purposeful formation of such a specialist is possible with the implementation of transdisciplinary, network and project approaches, the orienting basis of his training are multidimensional competencies, the so-called key metaprofessional merits. These include: socio-professional and virtual mobility; communication skills; practical intelligence; a responsibility; collectivism; performance; corporatism; innovativeness and others. In post-industrial society, trans-professionalism acts as a qualified characteristic. The article was written with the support of Grant RFBR № 18-013-01147 “The social and humanitarian paradigm of the formation of trans-professionalism of the subject of socionomic occupations”
FEATURES OF PROFESSIONAL HEALTH OF THE TEACHER IN THE "THIRD AGE"

Elvira Symanyuk
Pecherkina Anna
Ural Federal University (Ekaterinburg, Russia)

Today, many scientists consider health as an important resource of a successful professional life and the main indicator of the preservation of its effectiveness (G. Verbina, E. Kaliteevskaya, L. Mitina, G. Nikiforov, Yu. Orlov, K. Griva, K. Joekes, F. Kittel, F. Leynen, U. Sann, etc.). The professional health of the teacher is defined by us as the state of the organism, which provides the optimal level of efficiency for the given activity, professional competence and constructive development of the personality at all stages of professional development. It includes motivational, emotional and reflective components. The goal is to determine the peculiarities of the teacher’s professional health at the “third age” (more than 35 years of work at school). The study involved teachers of Yekaterinburg (148 people), all participants in the study were women. The sample is divided into two groups — with work experience in school for more than 35 years (experimental group) and with work experience of up to 3 years (control group). The age of the experimental group ranged from 57-66 years old, the average age was 58.7 years. Based on the teacher’s professional health components, the following methods were selected: a questionnaire “Motivation for success” (T. Ehlers), a questionnaire “Motivation to avoid failures (T. Ehlers), a questionnaire “Self-assessment of emotional states”(G. Ayzenk), a questionnaire “Empathy” (A. Mehrabian), differential reflexivity test (D. Leontyev, E. Osin), methods for diagnosing the level of reflexivity development (A. Karpov). It is established that the teacher’s professional health at the “third age” is characterized by: a high level of motivation for success (42%), motivation for avoiding failures (58%), anxiety (47%), rigidity (42%), empathy (57%) and systemic reflection (44%); low level of frustration (39%), aggressiveness (36%), introspection (46%) and quasi reflexion (45%); the average level of development of reflexivity (72.8%). Statistically significant differences between the control and experimental groups (Student’s t-test) in the direction of increasing the motivation to success, the level of anxiety and rigidity, systemic reflection were established. In the professional health of the teachers of the "third age" there are changes in the severity of indicators of all components. The reported study was funded by RFBR according to the research project № 19-013-00431 "Personal Mobility As a Means of Predicting and Maintaining Professional Health in Old Age"
THE ROLE OF PRIORITIZATION WHEN PURSUING MULTIPLE GOALS IN ADULTHOOD

Alexandra M. Freund
University of Zurich (Zurich, Switzerland)

Most adults pursue multiple goals related to work, family and leisure in their everyday lives. How do people manage the demands of multiple goals in the face of limited resources such as time? Based on research that stresses the importance of prioritization, particularly in aging individuals, we investigate the hypothesis that focusing on one goal at a given point in time and temporarily disengaging from competing goals contributes to lower goal conflict and emotional well-being. Study 1: An experimental with N = 185 young, middle-aged, and older participants were instructed to pursue two goals within a limited amount of time. This was repeated over the course of five rounds in order to assess a potential increase in prioritization and its effects on perceived goal conflict, affect, and control. Prioritization was operationalized behaviorally as performance discrepancy between the two tasks. Study 2: Complementing Study 1, young and middle-aged adults (N = 89; M = 42 yrs) filled out a brief questionnaire seven times a day over the period of 20 days on the importance, conflict, facilitation of personal goals and affect. Study 1 supported the hypothesis that older adults prioritize more than younger adults. However, prioritization led to higher perceived conflict, more negative affect and less control. Study 2 suggest that prioritization between goals in different life domains is more beneficial than within. In general, prioritizing work is negatively related to momentary affective well-being, but prioritizing family or leisure-related goals is to positively associated with momentary affective well-being. Overall, prioritization of goals within life domains as well as between life domains is positively associated with facilitation, while only prioritization between life domains leads to lower conflict. Taken together, the results of the two studies provide further evidence for an increase in prioritization with advancing age. However, prioritization seems to aggravate perceived conflict.
PSYCHOLOGICAL SUPPORT OF PROFESSIONAL ACTIVITIES IN THE FAR NORTH AND THE ARCTIC

Natalia Simonova
Lomonosov Moscow State University (Moscow, Russia)

Yana Korneeva
Northern (Arctic) Federal University (Arkhangelsk, Russia)

Abstract body. The symposium is devoted to the influence of production factors in combination with the harsh climatic and geographical conditions of the Arctic. Where professional success is mediated by overcoming a number of environmental constraints. The issues of functional states, adaptation, self-regulation, psychological safety, as well as various components of psychological support of personnel at various stages of professional development will be considered.

Press paragraph. Five famous psychologists, psychophysicists and physiologists of labor from Russia, Finland, Norway, the authors of more than 100 publications devoted to shift work in the Arctic, as well as the effects of cold factors on workers in the Arctic.

General summary of the Symposium. One of the global challenges is to strengthen Russia’s position in the field of the scientific exploration of the Arctic space. The Arctic is very rich in oil, gas and other minerals. A major role in the development of the Arctic is played by the attraction and preservation of the able-bodied population to these remote regions. To enable exploration and mining of mineral resources in these difficult-to-reach regions with extreme climatic and geographical conditions, a rotational method of organizing labor is used. In the studies of many authors, it was found that workers in rotational organization of labor in the conditions of the Far North and the Arctic are influenced by three groups of factors: climatic and geographical, associated with the harsh Arctic climate; production, due to the danger and harmfulness of production, and welfare, determined by the conditions of group isolation. Despite the large number of works in medicine and psychology devoted to these issues of human adaptation to harsh climatic and geographical conditions and shift work, the systematization and classification of the mechanisms of psychological, social and psychological adaptation of workers in the extractive industries is not sufficiently presented. As a scientific result of the study, it is planned to identify differences in self-regulation, regulatory processes, coping strategies, psychological defenses and the mechanisms and methods of socio-psychological adaptation among oil and gas and diamond mining workers of various professional groups. The identified mechanisms will allow developing readiness for shift work in the conditions of the Extreme North with vocational training more targeted and purposeful, the identified features must be taken into account at the stage of professional selection of personnel to develop recommendations and measures for the adaptation of workers. And also manage the psychological safety in enterprises and build a system of personnel motivation.
THE PROBLEMS AND METHODS OF MUSICAL PSYCHOLOGY IN THE INTERDISCIPLINARY SCIENTIFIC SPACE

Alla Toropova
Valentin Petrushin
Anna Kharzhevskaia
Moscow State Pedagogical University (Moscow, Russia)

Wolfgang Mastnak
Beijing Normal University, University of Music & Drama
Munich, European Academy of Sciences and Arts
(Munich, Germany)

Alla Shestakova
Peoples’ Friendship University of Russia (Moscow, Russia)

Lihong Fan
Ping He
China Shanghai Shanghai Tenth People’s Hospital
(Shanghai, China)

Abstract body. The symposium is aimed at concentrating in one place and time specialists from different scientific fields and schools dealing with the problems of musical psychology, at consolidating efforts to create a modern methodological platform of musical psychology for solving fundamental and applied problems, including in the practice-oriented area — music therapy, for which musical psychology is a theoretical foundation. Musical psychology has historically developed and studied from different scientific positions — musicology, cultural studies, folklore studies, sociology, philosophy, and, of course, psychology — as part of the psychology of perception and creativity, the psychology of special abilities, the psychophysiology etc. Today, music psychology, solving problems in the in-depth study of special musical abilities and talent, prevention of occupational diseases, universal musical need and music therapy, refers to the methods of psychophysiology and neurobiology, methods of psycho-genetics and differential psychology and psychophysiology, ethno-psychology and the sciences of linguistic consciousness.

Press paragraph. Program report of the head of the symposium A.V. Toropova includes a methodological analysis of the tasks of science at the present stage. The author of the report presents the concept of music-language consciousness and its ethno-cultural and individual-personal aspects as a modern paradigm of this scientific field. Musical psychology as a field of scientific psychology has its own history, the beginning of which can be considered the works of G. Helmholtz, who paved the line for a psychophysiological study of the ratio of auditory and musical sensations, this line in domestic science was continued S.N. Belyaeva-Exemplyarsaya and B.M. Teplov. Today musical psychology is solving new problems with the in-depth study of special musical abilities and talent (topic by A.V. Shestakova), or general needs in music through analysis of preferences music texts by new generation (topic by A.A. Kharzhevskaia). Musical psychology is creating scientific basis and feeds on the field of applied research for example — music therapy (report by V. Mastnak (Germany), report by V.I. Petrushin), psychological aspects of music education and development (A.V. Toropova & ets) and make a gate for develop interdisciplinary scientific field “Music-Psychological Anthropology” (report A.V. Toropova).

General summary of the Symposium. The opening report A.V. Toropova offers a methodological analysis of the problems and tasks of musical psychology at the present stage, raises questions about the tradition of contrasting cultural paradigm and the natural
science platform of musical psychology and music therapy. In connection with the conscious "crisis of science", the organizer sees the relevance of the symposium in the synthesis of scientific data and methods implemented in research on musical perception and influence, the development of a methodological platform for solving problems of musical psychology in various research contexts.

The report by W. Mastnak "Music Therapy: Features-Principles-Applications" includes an overview of the achievements and perspectives of music therapy in educational and clinical practice, discusses ways of bringing Western and Russian psychological paradigms closer together as a scientific and theoretical foundation of music therapy. The report by V. I. Petrushin is devoted to the possibilities of musical therapy and musical coaching in the formation of healthy and creative personality of a democratic society.

If with the help of music therapy the improvement of health is achieved, then with the help of music coaching the process of achieving by a person the goals that are aimed at the development and prosperity of the society in which a person lives is activated.

A.V. Shestkova in her reseach (with supervisor D.B. Bogoyavlensaya) addressed to the criteria for the early identification of musical talent. The musical creativity of young musicians is connected with the peculiarities and specificity of musical performing activity. The definition of the criteria of musical endowment serves as one of the possible ways of solving this problem. The ending of discussion will be around topic by A.V. Toropova «Musical- Psychological Anthropology as actual scientific project».

TEAM-BASED ADD-ON MUSIC THERAPY IN CANCER AND HAEMODIALYSIS PATIENTS

Lihong Fan
Ping He
Shanghai Tenth People's Hospital (Shanghai, China)

Wolfgang Masnak
Beijing Normal University, University of Music & Drama
Munich, European Academy of Sciences and Arts
(Munich, Germany)

For many years the 10th People's Hospital of Tongji University in Shanghai has been applying multimodal music therapeutic approaches to alleviate psychopatholoical sequelae such as of cancer. With regard to clinical psychologoly, patients not only develop features of depression and anxiety disorders, but also show a broad spectrum of psychologically important changes in selfesteem, self-image, life-perspective, social behaviour, etc. Multimodal music therapy that comprises activities such as interactive sound games, song-singing, and music-based body awareness, proved to be an efficient means to control this multifaceted negative spectrum. From a psychological perspective this approach encompasses the disciplines of clinical psychology, differential psychology, music psychology, social psychology, and culture psychology in a complex therapeutic framework of medical and social care. The speech explains theoretical backgrounds of music therapy, presents scientific research outcomes (particularly in oncology and nephrology), and future perspectives that particularly focus on music-therapeutic research collaboration with Russia.
MUSICAL-PSYCHOLOGICAL TRAINING OF SPECIALISTS IN THE FIELD OF MUSICAL EDUCATION

Alla Toropova
Moscow State Pedagogical University (Moscow, Russia)

The current situation in the world of education dictates special requirements for the professional competence of a music teacher. Professional competence of a specialist in the field of music education, along with existing ones, should also include professionally-oriented psychological and psychological-pedagogical components. The author of this report more than 20 years ago was concerned with the creation of the concept of professionally oriented psychological training of a music teacher on the basis of a systematic approach and a system-forming category — musical consciousness (personality and society). The organization of professionally oriented psychological training of a music teacher in a university is carried out in the subject field of psychological and pedagogical disciplines with the support of the academic high school discipline “Musical Psychology and Psychology of Music Education”. The training course “Musical Psychology and Psychology of Music Education” in the pedagogical university has its own history and, when it was created, it relied on the idea of convergence of science, art and education in the space of education of culture and respect for the creative freedom of the individual. In the author’s Program of the course (1997), adopted as a basis in the state standard on the subject, for the first time problems of psychogenetic origins and functions of the human musical consciousness, phylogenetic stages of its development, the problem of musicality in its refraction to the context of musical abilities, individual psychological features of personality and etc. In the designated scientific space and educational subject at this stage were identified such basic aspects relating to the musical and psychological development of the student as a subject of the educational process: this — the problem of the development of musicality as an integral personal phenomenon and as a complex of special musical abilities; — the problem of musical perception and ways of its development and activation in the musical and pedagogical process; — the problem of cognition and development in music of the sphere of emotions and emotional intelligence of a person; — the problem of creativity as a mental process, the essence, purpose and means of development of Homo-musicus.
THE MUSIC-STRESS-INTERFACE. A NEUROPSYCHOLOGICAL MODEL OF MUSIC-BASED STRESS-MANAGEMENT AND BURNOUT-PREVENTION

Wolfgang Mastnak
Beijing Normal University, University of Music & Drama Munich, European Academy of Sciences and Arts (Munich, Germany)

Both in self-application and in clinical contexts, music/music therapy is used to modulate and reduce stress with that interferes negatively with healing processes and can cause psychopathological sequelae. Moreover, music-based approaches are applied for burnout prevention and to improve life quality. In spite of good empirical results, the underlying mechanisms remain unclear. On a meta-level, working with data from empirical studies in clinical psychology and medicine is usually limited to systematic reviews and meta-syntheses. Nonetheless, these approaches most probably do not fully exploit the systemic epistemological value of these the studies referred to. Broadly speaking, singular empirical data can be regarded as carrier of information that plausibly forms complex systems and hence lead to novel theoretical frameworks. From the perspective of the philosophy of science, system theory, and information theory, these approaches transcend the explanatory power of one-dimensional designs such as common input-outcome models of quantitative empirical research. They have the power to reveal the systemic value of its components and suggest the, e.g., neuropsychological interplay of its components. The presented framework-synthesis belongs to this form of meta-synthetic research and suggests a hypothetical model of a ‘music-stress-interface’. It shall elucidate underlying mechanisms of music therapy in stress-related disorders and burnout and help to design comprehensive therapeutic plans. Music and auditory stimuli that help to modulate and/or reduce particularly chronic stress and associated psychosomatic issues depend on socio-cultural settings, individual modes of data processing—including the stressor and music—and biological conditions of the central nervous system. These can be considered a dual interactive system of cortical and sub-cortical processes. The cortical domain involves cognitive, emotional, and aesthetic modes, the subcortical refers widely to neuroendocrine circuits and meso-limbic processes. In this context, neuroplasticity and neurogenesis are seen as a certain meta-principle.
THE FINAL GOALS OF MUSIC THERAPY AND MUSICAL COACHING

Valentin Petrushin
Moscow State Pedagogical University (Moscow, Russia)

The advantages of using music therapy in comparison with traditional medical approaches are that it can be used to broaden the scope of patients with their involvement in active musical activities, which can be presented in the form of collective listening to musical works according to a specially organized technique, as well as choral singing and playing musical instruments. Clinical studies in the field of music therapy, successfully conducted in many countries, prove the validity of using music as an effective therapeutic agent. But is good health the ultimate goal of music therapy? Does possessing good health make a person happy and fully functioning? This question can be answered with the words of Socrates — “Health is not all. But everything without health is nothing.” What should a person do when he becomes healthy after an illness? Apparently, this should be the spiritual self-realization that modern humanistic psychotherapy speaks of. Medicine can not answer this question in full, because it is not within its competence. Psychology and philosophy, which are responsible for the meanings of life and speak of the existential essence of man, must come into the business. In modern psychology, coaching as a method of setting and achieving goals has become particularly popular due to the growing interest of many people in solving the problem of finding their purpose and self-fulfillment as a unique personality. Connecting musical accompaniment to modern coaching can significantly intensify the process of learning the practice of achieving the goals, because each type of activity additionally receives sensory replenishment in various emotions generated by musical means, songs, affirmations, breathing practices and special physical exercises. A single musical activity in the form of choral singing can form a team spirit that is highly valued in modern management and coaching.

CRITERIA OF MUSICAL TALENT: PROBLEMS OF RESEARCH

Alla Shestakova
Peoples' Friendship University of Russia

The musical creativity of young musicians is connected with the peculiarities and specificity of musical performing activity. The identification of talented and gifted children in the early stages of development is considered as one of the priority areas of research at the present time. The definition of the criteria of musical endowment serves as one of the possible ways of solving this problem. In accordance with the goal, one of the main tasks of our research was to analyze the criteria for assessing the signs of children’s giftedness with experts in a competitive selection of children who participated in the Nutcracker international music television competition for young musicians from 2006 to 2018. In this connection, the need to identify: signs of children’s talent and features of their manifestation in the process of musical and performing activities; the main factors and conditions affecting the process of formation and development of the personality of a gifted, young musician. Our approach is based on the understanding of musical endowments as one of the central problems in the study of musical creativity. As part of the study, at the stage of analyzing the results of children’s musical and performing activities, the idea of giftedness as an ability to “develop activities on its own initiative” is of fundamental importance. In this regard, the signs of children’s giftedness, taking into account their characteristics and specificity, unlike the giftedness of an adult, are considered by us as the potential of mental development in relation to the subsequent stages of the life path. The
MUSICAL-PSYCHOLOGICAL ANTHROPOLOGY AS ACTUAL SCIENTIFIC PROJECT

Alla Toropova
Moscow State Pedagogical University (Moscow, Russia)

Experimental data compiled a sample of a contingent of students of music schools participating in the competition (from 2006 to 2018) of 549 people. Analysis of the results based on the use of expert assessment method, showed in the period 2006-2009: — expert opinion on the need for a competitive form for selecting gifted children was controversial and was viewed as the need to fulfill a social order.

Musical and psychological anthropology as a field of knowledge allows to comprehend the history of musical art and ethnocultural variations of musical traditions, historical and modern musical styles as the phenomena and artifacts of cultural anthropology. All listed above accumulate the psychological needs and values of a particular social or ethnical group. The system’s construction of principles and concepts in this area, methods, sources and material for study makes it possible to provide researches of such things as: psychological identity’s complex to a particular culture or subculture, the base of musical preferences and predilections, social and cultural intonation identity, musical style as modal personality of the manifestation to specific social group and others. The purpose, content and principles of this scientific discipline accumulate and refract in a new perspective differentiated and non-intersecting scientific facts and presentations of such scientific fields as musicology, cultural and historical psychology, psychology of consciousness and personality, social and cultural anthropology. The result of the project will be the conception Musical and Psychological Anthropology in the system concepts and methods for the researcher’s construction, it is very significant for cultural studies, psychology, pedagogy, musical psychology, and pedagogy. Musical and pedagogical analysis of musical culture’s phenomena and artifacts can be material for training courses material in the musical, physiological and pedagogical educational system, refresher courses how part modern interdisciplinary approaches in area of musical education. It can be supporting method for planning social and pedagogical work or music therapy in psychological, educational and clinical practice. The project has fundamental and applied importance because it creates pedagogical model of construction higher school course “Musical Psychological Anthropology” for a wide range of educational programs and advanced training programs, including for non-musical specialties and students who do not have a basic musical education. The project has such characteristics of high scientific novelty as the identification and research of a new scientific field. This area has a connection with the sociocultural reality and personality’s inner world, and the relevance in the system of general, additional and higher professional education, as well as in the system of psychological and pedagogical support of education.

MUSIC THERAPY: FEATURES-PRINCIPLES-APPLICATIONS

Wolfgang Mastnak
Beijing Normal University, University of Music & Drama Munich, European Academy of Sciences and Arts (Munich, Germany)

In international clinical fields and public health, music therapy has become a distinguished discipline. Comparing convincing clinical outcomes and evidence based medical research, particularly randomized controlled trials that state low efficacy, rises questions. From the perspective of differential psychology we hypothesise individual music processing, different aesthetic preferences, and complex modes of mental response as crucial factors that make exclusively physiological approaches an inadequate tool. On that basis, the speech suggests a dual approach that comprises physiological and neuro-psychological as well as cognitive-behavioural and phenomenological perspectives. This way of studying music therapy reminds us of the contradictory or complementary positions of Ivan Sechenov (Reflexes of the Brain, 1863) and Konstantin Kavelin, who was greatly in favour of humanities for studying the human psyche. In line with the paradigms of the Moscow Psychological Society and it’s early publication on Questions of Philosophy and Psychology (1889), the author of this paper calls for an inter-disciplinary, epistemological, and science theoretical basis of music therapy. Focusing on neuro-psychological parameters, the author highlights particularly a) efferent nerve fibres from the auditory pathway, b) retro-loops such as from the auditory cortex to the inferior colliculus that deny acoustic-perceptive ’raw material’, c) qualitative brain-networking to generate musical experience, d) the default mode network (DMN) as possible processor of creativity and subconscious intelligence, and e) music as a driving force of neuro-plasticity. Complementary to these more physiological mechanisms, the paper suggests to identify crucial moments and qualities in music therapy that cannot be (at least in an adequate way) reduced to mere physiological processes: a) musical symbols as form of self-expression and mode of self-discovery, b) artistic creativity as a sense-giving moment in life, c) experienced identity with music and music-self-interplay, d) motivation and joy, e) non-pragmatic and non-functional communication and bonding, f) experience of beauty, harmony, and balance. In sharp contrast to some (particularly US-American) approaches that assume transcultural applicability of music therapy, the author and his Chinese team also refer to the pioneers of cultural-historical psychology, namely Gustav Shpet and Lev Vygotsky. Greatly in line with their theory, the paper advocates culturally sensitive music therapy and the need to respect the patient’s cultural background and living space.

ANALYZING MUSIC PRECEDENT-TEXTS OF SOCIAL GROOPS AS METHOD OF MUSICAL PSYCHOLOGICAL ANTHROPOLOGY

Alla Toropova
Anna Kharzhevskaia
Moscow State Pedagogical University (Moscow, Russia)

The historical emergence of the ”precedent texts method”. The relevance and propriety of using this method in relation to analize mentality and individuality through musical precedent texts. Examples of modern musical precedent texts and the level of their impact to generation Y’s communication, creativity, critical thinking, collaboration (cooperation) and productivity in uncertainty situation. Possibility of reseaching the influence of musical precedent texts on reflection and pre-adaptation to uncertainty in a rapidly changing socio-cultural reality as well as an impact of this research to music psychology and music therapy. The publication was supported by the Russian Foundation for Basic Research - № 19-013-00171 A.
Abstract body. Coping with close relationships’ breakdown among early adults in the stress load context Kryukova, Tatyana; Opekina, Tatyana; Ekimchik, Olga; Saporovskaia, Maria: Kostroma, Russia (tat.krukova44@gmail.com) Close relationships’ loss is an acute stress for a person (Regan, 2011). Early studies confirm that individual coping with the ending stage/disengagement (break) of relationship is not productive — mainly escape-avoidance strategies; complicated by intense negative experiences (Kryukova, Ekimchik, 2014). Productive coping requires many internal and external personal resources that can be exhausted by both negative relationships dynamics and a number / frequency of stress experienced outside relationships. Goal: to study the relationship between the general accumulation of non-relationship stressors influencing a person during the year preceding the relationships break and coping productivity in the situation of break. The study involved 64 people or 32 couples (32 males and 32 females, av. age = 21 yrs, SD = 0.3), who survived a break in close relationships (lasted 2 to 2.5 yrs). Ways of Coping Questionnaire (adapted by Kryukova et al., 2003), The social readjustment rating scale (Holmes, Rahe, 1967, modified), an interview. Respondents with a high level of external stress accumulation during the year before a relational break choose problem solving less often (r = -0.323; p≤0.02) and escape-avoidance more often (r = 0.298; p≤0.03). They also less likely use positive reappraisal (r = −0.341; p≤0.04), which indicates an increase in pessimism assessing current events, the accumulation of negative stress effects, less often seek social support (r = −0.424; p≤0.04). They prefer to be alone, which increases the depth of the negative affectivity, experiencing absence or inadequate social support which enhances isolation (an interview). Correlations between stressful influences accumulation throughout the lifespan and coping with a partner relationships’ break stress have been found. The more stress and difficult life situations they experienced, the more often they choose escape-avoidance coping (r = 0.385; p ≤ 0.05) and are less able to positively re-appraise a situation (r = -0.590; p ≤ 0.05). High total stress reduces coping productivity, ability to overcome the negative emotional outcomes of a break. Thus relationships dissolution / break is connected with traumatic feelings, causes much stress which are hard to cope with.

Press paragraph. The symposium “Stress-coping psychology: modern state and perspectives” (Head: Tatiana Kryukova, prof., Dr. (Kostroma State University, Russia) has united researchers from 4 countries and 5 institutions interacting within the problem with each other for several years. They are doing research in the field on cultural, educational, relationships and ordinary everyday stress and coping. 1. Kryukova, Tatyana; Opekina, Tatyana; Ekimchik, Olga; Saporovskaia, Maria: Kostroma, Russia (tat.krukova44@gmail.com) Coping with close relationships’ breakdown among early adults in the stress load context 2. Kepalaite, Albina; Gerulaitis, Darius; Alifanovienė, Daiva; Vaikeviciene; Asta, and Odeta Sapelite: Kaunas, Siauliai, Lithuania (albis2002@yahoo.com) Analysis of coping tendencies and abilities among the youth in Lithuania and Russia 3. Olga Strizhitskaya, Larisa Golovey, Marina Petrash, Svetlana Saverysheva : Saint-Petersburg, Russia (strizhitskaya@mail.ru) Resources of coping with daily stress 4. Anna Kwiatkowska, Magdalena Bartoszak, and Ben C. H. Kuo : Warszava, Poland; Toronto, Canada (akwiatk@gmail.com) Relationships between Social Axioms and Subjective Well-being: The Mediating Role of Stress Coping Strategies 5. Svetlana Khazova, Tatiana Adeeva, Inna Tikhonova, Natalia Shipova, and Maria Maiorova: Kostroma, Russia (svetlana-hazova@yandex.ru) Adults with disabilities: stress coping behaviors and subjective well-being.
**General summary of the Symposium.** Research shows that daily stress may negatively affect mental and physical health. Respondents (n=400) had moderate to high levels of daily stress, and stressors represented in all domains. Daily stressors were associated with self-esteem (p=0.028), locus of control (p=0.003) and emotional stability (p=0.007). Daily stress was associated with coping strategies, younger adults used less strategies (more cognitive ones), and older ones got the wider coping range. Close relationships’ loss is an acute stress. Studies confirm that individual coping with the ending stage of relationship is not productive: mainly escape-avoidance strategies used; complicated by intense negative experiences. The relationship between general stress and coping productivity during relationships break showed: people with high level of external stress choose problem solving less often, escape-avoidance more often. Rare use of positive reappraisal indicates increase in pessimism and isolation. Coping behavior may be seen as a factor of life quality and subjective well-being.

Disabled-since-childhood adults (n=130, av. age 37) took part. The conclusion: differences in the level of life quality and subjective well-being among respondents with disorders and “healthy” ones are missing. Distancing, avoidance positive revaluation strategies made the greatest contribution to the life quality. The first variant adaption of WCQ (Lazarus, Folkman, 1988) among Lithuanians was done (n=761). The results show not very high consistency of scales: \( \alpha = 0.578 - 0.759 \); especially low for Self-Controlling \( \alpha = 0.584 \). Norms show average strategies’ means as below middle-to middle. Coping means among Russians are higher. Among five axioms (generalized beliefs about oneself, social and physical environment) two are used in the study: the Social Cynicism axiom — a negative view of people, and certain groups; and the Reward for effort axiom emphasizing the benefits of hard work. The study carried out in Russia, Poland and Germany (N = 2225) revealed: across cultural groups (a) Engagement Strategy was a mediator between Reward for Effort and self-esteem and life satisfaction, (b) Avoidance Strategy — between Social Cynicism and self-esteem and life satisfaction, as predicted, but (c) Collectivistic Strategy was a mediator in a German and Polish samples.
COPING WITH CLOSE RELATIONSHIPS` BREAKDOWN AMONG EARLY ADULTS IN THE STRESS LOAD CONTEXT

Tatiana Kryukova
Tatyana Opekina
Olga Ekimchik
Maria Saporovskaia
Kostroma State University (Kostroma, Russia)

Coping with close relationships` breakdown among early adults in the stress load context

Close relationships` loss is an acute stress for a person (Regan, 2011). Early studies confirm that individual coping with the ending stage / disengagement (break) of relationship is not productive — mainly escape-avoidance strategies; complicated by intense negative experiences (Kryukova, Ekimchik, 2014). Productive coping requires many internal and external personal resources that can be exhausted by both negative relationships dynamics and a number / frequency of stress experienced outside relationships. Goal: to study the relationship between the general accumulation of non-relationship stressors influencing a person during the year preceding the relationships break and coping productivity in the situation of break. Method: the study involved 64 people or 32 couples (32 males and 32 females, av. age — 21 yrs, SD = 0.3), who survived a break in close relationships (lasted 2 to 2.5 yrs).

Measures: Ways of Coping Questionnaire (adapted by Kryukova et al., 2003), The social readjustment rating scale (Holmes, Rahe, 1967, modified), an interview

Results: respondents with a high level of external stress accumulation during the year before a relational break choose problem solving less often \( r = -0.323; p \leq 0.02 \) and escape-avoidance more often \( r = 0.298; p \leq 0.03 \). They also less likely use positive reappraisal \( r = -0.341; p \leq 0.04 \), which indicates an increase in pessimism assessing current events, the accumulation of negative stress effects, less often seek social support \( r = -0.424; p \leq 0.04 \). They prefer to be alone, which increases the depth of the negative affectivity, experiencing absence or inadequate social support which enhances isolation (an interview).

Correlations between stressful influences accumulation throughout the lifespan and coping with a partner relationships` break stress have been found. The more stress and difficult life situations they experienced, the more often they choose escape-avoidance coping \( r = 0.385; p \leq 0.05 \) and are less able to positively re-appraise a situation \( r = -0.590; p \leq 0.05 \). High total stress reduces coping productivity, ability to overcome the negative emotional outcomes of a break. Thus relationships dissolution / break is connected with traumatic feelings, causes much stress which are hard to cope with.
The aim of the study was to present the first variant of Ways of Coping Questionnaire adaption for Lithuanian population (N=761). The results obtained in Lithuania show not very high consistency of scales: in the period of $\alpha = 0.578 - 0.759$. Especially low they are for Accepting Responsibility $\alpha = 0.578$; Self-Controlling $\alpha = 0.584$; Confrontive Coping $\alpha = 0.600$ scales. The best $\alpha$ is shown for Positive Reappraisal $\alpha = 0.759$, Seeking Social Support $\alpha = 0.734$; Planful Problem Solving $\alpha = 0.694$. One of the reasons of low to middle self-consistency of coping scales is the following. The “direct-back” translation from English into Lithuanian and back from Lithuanian into English was not done according to a standard procedure — only by one person (not by 3 as demanded). It could have influenced transmitting wrong or distorted meanings to the translated into Lithuanian items. Concurrent validity has not yet been got as there is not a single psycho-diagnostic coping instrument in Lithuanian now. Thus the process will include getting correlations with other important tests giving indicators of adaptive / maladaptive behavior (i.e. Self-efficacy Scale, STAI, BDI, etc.). All average coping strategies’ means are of below middle level: it could manifest low stress / coping reaction. Observations of the sample (social risk groups) are prompting a weak level of respondents’ recognizing, reflecting their own psychological experiences (stress, depression, social ill-being, etc.): socially desirable replies are possible. It explains that productive coping strategies (Positive Reappraisal, Seeking Social Support, Planful Problem Solving) have high ratings contradicting real behavior in difficult situations (people are eagerly missing the appointments for counseling, are not engaged in the process of self-change, etc.). Weak sex differences and more evident cross-cultural and age differences are revealed. All coping means among Russians are higher (especially Self-controlling, Planful Problem Solving), which is connected with either higher stress levels or its better recognizing, as the Russian sample consists of people belonging to different socio-cultural context. So the adaptation process isn’t finished, its quality may be done sufficiently better. Still the current WCQ version can be used now in new pilot investigations.
RESOURCES OF COPING WITH DAILY STRESS

Larisa Golovey
Marina Petrash
Svetlana Savenysheva
Olga Strizhitskaya
Saint Petersburg State University (Saint-Petersburg, Russia)

In the contemporary world people have to deal with high variety of complex tasks and highly dynamic environment, and experience many stressful situations on a daily basis. Most of the people do not pay much attention to these situations and do not recognize them as stressors. At the same time solid body of research shows that daily stress may negatively affect one’s mental and physical health, and have the impact comparable to the stress associated with major stressful events (Almeida, Horn [2004], Diehl, Hay [2010], Stawski et.al. [2008]). In the present study we were interested if some psychological resources may help to reduce the perception of daily stress. We hypothesized that self-esteem, locus of control and emotional stability might be among the factors that impact associations of daily stress and coping strategies. In our study we examined 400 adults aged 20-60 (M =119, F = 281), living inSaint-Petersburg and Arkhangelsk, Russia. Scale of Perceived Stress (Ababkov et.al., 2016), Inventory of Daily Stressors (Petrash et.al., 2018), 16 PF (emotional factors, Cattell), Locus of Control test (Rotter), Self-esteem scales (Dembo-Rubinshtein), Ways of Coping (Lazarus). Results showed that our subjects had moderate to high levels of daily stress, and the stressors were represented in all the studied domains. We found that daily stressors were associated with self-esteem (p=0.028), locus of control (p=0.003) and emotional stability (p=0.007).Our data revealed that daily stress was associated with coping strategies, particularly, younger adults used fewer strategies and those were more cognitive strategies, while the older adults used more strategies. These data are consistent with previous research. But the mediating effect was found only for locus of control and emotional stability (Chi-square=8.322, df=6, p=.215, RMSEA=.037, PCLOSE=.788). These effects were stable after controlling for age and gender effects. Research was supported by RSF grant 16-18-10088.
RELATIONSHIPS BETWEEN SOCIAL AXIOMS AND SUBJECTIVE WELL-BEING: THE MEDIATING ROLE OF STRESS COPING STRATEGIES

Anna Kwiatkowska  
Magdalena Bartoszak  
The Institute of Psychology, PAN (Warsow, Poland)  
Ben C. H. Kuo  
University of Windsor (Ontario, Canada)  
Kwiatkowska Anna  
Polish Academy of Science (Warsow, Poland)

The aim of the study was to verify the hypothesis about the mediating role of coping strategies in relationships between social axioms and subjective well-being in different cultural contexts. Social axioms are generalized beliefs about oneself, the social and physical environment, or the spiritual world, and are in the form of an assertion about the relationship between two entities or concepts (Leung & Bond, 2009). Among the five axioms dimensions, identified by Leung et al. (2002, 2004) there are two of our interests: the Social Cynicism axiom — a negative view of people, a mistrust of social institutions, and negative stereotypes about certain groups; and the Reward for effort axiom which emphasizes the benefits of effort and hard work. Although there are empirical evidence that social axioms can predict subjective well-being, the possible mechanisms are unclear. We expected that stress coping strategies could mediate between social axioms and well-being; however they could work differently in countries of different level of cultural collectivism-individualism. The study was carried out in Russia, Poland and Germany (N = 2225). We used the Social Axioms Scale by Leung & Bond, the Self-Esteem Scale by Rosenberg, the Life-Satisfaction Scale by Diener, and the Cultural Coping Strategies Scale by Kuo et al. Path models revealed that across cultural groups (a) the Engagement Strategy was a mediator between Reward for Effort and self-esteem and life satisfaction, (b) the Avoidance Strategy — between Social Cynicism and self-esteem and life satisfaction, as predicted, but (c) the Collectivistic Strategy was a mediator in German sample (between Reward for Effort and self-esteem), and in Polish sample (between Reward for Effort and life satisfaction), only. Results were discussed in the terms of cultural differences as regard the meaning of well-being and preferences of stress coping strategies.
ADULTS WITH DISABILITIES: STRESS COPING BEHAVIORS AND SUBJECTIVE WELL-BEING

Maria Maiorova
Tatiana Adeeva
Inna Tikhonova
Natalia Shipova
Svetlana Khazova
Kostroma State University (Kostroma, Russia)

The problem of coping determinants of the disabled since-childhood adults’ is becoming highly relevant now. There are some reasons as: demands of modern society to the subjectivity of people with disabilities, the fact that the efforts to cope with difficulties depends on a personal life position: activity and productivity or social disability. For this reason we’ve suggested that coping behavior might be seen as a factor of life quality and subjective well-being. The participants: disabled-since-childhood adults with visual (n=41), hearing (n=18), mobility (n=35), mental disabilities (n=35); persons with typical development (n=140). The respondents’ average age is 37 years old. Method: the brief questionnaire WHO Quality of Life-BREF (in adaptation of Bekhterev Research Institute); the Subjective Well-Being Scale; Ways of Coping Questionnaire (Lazarus, adapted by Kryukova et al., 2003). The results revealed the lack of differences in the level of life quality and subjective well-being between respondents with disorders and respondents without disorders. We’ve also found a reasonably high life quality and subjective well-being of adults with disabilities regardless of a type of impairment. Comparative analysis shows that people with disabilities avoid problem solving (p≤0.02), seeking social support (p≤0.01) more often than adults with no disabilities, significantly less often make efforts to self-control (p≤0.009) and take responsibility for what is happening (p≤0.000). Respondents with visual impairment more often than other groups, make active efforts aimed at finding a solution of the problem (p≤0.015). Respondents with hearing and mental disorders are more likely, than others, choose distancing from a stressor (p≤0.009). Finally respondents with mobility disorders choose avoidance (p≤0.003) less extent than two other groups. The significant correlations of coping strategies with indicators of life quality and subjective well-being also occurred. The conclusion is made about the greatest contribution of distancing (p=0.000), avoidance (p=0.000), positive revaluation (p=0.000) to the life quality. The results of the study can be used in creating rehabilitation programs to help people with disabilities. The study was supported by RFBR, project 17-06-00812.
PERSONALITY, SELF-REGULATION AND GOAL ACHIEVEMENT

Varvara Morosanova
Russian Academy of Education (Moscow, Russia)

Yulia Kovas
University of London (London, United Kingdom)

Abstract body. The symposium explores the relationships between Self-Regulation (SR) and life goals achievement. Self-regulation is considered at different levels, including reflexive, personal, and cognitive and neurocognitive. The research is based on the concept of conscious SR as a mechanism of human self-organization of activity, which integrates its various levels and allows to consciously mobilize personal and cognitive resources for goals achievement. The symposium presents recent theoretical and empirical research into general capacity for conscious SR at different ages. Empirical evidence on the contribution and role of SR and personal characteristics in academic achievement and psychological well-being will be presented. The symposium also addresses the links between SR and cognitive characteristics and basic executive functions.

Press paragraph. The symposium explores the relationships between Self-Regulation (SR) and life goals achievement. The symposium is organized by two psychologists, known for their work on cognitive psychology and behavioral genetics (Y. Kovas, London) and psychology of SR and personality (V. Morosanova, Moscow). The first study, presented by T. Fomina, explores the contribution of conscious SR and personality characteristics in mathematical achievement and their mediating effects (Morosanova, Kovas, & Fomina). The second study, presented by I. Bondarenko, proposes a new experimental design for investigation of SR general capacity and offers empirical research into SR at different ages (Bondarenko, Morosanova). The third investigation, presented by B. Velitchkovsky, explores executive functions as the basis for conscious SR in the middle school (Velitchkovsky, Bondarenko). The fourth study, presented by A. Burmistrova, demonstrates the results of a longitudinal investigation into the relationship between SR and psychological well-being (Morosanova, Fomina, Burmistrova-Savenkova).

The fifth study, presented by Y. Kovas, explores the associations between personality, behavior and school achievement in a unique sample of adolescents, selected for outstanding achievement. (Kovas, Likhanov, Tsigeman, Papageorgiou). These five studies provide new insights into the complex interrelationships between SR, personality, intelligence, executive functions and achievement.

General summary of the Symposium. Self-regulation is considered as one of the most important factors of successful functioning in educational, professional, sports and other fields across the life span (SR). We consider conscious SR as a multi-level (cognitive and personality) and dynamic metasystem of processes, states and properties. SR is a tool for initiating and maintaining activity aimed at consciously advancing and achieving personal goals. Conscious SR development depends on the operational cognitive level (goals planning, modeling of significant conditions for goals achievement, programming of actions, results evaluation). In addition, SR includes instrumental personal regulatory characteristics (flexibility, reliability, responsibility, perseverance, initiative, reflexivity). The symposium explores the relationships between (SR) and life goals achievement. Self-regulation is considered at different levels, including reflexive, personal, cognitive and neurocognitive. The symposium presents recent theoretical and empirical research into general capacity for conscious SR at different ages. Empirical evidence on the contribution and role of SR and personal characteristics in academic achievement and psychological well-being will be presented. The symposium also addresses the links between SR, cognitive characteristics and basic executive functions. The five studies provide new insights into the complex interrelationships between SR, personality, intelligence, executive functions and achievement.
MEDIATING ROLE OF THE CONSCIOUS SELF-REGULATION IN THE SYSTEM OF COGNITIVE AND PERSONAL PREDICTORS OF ACADEMIC ACHIEVEMENT

Varvara Morosanova
Tat’yana Fomina
Russian Academy of Education (Moscow, Russia)

Yulia Kovas
University of London (London, United Kingdom)

Our research is carried out in the context of the conscious self-regulation concept (Morosanova, 2013). We conducted several studies that revealed a direct influence of the conscious self-regulation on the productivity of learning activities (Morosanova et al., 2015, 2016). We explored whether conscious self-regulation plays both direct and mediating roles in its links to cognitive, personal, motivational characteristics. The present study investigated mediating role of the conscious self-regulation in the links between cognitive and non-cognitive factors and academic success of schoolchildren. To evaluate the regulatory features, we used Morosanova’s «Self-Regulation Profile of Learning Activity Questionnaire — SRPLAQ» that measures the general level of students’ self-regulation development and different aspects of self-regulation related to achieving academic objectives. The computerized test battery assessed cognitive characteristics and non-verbal intelligence. Maths Interest was measured with 3 items drawn from PISA student questionnaires. To estimate trait anxiety level, we used the Russian adaptation of Spilberger’s «Test Anxiety Inventory — TAI». As indicators of academic success, we used annual marks and exam results in mathematics. The total sample included more than 500 people educated in the state secondary schools in Russia. The mediator analysis of the links between cognitive characteristics and mathematical abilities and students’ progress in mathematics creates the basis to consider the regulatory process of modeling significant conditions as a mediator in this influence. The results demonstrated that general level of SR plays a mediating role between personality characteristics and exam results, being a more integrative indicator of self-regulation which enhances the positive impact of learning motivation and reduces the negative impact of test anxiety. In addition, the data was obtained on the specifics of the relationship between conscious self-regulation and mathematical success: self-regulation mediates the link between Math interest and Year Math Grade.
GENERAL CAPACITY FOR SELF-REGULATION: PHENOMENON, DIAGNOSTICS, AND THE AGE EFFECTS

Varvara Morosanova
Irina Bondarenko
Russian Academy of Education (Moscow, Russia)

The report presents findings on conscious self-regulation (SR) as a person’s general capacity for development. We define the general capacity for self-regulation as a psychological personality feature. It is the basis for active, independent and successful mastering of the various new types and forms of activity and social relations. This capacity is one of most important resources of a person. The main features of the general capacity for self-regulation allowing to judge about its development are as follows: the level of accomplishment and harmony of the conscious self-regulation profile, its stability in different situations as well as the presence of a developed internal plan of interaction with reality. The report highlights the features of manifestation of general capacity for self-regulation: effective coping with atypical, unfamiliar situations at all the stages of mastering various kinds of activity and spheres of life, productive independence, and persistence in achieving the accepted goals. A computerized diagnostics complex («Diagnostics of situational specificity of self-regulation — DSSSR» (Morosanova, Bondarenko, 2015)) including popular questionnaire and new original experimental method, supported by diagnostics of the regulatory profiles of SR style characteristics was used on a sample of the 7-9th grade pupils (N = 88). Experimental tasks simulate situations with a high level of ambiguity. DSSSR provides varying levels of complexity, significance and feedback specificity. Based on the results of DSSSR performance, students were classified into groups with different levels of capacity for self-regulation. The results showed that a high level of the capacity is brought about with stability of conscious self-regulation in new and ambiguous situations due to the presence of an internal plan of interaction with reality and an active search for the ways of correction and quick goal achievement. It was demonstrated that purposeful variation of experimental situations (complexity, significance, feedback) could contribute to mobilization and development of regulatory resources, improvement of the task performance of the students, especially those whose self-regulation capacity is at a low or medium level.
EXECUTIVE FUNCTIONS AS THE BASIS OF CONSCIOUS SELF-REGULATION IN THE MIDDLE SCHOOL

Boris Velitchkovsky
Lomonosov Moscow State University (Moscow, Russia)

Irina Bondarenko
Russian Academy of Education (Moscow, Russia)

At the neurocognitive level, self-regulation (SR) is represented by executive functions (EF). We used the approach of Miyake et al., 2000, identifying three basic EFs: switching (attention and task-set shifting), inhibition (ability to consciously suppress irrelevant representations and reactions), and updating working memory. The purpose of this study was to establish the relationship of the basic EFs to the components of SR in order to identify the cognitive mechanisms of conscious SR. Participants in the study were pupils of the 7th and 9th grades (N=171, 50.3% — girls) of Russian schools. A series of multiple linear regressions with components of conscious SR as criteria and basic EFs (including error monitoring) as predictors was calculated. Planning is associated with the speed and accuracy of updating information in the working memory (n-back task) and a tendency of communication with inhibition interference effect (in Eriksen tasks). Simulation is related to the effectiveness of inhibition (the effect of interference in the Eriksen tasks) and a tendency to correlate with the accuracy of updating the working memory. Programming is related to switching efficiency ("switching cost" in the letter-number task) and inhibition efficiency. Results evaluation is related to the accuracy of updating the working memory (n-back task). The overall level of SR is related to the switching efficiency (trend), inhibition efficiency, and the efficiency of updating the working memory. However, evidence was found that the relationship between basic EFs and SR is less pronounced in the 7th grade than in the 9th grade. Overall, the results indicate that there is a regular connection between the EFs and the components of the SR. In particular, a close connection between planning and modeling with the efficiency of working memory was found, which is associated with the use of working memory to build a mental model of activity and retain plans for activity. The relationships among inhibition and implementations of almost all SR functions was also found, which confirms the crucial value of voluntary inhibition for the organization of deliberate activity and the special status of this EF. The reported study was funded by RFBR, project № 17-29-09094.
SELF-REGULATION AND PSYCHOLOGICAL WELL-BEING IN PRIMARY SCHOOL

Angelika Burmistrova-Savenkova
Tat'yana Fomina
Varvara Morosanova
Russian Academy of Education (Moscow, Russia)

Educational environment is considered as a significant factor of the students’ Psychological Well-Being (PWB). School life makes a solid foundation for well-being and positive functioning in adulthood (Eryilmaz, 2012; McCabe K. et al., 2011). Studying factors ensuring stability of PWB during the schooling is an important task of modern research. Personality factors are most often regarded as predictors of PWB. However, along with them, self-regulation has been actively investigated in recent years (Steeletal., 2008, DeNeve, Cooper, 1998). The present study explores specificity of the relationship between conscious self-regulation of educational activities, personality characteristics and PWB in the primary school students. Research sample consisted of 401 students of Russian schools (53% boys, 47% girls; average age = 10.20 years). Methods: Morosanova’s «Self-Regulation Profile Questionnaire — Junior» was used for self-regulation diagnostics (Morosanova, Bondarenko, 2015). The questionnaire consists of 7 scales: Planning the goals, Modeling significant conditions, Programming Activity, Evaluating Results, Flexibility, Independence, Responsibility, and the integrative indicator — General SR level. The stimuli are presented in the form accessible for primary school age. Russian version of the «Big Five Questionnaire — Children» was used for measuring the personality characteristics. To estimate PWB parameters a Russian adaptation of the «Well-Being Manifestation Measure Scale» (Masse et. al., 1998) was developed. The results demonstrated that almost all regulatory indicators are significantly related to the indicators of the schoolchildren’ PWB. The study results show that at this age the important processes relevant to life satisfaction are associated with self-organization, the ability to respond adequately to changing conditions of activity, and successful goal achievement. The greatest number of significant correlations was observed for regulatory processes of planning, modeling, programming, and results evaluating. The general level of self-regulation of educational activity is also associated with all parameters of PWB. As expected, significant correlation coefficients of «Extraversion» and «Openness to experience» with all well-being indicators were noted. The obtained results confirmed the importance of regulatory mechanisms in ensuring the psychological well-being of the primary school students.
THE ROLE OF PERSONALITY AS A PREDICTOR OF BEHAVIOR AND ACADEMIC PERFORMANCE OF HIGH ACHIEVING ADOLESCENTS

Yulia Kovas
Tomsk State University (Tomsk, Russia)

Maxim Likhanov
Elina Tsigeman
Sirius, Educational Centre «Talent and Success» (Sochi, Russia)

Kostas Papageorgiou
School of Psychology, Queen’s University Belfast (Belfast, United Kingdom)

Findings suggest that personality traits play a role in school achievement. The present investigation was aimed at exploring the associations between personality, behavior and school achievement in a unique sample of adolescents, selected for outstanding achievement. Method. We assessed the Dark Triad (DT) traits; the Big Five (B5) traits; pro-social behavior and behavioral difficulties in a sample of 1,191 adolescents (14 to 18 years of age), selected for outstanding achievements in four fields of ability – Science, Arts, Literature and Sports. We explored sex differences and educational track differences in individual traits and in networks of traits. Furthermore, we tested direct, moderated and mediated associations between personality, behavior and school achievement (self-reported grades and actual grades in state exams). While mean-level trait changes across sexes and educational tracks were present (e.g. males generally reported higher scores on the DT than females), the resulting networks were similar between males and females and across tracks. Narcissism was unique among the DT traits predicting fewer behavioral difficulties. Personality traits predicted a significant amount of variance in behavioral difficulties, pro-social behavior and self-reported school achievement, but they did not predict school achievement as assessed by state exams. This investigation provides unique insights into the personality and behavior of this highly-selected sample of adolescents. We will discuss some of the theoretical implications of these findings for understanding the factors that influence performance in high performers, as well as implications in terms of optimizing educational outcomes and well-being of adolescents.
Abstract body. The inter-discipline context in psychology has been intensively developed in last decades. Particularly in forensic and legal psychology, that means integration with linguistics, computer vision, medicine and some innovation methods. The symposium addresses problems of such integration in research and in practical procedures. Its objective is to discuss and to outline a consolidated approach, both methodically and technically. By this, the requirements to objectivity, validity and quality assurance of used psychometric instruments are decisive ones. Weakly formalized methods, the outcome of which strongly depends on the experience, proficiency, and intuition of particular forensic psychology expert, are mostly used nowadays. In the contributions at the symposium authors try to overcome this problem by presenting modern formalised and integrative approaches. A join discussion at the symposium should pave the ways to improve the quality and reliability of psychological assessment in forensic and legal psychology.

Press paragraph. The symposium includes scientists and research groups from different countries work together on some presented projects. So, the team from Tsiolkovskiy Kaluga State University and Swiss Institute for Handwriting Research represented by Engalychev V.F. and Chernov Y. presents a join project on supplement of a forensic psychological profile of a person with the formal handwriting analysis’ date. Russian researches from Kostroma State University, Kryukova T.L., and Kostroma Region Psychiatric Hospital,Yuvenskii I.V., devoted their presentation to forensic examination of affects, measuring maladaptive coping by women — husband killers. The German researcher Caspers C. presents the problem of Interlab proficiency testing as a method of quality assurance for projective psychodiagnostic instruments applicable in forensic expertise. The Armenian researcher from Yerevan State Medical University after M. Heratsi, Ghazaryan G., speaks on the examination of the mental state of a mother accused of killing a new-born baby, revealing psychological and social aspects. The team from Tsiolkovskiy Kaluga State University and Moscow Engineering Physics Institute — Engalychev V.F., Danshin V. V., Leonova E.V., Khavylo A.V. and Mirzeabasov O.A. are working on methods of mimic indicators of mental processes during forensic psychological examination.

General summary of the Symposium. Psychodiagnostic tools of forensic psychology differ not only in different countries, but also in the same country. Moreover, they are often insufficiently validated, which leads to the fact that results of their application strongly depend on the experience and competence of individual experts. That makes it difficult to reveal the truth in civil and criminal cases, and thus does not allow the duly revealing of guilty persons and protecting of non-guilty ones.

Development of forensic psychological expertise demands creation of new instruments and improvement of existing ones, which should ensure reliability and objectivity of personal psychological profiling by means of a complex analysis. The practise demonstrates that the most promising of such instruments and procedures are being developed in the inter-
disciplinary context. Regarding psychology, we can speak about interfaces between psychology and linguistics, psychology and computer vision, psychology and medicine, etc. The symposium includes specialists, who achieved outstanding research and practical results in mentioned areas. Among the participants are university professors and researchers, scientists from research centres and laboratories and forensic experts from Russia, Switzerland, Armenia and Germany. Therefore, the first aim of the symposium is to find consolidated inter-discipline relations of forensic psychology with different research projects and directions, in order to develop integrated models. The second aim related to the requirement of objectivity, validation and quality assurance of still poorly formalised methods of forensic psychology, like observation, psychological analysis of behaviour, psychological handwriting analysis. The general objective is to provide a context for a joint discussion, at which the participants could specify the mentioned aims and work out certain ways of solving the pointed problems.

EXAMINATION OF THE MENTAL STATE OF A MOTHER ACCUSED OF KILLING A NEWBORN BABY: PSYCHOLOGICAL AND SOCIAL ASPECTS

Gayane Ghazaryan
Yerevan State Medical University after M.Heraci (Yerevan, Armenia)

When conducting forensic psychological examinations of the mental state of a mother accused of killing a newborn child, great attention is paid to the psychological and social aspects of this type of crime, especially the motivational sphere. Everyone is well aware of the fact that a woman experiences significant psychophysical stress immediately after childbirth, which affects her ability to understand her behavior and make decisions, in particular, this is manifested when she killed her newborn baby during or immediately after birth. On the subjective side, a mother who causes death to her child is aware that her actions or inactions are aimed at depriving a person of life. These actions or inactions can be committed: both with direct and indirect intent; both suddenly and deliberately. Negative emotions that accumulate in the mother as a result of exposure to her stressful situation reduce the ability to adequately assess the value of her actions and the possibility of negative consequences. Consequently, with this type of examination it is important to find out what exactly was the traumatic situation. Various socio-and ethno cultural factors, such as the father’s abandonment of the child, difficult financial situation, the value system is of particular importance, including the assimilation of local national customs and traditions (including those related to the regulation of the sexual life of women), the fear of being condemned for having a child outside of marriage, etc. An important fact in this period is the fact that a woman is not always able to perceive a born person as an independent living being and continues to see her fruit in it, to feel him as a source of pain and suffering. Here one should especially take into account the individual psychological characteristics of the subject of the expertise, which is collective and along with the orientation of the personality, features of the motivational, volitional, emotional spheres, character, temperament, cognitive activity, includes socio-culturally determined value orientations, features of semantic perception of various situations, behavior patterns and emotional response.
PSYCHOLOGICAL PROFILING WITH THE SUPPORT OF FORMAL HANDWRITING ANALYSIS

Yuri Chernov
Institute for Handwriting Sciences (Zurich, Switzerland)

Vali Engalychev
Tsiolkovskiy Kaluga State University (Kaluga, Russia)

Forensic psychological examination strongly requires methodological tools that are objective and reliable. Often the explicit involvement of the person under investigation is not possible or information by him is not credible. In these cases, handwriting psychology could be useful. It provides a wide coverage of personal characteristics and excludes social desirability. The problem of the tradition handwriting analysis is insufficient validation. In the current paper, we propose computer-aided formal handwriting analysis by means of HS Detect system developed by one of the authors. The system was verified in a series of validation experiments with psychometric tests like NEO-FFI, D2, 16PF, EQ-i 2.0, PVQ and with the Wacom graphical tablet equipped with CSWin program for measurement of handwriting characteristics. The current paper describes both the principles and the model of the formal handwriting analysis and its practical implementation, which is based on the normative database of several hundred subjects and handwriting samples in different languages. In forensics, handwriting psychology supplements traditional instruments in different questions, which a criminal and forensic psychologist faces: • In-person forensic psychological examination. • Forensic psychological examination in absentia that is usually carried out towards suicide victims or missing people who left notes, letters, diary entries, etc. • Expert examinations conducted at the lawyers’ and human rights defenders’ requests that have become an important trend in recent years. The examination of handwritten materials of the surrender and first confessions often reveals indications of inadequate mental state of the subject that may indicate an illegal psychological impact made on him. • Criminal profiling that enables the linking of individual’s action to its psychological profile. The profiling is most often used to identify potential or acting terrorists, paedophiles, criminals demanding ransom for kidnapped people, etc. • Distance profiling allows use of psychological handwriting analysis along with other techniques and methods of analysis of video records, photographs, audio recordings, witness testimonies, video surveillance, etc. This results in creation of psychological portraits of the leaders of criminal gangs, corruptionists and others who cannot be examined during regular psychological examination. Handwriting analysis strongly contributes to reliability and enables profiling and examination when other methods are not available.
Often various mental processes are accompanied by facial muscles movement, and only a small part of these movements are controlled by the person. Therefore the analysis of mimic muscles motions is one of perspective ways to solve the problem of psychological states assessment in forensic expertise. To create a tool for assessing the true subjective difficulty of each question for each person during the forensic psychological examination it is necessary to develop the software for facial muscle micro-movements fixation an analysis algorithm of each muscle movement during solving problems. The problem of facial muscles’ micro-movements recognition is considered. The capabilities of the ”System of Psychophysiological Research” software are explored. Mimic activity of 15 respondents during answer 50 simple and 50 difficult questions is studied. Their facial reactions (each mimic muscles motion) were fixed by high resolution digital video recorder. The results of 1500 video fragments’ analysis are presented. Preprocessing and data analysis were performed on programming language R v. 3.5.0. The obtained digital data were analyzed using multidimensional statistical methods (factor analysis, cluster analysis, spectral analysis). Both general and individual patterns of face micro-motions of certain muscle groups are identified. Separation of the right and left half of the face into zones of synchronous patterns is revealed. It has been shown that (1) mimic muscles motions are closely interrelated and by using of factor analysis it is possible to reduce multidimensional data to four main factors (second order channels), but the composition of these factors is individual for each subject; (2) before answering each question, the moment of change in the amplitude of movements of facial muscles is fixed, and this is not always associated with articulation; (3) this period of mimic activity before answer indicate the difficulty or significance of the question for the person. The results allow to create a predictive assessment model in forensic expertise. At the initial stage it is necessary to apply jointly the developed method and expert analysis of video footage. The developed method lead to improve the accuracy of expert estimates the psychological signs of reliability or unreliability of the information reported.
INTERLABORATORY PROFICIENCY TESTING — A METHOD OF QUALITY ASSURANCE FOR FORENSIC-PSYCHOLOGICAL EXPERTISE

Claudia Caspers
Munich School of Philosophy (University) (Munich, Germany)

The court selection of forensic-psychological experts in Germany is based on their personal competence. Therefore, the use of adequate diagnostic methods to prove competence in forensic psychology is a central aim. To ensure this, a certified postgraduate training programme for forensic psychology was set up in Germany at the beginning of 2000. However, an ambitious postgraduate course and corresponding professional experience alone are not sufficient, because the responsibility and complexity a forensic-psychological expert faces require continuous quality control measures. A characteristic that legal psychology shares with all disciplines making quantitative-qualitative diagnostics. In those disciplines (e.g. human medicine, building physics, handwriting analysis), the quality control of the experts is carried out by interlaboratory proficiency tests according to defined criteria. This ensures high performance and accuracy of the diagnosis and judgements and prevents the phenomenon of "competence illusion". Last but not least, regularly performed proficiency tests increase the credibility of experts in legal contexts. In addition to an exemplary overview showing with which diagnostic material based on which criteria and with which statistical methods proficiency tests can be carried out in legal psychology, two examples of results from an online-based research platform in the field of handwriting analysis are presented: 1. A defined qualitative handwriting sign has been diagnosed by 21 participants from eight countries on four international handwritings. 2. The degree of personality change due to the change of the handwriting was measured in twenty test persons over a period of at least ten years using a manual-qualitative and a computer-aided-quantitative method of handwriting psychology, and the results were compared. Since the quantitative-qualitative evaluation of human information and data as well as the creation of expert reports with the indication of degrees of probability in legal psychology fall within the field of empirical science, the continuous performance of interlab proficiency testing is a necessary form of quality control for both qualitative and quantitative, computer-aided diagnosis. Proficiency tests can be used for the evaluation of new diagnostic methods and also for comparisons between countries.
FEATURES OF DIAGNOSTICS OF COGNITIVE FUNCTIONS IN FORENSIC PSYCHOLOGICAL EXPERTISE USING RBANS METHOD

Anahit Ter-Stepanyan
Yerevan State Medical University after M. Heratsi (Yerevan, Armenia)

The abstract represents the results of study of cognitive functions of patients with schizophrenia and healthy participants with the help of the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS; Randolph, 1998). In the frame of development Forensic Psychological Expertise (FPE) in nowadays, it’s important to estimate the cognitive functions correctly, using modern, valid and adapted methods. One of the complete tests is RBANS method, with extensive normative data (Aupperle et al., 2002) capable of distinguishing between different cognitive domains such as Immediate and Delayed Memory, Visuospatial/Constructional, Attention, Language (Duff et al., 2005). In Armenia the RBANS was adapted in Armenian language according with cultural features of Armenian population (Azizian et al. 2011). Method. The research was conducted in the "Nork", "Avan", "Nubarashen" INTRA Mental Health Centers, Yerevan State Medical University after M.Heratsi in 2011-2018. The main group of the studied consisted of 46 patients with paranoid schizophrenia: 26 men and 20 women. The control group consisted of 46 mentally healthy participants: 16 men and 30 women. In the frame of FPE we used RBANS method in more than 15 cases. RBANS Total Score of patients with schizophrenia (N1=46) is 63.86±14.75 and healthy controls (N2=46), Immediate Memory: N1=67.52±19.02, N2=106.63±15.56 Visuospatial/Constructional: N1=78.43±18.78, N2=105.26±14.52, Language: N1=69.86±15.07, N2=86.47±15.29, Attention: N1=61.39±12.25, N2=82.23±14.15, Delayed Memory: N1=70.63±19.52, N2=101.82±10.56. Healthy controls scores in comparison to schizophrenic patients are obviously high. RBANS Subtests correlation analysis by Pearson and Spearman shows that there are strong and significant interconnections between Immediate and Delayed Memory (r=.738**, p<0.001), Language and Immediate Memory (r=.570**, p<0.001), Language and Delayed Memory (r=.558**, p<0.001), Immediate Memory and Attention (r=.498**, p<0.001). From the practical point of view this test stands out with its usability and at the same time it provides detailed information both about cognitive status and separate cognitive functions. Normative data for Armenian population for each age and different educational level groups makes psychological diagnosis possible to study the ability of the victim, accused (suspected), witness to percept facts in a correct way, remember and reproduce, concentrate on them in the FPE.
FORENSIC EXAMINATION OF AFFECT: MEASURING MALADAPTIVE COPING IN HUSBAND-KILLERS WOMEN

Tatiana Kryukova  
Kostroma State University (Kostroma, Russia)  
Igor Yuveskii  
Kostroma Region Psychiatric Hospital (Kostroma, Russia)

The study aim is forensic examination of specific affect and coping in dysfunctional relationships connected with long-term home violence. Sample (non-clinical) is 106 women, spouses‘ violence victims (aged 19 to 52 yrs old, av. age is 39 yrs old) who committed homicide, killing husbands. About 80% of women have been suffering home violence during 5-15 yrs long. It is assumed that women who have committed a crime, due to their individual personal traits and a threatening everyday life context, have a narrow range of destructive coping strategies and ego defenses, which lead to chronic stress and life-threatening interaction. 1. Qualitative methods: criminal cases’ study based on testimony from relatives, neighbors, etc.; independent expert evaluation (school, household, job, medical records, other documents). 2. Observation and a semi-structured interview. 3. Psychodiagnostics: CISS, Endler & Parker, adapted by Kryukova, 2002; a modified MMPI test, Sobchik, 2000; etc. The study found support for the idea that long-term dysfunctional marital situation associates with the husbands‘ constant violence — physical and verbal aggression against women, alcoholism, social maladjustment, degradation, and, on the other hand, with maladaptive women’s response to an aversive situation. Women with predominantly anxious, dependent traits at the initial stage have more often chosen an emotionally-oriented coping style. The existing coping had negative dynamics during 5–15 years of long-term family destruction: inconsistent problem-oriented coping being replaced by emotions outbursts and avoidance as well as immature ego-defenses (rejection, etc.). Exhaustion of defense mechanisms and final exhaustion of coping resources “triggered” a delict-homicide. The second group of women with a high level of aggressiveness, hostility, short temper, ignoring the interests of close people, inadequate social norms, showed an extremely narrow coping repertoire. It was reduced to emotional coping: confrontation, aggression aimed at the spouse. Fixed destructive ineffective conflict resolution led the spouses to life-threatening interaction. Forensic examination of coping ways help determine a crime by a complex of united factors — the women-victims‘ personal traits; dysfunctional marital behavior accumulating negative emotions with aggressive explosions; the predominance of immature ego-mechanisms; maladaptive, unproductive patterns of women’s coping behavior. The study was supported by RFBR, project 18-013-01005.
Abstract body. Neurochemical model of biologically based traits (temperament) Irina Trofimova, Department of Psychiatry and Behavioral Neurosciences, McMaster University, Canada Introduction: Specialization between neurotransmitter systems underlying temperament traits and psychopathology is in the front line of studying biomarkers for psychological and psychiatric taxonomies. Method: This specialization was analyzed based on multi-disciplinary reviews and from a functional ecology perspective, considering the functional architecture of human activities. The functional differentiation within neurochemical systems is compared to models in kinesiology, psychophysiology and clinical neuropsychology that investigated key stages and regulatory systems of human actions. Results: The roles of monoamine neurotransmitters (serotonin, dopamine, noradrenaline), as well as the roles of acetylcholine, neuropeptides and opioid receptor systems in the regulation of specific dynamical properties of behavior is summarized within the neurochemical Functional Ensemble of Temperament (FET) model. Discussion and conclusions: The FET framework allows having both, a common taxonomy for biologically based traits in healthy individuals and for taxonomies of mental illnesses. The presentation will give examples of how the FET framework can be used in psychiatry and clinical psychology for assessment and treatment.

Press paragraph. The topics of the symposium will include a discussion of new approaches to solving the issues of relation between brain and mental aspects of purposeful behavior regularities. The problem of distant identification of human stress by cluster analysis infrared and terahertz radiation from different face regions will be described by professor A.M. Chernorizov (Lomonosov Moscow State University, Russia); brain mechanisms of attention — by professor K. Alho (University of Helsinki, Finland); personal view on the development of cognitive neuroscience (or psychophysiology) will be presented by professor M. Sams (Aalto University School of Science, Finland); neurochemical model of individuality in normal and pathological states will be described by adjunct Professor I. Trofimova and associate professor W.H. Sulis (McMaster University, Canada); the idea of evolutionally meaningful mechanisms of regression will be justified by professor Y.I. Alexandrov (Institute of psychology, RAS); brain-based view of learning for achievement or avoidance will be provided by A.A. Sozinov (Institute of Psychology, RAS).

General summary of the Symposium. 5.1 General summary. The data concerning the distant identification of human stress by cluster analysis infrared (IR) and terahertz (THz) radiation from different face regions, where IR and THz signals correlated with heart rate in the situations of informational and physical stress will be presented. Arguments in favor of suggestion that selective attention to spoken or written sentences is largely automatized will be put forward. Experimental data that show that we activate motor, somatosensory and emotional brain regions while we perceive the actions, sensations and emotions of others and that the propensity to empathize spontaneously with the feelings of others may be critical for normal social development will be presented. On the basis of review of the development of cognitive neuroscience the conclusion will be made that...
much of the progress had depended on the methodological advancements such as the possibility to use more "naturalistic" stimuli and on the moving from "stimulus-response" paradigms to such where it is increasingly important to characterize the experimental subjects as well as their behavior. Data showing that post-hypnotic suggestions diminish Stroop effects by enhancing proactive executive control over lexico-semantic conflicts will be presented. Arguments will be justified in favor of the fact that the Functional Ensemble of Temperament (FET) model that allows having both, a common taxonomy for biologically based traits in healthy individuals and for taxonomies of mental illnesses. It will be shown that reversible dedifferentiation, which is phenomenologically described as regression, is a general mechanism for restructuring the organism-environment interactions in situations when behaviors that were effective in the past become ineffective. Approach- and avoidance-motivated learning differences will be explained by principles derived from neuronal activity analysis.

5.2 Individual abstracts (first author variants before final correction according general rules) Brain activity associated with attention to audio-visual speech

K. Alho1,2, M. Verwoert1,3, E. Sahari1, M. Moisala1, P. Wikman1, V. Salmela1, M. Leminen4, M. Laine5 & A. Leminen1 1 Department of Psychology and Logopedics, University of Helsinki, Helsinki, Finland 2 AMI Centre, Aalto University, Espoo, Finland 3 Department of Experimental Psychology, Utrecht University, Utrecht, The Netherlands 4 Department of Phoniatrics, Helsinki University Hospital, Helsinki, Finland 5 Department of Psychology, Åbo Akademi University, Turku, Finland Background. Human listeners are able to attend selectively to a particular speaker at the presence of irrelevant speech or in otherwise noisy situations. However, only a few brain imaging studies have mapped the underlying brain activity in naturalistic selective-listening situations. Methods. Using functional magnetic resonance imaging in two studies with 15 and 19 healthy adult participants, we examined brain activity during selective attention to dialogues on emotionally neutral topics by a female and male speaker seen on a screen at the presence of irrelevant speech in the background. The perceptual quality of the dialogues was manipulated by noise-vocoding of speech signals and by masking speech-related facial movements. After each attended dialogue, the participants answered to questions about its content. In control conditions, the participants were instructed to ignore the speech stimuli, attend to a fixation cross and count the number of rotations of the cross (from "x" to "+", or vice versa). Results and Discussion. Attention to dialogues was associated with enhanced auditory cortex activity. This activity was higher for higher auditory and visual quality. Lower auditory quality, in turn, was associated with higher frontal and parietal cortical activity presumably due to enhanced attentional demands. Moreover, attention to the dialogues (vs. attention to the fixation cross) was accompanied by enhanced activity in the ventromedial prefrontal cortex, temporal pole, and posterior cingulate gyrus. In previous studies, these areas have shown enhanced activity in conditions demanding, for instance, theory of mind or moral judgment. Thus, in addition to auditory cortex speech comprehension systems, selectively attended audio-visual speech appears to activate brain networks of social cognition even when the speech content is emotionally neutral and there is no need for social decision-making. This research was supported by the Academy of Finland (grant #297848).

Sociological–Psychological Cognitive Neuroscience Mikko Sams, Department of Neuroscience and Biomedical Engineering Department of Computer Science Aalto University, Finland Introduction. I will present my personal view of the evolution of human cognitive neuroscience (or psychophysiology) during my own research career hoping to illustrate some important trends within this field of science. Much of the progress had depended on the methodological advancements such as the possibility to use more "naturalistic" stimuli in and advances in signal analysis methods. This has made it possible to address new types of questions of the neural mechanisms underlying behavior. One important trend has been moving from "stimulus-response" paradigms to such where it is increasingly important to characterize the experimental subjects as well as their behavior. Results: I will describe our recent experiments on decoding emotions from the
brain activity and taking different perspectives on what we are viewing, and how the differences in the ways people see the world around us is reflected on the neuronal level. Discussion: One way of describing my research at present stage would be “a study of neural and bodily mechanisms of socially constructed reality”. One outstanding question I am addressing with my colleagues is how momentary or longer-duration belonging to specific ingroups influences our thinking and underlying neural mechanisms. We are also scrutinizing the nature of empathy and how it can be conceptualized and real-life like conditions. Neurochemical model of biologically based traits (temperament) Irina Trofimova, Department of Psychiatry and Behavioral Neurosciences, McMaster University, Canada

Introduction: Specialization between neurotransmitter systems underlying temperament traits and psychopathology is in the front line of studying biomarkers for psychological and psychiatric taxonomies. Method: This specialization was analyzed based on multi-disciplinary reviews and from a functional ecology perspective, considering the functional architecture of human activities. The functional differentiation within neurochemical systems is compared to models in kinesiology, psychophysiology and clinical neuropsychology that investigated key stages and regulatory systems of human actions. Results: The roles of monoamine neurotransmitters (serotonin, dopamine, noradrenaline), as well as the roles of acetylcholine, neuropeptides and opioid receptor systems in the regulation of specific dynamical properties of behavior is summarized within the neurochemical Functional Ensemble of Temperament (FET) model. Discussion and conclusions: The FET framework allows having both, a common taxonomy for biologically based traits in healthy individuals and for taxonomies of mental illnesses. The presentation will give examples of how the FET framework can be used in psychiatry and clinical psychology for assessment and treatment. Assessing the continuum between temperament and mental disorders in the context of brain neurochemistry William H. Sulis, Clinical Associate Professor, Department of Psychiatry and Behavioral Neurosciences, McMaster University, Canada

Introduction. Temperament traits, i.e. biologically based individual differences, are observable not only in healthy humans, but also in animals and very young children, i.e. in pre-cultural individuals. A taxonomy of temperament could provide the basis for a new taxonomy of mental illness as temperament and mental illness represent varying degrees along the same continuum of neurotransmitter imbalances. A good temperament taxonomy therefore should be able to discriminate between mental disorders. Method. The presentation reports on several studies conducted by our lab in South Ontario, Canada that compared temperament profiles in patients with Major Depression, Generalized Anxiety Disorder and comorbid depression and anxiety. These studies used the Structure of Temperament Questionnaire (STQ-77) which assess 12 temperament traits in line with the neurochemical model Functional Ensemble of Temperament (FET). Using the STQ-77, the temperament profiles of 246 control subjects and 371 patients with these disorders were compared across four adult age groups (18-24, 25-45, 46-65, 66-84). Results. MDD and GAD appear to be accurately distinguished by the traits of Motor Endurance and Motor Tempo (much lower values in depression), and Neuroticism (much higher value in anxiety). Comorbid can be distinguished based on a significant decrease in the traits of Plasticity, Intellectual Endurance, Probabilistic Processing, and increased Impulsivity. These effects seemed independent of age and gender. Discussion and conclusions. The main goal of this study was to examine whether the neurochemical FET model possessing an extensive set of non-emotionality traits provides better discrimination between MDD, GAD and Comorbid MDD and GAD, in comparison to emotionality-based temperament models. Our results suggest the benefits of including non-emotionality-related traits and the usefulness of a functional approach to both taxonomy of temperament and classification of mental disorders. Moreover, FET framework is more compatible with the symptoms of mental disorders than other existing models of temperament and personality. Reversible Dedifferentiation (RD) During Regression as a Basis for Effective Adaptation Alexandrov Yuri I. Institute of Psychology, Russian Academy of Sciences, Moscow

Introduction. The concept of
regression is usually understood as a decrease in the "level of organization" of behavior and its return to earlier stages of development. The purpose of our study was to identify which patterns of the dynamics of individual experience and its brain organization underlie the phenomena described as regression. Results and Discussion. I will discuss the results of analyses of the dynamics of individual experience in situations when regression occurs, such as stress, disease, learning, highly emotional states and alcohol intoxication. Our studies explored a wide range of phenomena, from changes in gene expression and impulse neuronal activity in animals to prosocial behavior in humans of different ages. Common mechanisms of regression in various situations are proposed. We had previously found that implementation of behavior is based on simultaneous activation of new, most differentiated functional systems (elements of experience), formed at relatively late stages of development, as well as many other relatively early formed and less differentiated systems. Regression is observed after acute administration of alcohol, under stress and in emotional states. As we have found, the common mechanism of regression can be described as RD, which is understood as a relative increase of the proportion of low-differentiated systems in the actualized experience. For example, it was shown that under stress, adults regress to "childish" forms of moral decisions. RD has been found to characterize the initial stages of learning (systemogenesis). In all of the cases of dedifferentiation mentioned above, the complexity of the systemic organization of behavior, measured by sample entropy of the heart rate, significantly decreases. The results of mathematical modeling support the idea that RD can be one of the mechanisms for increasing the effectiveness of adaptation through learning. Conclusions. RD is a general mechanism for restructuring the organism-environment interactions in situations when behaviors that were effective in the past become ineffective. Thus, RD has evolved as a component of adaptation when new behaviors are formed and large-scale modifications in the existing behaviors are required in the face of changes in the external and / or internal environment. Detection of Human Emotional Arousal by Analyzing the Terahertz Passive Radiation from Facial Areas A.M. Chernorizov1, E.E. Berlovskaya1, O.P. Cherkasova2, S.A. Isaychev1, A.P. Shkurinov1 1Lomonosov Moscow State University, Moscow, Russia 2Institute of Laser Physics of SB RAS, Novosibirsk, Russia

Background. To date the development of systems for monitoring of personal emotional arousal, EA (sleep/wake states, emotions, stress responses), are focused on remote (non-contact) methods for registration of physiological parameters. We present the data concerning the distant identification of human stress by cluster analysis terahertz (THz) radiation from different face regions, where THz signals correlated with heart rate (HR) in the situations of informational and physical stress. Methods. 38 volunteers, aged from 19 up to 57 years, participated in the experiments. Stress states were provoked by physical (threat of electric shock) or mental (solving of a hard task) stressors. For the control of EA were registered using electrocardiogram, photoplethysmogram, and galvanic skin response. The registration of the face images in the THz range by THz detector IRVT0831 was synchronous to the registration of psychophysiological indicators. Results and Discussion. The original algorithm of cluster analysis the THz radiations was developed. In stress situations there it was revealed that statistically significant (p < 0.05) resistant in time correlations between THz images, from one hand, and HR, from another one, are occurred in the areas of forehead and nasolabial triangle. It is shown that cluster analysis of distant registered THz images enables to divide the subjects into two groups by the type of reactions of the circulatory system in stressful conditions. In subjects from the first group stress causes a rush of the blood. In the subjects from the second group it provokes a spasm of the blood vessels and, as a consequence, a decrease in the intensity of blood circulation. It is also shown that the intensity of the THz signal around nose wings is reduced while person breathes. This phenomenon may be used to develop algorithms for non-contact registration of the respiratory rhythm. The authors are grateful to Dr I.A. Ozheredov and Dr A.N. Varaksin for effective assistance in conducting experiments and data
analysis. The work was supported by RFBR, project № 17-29-02487. Loci of Stroop Effects in Vocal and Manual Tasks, Revealed by Event-Related Brain Potentials and Post-Hypnotic Suggestions Anoushiravan Zahedi1, Rasha Abdel Rahman1, Birgit Stürmer2, Werner Sommer1 1Humboldt-Universität zu Berlin 2International Psychoanalytic University, Berlin Background. In the Stroop task color words are shown in various print colors. When print colors are named or classified with button presses, interference occurs if word meaning is color-incongruent and facilitation if it is congruent. Although the Stroop effects in vocal and manual task versions are similar, it is unclear whether the underlying mechanisms are equivalent.

Method. We addressed this question by (1) recording event-related brain potentials (ERPs), (2) manipulating the lexicality of neutral stimuli, and (3) giving post-hypnotic suggestions (PHS) that written words would lose their meaning. Results. The Stroop effect in the vocal version was twice its manual counterpart. PHSs strongly reduced both effects by a similar amount, supporting a common semantic locus during reading. Task- and hypnosis-invariant lexicality effects for neutral words ruled out pre-semantic reading loci. Articulation-artifact corrected ERPs showed task-invariant Stroop effects in N400 amplitudes, supporting similar semantic loci. However, in the vocal task response-locked ERPs indicated a task-specific Stroop effect over left-inferior frontal and parietal scalp sites, suggesting interference during word production. Interestingly, PHS increased the N1 and decreased the N2 components in ERPs, regardless of congruency, indicating enhanced proactive executive control and diminished demands on conflict-monitoring, respectively. Stroop effects in the N400 were reduced by PHS.

Discussion. Vocal and manual Stroop versions seem to share semantic loci of conflict. The bigger vocal Stroop effect may be due to additional loci in the word production lexicon. Apparently, PHS diminish Stroop effects by enhancing proactive executive control over lexico-semantic conflicts. This work was supported by a PhD stipend of the DeutscherAkademischerAustauschdienst to AZ.

Learning for achievement and avoidance: cultural differences and similarities Sozinov A.A.a,b, Tskhadaia L.G.b, Kudinov S.S.c, Tuominen T.d, Laukka S.d, Alexandrov Yu.I.a,c,f a V.B. Shvyrkov Laboratory of Neural Bases of Mind, Institute of Psychology, RAS, Russia; b State Academic University for Humanities, Russia; c RUDN University, Russia d University of Oulu, Finland e National Research University Higher School of Economics, Russia f Moscow State University of Psychology and Education, Russia Background. Social and cultural neuroscience has made it persuading that psychological categories are not universal. Neuronal activity recordings (including our own) reveal the main ground for this — they show that the structure of experience is derived from individual history of interactions with the environment. Brain activity and behavioral data show that approach and avoidance are basic categories that underlie our understanding of organization of behavior. We propose that this division also manifests the structure of individual experience: the “negative” domain is more complex, differentiated, and is characterized with more cognitive load, than the “positive” domain. Accordingly, in our prior study accuracy measures were lower for learning session and higher for transfer session in the loss context, compared to gain context. Since human interactions are social, we also expected the domain effect to be mediated by cultural traits.

Methods. Our neuronal recording setup and rationale (Alexandrov et al., 2018), as well as our A-ware program used to assess gain- or loss-learning in humans (Sozinov et al., 2018) are described elsewhere. In the latter, we compared performance indices between groups of Chinese and Russian participants, known to differ in traits that presumably reveal approach and avoidance motivation. The between-group context of gain or loss defined the type of feedback. Findings. The time of the first correct trial was greater in the loss context than in the gain context in Chinese participants, but not in Russians (ANOVA, F (1, 125) = 8.49; p < 0.01). The transfer indices in the current dataset have not revealed corresponding greater transfer in the loss context that we expected. Importantly, our neuronal activity analysis shows that the brain underpinnings of behavior depend on the way that behavior had been formed. Discussion. The difference in human learning study presumably reflects
cultural specificity of approach-avoidance motivation. Therefore, an essential insight from social neuroscience and systems psychophysiology is that the characteristics of neuronal activity and behavioral events are derived from individual experience and reflect history of organism-environment interactions.

However, only a few brain imaging studies have mapped the underlying brain activity in naturalistic selective-listening situations. Using functional magnetic resonance imaging in two studies with 15 and 19 healthy adult participants, we examined brain activity during selective attention to dialogues on emotionally neutral topics by a female and male speaker seen on a screen at the presence of irrelevant speech in the background. The perceptual quality of the dialogues was manipulated by noise-vocoding of speech signals and by masking speech-related facial movements. After each attended dialogue, the participants answered to questions about its content. In control conditions, the participants were instructed to ignore the speech stimuli, attend to a fixation cross and count the number of rotations of the cross (from “x” to “+”, or vice versa). Attention to dialogues was associated with enhanced auditory cortex activity. This activity was higher for higher auditory and visual quality. Lower auditory quality, in turn, was associated with higher frontal and parietal cortical activity presumably due to enhanced attentional demands. Moreover, attention to the dialogues (vs. attention to the fixation cross) was accompanied by enhanced activity in the ventromedial prefrontal cortex, temporal pole, and posterior cingulate gyrus. In previous studies, these areas have shown enhanced activity in conditions demanding, for instance, theory of mind or moral judgment. Thus, in addition to auditory cortex speech comprehension systems, selectively attended audio-visual speech appears to activate brain networks of social cognition even when the speech content is emotionally neutral and there is no need for social decision-making. This research was supported by the Academy of Finland (grant #297848).
REMOTE DETECTION OF HUMAN EMOTIONAL AROUSAL BY ANALYZING OF TERAHERTZ PASSIVE RADIATION FROM FACIAL AREAS

NEUROCHEMICAL MODEL OF BIOLOGICALLY BASED TRAITS (TEMPERAMENT)

I. Trofimova
McMaster University (Hamilton, Canada)

Specialization between neurotransmitter systems underlying temperament traits and psychopathology is in the front line of studying biomarkers for psychological and psychiatric taxonomies. This specialization was analyzed based on multi-disciplinary reviews and from a functional ecology perspective, considering the functional architecture of human activities. The functional differentiation within neurochemical systems is compared to models in kinesiology, psychophysiology and clinical neuropsychology that investigated key stages and regulatory systems of human actions. The roles of monoamine neurotransmitters (serotonin, dopamine, noradrenaline), as well as the roles of acetylcholine, neuropeptides and opioid receptor systems in the regulation of specific dynamical properties of behavior is summarized within the neurochemical Functional Ensemble of Temperament (FET) model.

The FET framework allows having both, a common taxonomy for biologically based traits in healthy individuals and for taxonomies of mental illnesses. The presentation will give examples of how the FET framework can be used in psychiatry and clinical psychology for assessment and treatment.

SOCIOLOGICAL–PSYCHOLOGICAL COGNITIVE NEUROSCIENCE

Mikko Sams
Aalto University (Helsinki, Finland)

Introduction. I will present my personal view of the evolution of human cognitive neuroscience (or psychophysiology) during my own research career hoping to illustrate some important trends within this field of science. Much of the progress had depended on the methodological advancements such as the possibility to use more “naturalistic” stimuli in and advances in signal analysis methods. This has made it possible to address new types of questions of the neural mechanisms underlying behavior. One important trend has been moving from “stimulus-response” paradigms to such where it is increasingly important to characterize the experimental subjects as well as their behavior.

Results. I will describe our recent experiments on decoding emotions from the brain activity and taking different perspectives on what we are viewing, and how the differences in the ways people see the world around us is reflected on the neuronal level. Discussion. One way of describing my research at present stage would be "a study of neural and bodily mechanisms of socially constructed reality". One outstanding question I am addressing with my colleagues is how momentary or longer-duration belonging to specific ingroups influences our thinking and underlying neural mechanisms. We are also scrutinizing the nature of empathy and how it can be conceptualized and real-life like conditions.
LOCUS OF STROOP EFFECTS IN VOCAL AND MANUAL TASKS, REVEALED BY EVENT-RELATED BRAIN POTENTIALS AND POST-HYPNOTIC SUGGESTIONS

Temperament traits, i.e. biologically based individual differences, are observable not only in healthy humans, but also in animals and very young children, i.e. in pre-cultural individuals. A taxonomy of temperament could provide the basis for a new taxonomy of mental illness as temperament and mental illness represent varying degrees along the same continuum of neurotransmitter imbalances. A good temperament taxonomy therefore should be able to discriminate between mental disorders. The presentation reports on several studies conducted by our lab in South Ontario, Canada that compared temperament profiles in patients with Major Depression, Generalized Anxiety Disorder and comorbid depression and anxiety. These studies used the Structure of Temperament Questionnaire (STQ-77) which assess 12 temperament traits in line with the neurochemical model Functional Ensemble of Temperament (FET). Using the STQ-77, the temperament profiles of 246 control subjects and 371 patients with these disorders were compared across four adult age groups (18-24, 25-45, 46-65, 66-84). MDD and GAD appear to be accurately distinguished by the traits of Motor Endurance and Motor Tempo (much lower values in depression), and Neuroticism (much higher value in anxiety). Comorbid can be distinguished based on a significant decrease in the traits of Plasticity, Intellectual Endurance, Probabilistic Processing, and increased Impulsivity. These effects seemed independent of age and gender. The main goal of this study was to examine whether the neurochemical FET model possessing an extensive set of non-emotionality traits provides better discrimination between MDD, GAD and Comorbid MDD and GAD, in comparison to emotionality-based temperament models. Our results suggest the benefits of including non-emotionality-related traits and the usefulness of a functional approach to both taxonomy of temperament and classification of mental disorders. Moreover, FET framework is more compatible with the symptoms of mental disorders than other existing models of temperament and personality.
REVERSIBLE DEDIFFERENTIATION (RD) DURING REGRESSION AS A BASIS FOR EFFECTIVE ADAPTATION

How does our brain make us understand what other people do and feel? How does our brain make us empathize with the emotions of others? I will initially review fMRI experiments from our lab that show that humans activate their somatosensory and emotional brain regions while we perceive the sensations and emotions of others. This has been taken to suggest that we recruit neurons involved in our own pain while we witness the pain of others, and that this is what triggers us to share the pain of others. To test whether this is true, we have developed a rodent model of empathy. Methods: We used single cell recordings in 17 rats and muscimol deactivations in 14 rats, both targeting the anterior cingulate cortex, while the rats witnessed another animal receive painful shocks. In addition, we recorded single cell recordings while the animals themselves experience pain (via a laser) and fear (via a fear conditioned sound CS). The rat ACC (area 24) contains neurons responding when a rat experiences pain and while witnessing another rat receive footshocks. Most of these neurons do not respond to fear. Deactivating this region reduces freezing while witnessing footshocks to others but not while hearing the CS. Mirror-like neurons for pain thus exist in the mammalian ACC that map the pain of others selectively onto the very same neurons involved in our own pain. Interfering with that ACC activity causally impairs emotional contagion.
Abstract body. The symposium addresses the problems of the modern family. Topics covered include: the characteristics of the family conflicts in the families with different durations of marriage; the motivational basis of partner choice in the biethnic families; prosocial behavior of the child in the context of parental relations; peculiar properties of mother interaction with a child with a diagnosis of cerebral palsy; the individual as a product of family history, the subject of which he strives to become.

Press paragraph. The study of the problems of the modern family is of great social importance in view of the observed negative trends in the development of the institution of the family. A large number of divorces, worsening of marital interaction, the effect of "loneliness together", disunity in parent-child relationships, the growth of children with severe congenital diseases — all these issues will be addressed in the framework of the symposium "Family Psychology." The symposium is conducted by Natalya Tsvetkova (Russia), Professor at Moscow State Pedagogical University and Vincent de Gaulejac (France), Professor Emeritus at

Paris Diderot University. At the symposium there are presentations by the Professor at the Moscow State Pedagogical University Z. Aygumova on biethnic families; by the Professor at Moscow State Pedagogical University M. Shvetsova on the child’s prosocial behavior in the context of parental relations; be the docent at Moscow State Pedagogical University E. Makarova about the peculiar properties of motherinteraction with a child with a diagnosis of cerebral palsy.

General summary of the Symposium. Currently, the study of family problems, family relations attracts much attention of researchers. The study of the problems of the modern family is of great social importance in view of the observed negative trends in the development of the institution of the family. A large number of divorces, worsening of marital interaction, the effect of "loneliness together", disunity in parent-child relationships, the growth of children with severe congenital diseases — all these issues will be addressed in the framework of the symposium "Family Psychology." The theoretical and methodological basis of the study of family problems were the ideas of A. R. Luria that culture determines the relationship of man and society, forms consciousness and self-consciousness, his personal activity, and R. Murshstein that the factor of homogeneity (in values and religious orientation) dominates the motivation to choose a partner for marriage. It was shown that representatives of mono-ethnic marriages, fulfilling the requirement of homogeneity of marriage choice, are guided by both the criterion of social approval of ethnically homogeneous marriage partner (interpsychic factor), and the presence of high indicators of ethnic identity, the possession of their cultural value orientations (intrapsychic factors). Representatives of bi-ethnic marriages have lower rates of ethnic identity compared to representatives of mono-ethnic marriages, as well as value orientations that differ from the value orientations of representatives of mono-ethnic marriages in the case of high rates of internality of locus control. The features of parent-child relationships are also discussed in the papers presented at the symposium.
CHARACTERISTICS OF CONFLICTS AND WAYS OF RESOLVING THEM IN FAMILIES WITH DIFFERENT EXPERIENCE OF MARRIAGE

Natalia Tsvetkova
Moscow State Pedagogical University (Moscow, Russia)

The empirical research of the 84 couples with the different duration of their marriage (1–3, 4–10 and 12–20 years) is described in the report. The purpose of research was to investigate the coping strategies on the different periods of the marriage. It was observed that the coping strategies that spouses choose varies in dependence of the marriage duration. Families with 1–3 and 4–10 years of their marriage choose problem-oriented coping. Families with 12–20 years marriage choose emotionally-oriented coping, but they use three coping strategies including coping oriented on escaping from the problems. As the marriage duration increases the adaptive cognitive coping becomes less used. At the same time the emotional oriented coping is used with equal frequency. Optimism is the most often used style of emotional oriented coping in every period of marriage.

THE INDIVIDUAL AS A PRODUCT OF FAMILY HISTORY, THE SUBJECT OF WHICH HE STRIVES TO BECOME

Vincent De Gaulejac
Paris Diderot University (Paris, France)

How to understand such a subtle relationship between being a person and being of society, in particular, when analyzing the social genesis of mental conflicts. The use of a clinical approach in sociology opens up new perspectives for all psychotherapists and psychoanalysts who come from different layers of the horizons of science and who want to better integrate our social nature into their practice. How to perceive the mutual influences between social processes and mental processes in stories about life? How to build a clinic of complexity that promotes integration between body, mind and social? How to understand the weight of the family novel in the development of personality? There is a discrepancy between the “objective” history and the “subjective” story about it, or rather, the space that allows us to think about the dynamics of the transfer of behavioral patterns, about adjustments between the given, desired and acquired identities. To think about family scenarios that indicate to children what is desirable, what is possible and what threatens them ... The subject builds himself up in the answers he brings to the contradictions that permeate his existence.
BIETHNIC FAMILIES: A MOTIVATIONAL BASIS OF CHOICE OF PARTNER

Zagrat Aygumova
Moscow State Pedagogical University (Moscow, Russia)

The article discusses the motivational basis for choosing a partner in a bi-ethnic family, that is, a set of inter- and intra-psychic factors. The theoretical and methodological basis of this study are the ideas of A. R. Luria (1976) that culture determines the relationship of man and society, forms consciousness and self-consciousness, his personal activity, and R. Murshtein (1982; 1999) that the factor of homogeneity (in values and religious orientation) dominates the motivation to choose a partner for marriage. The methods chosen for the study of intra- and interpsychic factors allowed to prove the hypothesis that the choice of a marriage partner is motivated and determined by a variety of inter- and intrapsychic factors. Thus, representatives of mono-ethnic marriages, fulfilling the requirement of homogeneity of marriage choice, are guided by both the criterion of social approval of ethnically homogeneous marriage partner (interpsychic factor), and the presence of high indicators of ethnic identity, the possession of their cultural value orientations (intrapsychic factors).

Representatives of bi-ethnic marriages have lower rates of ethnic identity compared to representatives of mono-ethnic marriages, as well as value orientations that differ from the value orientations of representatives of mono-ethnic marriages in the case of high rates of internality of locus control. The results obtained allow us to note that with the increase in the indicators of ethnic identity, the level of compliance of value orientations of the individual with the value orientations of her ethnic group and the probability of entering into a mono-ethnic marriage, as well as the role of intrapsychic factors in motivating this choice increases. With a decrease in the indicators of ethnic identity of the individual, the level of compliance of her value orientations with the value orientations of her group decreases and the probability of her entering into a bi-ethnic marriage increases. Moreover, with the increase in the importance of intra-psychic factors (and the decrease in the importance of environmental factors) in the motivation of this choice, the probability of changing the place of residence to the native country of the spouse increases.
Abstract body. A specialized method of imaging traumatatherapie children and adults Hagedorn Udo Specialized method of visualization in trauma therapy of children and adults U. Hagedorn@alexianer.de Background. In the context of clinical, psychiatric and psychological care of patients it is especially important and efficient to visualize difficult relations and relational structures with the help of a visualization method. Udo Hagedorn is the creator of the visualization tool "Sieben schlaue Köpfe" (eng. "seven clever heads"). The user is able to conceptualize his own relational structures with the use of "face-stamps" with associative expressions in combination with colored pencils to draw the individual relations. With this method the user receives a better understanding of his own situation and an overview displayed on the paper. The system effect of this method is based on the necessary "microcracks" taken in the process of self-creating the image of relationships with people. The method of analyzing complex and traumatic relationships between people is applicable in the field of pedagogical and clinical psychology, family counseling, individual counseling and traumatology. Materials and methods. We conducted a study of 77 women and 8 men (Russia—Germany—Bulgaria) who have experienced cumulative trauma of interpersonal relationships. The age of the examined patients ranged from 18-25 years-9.4%, 26-35 years-30.6%; 36-45 years — 45.9%; 46-55 years — 9.4%; 56-65 years-4.7%. Results. The results showed that the following characteristics of the trauma process with a certain factor weight were dominant: manifestations of depression (factor weight — 0.737), memories of images (0.676), the desire to retire (0.640), flashbacks (0.633), a return to discomfort (0.630), frequent fright (0.617). Conclusions. In terms of providing clinical and psychological assistance to patients, visualization of important people in our lives and difficult relationships between close people is particularly effective. The visualization method allows to create an opportunity for associative self-perception of communication situations. Working with color and shape reveals all the features of relationships that develop with relatives, children, colleagues, partners. Special attention is paid to the structural mapping of relationships, human communication systems, feelings and analysis of emotions. The systemic effect of this method is based on the necessary "micro-solutions", which are taken in the process of self-image creation of relationships with people. It is associated with a General associative self-perception in situations of communication. The method of analysis of complex and psychotraumatic relations between people is applicable in the field of pedagogical and clinical psychology, family and individual counseling, in psychotraumatology.

Press paragraph. General summary of the Symposium. Methods of cognitive impairment and assistance to children and adults in correctional pedagogy and psychotraumatology study. The Symposium is devoted to the methods of studying and cognitive impairment correcting. It is expected to present the results of studies of cognitive mechanisms of information processing and decision-making normally developing children and those with intellectual disabilities. The speakers will present an analysis of the peculiarities of understanding the texts of different formats by school students and students depending on age, clinical diagnosis and their individual experience. To register a process of perception eye-tracker will be used. The visual stimuli understanding is analyzed. The reports will present the data on the formation of the mental model in preschool children of 5-7 years old. Some reports reveal the possibility of using modern methods of studying cognitive impairment in ergo- and trauma therapy. The method of analysis of complex and psychotraumatic relations between people is shown. The results of the performed studies are applicable in the field of correctional, clinical psychology and psychotraumatology.

2. Пресс-параграф (рассказывающий о теме и о спикерах, не более 200 слов).

The relevance of the theme of the Symposium is due to the importance of studying the understanding of texts of varying degrees of complexity and correction of cognitive impairment in children at different stages of ontogenesis. Understanding the text, instructions-the basis of many human activities and interpersonal communication. At the same time, the mechanisms that promote and facilitate qualitative understanding are currently not sufficiently disclosed. Speakers from different countries (Germany, Russia, Bulgaria) will try to discuss the most problematic points of understanding and the possibility of its correction in children with mental retardation 3.

In the first report of Oksana Zashchirinskaia (Department of Pedagogy and Pedagogical Psychology, Saint Petersburg University, Saint-Petersburg, Russian Federation, zaoks@mail.ru) provide data on the understanding of texts by children with intellectual disabilities. It will describe the factors that complicate the process of understanding and facilitate it. In the second report, Hagedorn Udo (Psychiatric and psychotherapeutic clinic, Charité, Berlin, Germany, U. Hagedorn@alexiener.de) demonstrate the role of imaging in the treatment of cumulative trauma in the interpersonal process. In the third report, Veselina Kirilova (Varna, Bulgaria, veselina.kirilova@mail.ru) will present a comparative analysis of the treatment of cumulative injury in Russia and Bulgaria. In the fourth report of Natalja Medina Brakamonte (Department of Pedagogy and Pedagogical Psychology, Saint Petersburg University, Saint-Petersburg, Russian Federation, mbna@yandex.ru) will present the results of the assessment and the creation of conditions for the well-being of children. Discussant Elena Nikolaeva (Herzen State Pedagogical University, Saint-Petersburg, Russian Federation, klemtina@yandex.ru) will present its assessment of the reports made. The method of oculography in the study of the understanding of texts of different visual complexity by students with mental disorders Zashchirinskaia Oksana, zaoks@mail.ru Background. The problem of understanding visual stimuli, containing images or texts of communicative content, remains very little studied in children and adolescents with intellectual disabilities, including the study of the mechanisms of students’ understanding of images of different formats. The aim of the study was to identify and characterize the relationship of perception and understanding, defined by the example of images and texts with different degrees of blur of stimulus material. To identify patterns of efficiency of perception and understanding of texts and images of varying degrees of complexity, students used images and texts with different degrees of blurring of stimulus material. Material and methods. The study involved 25 students aged 19 to 25 years. Research methods included a survey and content analysis. The method of oculography (eye-tracking) was applied. Only used 15 incentives to 7 8 texts and images. The results of the study showed that the analysis of texts and comics for students is characterized by fixation on important for understanding the details and characters of the plot. The subjects identify key
image fragments for a common understanding of their content. The volitional regulation of cognitive processes allows for the reading of texts or images with a high degree of blur to highlight the main characters and keywords for the reconstruction or anticipation of the meaning of visually perceived information constructs. The psychophysiological aspect of the process of recognition of nonverbal patterns is influenced by the success of projective identification of the end of the pictorial story. A survey of 120 students aged 9-10 years with varying degrees of decline in intelligence showed that when reading and analyzing texts, the degree of clarity of the texts has an impact on the understanding of the read. The number of visual fixations increases with difficulty recognizing words and reduces the contextual understanding of the read. An important result is the assessment of the importance of volitional efforts for effective text recognition. The data obtained allow us to say that the integral visual and textual images based on the system analysis of stimuli in young people arise Conclusions. Strong-willed regulation of cognitive processes in normative developing children and adolescents allows them to identify the main parts of images and key words for understanding visually perceived information constructs when reading texts. For students with intellectual disabilities (mental disorders) is characterized by fixation on emotionally colored parts of the images, low pertinence in the analysis of test fragments, improving the relevance of the search for meaning based on social intelligence. A specialized method of imaging traumatherapy children and adults Hagedorn Udo Specialized method of visualization in trauma therapy of children and adults U. Hagedorn@alexianer.de Background. The systemic effect of this method is based on the necessary "micro- solutions", which are taken in the process of self-image creation of relationships with people. It is associated with a General associative self-perception in situations of communication. The method of analysis of complex and psychotraumatic relations between people is applicable in the field of pedagogical and clinical psychology, family and individual counseling, in psychotraumatology. Methods of studying cumulative Psychotrauma: on the example of clinical and psychological study of the mental state of adults from Russia and Bulgaria Zashchirinskaia Oksana, Kirilova Veselina zaoks@mail.ru veselina.kirilova@mail.ru
Background. Psychological trauma is very common in the modern human population, has certain causes and consequences for the functioning and adaptation of the individual. Based on the analysis of theoretical sources, the specific features of cumulative traumatic experience in interpersonal relationships, as well as the ethnopsychological specifics of experiencing psychological trauma were considered. The aim of the empirical study is to characterize the experience of traumatic experiences in adults in Bulgaria and Russia.

Materials and methods. The study involved 85 participants. Subjects filled out an informed consent, demographic questionnaire. Research methods are "the scale of the reaction after exercise", "Basic beliefs scale" and "scale assessment, and interviews for complex post-traumatic stress disorder " (G. Fischer).

Mathematical and statistical methods of analysis of empirical data used content analysis, factor analysis, analysis of the reliability of differences.

Results. Respondents identified three main types of Psychotrauma of interpersonal relationships: trauma of betrayal (divorce, treason, insult at work, Theft and separation); trauma resulting from violence (mental and physical); trauma of loss (death of loved ones and death of animals). Psychological trauma due to external events arose after car accidents, fires and snake bites. The specificity of traumatic experience forms the features of experiences, manifested in the features of interpersonal contacts, the specifics of self-perception, the features of post-traumatic manifestations. Features of injuries associated with interpersonal relationships (loss, betrayal, etc.) determines the characteristics of post-traumatic reaction: stable emotional States with feelings of guilt, anger, irritation, the specifics of victimization and self-destructive behavior.

Conclusions. The experience of traumatic experience is manifested in people from two countries in 1) the process of social maladaptation; 2) features of the emotional state; 3) the perception of themselves and their social environment. Russians are characterized by more trusting relations with others, acceptance of their own destiny, belief in good and justice. The same for the Bulgarians and Russians-the presence of guilt and shame. Methods of art-pedagogical influence on emotional intelligence of children in educational environment Medina Brakamonte Natalia, PHD, associate professor of the Department of Pedagogy and Pedagogical Psychology, Saint Petersburg University, Saint Petersburg, Russian Federation mbna@yandex.ru

Background The educational environment affects the mental health of children. Emotional well-being is possible with the complex approach of a psychologist in working with children and their parents. In the process of development of a preschooler is effective art-pedagogical support, contributing to the formation of emotional intelligence. The method of art-pedagogical influence allows to develop and correct: ability to recognize and control the feelings; ability to understand and accept the feelings, the ability to use their emotions for the benefit of themselves and others, to recognize and recognize the feelings of others, to represent themselves in their place (eg, empathy); the ability to communicate with children, adults (parents, teachers).

Materials and method. The longitudinal study was conducted on the basis of preschool organization for 4 years. The sample consisted of 20 families with one and two children aged five years. The method of art pedagogy was used in the process of studying and correcting the emotional intelligence of children. It included game therapy, art therapy and psychogymnastics, including training to improve parent-child relationships, creating a favorable atmosphere in the group (11 classes with a set of exercises), various developmental individual classes for children, consultations for parents. Psychological testing: interview, observation of parent-child relationships, individual supervision of children in the group, a questionnaire parental relationship (A.J. Varga).
ETHICS OF CLINICAL SUPERVISION: GLOBAL CHALLENGES AND ADVANCES IN TRAINING, GUIDELINES, AND PRACTICES OF EFFECTIVE SUPERVISION

Nina Dalen
(Hovet, Norway)

Carol Falender
Pepperdine University (Los Angeles, USA)

Yesim Korkut
Bilgi University (Istanbul, Turkey)

Carole Sinclair
Independent Practice (Toronto, Canada)

Per Straumsheim
Norwegian Psychological Association (Oslo, Norway)

Abstract body. As clinical supervision is increasingly recognized internationally as a distinct professional competence requiring specific training, the focus of this symposium is to address international themes and strains in the ethics of clinical supervision. With emerging best practices, guidelines, and standards, significant ethical issues arise. Also, EuroPsy pays due attention to the requirement that supervisors should meet, and to the way in which the process should be organized and documented. In this symposium, presenters will describe the commonly accepted components of effective clinical supervision, as well as the status of ethical guidelines for supervision in psychology. Components include clarity of expectations and informed consent, alliance, goal setting, and feedback, all essential to the supervisor-supervisee relationship. Presentations include results from a survey research, feedback tools used as a basis for reflection between supervisor— and, and supervision processes in graduate programs. Presenters are from Canada, Turkey, USA, Norway and Russia.

Press paragraph. From ancient times to the present, people throughout the world have struggled to define right and wrong behavior for professionals (Sinclair, 2012). Ethical guidelines provides guidance on how to apply principles to professional practice in such a way that they will advance ethical awareness and reflection.

Among others, it aims to retain and enhance the public’s trust in the practice of professional psychologists and protect clients against inappropriate and/or harmful measures. Clinical supervision is the cornerstone of clinical training and transmission of the psychology profession and its practice to future generations. In this symposium we will address the quality and criteria for successful, ethical clinical supervision.

General summary of the Symposium. A cornerstone of the psychological profession, worldwide, is the commitment to professional ethics. EuroPsy, is a European standard and benchmark for psychologist practitioners. EuroPsy standards require psychologists to have at least one year of supervised practice, before independent practice. The EFPA Board of Ethics developing the first edition of Ethical Guidelines for Supervision in Psychology. Dr. Carole Sinclair will provide a brief overview of the Canadian experience of developing guidelines for supervision. Dr. Sinclair will explain how the underlying philosophy incorporates an emphasis on mutual respect and responsibilities, and the importance of ethical principles and ethical reasoning in resolving problems. Prof. Carol Falender will address international consensus on common factors of clinical supervision, specific ethical guidelines for clinical supervision and a summary of ethical aspects of supervision guidelines developed and emerging (United States, Australia, New Zealand, U.K., EFPA). Critical questions to be addressed include
identifying and strengthening international training procedures that result in ethical clinical supervision. Prof. Yesim Korkut will describe how in Turkey, regular assessment of the supervisory processes during graduate programs is very scarce. In this presentation, the preliminary results of an attempt to evaluate the supervision process in a clinical psychology M.A program in Turkey will be outlined. Special Advisor Per A Straumsheim will describe a project started in autumn 2018, where 250 supervisors/supervisees were invited to apply 3 feedback tools for a period of 4 months. After the pilot period, supervisors and supervisees are asked to answer an online questionnaire about their experiences with these tools. The results of the implementation project will be presented and implications discussed. Discussant: Professor Alla Shaboltas, St Petersbourg State University

STATUS AND FUTURE OF ETHICS OF CLINICAL SUPERVISION INTERNATIONALLY

Carol Falender
Pepperdine University (Los Angeles, USA)

This presentation addresses the international status of guidelines, regulations, and training criteria for the ethics of clinical supervision. Although clinical supervision is the cornerstone of clinical training and transmission of the psychology profession and its practices to future generations, generally, psychology has relied upon the process of osmosis for supervision and has addressed neither the quality nor criteria for successful, ethical clinical supervision. An assumption was that if one had been supervised, one had absorbed the essence of ethics of supervision and thus would be competent to provide ethically sound clinical supervision. International research studies have revealed the fallacy of that assumption, identifying inadequate, counterproductive, and even harmful supervision and a profusion of ethical errors made by supervisors and observed and reported by supervisees. Specific ethical infractions include perceived failure to adequately monitor the supervisees’ work with clients, failure to model professionalism and ethical practice, to adhere to ethical standards for multiple relationships with supervisees, to describe the limits of confidentiality of supervisee personal disclosures, and to provide a respectful, collaborative supervisory relationship, acknowledging the contributions of knowledge, skills, and attitudes of the supervisee in the context of the client presentation and in the context of evaluation and the power differential. Although international progress is underway, the ethics of clinical supervision have not generally been at the forefront. Recently, there has been increasing convergence of international ethical principles and increasing agreement on components of effective ethical supervision practice. The topics addressed include international consensus on common factors of clinical supervision, specific ethical guidelines for clinical supervision (Canada) and a summary of ethical aspects of supervision guidelines developed and emerging (United States, Australia, New Zealand, U.K., EFPA). Critical questions to be addressed include a) identification and strengthening international convergence of training procedures and requirements that result in ethical clinical supervision; b) ensuring ethical clinical supervision and supervisor competence transtheoretically; c) identifying and summarizing research that informs these efforts; d) describing innovations that impact ethics of clinical supervision practice and potentially enhance client care.
SUPERVISION ETHICS IN CANADA: HISTORY, ISSUES AND RESOURCES

Carole Sinclair
Independent Practice (Toronto, Canada)

As with many other countries, Canada was slow to recognize the unique competencies and ethical issues involved in supervision. This presentation will provide a brief overview of the Canadian experience, including an outline of the types of ethical issues brought to the Canadian Psychological Association (CPA) Committee on Ethics for consultation, and how these issues led to the development of the first edition of CPA’s Ethical Guidelines for Supervision in Psychology: Teaching, Research, Practice, and Administration, and its accompanying “Resource Guide.” The underlying philosophy of these resources, which incorporates an emphasis on mutual respect and responsibilities, and on the importance of ethical principles and ethical reasoning in resolving problems, will be explained as part of the presentation.

AN ATTEMPT TO EVALUATE THE QUALITY OF THE SUPERVISORY PROCESSES IN A CLINICAL PSYCHOLOGY M.A PROGRAM IN TURKEY

Nina Dalen
AS Clinical neuropsychologist (Hovet, Norway)

Clinical supervision has a very important function in the training of competent clinical psychologists. It is the core part of the education, in which theoretical knowledge is integrated with the internship experiences and own case work with the help of a senior clinical psychologist. Falender & Shafranske (2004) defines supervision as a collaborative interpersonal professional activity which involves observation, evaluation, feedback, facilitation of supervisee self-assessment, and acquisition of knowledge and skills by instruction, modeling, and mutual problem-solving. In Turkey regular assessment of the supervisory processes during graduate programs is very scarce. In this presentation the preliminary results of an attempt to evaluate the supervision process in a clinical psychology M.A program in Turkey. The students had one year theoretical education and second year internship at a mental hospital. They had their first cases from private counseling centers. Altogether they had three -fold supervision (from hospital, individual, and group supervision). The students, were requested to evaluate all the supervision at the end of both semesters. Their responses, will be provided during the presentation and will be discussed in terms of meeting the criteria of a supervision aiming to build competency.
FEEDBACK ON ALLIANCE AND GOALSETTING IN THE SUPERVISOR-SUPERVISEE RELATION

Nina Dalen
AS Clinical neuropsychologist (Hovet, Norway)

Per Straumsheim
Norwegian Psychological Association (Oslo, Norway)

Norwegian supervisors, giving supervision in the specialist training for psychologists in Norway have in a survey (Straumsheim, 2016), asked for feedback tools that can be used as a basis for reflection in the supervisor—supervisee relationship. The author performed a literature review, and selected together with other stakeholders three questionnaires, two about the supervision alliance and one about goalsetting and giving feedback: The Leeds Alliance in Supervision (Wainwright, 2010), The Short Supervisory Relationship Questionnaire (Cliffe, Beinart and Cooper, 2013), and Evaluation Process within Supervisory Inventory (Lehrman-Waterman & Ladany, 2001). After permission to translate and use the questionnaires were granted, translation was done and checked with help from subject matter experts. A pilot started autumn 2018, where 250 supervisors were offered to use the questionnaires for a period of 4 months. After the pilot period supervisors and supervisees are asked to answer an online questionnaire about their experiences with the questionnaires, if and how the questionnaires were helpful, if there were any disadvantages, and if they have suggestions to improve the wording of the forms. They will also be asked to return the forms, and we will perform analysis to see if the psychometric properties and the factor structure can be replicated in a Norwegian setting. The results of the implementation project will be presented in this talk, and implications discussed.
PSYCHOLOGY IN EDUCATION: CREATING A FUTURE TOGETHER

Nina Dalen
AS Clinical neuropsychologist (Hovet, Norway)

Alla Shaboltas
Saint-Petersburg State University (Saint-Petersburg, Russia)

Abstract body. Inclusion in education aims to give children a future together. Psychology in Education, PiE, contributes to this objective. In this seminar we present information about the ways PiE contributes to this process. Themes that are discussed in this symposium are: the results of a support system change, the implementation of the basic principles of Russian tradition of educational psychology, how the growingly important concept of emotions was shown and experienced in an interactive way by children and adults attending formal and non-formal educational contexts and how the results of a questionnaire to discover a list of shared competences/activities and training that are carried out by the Psychologist for Education in Spain and several European countries.

General summary of the Symposium. Title of the symposium: Psychology in Education: Creating a future together. If and how people live together depends to a significant extent by the way they are educated. Education shaped by the curriculum, the teaching methods, the support in education and the education system, which defines the kind of citizenship that the child will develop. This citizenship shaping is characterized by inclusiveness, inclusiveness in the broadest sense: religion, gender, disability, culture, sexual orientation, age, socio economic status, disadvantage in early childhood and early school leaving. Education has a preventive effect on many things for example poverty, health problems, and unemployment. Each of these problems results in an individual that often cannot participate fully in society. The person is excluded from society. Good education makes it possible that the student in the future has a good job, avoids poverty and reduces health problems. When education is inclusive it works preventively for all these problems. A way to create inclusion in education is by prevention. What are the mechanisms in education that make education inclusive by prevention? Prevention mechanisms in education that can make education more inclusive are: the kind of support system, the didactics principle "the Activity approach to learning" based on the principles of Russian tradition of educational psychology, a visit to an exhibition that toured the South of Portugal that showed in an interactive way how the growingly important concept of emotions was experienced by nine hundred children and adults attending formal and non-formal educational contexts, and a questionnaire intending to discover a list of...
shared competences/activities and training that are carried out by of Psychologist for Education to promote inclusion in schools. Of importance is the psychologist in education, or school psychologist, takes the role to implement these scientifically proven effective preventive mechanisms, to monitor the implementation, to learn from evaluation and evolve the education system in the school.
The aim of this presentation is to discuss a tricky question: does psychology have opportunities to make changes to the educational system or it can be considered as science, which only supports educational process, which only finds knowledge and gives recommendations to teachers, students, parents and so on. To what extend can we influence the central processes in education — the process of learning and teaching? In more detail — how can we take part in construction of educational programmes contents? Russian educational psychology has some very interesting theoretical foundations, which are based on the philosophy of Marxism. It’s cultural-historical and activity approach has been designed by L.S.Vygotsky, A.N.Leontiev, V.V.Davidov, D.B.Elkonin and others. According to it an educational psychologist not only can, but should take part in construction of educational programmes, because the main part of any learning is student’s domain of specific actions, which teachers should organize. Psychologists can help educators to choose appropriate student’s actions, based on logical-psychological analysis of the specific cultural area and can help to provide psychological conditions for the effective learning (there are some systems of such psychological conditions which are very essential). In this presentation I am going to tell you about the basic principles of Russian tradition of educational psychology (Activity approach to learning), and try to compare it with other approaches (e.g. Cognitive, Constructivist, Discovery, Problem-based teaching and so on). I will also describe some ways in which my colleagues and I have tried to develop this approach now in a real school, our research and our empirical results, which concern motivational and cognitive effects of such education. At the end of my presentation we’ll discuss a problem — how can we all expand this aspect of psychology in education together and what are the main difficulties of such work.
PSYCHOLOGY IN EDUCATION IN RUSSIA: TRADITIONS AND PERSPECTIVES

Anastasia Sidneva
Lomonosov Moscow State University (Moscow, Russia)

The aim of this presentation is to discuss a tricky question: does psychology have opportunities to make changes to the educational system or it can be considered as science, which only supports educational process, which only finds knowledge and gives recommendations to teachers, students, parents and so on. To what extend can we influence the central processes in education – the process of learning and teaching? In more detail – how can we take part in construction of educational programmes contents? Russian educational psychology has some very interesting theoretical foundations, which are based on the philosophy of Marxism. It’s cultural-historical and activity approach has been designed by L.S.Vygotsky, A.N.Leontiev, V.V.Davidov, D.B.Elkonin and others. According to it an educational psychologist not only can, but should take part in construction of educational programmes, because the main part of any learning is student’s domain of specific actions, which teachers should organize. Psychologists can help educators to choose appropriate student’s actions, based on logical-psychological analysis of the specific cultural area and can help to provide psychological conditions for the effective learning (there are some systems of such psychological conditions which are very essential). In this presentation I am going to tell you about the basic principles of Russian tradition of educational psychology (Activity approach to learning), and try to compare it with other approaches (e.g. Cognitive, Constructivist, Discovery, Problem-based teaching and so on). I will also describe some ways in which my colleagues and I have tried to develop this approach now in a real school, our research and our empirical results, which concern motivational and cognitive effects of such education. At the end of my presentation we’ll discuss a problem – how can we all expand this aspect of psychology in education together and what are the main difficulties of such work. 7.3.
HOW AN EXHIBIT ON EMOTIONS PROMOTED INCLUSION

Sara Bahia
Ordem dos Psicólogos Portugueses (Lisboa, Portugal)

Inclusion is a main theme of Psychology because it is a moral duty and a prime responsibility of psychologists. Emotions are a main theme of Psychology and Social Emotional Learning a key need in Psychology in Education. Aiming at explaining in an interactive way what emotions are and how they may be regulated, the Southern Regional Delegation of OPP (Order of Portuguese Psychologists) developed an exhibition named “Experiencing Emotions” with thirty different activities divided into three parts: Recognising, Living and Transforming Emotions. The dynamic and active exhibition toured the Southern Region of Portugal during nine months and was visited by more than nine thousand people. This presentation shows how visitors of all ages and educational contexts enriched their knowledge on emotions, on how they affect people’s lives and on how they can be transformed. The data was collected through interviews, questionnaires and grids filled by visitors and psychologists leading the visits. It is concluded that exhibitions like this may be a powerful instrument in the future to ensure that everyone has access to interactive experiences and may gain knowledge about themselves, others and the world.

COMPETENCY QUESTIONNAIRE OF PSYCHOLOGIST IN EDUCATION IN SPAIN. ANALYZING THE PRESENT TO BUILD THE FUTURE TOGETHER

Jose Leon
Universidad Autónoma de Madrid (Madrid, Spain)

This questionnaire has been designed by the Autonomous University of Madrid (José A. León* and team) in collaboration with the General Council of Psychology of Spain and with Standing Committee for Psychologists in Education in the European Federation of Psychological Associations (EFPA). This questionnaire intends to discover a list of shared competences/activities and training that are carried out by of Psychologist for Education in Spain. This questionnaire introduces a several questions about what competences do they develop in their work, how often do they carry out these competences / activities, need for training, and support for a European Master training and Europsy card. A total of 242 professional psychologists (79% females) took part in this study.

Results showed a wide list of competences that are carried out by professional educational psychologists in Spain. This model would be used to develop a common base of competences in the rest of the countries of the European Union, and could serve to formalize a database about specialized and professional European activities/competences that was approved and valid for all countries.
THE IMPACT OF PSYCHOLOGY ON DECENT WORK, POVERTY AND OTHER GLOBAL ISSUES AT THE UNITED NATIONS AND WORLD REGIONS

Walter Reichman
Judy Kuriansky
International Association of Applied Psychology (Larchmont, USA)

Stuart Carr
Massey University (Auckland, New Zealand)

Gary Latham
University of Toronto (Toronto, Canada)

Abstract body. The symposium will describe the way psychologists are bringing psychology to the deliberations of the United Nations. Psychology is important in every discussion at the UN because it involves human behavior and we are the science of human behavior. Our research, theories and best practices are relevant to any issue facing our world. Its importance had been overlooked because we are the youngest of the sciences, it is little known in many areas of the world and there are negative stereotypes associated with it. Because of our efforts psychology is called upon in dealing with all important issues. We have been concentrating on helping implement the 17 Sustainable Goals with a concentration on ending poverty, decent work and mental health and well-being. We will describe how we reached this point, our future and research that can improve the lives of millions.

Press paragraph. At long last psychologists are succeeding in bringing our discipline to the deliberations of the United Nations. Every issue deliberated at the United Nations has a psychological component to it because it deals with some aspect of human behavior whether it be cognitive, emotional or attitudinal. Despite the importance of psychology to the UN’s deliberations, there has been a lack of involvement of psychologists and psychology at the UN, until recently. In the past two decades psychologists have worked to bring their science, theory and best practices to the discussions at the UN. The process has been long and in some respects difficult. We will describe the progress we have made, are making and our plans. We aim to bring psychology to every aspect of the UN and make it a pivotal point in all deliberations. We are concentrating on the Sustainable Development Goals, especially ending poverty, providing decent work and bringing mental health and well-being to the people of the world. The members of the European Congress of Psychology will be asked to help in this endeavor by influencing the delegations in their own countries.

General summary of the Symposium. The symposium will describe the importance of psychology to the deliberations of the United Nations. It will describe how we are working to include psychological research, theory and best practices in every presentation and document at the UN. The first presentation will describe our work on the Sustainable Development Goals especially those on elimination of poverty, decent work and mental health and well-being. Our strategy for bringing psychology into these deliberations will be described as well as our method for gaining partners among the delegations and overcoming challenges to our goals. We will describe the method we used to bring a strategy to help eliminate poverty among persons with disabilities to the Economic and Social Council of the UN. We will demonstrate some of our activities through videos. The second presentation will describe our plans for making psychology the focal point of all documents emanating from the UN and in all presentations made by the ambassadors to the UN from the 93 member nations. We will present our nine-step program of how to make psychology indispensable to the deliberations of the United Nations and for presentations to the UN by the delegates to the UN. One of our goals...
will be to have a Department of Psychology within the Secretariat of the UN. We will also describe how psychologists around the world can contribute to that outcome. The third presentation will describe unique research to determine whether it is possible to provide everyone in the world with a living wage and still promote communities, and organizations to thrive. Their research utilized a mix of surveys, interviews, case studies and longitudinal research. The research carried out in New Zealand indicates that a living wage is advantageous to both employees and employers. The living wage may be pivotal for providing decent work. Further work in urban versus rural communities and larger versus smaller organization is the next step in this project.

CONTRIBUTIONS OF PSYCHOLOGY TO THE SUSTAINABLE DEVELOPMENT GOALS OF THE UNITED NATIONS

Walter Reichman
Judy Kuriansky
International Association of Applied Psychology
(Larchmont, USA)

This presentation gives an important overview of the global goals that have been set at the United Nations, with a focus on Goal 1 about poverty, Goal 8 about decent work and Goal 3 about health and well-being, that affect psychologists globally and where psychologists can make a contribution. Programs that address these goals will be presented that are models that can be adapted and scaled up, including integrating education, entrepreneurship and empowerment, as well as integrating mindset into entrepreneurship training. Events that have been organized at the UN regarding these specific topics will be described. Videos will be shown, with discussion of the importance of various approaches and engagement of partners in making progress in these areas. The process of advocacy regarding work and disability will be described, leading to a statement accepted by the UN Economic and Social Council about Strategies for Eradicating Poverty to Achieve Sustainable Development for All and the Equalization of Opportunities for Persons with Disabilities.
The United Nations, the site of deliberations on the world’s problems needs the science and practice of psychology to help resolve those problems. Through our efforts Psychology, as the newest science, is just now beginning to have a voice. In every issue facing the world psychology has research, theory and best practices directly related to that issue. Whether it be poverty, economics, work, environment, gender equality, justice or health there is psychological research and practice to provide important valid information to bring to the solution of the problem. Dr. Kuriansky has described the contributions we have made in the past years. Our task now is to become an integral part of the UN deliberations. We want the UN to eventually have a psychology department within the Secretariat in which every document stemming from UN is vetted for psychological significance. We want every delegate to the UN to ask for psychological input to every speech or document they present. We believe we can reach this status by: 1. Continuing to submit psychological contributions to every UN commission and committee meeting 2. Continue Psychology Day at the United Nations with topics relevant to their deliberations 3. Share our levels of expertise with other areas of the Secretariat as we have done with Human Resources, Development Program, UNICEF and UNESCO 4. Help the UN missions in preparing reports to the High Level Political Forum as they present their nation’s contributions to the SDGs 5. Providing psychological programs to assist delegates to become more effective in their work by better managing their time, getting their ideas accepted and reducing stress 6. Work with the delegations to develop Friends Of..., such as Friends of Mental Health and Friends of Decent Work to promote issues relevant to psychology 7.

Continue to network among UN missions and include them in side events and special meetings 8. Urge psychologists around the world to contact their UN Ambassadors to inform them that psychologists are available to their delegations 9. Create a library of psychological research and practices for use in preparing documents for the UN.
WHAT MAKES A LIVELIHOOD SUSTAINABLE? THE OPTICS OF A LIVING WAGE

Stuart Carr  
Massey University Professor (Auckland, New Zealand)

In 2016, the International Labor Organization (ILO) published a work psychology research program designed to help the ILO and United Nations (UN) achieve UN Sustainable Development Goal 8 — Decent Work and Economic Development. This program is being implemented by a global network called Project GLOW (Global Living Organizational Wage, http://www.massey.ac.nz/project-glow). Supported by the Society for Industrial and Organizational Psychology (SIOP), GLOW is a 25-country, multi-generational, and interdisciplinary collaboration focused on one question: using Purchasing Power Parity, “is there a Global Living Wage that enables people, organisations and communities to prosper and thrive?” This presentation summarizes evidence to-date primarily from New Zealand, which like other economies has undergone a rapid growth in working poverty and witnessed controversial calls for a living wage over and above the current legal Minimum Wage. Our national research is utilizing a mix of survey, interview, case study and longitudinal research to implement the 2016 program. To-date, this mixed methods approach is consistent with the following propositions from the program. First and foremost, core job attitudes, sense of fairness, work-life balance and life satisfaction remain depressed in a ‘capability trap’ for workers who earn below the current living wage figure on a wage spectrum. To the extent that core job attitudes, holistic wellbeing and happiness factors are widely linked to organizational outcomes, living wages look like a win-win for both employees and employers. Additional household income streams and household dependents moderate, but do not appear to radically alter the fundamental point that living wages remain pivotal for attaining SDG8 (in New Zealand). Like other hubs in GLOW, we are currently testing the robustness of these findings across higher-cost urban versus rural (New Zealand) communities, smaller versus larger organizations, and over developmental time, including income mobility for future generations. 1 Carr, S. C., Parker, J., Arrowsmith, J., & Watters, P. A. (2016). The Living Wage: A theoretical integration and an applied research agenda. International Labor Review, 155, 1-24. 2 SIOP (Society for Industrial and Organizational Psychology). (2016). The Sustainable Development Goals need to build a Social and Business case for Living Wages. New York: Economic and Social Council.

Moderator and Discussant: Walter Reichman (International Association of Applied Psychology), Gary Latham (University of Toronto Professor). Professor Latham will be moderating the symposium and will be the discussant of the three presentations.
INTIMATE RELATIONSHIPS IN CROSS — CULTURAL PERSPECTIVE

Valery Sitnikov
Herzen University (Saint-Petersburg, Russia)

Charles Hill
Whittier College (Whittier, USA)

Anna Strelenko
Vitebsk State University Named After P.M. Masherov
(Vitebsk, Belarus)

Abstract body. Romantic relations are an extremely important sphere of interpersonal interaction in adolescence, as well as an important resource of personal development. However, unsuccessful close relationships can become a source of conflicts, decrease the psychological well-being of the individual. The article describes the results of the empirical study of romantic relationships and psychological well-being among young men and women. Correlation links between the character of romantic relationships and psychological well-being, the locus of control, coping strategies have been revealed.

Press paragraph. Valery L. Sitnikov — Professor of Psychological Sciences, head of the department of age psychology and pedagogics of a family HERZEN UNIVERSITY Sankt-Petersburg; Doctor of Sciences — St Petersburg University, 2001; Charles T. (Chuck) Hill — Professor of Psychological Sciences, Whittier College USA, Ph.D. Harvard University, 1975, Social Psycholog; M. A. University of Washington, 1970, Sociology; M. S. General summary of the Symposium. Conceptual and statistical tools are introduced in a forthcoming book titled, Intimate Relationships Across Cultures: A Comparative Study, published by Cambridge University Press. The book is based on a questionnaire that is online in multiple languages at http://cf.whittier.edu/chill/ir, in collaboration with more than forty colleagues around the world. Data analyses of more than 8800 responses make explicit comparisons across nine cultural regions, as well as eight relationship types consisting of women and men in opposite sex or same-sex relationships who are unmarried or married. Among the conceptual tools, the book develops a Comprehensive Partner Model of factors that predict having a current partner, and a Comprehensive Commitment Model of factors that predict relationship commitment indirectly through relationship satisfaction, as well as directly regardless of whether relationship satisfaction is high or low. The book introduces the concept of Central Factors, which capture the predictions of other factors that are correlated with them. Among the statistical tools, the book compares predictions of factors, not just average levels of factors. The book reports effects sizes, introducing the term Trivial Correlations for those that explain less than 1% of the variance. The book emphasizes similarities as well as differences, instead of just focusing on differences.
REFLECTION OF THE SPOUSE IN CONSCIOUSNESS OF MEN AND WOMEN DURING THE DIFFERENT PERIODS OF LIFE

Natalia Parnjuk
Saint-Petersburg University of the Ministry of Internal Affairs of the Russian Federation (Saint-Petersburg, Russia)

Images of “Ideal” and Real Spouses at Different Levels of Family Development Sitnikov V.L., Doeva L.I., Ilchenko V.V., Karagachova M.V., Parnjuk N.V. A successful marriage is based on the adequate reflection of spouses by each other and their compatibility as individuals. Marriage satisfaction depends on the requirements for the partner's personality. 160 married couples from North Ossetia (Russia) took part in this study. The method “The structure of a man’s image (hierarchical)” (by V.L. Sitnikov) [2] was used to identify and correlate the structure and content of images in the consciousness of another. Individual structures of social-perceptive images of spouses in males and females’ consciousness were revealed. These structures were ordered by ranking method; frequency and aggregate dictionaries and averaged structures of images were made [1]. Due to this method, features of «ideal» and real spouse’s images in the consciousness of men and women with different experience of family life were highlighted: components of the structure of social-perceptive images and their content (quality, characteristics, definitions). The analysis shows that the duration of the marriage has an impact on the dynamics of perceptive images in the consciousness of men and women. According to the opinion of male respondents, the importance and order of ranking components of a wife’s image undergoes some changes after 25 years of marriage. The study indicates a great dynamics in the content of the image. There is a decrease in the importance of physical and emotional components in the image of an “ideal” wife, whereas social characteristics and features of “social intellect” become more significant. Our findings concern the fact that increasing females’ family life experience affects their partner’s perception. In the course of marriage, female respondents consider partners’ physical characteristics less important. In a real spouse image, social intellectual features are perceived more significant. Acquisitive characteristics are taken into account in an “ideal spouse image [3]. The results demonstrate that family life experience significantly influences partners’ perception of each other, which undoubtedly have an impact on the processes taking place in the family.

PSYCHOLOGICAL WELFARE OF THE YOUNG PEOPLE AND YOUNG GIRLS HAVING VARIOUS EXPERIENCE OF THE ROMANTIC RELATIONS

Charles Hill
Whittier College (Whittier, USA)

Sitnikov Valery
Herzen University (Saint-Petersburg, Russia)

Psychological Well-Being of Young Males and Females at Different Levels of Romantic Relationships V. L. Sitnikov, V. V. Ilchenko, M. V. Karagachova, N. V. Parnjuk, A. A. Strelenko The present study aims to examine psychological well-being and individual psychological characteristics of young males and females having different experience in romantic relationships. 231 young people responded to the survey. Respondents ranged in age from 18 to 25. Of all participants, 126 were female, and 105 were male [1; 3]. The following methods were included in the study: the author’s questionnaire “Youth romantic”.
THE BEST EDUCATIONAL PRACTICES: MOTIVATING STUDENTS THROUGH THE LENS OF SELF-DETERMINATION THEORY

Tamara Gordeeva
Lomonosov Moscow State University (Moscow, Russia)

Nathalie Aelterman
Ghent University (Ghent, Belgium)

Frédéric Guay
Université Laval (Quebec City, Canada)

Natalia Shumakova
Psychological Institute Russian Academy of Education (Moscow, Russia)

Abstract body. The goals of the symposium are to foster exchange among researchers actively working in the area of educational psychology and education, and provide audience members with an overview of the state of the field. In particular, in this symposium we will discuss recent developments in optimal teaching styles and teachers’ professional development programs that influence children’s academic motivation and achievement from the perspective of both self-determination theory (Ryan, Deci, 2000, 2017) and the more applied Russian Developmental approach to education theory (Davydov, 2008) based on Vygotsky’s ideas. We argue that the two approaches can significantly enrich each other, because the developmental approach to learning contains productive teaching methods, strategies for organizing the learning process and evaluating children, and self-determination theory provides a powerful theoretical framework to understand the origins, mechanisms and conditions of students’ motivation and positive development.

Press paragraph. In the opening presentation Nathalie Aelterman discusses motivating and demotivating teaching styles and their consequences for students and teachers from an SDT perspective. In the second talk, Frederic Guay will introduce the program CASIS, based on self-determination theory, in which teachers are taught to use collaboration, authentic activities, structure, involvement, and support for autonomy. The potential of the El’konin-Davydov system of developmental education will be considered in the presentations of Tamara Gordeeva and Anastasiya Nisskaya. The first presentation will compare academic motivation and attitudes toward school among elementary school children who study in classes that follow the developmental approach to education with those in so called traditional classes. In the second presentation the advantages of the developmental approach to education for preschoolers, including both their social and cognitive development will be elaborated. Natalia Shumakova will discuss her research on creativity and how creativity can be taught to elementary school children with the special well-elaborated curriculum that she proposed and implemented in Russian schools. Finally, drawing upon ideas presented within the symposium, Martin Lynch will discuss the potential of self-determination theory and the developmental approach to shape the future of pedagogical practices in both preschool and elementary school.

General summary of the Symposium. The goals of the symposium are to foster exchange among researchers actively working in the area of educational psychology and education, and provide audience members with an overview of the state of the field. In particular, in this symposium we will discuss recent developments in optimal teaching styles and teachers’ professional development programs that influence children’s academic motivation and achievement from the perspective of both self-determination theory (SDT, Ryan & Deci) and the more applied Russian Developmental approach to education theory based on Vygotsky’s ideas. We argue that the two approaches can significantly enrich each other, because the
developmental approach to learning contains productive teaching methods, strategies for organizing the learning process and evaluating children, and self-determination theory provides a powerful theoretical framework to understand the origins, mechanisms and conditions of students’ motivation and positive development. What are the concrete practices that teachers rely on to foster students’ motivation? In the opening presentation Nathalie Aelterman discusses motivating and demotivating teaching styles and their consequences for students and teachers from an SDT perspective. In the second talk, Frederic Guay will introduce the program CASIS, based on SDT, in which teachers are taught to use collaboration, authentic activities, structure, involvement, and support for autonomy. The effectiveness of the El’konin-Davydov system of developmental education will be considered in the presentations of Tamara Gordeeva and Anastasiya Nisskaya. Natalia Shumakova will discuss her research on creativity and how creativity can be taught to elementary school children. Finally, drawing upon ideas presented within the symposium, Martin Lynch will discuss the potential of self-determination theory and the developmental approach to shape the future of pedagogical practices in both preschool and elementary school.
ELEMENTARY SCHOOL STUDENTS’ INTRINSIC AND EXTRINSIC MOTIVATION AS A FUNCTION OF EDUCATIONAL APPROACH

Tamara Gordeeva
Lomonosov Moscow State University (Moscow, Russia)

Oleg Sychev
Shukshin Altai State Humanities Pedagogical University (Biysk, Russia)

Although current literature provides valuable insight into how school climate perceptions and student motivation are consistently associated with academic achievement, research examining the mediating effects of motivation in linking innovative educational systems, school climate, and achievement is limited. In this study the potential of the El’konin-Davydov system of developmental education (DE) is considered (Davydov, 2008). With respect to academic motivation, self-determination theory is applied as a useful theoretical framework that allows for the consideration of both the intensity and the quality of motivation (Ryan, Deci, 2000, 2017). The study examines a model that illustrates the role of different types of academic motivation in linking the El’konin- Davydov system of DE and school climate to the academic achievement of elementary schoolchildren. Participants were 345 3rd and 4th graders drawn from four public schools located in Moscow, with some (N=192) educated in the traditional system and others (N=153) in DE. To measure intrinsic and different types of extrinsic motivation we created an extended version of the SRQ-A (Ryan & Connell, 1989). CFA for the questionnaire is CFI = 0.841; NNFI = 0.820; RMSEA = 0.061. T-tests conducted upon the academic motivation scales comparing two educational systems revealed that students in the DE system showed significantly lower extrinsic motivation (Teachers, General and especially Parents subscales (d=0.60)), had better attitudes towards school and studies and a slightly more positive perception of school, which was demonstrated both via self-report and nonverbal measures. The results of SEM showed that the hypothesized model fit the data well, supporting the hypothesis that student external motivation plays a mediating role in linking educational system (innovative vs traditional) with academic achievement. Students’ intrinsic motivation played a mediating role in linking positive perceptions of school climate with academic achievement. The model yielded a good fit to the data: CFI = 0.971; NNFI = 0.964; RMSEA = 0.051. These results highlight that the developmental education approach compared to the so called traditional approach provides better instructional quality, promoting decreased external motivation as well as a better attitude towards school and study, which in turn is associated with higher academic achievement.
Given the pivotal role teachers play in students’ engagement, learning and well-being, it is critical to gain a better understanding of the practices they rely on to foster students’ motivation. Multiple studies in the Self-Determination Theory literature (SDT; Ryan & Deci, 2017) have examined correlates of autonomy-supportive and controlling teaching styles as well as the role of structure, whereas chaos has been largely ignored. In addition, few studies have included assessments of multiple critical (de)motivating dimensions simultaneously. Therefore, a new vignette-based instrument (i.e., Situations-in-School Questionnaire, SIS-Education; Aelterman, Vansteenkiste et al., 2018) was developed to obtain an integrative and more fine-grained insight into a broad variety of motivating and demotivating teaching practices. Relying on multidimensional scaling analyses in seven independent samples of secondary school teachers (N = 1332; Mage = 40.90 years) and students (N = 2299; Mage = 14.38 years), evidence was obtained for a two-dimensional circumplex model, with need-supportive relative to need thwarting teaching, and high relative to low directiveness representing the two axes. Eight different subareas were identified along the circumplex (e.g., participative, attuning, guiding, clarifying, demanding, domineering, abandoning, and awaiting), which appeared highly stable across informants. Correlations of these distinguished subareas followed an ordered sinusoid pattern, both among each other as well in the relation with outcome variables. Overall, students’ perceptions of an attuning and guiding teaching approach yielded the strongest positive correlations with desirable motivational (e.g., need satisfaction, autonomous motivation) and academic (e.g., deep-level learning, persistence, rated teacher quality) outcomes and the strongest negative correlations with undesirable outcomes (e.g., need frustration, controlled motivation, amotivation, procrastination), whereas the opposite pattern was found for the domineering and the abandoning approach. Similar results were obtained for teacher outcomes, including experienced need satisfaction and -frustration at school, motivation to teach, and burnout. The present study suggests that rather than categorizing teachers as either motivating or demotivating, a more dynamic approach is warranted. The greater clarity allows teachers to gain more precise insight into their own teaching style, so that they adopt a more need-supportive style that benefits their students and themselves.
DEVELOPING TEACHERS’ PEDAGOGICAL PRACTICES AND STUDENTS’ MOTIVATION THROUGH SELF-DETERMINATION THEORY

Frédéric Guay
Université Laval (Quebec City, Canada)

Background: In Quebec, a Canadian province where the official language is French, approximately 20% of sixth-grade students fail their final French exam. Recently, we have developed and evaluated an inservice and preservice teachers’ professional development program, designed to improve teachers’ pedagogical practices and to foster elementary students’ motivation toward writing. This program called CASIS involves a two-day workshop based on self-determination theory, where we taught teachers to use collaboration, authentic activities, structure, involvement, and support for autonomy during a writing lesson. A recent study (Guay et al., 2015) supported the effect of CASIS on students’ motivation and achievement in written French. However, in this quasi-experimental study the low number of teachers and students prevented us to draw any definitive conclusion on CASIS effectiveness. The goal of this presentation was to summarize results from two new quasi-experimental longitudinal studies testing CASIS.

Method: These two studies involve preservice and inservice elementary school teachers as well as their students. Specifically, we investigated if a) CASIS helps teachers to use more frequently the aforementioned pedagogical practices, b) if children increase their motivational resources, and c) if different moderators affect the strength of the impact of CASIS on teachers’ pedagogical practices and students’ motivation. Each teacher was videotaped in her classroom giving a writing lesson on three occasions over a two-week period. Practices were assessed at the beginning (pretest) and end of the school year (post-test). Two well-trained research assistants were asked to evaluate the pedagogical practices with a Q-sort procedure. Children’s motivational resources were assessed via self-report scales. Results: Results of these two studies show that teachers of the experimental group (CASIS) use more frequently the aforementioned pedagogical practices. Moreover, students’ motivation was higher for those whose teachers have followed CASIS than for those whose teachers were in the control group. Few moderators affect the strength of the impact of the program on students’ outcomes. Discussion: In sum, these studies found that offering a PD workshop on teachers’ pedagogical practices could be an effective way to improve teachers’ pedagogical practices as well as students’ motivational resources during childhood and the early adolescence period.
INFLUENCE OF THEMATIC INTERDISCIPLINARY INSTRUCTION ON ELEMENTARY SCHOOLCHILDREN’S CREATIVITY

Natalia Shumakova
Psychological Institute Russian Academy of Education (Moscow, Russia)

Creativity has been viewed in modern society as one of the four key “21st century skills” considered important for professional success and personal development. Studies on the development of creativity have highlighted the impact of learning environments (Besançon & Lubart, 2008). It has been shown that children’s creative performance was influenced not only by the type of task but also by the type of school. The construct of creative potential is viewed in last researches as multifaceted and partly domain-specific (Barbot, Besançon & Lubart, 2015). However, little research has been done to identify the impact of different learning environments and pedagogical approaches on the creative potential of junior schoolchildren. The aim of this study is to compare the special features of creativity in verbal and graphic domains among elementary schoolchildren studying in different learning environments (with traditional and alternative pedagogical approaches). Is there a specific impact of different learning environments on their verbal and non-verbal creativity? Design. A study was conducted during one year with 252 children in elementary schools with traditional and alternative pedagogical approaches. The alternative curriculum was founded on the thematic interdisciplinary model and problem solving approach to teaching (Shumakova, 2009). The main goal of this curriculum was to encourage the creativity, intellectual and motivational development of elementary schoolchildren. A special instrument for creativity assessment (VFCT) in verbal and non-verbal domains of activity was used to derive data from the schoolchildren (Shumakova, 2015). The VFCT contains two divergent thinking tasks (verbal and graphic), which measure fluency, flexibility, originality, elaboration in verbal and figural domains. Two groups of schoolchildren aged 8 (mean age 8.2) participated in the research: Those studying the alternative curriculum (n=101) and others (n=151) studying a traditional curriculum. The results showed significant differences in verbal creativity between two groups. Multivariate analysis of variance (ANOVA) revealed the positive impact of the thematic interdisciplinary instruction on the verbal creativity of the junior schoolchildren. Implications of the findings for education will be discussed.
THE EFFECTS OF TRADITIONAL AND DEVELOPMENTAL APPROACHES IN PRESCHOOL EDUCATION

Anastasia Nisskaya
Institute of Education, National Research University
Higher School of Economics (Moscow, Russia)

This presentation contains a description of two studies. Their aim was to compare effects of the different preschool environments on child school readiness and independence in the 3rd grade. The traditional approach focuses on the transmission of knowledge, patterns of social behavior, and assumes teacher-centered interaction between child and teacher. The developmental approach (Davydov, 2008) focuses on developing the child’s abilities and using cultural tools, rather than just transmitting educational content. Our research questions were: Are there any differences in the school readiness outcomes of the developmental and traditional approaches? Are there any differences in children’s independence depending on the quality of preschool educational environment? In Study 1 we surveyed 92 children aged 6 to 7, who attended a preschool with traditional (N=45) or developmental approach (N=47). The level of mental abilities, figurative thinking, verbal-logical reasoning, self-regulation and abstract reasoning were used as school readiness measures. Data analysis revealed significant differences in children’s school readiness in favor of DA. In Study 2 314 first-graders and 12 teachers were surveyed. Child independence was measured by teachers with the Personal, Social and Emotional Development (PSED) Scale. Assessment of the quality of pre-school educational environment was carried out with the Early Childhood Environment Rating Scale (ECERS). Correlation analysis was carried out between the ECERS scores and the level of children’s independence. Comparison of school readiness outcomes of traditional and developmental approaches showed that the children who attended a DA preschool demonstrated a higher level of school readiness: they were able to ask for help, to coordinate their creative intentions with peers, and to empathize with them. Their self-consciousness was greater than that of their peers who were educated under the traditional approach. Also, they demonstrated a greater voluntary readiness for school. Meanwhile, children who attended preschools with the traditional approach demonstrated a higher level of verbal-logical reasoning. Comparison of child independence during transition to school showed that children whose preschool teachers stimulated communication, supported respect between children and adults, promoted children to resolve conflicts independently, emphasized positive behavior, and practiced a smooth transition between different activities were more independent in the first grade.

Discussant: Tamara Gordeeva Russia Moscow (Moscow State University Associate professor), Martin Lynch (USA Rochester).
CONNECTIONS BETWEEN CENTRAL ASYMMETRY AND LATERAL PREFERENCES IN CHILDREN AND ADULTS

Elena Lysenko
Pirogov Russian National Research Medical University
(Moscow, Russia)

Liudmila Liutsko
The international society of applied neuropsychology, ISGlobal (Barcelona, Spain)

Abstract body. The Symposium will focus on the relationship of central and peripheral asymmetry in ontogenesis. The relevance of such Symposium is associated with the extreme inconsistency of the results in studies of brain asymmetry and the prognostic possibilities of evaluation of lateral peripheral indicators at different stages of ontogenesis. Discussion of the reasons for this inconsistency when using the latest equipment to assess the lateral signs is essential to deepen both the theoretical understanding of the causes of hemispheric asymmetry of the brain, and the creation of methods for the use of methods of evaluation of lateral signs in the sensory and motor sphere to predict the effectiveness of training in school or the results of therapy with specific effects separately on the left or right hemisphere of the brain. The Symposium will bring together experts from different countries with different theoretical positions on the role of hemispheric asymmetry in ontogenesis.

Press paragraph. The relevance of the theme of the relationship of functional brain asymmetry and lateral preferences in the sensory and motor spheres is due to theoretical ideas about the genetic courses of asymmetric preferences and their connection with individual characteristics (learning disabilities, adaptation both in norm and in disorders). At the same time, the inconsistency of research results, often associated with the difference in methodological approaches to the evaluation of lateral preferences and psychological individual characteristics does not allow to restore a complete picture of the interaction between lateral preferences and functional brain asymmetry. Moreover, these phenomena appear independently in ontogenesis, which further complicates the understanding of their mutual influence in late ontogenesis. Within the framework of the Symposium, experts from different countries working at different age stages and using different methods of assessing asymmetric preferences and functional brain asymmetry will seek consensus in understanding the phenomenon of asymmetry and using it for prognostic purposes to assess the effectiveness of children’s learning and adult adaptation.

General summary of the Symposium. The Symposium will include several presentations covering different aspects of the problem. In the first report, Zh. Glozman (Moscow State University, Glozman@mail.ru) will present data on the current understanding of the phenomenon of cross-laterality and prognostic possibilities of its evaluation to describe the probability of stuttering and problems with learning in children. The second report (reporter G. Danilov from N.N. Burdenko National Medical Research Center for Neurosurgery, Moscow, Russia) presented by a group of authors from different institutions of Moscow will be devoted to the longitudinal observations of a group of patients who received radiation therapy on the hippocampus and various sensitivities of the brain to the effects of radiation (by a group of patients of the Moscow medical Research Center for Neurosurgery, Moscow, Russia). The third report (Lysenko, Pirogov Russian National Research Medical University), also presented by a team of authors from various scientific institutions of Moscow, will show a description of the dynamics of interaction of brain hemispheres in terms of increasing the rate of blood flow in the arteries of the cerebral hemispheres in the performance of speech and visual-spatial tasks. In the report from Spain (L. Liutsko, ISGlobal, Barcelona, Spain)
Spain) will be presented data on the activity of various brain structures in the left-handed and right-handed people. Report by E. Nikolaeva (Herzen State Pedagogical University, Saint-Petersburg, Russian Federation) will devote to the connection of the latter characteristics with cognitive processes in individuals with different stuttering severity. Discussion of the reports will expand the understanding of the relationship between functional asymmetry of the brain and lateral preferences in children and adults.

CROSS-LATERALITY AS A RISK-FACTOR OF COGNITIVE DISTURBANCES IN CHILDREN AND ADULTS

Janna Glosman
Lomonosov Moscow State University (Moscow, Russia)

Crossed laterality, especially intermodal one, has negative effect on verbal functions and memory. Intermodal crossed laterality had a negative effect on disease progress (stage of PD and severity of verbal and emotional disturbances in stuttering, as well as the degree of cognitive delay in ADHD). Crossed laterality significantly decreases everyday activity. The highest correlation with learning disability and severity of cognitive disturbances is revealed in cases of different lateral preference for hand and eye. Age and gender differences are discussed. Crossed laterality is a significant pathological factor both in organic and functional brain pathology. The physiological reason for it is a delayed interaction of the cerebral hemispheres. Social help – an early stimulation of interhemispheric interaction by neuropsychological remediating techniques in the preschool age decreases the crossed laterality, provides better cognitive functioning and learning, reduces speech problems in stutterers. Acknowledgments The study have been supported by the Russian Foundation of Fundamental Investigations (grant RFFI #18-013-00721).
THE IRREGULARITY OF FUNCTIONAL CHANGES IN THE BRAIN EXPOSED TO RADIATION THERAPY

Gleb Danilov
Olga Krotkova
Michail Galkin
N.N. Burdenko National Scientific and Practical Center for Neurosurgery (Moscow, Russia)

Anna Alekseyeva
Lomonosov Moscow State University (Moscow, Russia)

Radiotherapy in patients with brain tumors is faced with the problem of the neurotoxic side effects of ionizing radiation, manifesting in cognitive functions decrease and the reduction of primary attention, memory, and ability to solve new tasks. The effects of radiotherapy were studied in 17 patients with cavernous sinus meningiomas. Tumors were adjacent to the temporal lobe and the hippocampus, however, not infiltrating the brain, which enables isolating the effects of radiation on the brain. The treatment was carried out in a standard fractionation mode with a single focal dose of 1.8 Gy, a total dose of 52.2 — 59.4 Gy. We examined patients during several visits: before radiotherapy, immediately after the end of the treatment, 6 and 12 months after irradiation. The protocol included a neuropsychological study using of A.R. Luria method, Wechsler memory scale tests, and our original technique objectifying the spatial distribution of visual attention (with eye tracking) and the subsequent storage of visual information in memory. The combination of methods enabled quantification of the functional state of the brain at each visit. The dynamics of mental processes was observed in the three trends. 1. The improvement of memory and attention in a number of tests, accompanied by a reduction of tumor volume after of radiation therapy and a decrease in adjacent brain structures compression. 2. Worsening of the functional state related to the right hemisphere in the second visit compared to the first (in particular, the deficit of attention in the left visual field and the appearance of specific recognition errors). The absence of significant changes in the left hemisphere in the second visit compared to the first. 3. The deterioration of the left hemisphere functional state in the third point compared to the second (lack of attention in the right visual field, specific errors of stimuli recall in this area). The hypothesis of functional changes irregularity in the brain undergoing irradiation (anticipating the appearance and increase of right-hemispheric symptoms) was previously expressed by authors studied the consequences of the Chernobyl nuclear power plant accident. Work was supported by the Russian National Fund grant 17-15-01426.
THE ASSESSMENT BY DOPPLER ULTRASOUND OF HEMISPHERES INVOLVEMENT IN SPEECH AND VISUAL-PERCEPTUAL INFORMATION PROCESSING

Elena Lysenko  
Pirogov Russian National Research Medical University (Moscow, Russia)

Yuri Mikadze  
Maria Bogdanova  
Lomonosov Moscow State University (Moscow, Russia)

Saleh Abuzaid  
Burdenko neurosurgery Institute (Moscow, Russia)

The integrative brain work is determined by unequal contribution of each hemisphere to the provision of different activities. The identifying of functional specialization and the assessment of hemispheres degree involvement in speech and visual-perceptual information processing are demanded in neurosurgical preoperative procedures and rehabilitation practice. A special role in such assessment is played by the simplicity and accessibility and non-invasiveness of the methods used. The method of functional transcranial Doppler ultrasound corresponds to these requirements and now is actively used for identification of hemispheric functional specialization. There are new results of hemispheric dynamic interaction according to increase blood flow velocity in brain arteries during the performance of speech and visual-special cognitive tasks in healthy subjects (57 persons). There was the comparison of the results, which were obtained in healthy subjects and patients with unilateral tumor and cerebrovascular brain lesions (60 patients). There results permit to make a conclusion that different types of activities (speech or visual-perceptual) accompanied by join involvement of two hemispheres, but theirs dominant role are not equal. Also the unequal contribution of each hemisphere depends on lateralization of brain damage and its nosology.
ASYMMETRY IN FINE MOTOR PRECISION PERFORMANCE WITH AND WITHOUT VISUAL GUIDANCE: RIGHT-HANDERS VS. LEFT-HANDERS

Liudmila Liutsko
The international society of applied neuropsychology (Barcelona, Spain)

Ruben Muñios
Universitat Oberta de Catalunya (Barcelona, Spain)

Josep Maria Tous Ral
Universitat de Barcelona (Barcelona, Spain)

Maria José Contreras
UNED - Universidad Nacional de Educación a Distancia, (Madrid, Spain)

Previous studies showed brain asymmetry linked to handedness with greater lateralization in men (Amunts et al., 2000), which might affect both motor and cognitive performances (Fennell et al., 1978; Annett, 2013), the prevalence of some mental disorders (Dunivin, Zenhausern, 1981) was also detected. Nonetheless, it was pointed out that existing “neuro myths” about left-handedness, according to public consciousness, could also be derived from misleading studies (Yamashita, Sechi, 2018). Our study aims to observe whether there exist significant differences in fine motor precision performance between both hands (asymmetry/symmetry) in left-handers as compared with right-handers. 81 participants from pooled studies were included in the current research after being matched by age (mean 21, range 14-37 years old) and sex (86% men), 8.1% of them were left-handers. The neuropsychological test - Proprioceptive Diagnostics of Temperament and Character (DP-TC) (Tous, Liutsko, 2014) — was applied to observe the fine motor precision in graphical performance with and without visual guidance in both hands and three movement types: frontal, transversal and sagittal. Paired t-differences for each experimental condition (three movement types x two sensory conditions) were applied to compare both hands performances in both groups. Among six experimental conditions, right-handers showed a statistically significant difference between right and left hand precision performances (p=.037) — in transversal movement and without visual guidance (P-proprioceptive-only sensory condition). Whereas, left-handers showed the difference only in PV-proprioceptive-visual sensory condition (with visual guidance and the same movement type (p=.045). Symmetrical performance while comparing fine motor precision in the one hand with the other in both groups (left-handers and right-handers) was perceived as characteristic for majority of experimental test conditions (five out of six). The asymmetry was observed in different sensory conditions, which suggests different mechanisms of processes underlying them. On the other hand, owing to the differences noticed in the same movement type — the transversal one — it is assumed that there exist some common bases for such asymmetry: possibly a habit of writing. We hope that these findings can help to shed more light on the discussion about “neuro myths” of handedness and related brain asymmetry.
The objective of the pilot study was to study the lateral signs in stuttering young people and describe the relationship of these lateral signs with the features of cognitive processes. The subjects were boys and girls (mean age 21.1 years), 2 girls and 9 boys, who agreed to participate in the psychotherapeutic group in the Psychological Institute of RAO. The study was conducted before the start of the group. The following methods were chosen to implement the research goal. To identify the leading hand, the leading eye leading ear and lead foot were conducted most frequently occurring samples. To determine the total profile of the functional sensorimotor asymmetry, the corresponding General indicators of the leading arm, leg, eye, ear were first calculated as the arithmetic mean of the results of all the tests. Then the digital value of the functional sensorimotor asymmetry was calculated by summing up the corresponding General indicators and calculating the average value. To determine the location of the speech center, the method of verbal and manual interference was used. To describe the sensorimotor integration, the parameters of both simple and complex sensorimotor reaction were evaluated using the Rebos method. To determine the degree of interference in the working memory was used computerized technique "Interference" O. M. Razumnikova. Statistical data analysis was carried out using IBM SPSS Statistics (version 22). It was found that among persons with stuttering of high severity the number of right-handed (27.2%) was sharply reduced due to an increase in the number of mixed-handed (54.5%) and left-handed (18.3%). 45.6% of persons with high stutter rate increased the number of persons with 2 speech centers (45.6%). There is no connection between lateral preferences and efficiency of working memory and quality of sensorimotor integration in persons with stuttering.

The study have been supported by the Russian Foundation of Fundamental Investigations #18-013-00721
Unlike many other psychological phenomena, the advantage of the right ear for speech information in dichotic testing is not limited to Western societies, but is observed in people of different cultures and can therefore be considered as a global perceptive phenomenon in humans. According to modern concepts, it reflects the location of the center of speech in the subjects. The paper raises the question of how the results of dichotic testing correlate with the results of testing of lateral preferences. Was the selected tests in the literature are assessed as having a genetic basis (grip of the fingers, and Napoleon test shoulder test), and tests that are under social pressure (to close and open the lid of the jar, take the item from the table) and "a magic bag"- touch in the closed pouch on each hand to identify the object and name it. The study surveyed 96 children 5,2 -7,8 years. 30 children were in the control group and 66 children were included in the experimental group because they had specific linguistic impairment, SLI. The results of testing using samples, which are considered to be due to genetic factors that find a much more left-handed children than those who are exposed to social pressure to shear the sample to the right. Only the results of the evaluation of the leading hand using samples that are considered genetically determined correlate with the results of dichotic testing: the more pronounced the left signs in the evaluation of the leading hand, the less pronounced the effect of the left ear. The study supported by the Russian Foundation of Fundamental Investigations #18-013-00323
PSYCHOPHYSIOLOGICAL APPROACH IN DECISION OF EDUCATIONAL PROBLEMS ON DIFFERENT STAGES OF ONTOGENESIS

Victoria Efimova
LLC Prognoz clinic (Saint-Petersburg, Russia)

Elena Nikolaeva
Herzen State Pedagogical University (Saint-Petersburg, Russia)

Olga Rasumnikova

Mark Leikin
University of Haifa (Haifa, Israel)

Abstract body. The Symposium brings together speakers who apply psychophysiological approach in the study of speech, sensorimotor integration, perception of emotional events, creativity. Each speaker tries to reveal the psychophysiological cause of the phenomenon under study and connect it with the peculiarities of activation of brain structures. Language formation is often accompanied by disorders that have no obvious causes and require a deep psychophysiological analysis of the formation of language function in children. At the Symposium, an international team of authors will raise psychophysiological problems that arise during training at different stages of ontogenesis.

Press paragraph. The Symposium will focus on finding the reasons for the effectiveness or ineffectiveness of different methods of helping children in learning at different stages of ontogenesis. The research is combined with a psychophysiological approach and attempts to link psychological problems in development with brain processes. Speakers from different cities of Russia (Novosibirsk, St. Petersburg), as well as from Israel, will try to discuss the possibility of psychophysiological approach in solving educational problems.

General summary of the Symposium. In the report of Victoria Efimova (the head of the clinics “Prognosis”, Saint-Petersburg Russian Federation, prefish@yandex.ru) the reason for the failure of the primary school child in the tasks related to the story in the picture will be revealed. Using the eye tracking method, it will be shown that unsuccessful children cannot view the picture completely. In the report of Elena Nikolaeva (Herzen State Pedagogical University, Saint-Petersburg, Russian Federation, klemtina@yandex.ru) in co-authorship with Tatiana Brisberg, the connection of lateral preferences with the results of dichotic testing will be analyzed. The report of Elvira the Dunaevskaya (Herzen State Pedagogical University, Saint-Petersburg, Russian Federation, doroga2elvira@yandex.ru) in collaboration with Svetlana Nikiforova and Elena Nikolaeva will be presented to the features of sensory-motor integration of children with delay of mental and speech, and shows the relationship of the efficiency orientation in the sensor space with lateral preference. The report of Olga Razumnikova (Novosibirsk State Technical University, Russian Federation, razoum@mail.ru) in collaboration with Ekaterina Khoroshavtseva will be described the results of the evaluation of the EEG in students with the presentation of information with different emotional significance. In the report by Mark Leikin (The Interdisciplinary RANGE Center, Faculty of Education, University of Haifa, Haifa, Israel markl@edu.haifa.ac.il) in co-authorship with Roza Leikin and Ilana Waisman, decision-making mechanisms of students with different levels of creativity will be analyzed.
The formation of the child’s coherent speech—the most important stage in the development of his cognitive sphere. At the same time, there are a number of children who experience significant difficulties in the consistent presentation of the material seen. Therefore, the purpose of the study was the elucidation of the causes of the difficulties from the learners during the oral story in the picture. The study was conducted in the children’s neurological clinic “Prognoz”. 32 children (average age 7.5 years) were examined, including 19 boys and 13 girls. Children were asked to make a story in a series of three pictures. First, the child was asked to arrange the cards with pictures on the table in a sequence that seemed to him correct. Then the pictures were shown on the monitor screen, and the child told what was happening on them. Oculomotor activity in the process of retelling images was recorded on the installation Eyegaze Analysis System (eye tracking system). Analysis of the results showed that 15 children were unable to make a coherent story. At the same time, 12 of them fixed the view only on its Central part in the process of viewing pictures, while significant elements that allow to understand the essence of the story were on the periphery. The use of hardware assessment of eye movements allowed to differentiate the possible reasons why the subjects did not cope with the task. One of these reasons is the inability to combine elements into a single whole.
IMBALANCE BETWEEN EMOTIONALLY NEGATIVE AND POSITIVE LIFE EVENTS RETRIEVAL AND THE ASSOCIATED ASYMMETRY OF BRAIN ACTIVITY

Olga Rasumnikova  
(Saint-Petersburg, Russia)

Ekaterina Khoroshavtseva  
Novosibirsk State Technical University (Russia)

It is well known that emotions promote memorization and serve as reinforcement of behavioral activity useful for survival, i.e. stimulation of reactions expected to have positive emotions, and avoidance of negative affects. Sustained focusing on a negative assessment of life events can create negative background and changes in the emotional feedback to new information and would facilitate the development of depression. In this regard, it is important to assess the balance between self-assessment of emotional memories and the reflection of this process in brain activity. So, aim of the study was a research of the cerebral cortex activation using EEG analysis during mental memory retrieval of life events that had a positive or negative emotional character due to their self-assessment. The study involved 31 university students (25 women). EEG registration in 19 channels was performed in three experimental situations: resting, and memory retrieval due to emotionally positive or negative events. The power of biopotentials was calculated according to the Fourier transform in six frequency ranges from delta to beta2. Specific frequency oscillations associated with emotional memory retrieval were found by ANOVAs. The most informative for differentiation of emotions are the indicators of the power of alpha2 and beta2 rhythms with greater synchronization effect for positive than negative emotions. The memory retrieval of emotional events, regardless of the valence of emotions, is accompanied by desynchronization of alpha oscillations in the posterior regions of the cortex. Self-assessment of the intensity of memories did not differ significantly for events of positive and negative nature and tended to have positive correlations between negative emotions and alpha1power in the occipital sites and beta2 rhythm in the right posterior temporal cortex, and between positive emotions and beta2 in the left anterior temporal site. Thus, the brightness of episodic memory is reflected by activation processes in the visual cortex and areas associated with multimodal information processing whereas differentiation of the valence of emotions is presented by the neural systems at the temporal cortex areas. Obtained imbalance between self-assessment of emotional memory and the associated asymmetry of brain activity may indicate compensatory recourses to correction training emotional states.
The aim of the study was a comparative description of lateral preferences, reaction rate and erroneous actions in the process of performing a simple sensorimotor reaction in children aged 4-7 years of normative development and with mental retardation. The urgency of the problem lies in the fact that every year the number of children with mental retardation increases and new solutions are required in the education of these children within the framework of inclusion. The subjects were 70 children, 26 girls and 44 boys (mean age 5.7 years), 20 children of normative development, 20 children with mental retardation and 30 children with speech disorders. The following methods were chosen to implement the research goal. To identify the leading hand, the leading eye leading ear and leading foot were conducted most frequently using tests. To describe the sensorimotor integration, the parameters of both simple and complex sensorimotor reaction were evaluated. To determine the degree of interference in the working memory was used computerized technique “Interference” by O.Razumnikova. Both children with mental retardation and speech disorders differed from the children of normative development by high quantity of children with mixed lateral parameters and low quantity children with right profile of the functional sensori-motor asymmetry. The study supported by the Russian Foundation of Fundamental Investigations #18-013-00323 A.
EXPERTISE, GIFTEDNESS AND INSIGHT-BASED PROBLEM SOLVING IN MATHEMATICS

Roza Leikin
Ilana Waisman
Mark Leikin
University of Haifa (Haifa, Israel)

In this research report we discuss links between expertise in school mathematics, general giftedness and mathematical insight. Expertise is acquired by means of deliberate practice that leads to the ability to make fluent and flexible use of strategy-based processes as and when required.

Mathematical insight is associated with production of original work, invention and illumination, which is an experience of suddenly realizing "how to solve a problem". Several distinctions were introduced in the study: First, based on theories of gifted education (e.g., Milgram and Hong 2009), a distinction was made between levels of intelligence ("general giftedness," G, determined by IQ scores higher than 130) and levels of expertise ("excellence in mathematics," EM, determined by high scores in secondary school mathematics). This was applied in the sampling procedure, whereby four research groups were designed by a varying combination of EM and G characteristics. Second, based on the theories of mathematics education, a distinction was made between the translations of different representations of mathematical objects required by the task (Kaput 1998) and different areas of mathematics (i.e., algebra and geometry), together with a third distinction between learning-based and insight-based tasks; these distinctions were implemented in the design of the research tools. The task design was determined by Pólya's (1973) theory of problem-solving strategies. Comparison between behavioral and ERP measures associated with solving learning-based and insight-based mathematical problems will be presented. The study design led to some exciting discoveries: The distinction between general giftedness and expertise in mathematics proved to be powerful in understanding that these two characteristics, even though interrelated, are different in nature. It was also obvious that using behavioral measures only is insufficient and sometimes misleading. We will argue that effects associated with solving insight-based tasks are linked to general giftedness. In contrast, effects associated with solving learning-based tasks are linked to expertise in mathematics. The insight-based component associated with mathematical expertise when solving learning-based tasks will be analyzed.
THE DARK AND BRIGHT SIDES OF THE DARK TRIAD

Dmitriy Kornienko
Perm State University (Perm, Russia)

Delroy Paulhus
University of British Columbia (Vancouver, Canada)

Marina Egorova
Lomonosov Moscow State University (Moscow, Russia)

Abstract body. This symposium aims to present the studies concerning the constellation of three personality traits: Machiavellianism, subclinical narcissism, and subclinical psychopathy called the Dark Triad. The Dark Triad has many negative expressions in different spheres of life. However, the recent studies reveal that the Dark Triad traits can play a positive role in different circumstances for a person and society. The main idea of the symposium is to discuss the last findings of both negative and positive sides of the Dark Triad.

Press paragraph. The speakers of the symposium "The dark and bright sides of the Dark Triad" will present different studies from Norway, Serbia, Russia, and China. The idea of organizing this symposium emerges from studies which reveal that the Dark triad traits cannot be evaluated only as negative but, in some situations, they lead to social approval and success. Why should we assess the DT traits only as the bad side of personality? The topics of presentation spread from the debate of the positive or negative role of the Machiavellianism, subclinical narcissism, and subclinical psychopathy to individual differences in the DT depending on biological (hormonal system functioning) features. One of the reports reveals the impact of The DT on Facebook posts and answers the question about identifying dark personalities on the Internet. The findings concerning the understanding of the relations between regional and personal residential mobility and the Dark Triad will be demonstrated from the perspective of personality-environment association. The problem of perception of the DT host and the differences in attractiveness of people who tend to be more manipulative, selfish and impulsive will be presented.

General summary of the Symposium. The Dark Triad is one of the discussed topic in personality psychology for the last decades. The Dark Triad has revealed that this constellation of three traits—narcissism, psychopathy, and Machiavellianism. The association among Dark Triad traits is based on correlation analysis and was replicated in several studies (Jakobwitz, Egan, 2006; Lee, Ashton, 2014; Deshong et al., 2015). These traits are subclinical and represent a self-serving and instrumental style of social interaction that is linked with employing manipulative and egoistic strategies. Each trait has a long history in psychological research and reflects different sides of behavior. Narcissism is a disposition to perceive themselves better (attractive, smarter) than others. Narcissist individuals can be described as egocentric with a sense of grandiosity (Raskin & Terry, 1988). Finally, Machiavellianism is a tendency to seek the satisfaction on own needs by manipulating by others regardless of moral (Christie & Geis, 1970). Psychopaths is a disposition to thrill-seeking and impulsive behavior, lack of empathy and low moral values (Jonason & Krause, 2013). Lots of studies showed that Dark Triad traits share common influence to sexual success (Jonason, Li, Webster, & Schmitt, 2009), social influence (Jonason & Webster, 2012), self-promotion, coldness, disagreeableness, exploitation, and aggression (Furnham, Richards, & Paulhus, 2013). Sex differences in Dark Triad traits were replicated in some studies (eg. Jonason, Li, Webster, & Schmitt, 2009), and reveal that men are more tending to manipulate (Machiavellianism) and more impulsive (psychopathy). From the evolutionary psychology point of view, the explanation for Dark Triad traits is that each trait provides evolutionarily advantage. Dark Triad individuals use so-called "cheater strategies" (charm and deception) in opposition to altruistic strategies traditionally
considered as evolutionarily more attractive (Jonason & Webster, 2012). On the symposium, the participants will present several studies concerning the dark and bright sides of the Dark Triad. The idea of this symposium emerges from studies which exhibit that the Dark triad traits are not only negative but, in some situations, they lead to social favor and success. The issues of presentation developed from the discussion of the positive or negative role of the Machiavellianism, subclinical narcissism, and subclinical psychopathy to individual differences in the DT depending on biological features. The impact of The DT on Facebook posts and answers the question about identifying dark personalities on the Internet was revealed. The findings concerning the understanding of the relations between regional and personal residential mobility and the Dark Triad will be demonstrated from the perspective of personality-environment association. The problem of perception of the DT host and the differences in attractiveness of people who tend to be more manipulative, selfish and impulsive will be presented.

ARE THE “DARK PERSONALITIES” PERCEIVED AS BAD, AND "BRIGHT" AS GOOD?

The Dark Triad is a set of conceptually separate but empirically overlapping personality traits — Machiavellianism, subclinical narcissism, and subclinical psychopathy. Underlying these features are socially aversive behaviors such as self-centeredness, manipulation, and control. Machiavellianism is described by dishonesty, deceitfulness, and cold-heartedness. Psychopathy is associated with high impulsivity, emotional coldness, and low empathy. Narcissism exhibits as self-centeredness, need for admiration, and a sense of entitlement. Although it is recognized that “dark personalities” engage in a high level of interpersonal manipulation and exploitation, little is known about whether or how they assessed by the others. The current study investigated how a fictitious opposite- and same-sex Dark Triad traits hosts are perceived in a quasi-experimental design on the sample of 460 undergraduate students. Positive (bright) and Negative (dark) male and female images (video) of the others were presented to the respondents. Each image was evaluated by the general attractiveness, relevant characteristics of the Dark Triad and three attitude components (cognitive, behavioral, and emotional). Participants were diagnosed with the Short Dark Triad inventory. The polarization of the evaluation and attitudes toward Positive and Negative images of the others were found.

Participants perceive the Positive image as simple, and Negative image as complex. Positive male image is evaluated as more psychopathic than female image. Positive female images have higher scores in attitudes. The attractiveness of female images was higher than male regardless of the Dark Triad. The impact of the participants Dark Triad level was discovered. Higher Machiavellianism, narcissism, and psychopathy of the respondents make the Negative image more complex and hard to appraise in opposition "good-bad." The cognitive component of attitude toward Positive and Negative image become closer for respondents with high Dark triad traits.
SELFISH PERSONALITY — RELATIONS BETWEEN HEXACO AND THE DARK TRIAD

Bojana Dinić  
University of Novi Sad (Novi Sad, Serbia)

Anja Wertag  
Institute of Social Sciences Ivo Pilar Research (Zagreb, Croatia)

The Dark Triad represents a constellation of three personality traits: Machiavellianism, narcissism and psychopathy, reflecting a socially destructive character with behavioral tendencies towards manipulation, deception, self-promotion, emotional callousness and aggression. Although each of the Dark Triad traits has some specific characteristic, all three share a common core, largely defined by Honesty-Humility from the HEXACO model, a trait which explicitly contrasts prosocial and self-interested behavior. Selfishness is widely regarded as an excessive focus on one’s own welfare, regardless of the well-being of others, and fits well to the description of the Dark Triad constellation. However, selfishness can have several forms, and the direct relations with the Dark Triad traits and specific forms of selfishness have not been directly assessed up to date. Therefore, the aim of this study was to investigate the relations between the basic and the dark personality traits and selfishness, and whether the Dark Triad traits have a contribution above and beyond the HEXACO traits in explanation of specific forms of selfishness. Data were collected on a sample of 404 participants (51% of females) from general population from Serbia, using HEXACO-60, MachIV, Narcissistic Admiration and Rivalry Questionnaire, Levenson Psychopathy Scale measuring primary and secondary psychopathy, and Selfishness Questionnaire measuring Adaptive Selfishness (caring not just for the self, but also for the close ones), Egocentric Selfishness (a single-minded attentional focus on the self) and Pathological Selfishness (harming others for self-advancement). The results showed that selfishness and dark traits shared 70% of common variance, while selfishness and basic traits shared 46% of common variance. Results of the hierarchical regression analyses showed that Honesty-Humility was the most prominent predictor among HEXACO traits, which, taken together, explained 31 to 38% of the selfishness variance. The Dark Triad explained 11% of egocentric, 16% of adaptive and 18% of pathological selfishness above and beyond the HEXACO traits. Machiavellianism emerged as the significant predictor of all selfishness forms, while narcissism was related to egocentric, and psychopathy to pathological selfishness. These findings shed some light on selfish personality and could indicate including selfishness into “dark umbrella”.
DARK TRIAD TRAITS: NEGATIVE OR POSITIVE?

Marina Egorova
Oxana Parshikova
Timofey Adamovich
Lomonosov Moscow State University (Moscow, Russia)

Maria Sitnikova
Moscow School of Social and Economic Sciences (Moscow, Russia)

The Dark Triad is a constellation of traits including Machiavellianism, subclinical narcissism, and subclinical psychopathy, and it is linked with antisocial behavior. The researchers who proposed viewing Machiavellianism, narcissism, and psychopathy as a single complex (Paulhus, Williams, 2002) believed that the traits comprising the Dark Triad are independent: despite all of the correlations, each is a separate construct and they complement each other, manifesting in violations of conventional norms, inability to sustain long-term relationships, cynicism, misanthropy, indifference to the feelings of others, and propensity for lying, deceit, and unabashedly taking advantage of others to achieve one’s own goals. Machiavellianism, narcissism, and psychopathy have many negative expressions of all kinds. However, as research into the Dark Triad continues, more and more data emerge on the relatively "bright" aspects of the dark traits. Our study looked into (1) links between Dark Triad traits and other personality traits (using a sample of more than 3,000 respondents aged 16–84), (2) Dark Triad levels in a group of students who are most active socially and politically (the primary sample had 120 respondents, while control groups added up to more than 1,000 respondents), (3) mutual assessment of Dark Triad traits (using three samples of students and adults ranging from 60 to 132 respondents), and (4) perceptions of a successful individual (94 respondents, students).

The results of the study show that Dark Triad indicators are linked with personality traits that are traditionally interpreted as "positive": Extraversion, Openness to Experience, and Ambiguity Tolerance–Intolerance.

Sometimes, the correlation is quite significant. Thus, for example, the correlation between narcissism and Extraversion identified using various samples was in the .31–.54 range. Socially active students have higher Dark Triad indicators than students from control groups. When assessing people they know well (friends, siblings, co-twins), respondents tend to see more pronounced Dark Triad traits in them than in themselves. Descriptions of a successful individual also include higher Dark Triad levels than self-assessments. Thus, it appears that a positive image requires the existence of some negative characteristics and that, without them, it can lose its attractiveness.
MOVING TOWARDS DARKNESS: THE PERSONALITY-ENVIRONMENT ASSOCIATION BETWEEN THE DARK TRIAD AND RESIDENTIAL MOBILITY

Shijiang Zuo
Niwen Huang
Fang Wang
Shun Wang
Pan Cai
Beijing Normal University (Beijing, China)

From the perspective of personality-environment association, this research explored how the Dark Triad traits (narcissism, Machiavellianism, and psychopathy) be shaped by socioecological environment? Across three studies, we clarified the association between residential mobility in the environment and the Dark Triad traits. Both the role of regional and personal residential mobility in the Dark Triad traits are investigated. At the individual level, Study 1 (N = 233) found that lay persons had a social expectation that individuals with high (vs. low) personal residential mobility would be more likely to have a high level of Dark Triad traits; Study 2 (N = 325) further demonstrated that individuals’ personal residential mobility could contribute to their Dark Triad personality state, and this finding was replicated in Study 3 with an even larger sample (N = 1199). At the regional level, Study 3 revealed that regional residential mobility also played a role in the development of the Dark Triad. Although flow volume had no significant effect on the Dark Triad traits, flow direction influenced these traits significantly; the net population outflow of regions was associated with the residents' level of Dark Triad traits. The positive correlation among the Dark Triad traits, and personal residential mobility, and the net population outflow of regions can be understood from human’s adaptations to certain socioecological environments. These findings expand our understanding of the origin of the Dark Triad and the associations between socioecological environment and personality.
THE DARK TRIAD TRAITS AND ATTITUDES TOWARDS UNCERTAINTY IN PERSONS WITH DIFFERENT PERSONALITY TRAITS

Yulia Krasavtseva
Tatiana Kornilova
Lomonosov Moscow State University (Moscow, Russia)

The psychological portrait of a narcissistic personality seems incomplete without the links to other Dark Triad (DT) traits and personality features manifested when coping with uncertainty. Tolerance and intolerance of uncertainty are crucial elements in the regulation of decision-making. The aim of this study was to examine relations between the DT traits and decision-making styles, implicit risk theories and the Big Five traits. Methods: 381 participants took part in this study, aged 18 to 62 (m=24.78; s.d.=7.65), 75% women and 25% men. The following questionnaires, tested for the Russian-speaking sample, were employed: The Dirty Dozen Questionnaire — DD (Kornilova et al., 2015); New Questionnaire of Tolerance for Uncertainty (Kornilov, 2010); Ten-Item Personality Inventory Measure of the Big Five (Kornilova, Chumakova, 2016); Melbourne Decision Making Questionnaire — MDMQ (Kornilov, 2013); Implicit Risk Theories (Ordinova, 2013); Levenson Self-Report Psychopathy Scale — LSRP (1995). On a larger Russian sample of 1244 participants, narcissism was significantly positively correlated with Machiavellianism (.384) and psychopathy (.109), and the latter two were also significantly related (.384). DT significantly correlated with the LSRP primary psychopathy factor. DD psychopathy also correlated with the LSRP secondary psychopathy factor. The DT correlated with uncertainty attitudes rather dissonantly. Narcissism was significantly positively correlated with tolerance of uncertainty (.157), but also with intolerance of uncertainty in interpersonal relationships (.181). Narcissism was related to the adoption of implicit risk theories, where risk is viewed either as a pleasure or in terms of potential gains and losses. Narcissism was not related to the only MDMQ productive coping pattern — vigilance (n = 462), but correlated with all three unproductive copings (hypervigilance, buck-passing and procrastination). Psychopathy (.103) and Machiavellianism (.110) were also positively associated with procrastination; and Machiavellianism — with hypervigilance (0.095). Narcissism was significantly negatively correlated with emotional stability and positively with extraversion and openness to experience. Machiavellianism and psychopathy were negatively related to agreeableness and conscientiousness. For the first time, a complex relationship between narcissism and tolerance of uncertainty is outlined. Although, narcissism and procrastination have been studied before, this study examines the tendency of individuals with high levels of DT to use unproductive coping patterns.
SEX DIFFERENCES IN SELF-REPORT EMOTIONAL INTELLIGENCE AND DARK TRIAD OF PERSONALITY

Fedor Derish
Perm State University (Perm, Russia)

The Dark Triad (DT) traits of narcissism, Machiavellianism and psychopathy have weak relations with the general mental ability [Zajenkowski, Czarna, 2015], describe malfunctioning interpersonal relationship [Austin et al., 2007]. The interpersonal relationship based on socio-emotional intelligence included communication competence [Diez, 1984], social intelligence [Cantor, Kihlstrom, 1987; Gardner, 1993; Guilford, 1967] and emotional intelligence (EI) [Mayer, Salovey, 1997]. DT traits have unclear links with features of emotional intelligence: low affect and cognitive empathy [Turner et al., 2019], an inadequacy of recognizing emotional conditions and correctly to respond to them [Lyons, Brockman, 2017]. In recent stable sex differences was received in the values of self-report EI and DT traits, but not for relations between self-report EI and DT. The research was directed to test the hypotheses of correlation between DT and self-report EI by gender. A sample of 244 students aged 18-30 from different universities of Perm (54 % female) completed Russian translation of the Short-Dark Triad [Paulhus, Williams, 2014] and Questionnaire of Emotional Intelligence (D.V. Lyuisin, 2006, 2009). The hypothesis was tested using bivariate zero-order Person correlation, t-test and Cohen’s d. We have found statistically significant differences for Machiavellianism), psychopathy and control of emotional expression in male group. Significant relations between self-report EI and DT was observed for narcissism and psychopathy. In male sample correlations of narcissism were in the range of 0,20 to 0,27 where it was related to managing emotions. In a female group we found many correlations in the range of 0,18 to 0,39 with all components of self-report EI (except control of emotional expression). Psychopathy of men had significant negative relations in both group for intrapersonal EI (for male from -0,22 to -0,29; for female from -0,19 to -0,22). In general, narcissism is “bright” feature of personality for socio-emotional efficiency while narcissism is “darker” trait. Sex differences were observed in the narcissism of males which associated with the pragmatic side of EI: managing emotions of other people and emotional self-regulation. However, all of the received relations were weak. “Dark” personality can be considered as a factor of social and emotional efficiency in interpersonal relationships.
WHAT WE DON’T TEACH OUR STUDENTS? PROMOTION AND PREVENTION IN PSYCHOLOGY AT UNIVERSITIES ACROSS EUROPE

Britt Randi Hjartnes Schjodt
Department of Health and Care – city of Bergen (Bergen, Norway)

Panagiota Dimitropoulou
University of Crete (Crete, Greece)

Margarida Gaspar de Matos
University of Lisbon (Lisbon, Portugal)

Abstract body. Promotion and prevention have a rising profile in the governmental policies across Europe and the European Union. In line with that, the EFPA’s Board of Promotion and Prevention aims to support and strengthen the profile of promotion and prevention in the faculties of psychology, in the psychologists’ associations and in the society. A good place to put the Board’s focus is among students, the future of Europe’s psychology. This symposium aims at sharing the students’ perspective on promotion and prevention, how it is represented in study curricula across Europe and how these programs could be improved in order to better prepare students to become a psychologist. This symposium also aims at opening a discussion about the status of promotion and prevention in psychology across Europe and about possible future steps towards improving this status.

Press paragraph. The topic “What we don’t teach our students? Promotion and prevention in psychology at universities across Europe” aims at sharing the students’ perspective on promotion and prevention, how it is represented in study curricula across Europe and how these programs could be improved in order to better prepare students to become a psychologist. The speakers are members of EFPA’s Board of Promotion and Prevention. Irena Stojadinović and Britt Randi Hjartnes Schjodt have been researching students’ perspective on study programs across Europe in the last 3 years through the Board’s work. The results of this research will be presented in the symposium. Moreover, Britt Randi Hjartnes Schjodt’s work is focused on building professional competence of psychologists and engaging psychologists in policy making. Panayiota Dimitropoulou is a professor at University of Crete focused on mental health promotion and prevention in the field of educational psychology. Margarida Gaspar de Matos is the convenor of the Board, a professor at University of Lisbon and Coordinator of the Centre for Health Education and Promotion. Her work is focused on children and adolescents health promotion and prevention as well as on influencing public polices through research.

General summary of the Symposium. Prevention science has become a truly interdisciplinary field and psychology has only recently become an active player and much more needs to be done. The EFPA’s Board of Promotion and Prevention (previously Board of Prevention and Intervention) was established in 2012 to raise the profile of applied psychology approaches to prevention, as it had been clear that while the rhetoric of prevention approaches was very widespread (particularly among policy- makers) among psychologists it had a relatively low priority. The profession in general remains focussed on a culture of dealing with problems of human well-being one person at a time (or maybe one group at a time). There are, however, exceptions to this as the health psychologists and community psychologists have both developed significant experience and evidence to support population-based interventions applied to prevention and health and well-being promotion. The Board’s aim has been to spread this expertise so that it has wider currency, and also to join up the various areas where prevention has a key role. With this in mind, this symposium’s aim is to bring into focus the role of psychology education regarding establishing a solid ground for further development of promotion and prevention in
psychology across Europe. In reaching this aim, the presenters will seek to respond to questions such as: What do we do and don’t teach our students? What is the students’ perspective on promotion and prevention as a part of a study curriculum? What are attempts from some European universities in introducing these topics?

These and more questions will be discussed through results of European survey about students’ perspective on study curricula and needs for improving those as well as through case examples of Norway and Greece from both university and public policy perspective.

PROMOTION AND PREVENTION IN PSYCHOLOGY EDUCATION ACROSS EUROPE

Irena Stojadinović
Psychosocial Innovation Network (Belgrade, Serbia)

Britt Randi Hjartnes Schjodt
Department of Health and Care — city of Bergen (Bergen, Norway)

Psychology and the education of psychologists throughout Europe follow a variety of development processes and professional traditions. The growing understanding of the need for a change in psychology interventions, towards more promotion and prevention and cross-professional cooperation, is the background and cause for this survey. The primary objective of this study was to investigate to what degree promotion and prevention is present in the education of psychologists across Europe. The study was conducted as a survey directed to current students at faculties of psychology at European universities during 2018. The survey had 18 questions: demographic information, questions about the presence of promotion and prevention in different courses, research training, practical training, students’ professional confidence, mapping the presence of interdisciplinary topics such as project development and implementation, cross-professional cooperation, social inequality and UN sustainable goals and questions on how education can be improved when it comes to promotion and prevention. The responses will be analyzed qualitatively and quantitatively and presented here. It is expected to collect responses from more than 30 European countries. The results will show that the education of psychologists varies from country to country, thus as well with regard to promotion and prevention theory and practice. The presentation will show some trends in teaching promotion and prevention across Europe, various differences that occur between and within countries, from a university to another university and gaps that should be covered both nationally and internationally. The presentation will conclude with students’ suggestions as well as a general recommendation for the development and improvement of the education of future psychologists. The results from the survey give an insight into the education of European psychologists as well as an understanding of how students perceive, evaluate and reflect on promotion and prevention topics in their education. The students have many suggestions for improving the education programs, curricula, and teaching. Their perception of the high importance of promotion and prevention leads the presenters to be optimistic about the future development of the profession across Europe.
EDUCATIONAL REFORM IN NORWAY — PSYCHOLOGISTS FOR FUTURE CHALLENGES AND PRACTICE?

Birtt Randi Hjartnes Schjodt
Department of Health and Care — city of Bergen (Bergen, Norway)

The education of clinical psychologists follows different paths in European countries. Many countries use bachelor and master study program structure, while some — like Norway — have an integrated six years education model where students train and apply psychology in many different clinical settings during the study program. The students graduate with a clinical psychologist degree, ready to take patients into unsupervised treatment. For many years, psychologists have had a high professional and formal standing in specialized mental health services in Norway. For the last 15 years, the numbers of psychologists at the primary service level have increased after receiving special grants from the health authorities. From 2020, it will be mandatory for all municipalities to have psychologists in their health and social services. It has been evaluated that the faculties of psychology need to secure future psychologists with more knowledge on promotion and prevention, relevant also for the public health and primary service level. During 2018, the educational department and four other departments have developed new guidelines for psychology education in Norway. The guidelines are supposed to uniform the education across universities, to secure the quality and content, but also to leave some room for local adaptation and development. The guidelines focus on learning outcomes with clear progression, client perspective (both people and systems/services) and the integration of theory, practice and research. The guidelines define six main topics for psychology education. Of these, the topic ‘promotive and preventive psychological work’ will be presented in detail.

Knowledge, skills and general competence will be addressed and discussed and related to the influence and role of the Norwegian Psychological Association (NPA) and our strategic goal — “Prevention for children and youth”. Each country develops a psychologist education fitted to society-, community- and population needs. This education reform includes these needs. The presenter believes that this psychologist education reform would not have been so focused on promotion and prevention without the NPAs long-term efforts to include government, society, and members. In this perspective, the process can hopefully be of some inspiration to other countries and associations.
EDUCATING PSYCHOLOGISTS ON PROMOTION AND PREVENTION, EMPOWERING MENTAL HEALTH IN UNIVERSITIES

Irena Stojadinović
Psychosocial Innovation Network (Belgrade, Serbia)

Panagiota Dimitropoulou
University of Crete (Crete, Greece)

Nowadays, based on empirical evidence, there is a growing focus on mental health promotion and prevention in many developing countries which is reflected in practice and service delivery by various professionals. The common aim of those professionals regarding mental health promotion is enhancing individuals, families, organizations or communities’ well-being by a) helping people to cope with life events, both predictable and unpredictable, b) increasing their self-esteem, self-help, life skills c) improving the coping capacities of individuals and, c) strengthening social, economic and environmental protective factors. Furthermore, mental health prevention is defined as an intervention and implementation of strategies prior to the onset of a mental disorder in order to prevent their development. Since prevention is considered one of the aims and outcomes of a broader mental health promotion strategy, these two concepts are overlapping. Regarding the professions involved in the delivery of mental health promotion and prevention practices, psychologists have a crucial role in the delivery of such services. They are expected to be engaged and to apply best practices of promotion and prevention through increased awareness, knowledge, and skills developed by continuing education, training, supervision, and consultation. Part of their education is accomplished at university institutions through specialized courses included in undergraduate and graduate curricula. The general aim of these programs is competency development by utilizing the knowledge, skills, attitudes, and values that serve as the foundation required in psychology as a profession. Taking into consideration the aforementioned, the current presentation will be focused on the efforts in Greek educational system on university level to train on mental health promotion and prevention students attending psychological programs at different stages of formal education. Another topic that will be pointed out is the necessity of the development of specialties in the field of mental health promotion and prevention by identifying suitable programs that demonstrate adequate training in applying these specialties. At last, it will be discussed in what ways, students in psychology programs, could benefit not only on a professional level but also individually when acquiring skills and strategies that can be used to respond effectively and sensitively to their own needs.
FINANCIAL IDENTITY, FINANCIAL BEHAVIOR, AND FINANCIAL SOCIALIZATION: CRITICAL ISSUES DURING EMERGING ADULTHOOD

Margherita Lanz
Università Cattolica del Sacro Cuore (Milano, Italy)

Joyce Serido
University of Minnesota (St. Paul, USA)

Soyeon Shim
University of Wisconsin-Madison (Madison, USA)

Abstract body. Originally, the financial life domain was considered as mainly coincident with material and objective resources (e.g., income) and was investigated principally by scholars of Economics. However, once Easterlin (1974) recognized the importance of the subjective dimension within the financial domain, it has become a research topic for Psychology too. This symposium collected different studies focused on how psychological processes, like for example identity or socialization, affect the financial domain. Furthermore, this symposium aims to stress the relevance that these finance-related psychological processes have during a specific stage of life: emerging adulthood. The financial domain has a core position in the 18-29 years old individuals’ life both because the financial self-sufficiency is an essential aspect of subjective adulthood and because the emerging adults were the population most hurt by the 2008 economic crisis. This aim was reached using complex research designs like longitudinal, cross-cultural, and/or multiple informant methodologies.

Press paragraph. The current symposium aims to explore the emerging adults’ financial life investigating individual financial factors (financial identity, financial well-being, financial behavior) and relational factors (parental financial socialization) as well as their connections. The symposium wants to illustrate how both psychological and relational factors are relevant and have to be taken in consideration in interventions enhancing emerging adults’ financial condition. This symposium addresses issue relevant for researchers as well as financial educators, coaches, and other practitioners that are working toward understanding how the youth can achieve a better state of financial well-being.

As most of the studies about emerging adults’ financial life have been developed in USA, this symposium stresses the need to develop this research field in countries other than USA and compare results across different countries. At this end, Margherita Lanz, from Italy, organized this symposium inviting psychologists from different countries to give their contribution. Presenters of this symposium, indeed, are Angela Sorgente (Postdoctoral researchers) from Italy, Rimantas Vosylis (Postdoctoral researcher) from Lithuania, Maja Zupančič (Full Professor) from Slovenia, Ulrike Sirsch (Assistant Professor) from Austria, and Mihaela Friedlmeier (Associate Professor) coming from Romania, but working in Michigan. Professors Joyce Serido and Soyeon Shim from USA will be the discussants.

General summary of the Symposium. The investigation of the psychological factors affecting the emerging adults’ financial life has recently become a research topic (Sorgente & Lanz, 2017) and many research gaps have still to be filled. In particular, this symposium aims to address the following three gaps. First, there is a lack of validate measures assessing the psychological processes related to the financial domain. Sorgente et al.’s study presents the validation of the Financial Identity Scale measuring the identity statuses proposed by Marcia (diffusion, moratorium, achievement, foreclosure) within the financial domain. The measurement of financial identity is tested among emerging adults belonging to 3 different countries (US, Italy, Lithuania) to verify its invariance. Second, scholars recognize the financial self-sufficiency as a central marker of becoming an adult, but no study investigated the impact that the emerging adults’ financial well-
being and financial behavior have on emerging adults’ perception of their stage of life. Vosylis’ presentation addresses this issue testing the relation between income, spending behaviors, and financial well-being with the perceptions of emerging adulthood on Lithuanian emerging adults adopting a 3-wave longitudinal model. Third, scholars agree that the parent-child relation has a crucial role in the financial socialization process that parents should act to prepare their children to face the complex financial world (Gudmunson & Danes, 2011).

Three presentations aim to enrich the Shim et al.’s (2010) financial socialization model, collecting information from both parents and children, as previous studies only relay on child’s report. Specifically, Zupančič et al. tested this model integrating the parents and child’s reports; Sirsch et al. tested the model differentiating between maternal and paternal financial socialization using both Austrian and Slovenian data; while Friedlmeier & Friedlmeier test the model comparing child’s and parents’ point of views.
THE FINANCIAL IDENTITY SCALE (FIS): CROSS-CULTURAL VALIDATION AMONG AMERICAN, ITALIAN, AND LITHUANIAN EMERGING ADULTS

Angela Sorgente
Lanz Margherita
Università Cattolica del Sacro Cuore (Milan, Italy)

Joyce Serido
University of Minnesota (St. Paul, USA)

Rimantas Vosylis
Mykolas Romeris University (Vilnius, Lithuania)

Soyeon Shim
University of Wisconsin-Madison (Madison, USA)

Financial self-sufficiency is an essential aspect of subjective adulthood, and as such, identity development within the financial domain among emerging adults should be better understood. Barber, Card, Serido, & Shim (2011) developed the Financial Identity Scale (FIS) in order to measure the identity statuses (diffusion, moratorium, achievement, foreclosure) proposed by Marcia (1966). The current paper aims to validate and compare the FIS via various types of validity (score structure, generalizability, criterion-related, known group, and reliability evidence) among emerging adults across three countries (US, Italy, and Lithuania). US data were drawn from Arizona Pathways to Life Success, a longitudinal study launched in 2008 among 2098 first-year college students. Italian data were collected from 440 emerging adults (aged 18-25), while Lithuanian data were collected from 481 emerging adults (aged 18-25). Different Structural Equation Models were run in order to collect validity evidence. Score structure test confirmed the 4-factor structure across the three countries (despite the fact that the Italian version had a bifactorial item (item 8 "I've never really questioned my views about saving and spending; if it's right for my parents, it must be right for me") loaded on both diffusion and foreclosure factors. Generalizability testing showed that all factors (except for diffusion in Italy) had comparable meaning (i.e., invariant factor loadings) across the three countries. Both criterion-related evidence and known group evidence were demonstrated through significant relations of the FIS factors with the "Life Satisfaction" factor and also with socio-demographic variables (gender, age, living arrangement, occupation, and relational status), respectively. Reliability evidence was revealed by estimating the composite reliability of each factor within each country. Results showed that all factors were highly reliable (ω> .60). Furthermore, reliability evidence was found through testing the FIS’ stability over time through the US longitudinal dataset. More specifically, the scale showed full measurement invariance over time: factorial structure, factor loading, intercepts, and residual variance were equivalent across four waves. Findings confirm that the financial domain is relevant for emerging adults’ life satisfaction and that the Financial Identity Scale is valid in examining identity development within the financial domain during emerging adulthood across different cultures.
HOW INCOME AND FINANCIAL BEHAVIORS SHAPE EMERGING ADULTHOOD EXPERIENCES? FINDINGS FROM A BRIEF LONGITUDINAL STUDY

Rimantas Vosylis
Mykolas Romeris University (Vilnius, Lithuania)

Emerging adults consider attainment of financial self-sufficiency as a central marker of becoming an adult (Arnett, 2001). However, most emerging adults reach financial self-sufficiency gradually, relying on partial financial support from parents for a prolonged period of time. Living on a limited budget and striving towards financial independence, requires sufficient skills in managing personal finances (Serido, Shim, & Tang, 2013). Considering the previous, it can be expected that financial capabilities shape experiences of this period and the process of becoming an adult. However, today very little empirical evidence exist documenting such effects. The primary goal of this study is to investigate how income, spending behaviors, and subjective financial well-being shape perceptions of EA. This study will present the findings from a recently launched longitudinal with Lithuanian first-year students, studying in tertiary institutions. In total, 533 emerging adults were surveyed during the initial assessment (56.8% women; Mage = 18.92, SDage = 0.72; 21.6% employed; 49.0% living with parents) studying in four institutions. Findings based on three assessments will be presented during the conference. Subjective financial well-being was assessed using a scale developed by Sorgente (2017) and a financial anxiety scale (Shapiro, Gilla, & Burchell, 2012). Spending self-control (Haws et al., 2012) and impulsive buying (Rook & Fisher, 1995) were assessed to target financial behaviors. The short version (Crocetti et al., 2015) of the Inventory of Dimensions of Emerging Adulthood (Reifman et al., 2007) was used to assess perceptions of emerging adulthood. The preliminary findings, based on first wave data analyses, suggest that income is positively associated with self-focus and perceived possibilities, although the associations are rather small. Instead, stronger associations emerge between spending behaviors and subjective financial situation. Specifically, both spending self-control and impulsive buying are positively associated with all five EA dimensions. Subjective financial well-being is negatively associated with instability and positively with perceived possibilities, while financial anxiety in positively associated with identity explorations, instability and feeling in-between. Taken together, results suggest that an ability to effectively control one's spending and subjective experiences of a personal financial situation might shape experiences of emerging adulthood more than the actual income.
INTERGENERATIONAL PATTERNS OF FINANCIAL FUNCTIONING: PATHWAYS TOWARD FINANCIAL SATISFACTION AND DYADIC FINANCIAL RELATIONSHIP

Maja Zupančič
Mojca Poredoš
Žan Lep
University of Ljubljana (Ljubljana, Slovenia)

Mihaela Friedlmeier
Grand Valley State University (Allendale, USA)

Primary objectives of this contribution were to extend the Shim et al.’s (2010) financial socialization model to parental self-reported financial functioning and thus, consider both parental and emerging adult (EA) children’s reports on their financial outcomes. Specifically, we tested the proposed pathways of parents’ assessment of their household income, financial knowledge, and financial behavior control toward (i) their self-rated financial behavior, and financial teaching of their children, (ii) financial learning outcomes in their EA children (child-rated adoption of parental role modeling, financial knowledge, financial behavior control), (iii) and indicators of healthy financial outcomes (children’s self-rated financial behavior, satisfaction with money management in both parents and children, and parent-child relationship due to money matters considering aggregated standardized scores of both parents and children).

Participants were 474 Slovene first-year-university-students (Mage = 19.96 years, SD = .80; 45% males) and their parents (Mage = 48.16 years, SD = 4.87; 21% fathers). The participants responded to an online survey based on the battery of instruments by Shim et al. We performed the path analysis in Mplus using MLR method of estimation and obtained a good model fit. Parental self-rated financial functioning (knowledge, financial behavior control) influenced their self-evaluated financial behavior, and teaching their children about finances, which both predicted the EA children’s self-assessed financial learning outcomes (adopting parental financial role modeling, financial knowledge); these outcomes further affected children’s self-rated financial behavior control and financial behavior. Similar intergenerational patterns were revealed for the paths of (i) financial knowledge and financial behavior control toward financial behavior, and (ii) financial behavior control and financial behavior toward satisfaction with personal money management. Satisfaction of both parents and EA children directly contributed to parent-child financial relationship. Parental self-assessed income also directly influenced both their financial behavior and satisfaction with money management. Our findings suggest that the existing models for financial functioning apply not only to EAs attending college but also to their parents’ generation who differ in both age and financial experiences as the Slovene economy switched from state-run to market economy.

Additionally, parent-provided information appeared relevant for child financial outcomes; almost all previous studies relied solely on child-information.
DAUGHTER OR SON? DOES MATERNAL AND PATERNAL FINANCIAL SOCIALIZATION DIFFER?

Ulrike Sirsch
Katharina Levec
University of Vienna (Vienna, Austria)

Maja Zupančič
University of Ljubljana (Ljubljana, Slovenia)

Mihaela Friedlmeier
Grand Valley State University (Allendale, USA)

Research on parental financial socialization portrays parents’ important role in the development of offspring’s healthy financial outcomes such as financial behavior, financial relationship with parents, and financial satisfaction (e.g., Gudmunson & Danes, 2011; Jorgensen & Savla, 2010; Norvilitis & MacLean, 2010; Shim et al., 2010). Parental financial behavior and teaching directly and indirectly influence healthy financial behaviors of their emerging adult children. Findings dominantly stem from studies conducted in the U.S., and they usually did not differentiate between maternal and paternal financial socialization. Thus, we aimed to test parental financial socialization and its outcomes using Shim et al.’s first-year-student financial socialization model (2010) with first-year university students from two European countries, Slovenia and Austria. In addition, we differentiated between maternal and paternal financial socialization and how it relates to healthy financial outcomes in children by focusing on gender-specific dyads (i.e., father-son, father-daughter, mother-son, and mother-daughter dyads). Data were collected from 509 first-year university students in Slovenia (55.2% females, mean age 19.91 years, SD = 0.70) and 395 in Vienna (70.1% females, mean age 21.07 years, SD = 2.05). They responded to an online survey, which was based on a battery developed by Shim et al. Students in Austria, and in Slovenia answered separate questions regarding their perception of mother’s and father’s financial socialization variables. Using SPSS AMOS Version 24, we conducted separate analyses for each dyad in each country. Results indicated acceptable model fit with significant direct and indirect pathways of financial socializing experiences to financial learning outcomes in emerging adults. In addition, we found country and gender specific influences on students’ financial functioning; in Austria, mothers’ and fathers’ parental teaching directly influenced sons’ (but not daughters’) financial behavior. In Slovenia, adopting the parent as a role model directly affected students’ financial behavior in the same sex dyads. Our findings highlight the importance of testing models in different socio-cultural contexts and differentiating between financial socialization of the mother and the father by taking into account the effects of gender roles.
PARENTAL FINANCIAL SOCIALIZATION FROM PARENTS’ AND CHILDREN’S PERSPECTIVE: WHICH CONTRIBUTES MORE TO CHILDREN’S POSITIVE FINANCIAL Outcomes?

Mihaela Friedlmeier
Wolfgang Friedlmeier
Grand Valley State University (Allendale, USA)

Many young American adults today struggle against threats to their financial well-being, such as credit card and student loan debt. Although other agents are highly relevant (e.g., peers, school), parents play a critical role in shaping their children’s financial skills and attitudes through modeling, reinforcement, and intentional teaching of skills and information (Danes, 1994; Danes & Haberman, 2007). Majority of previous studies relied solely on children’s perspective regarding parental financial guidance (e.g., Jorgensen & Savla, 2010). The purpose of the current study is to investigate which source of information is most predictive of college students’ financial and overall life satisfaction. A total of 98 freshmen college students (72% female, predominantly white) and one of their parents (73% mothers) participated in the study using a paper and pencil procedure. Using Likert-scale questions, parents reported their engagement in teaching their children about money and monitoring their money spending, their own financial satisfaction, financial behaviors and knowledge. Students provided similar information about themselves as well as about their perception of their parents’ financial aspects. Overall, our findings suggest that children’s view on previous (i.e., while growing up) and current financial socialization contributed to their financial satisfaction to a greater extent compared to parents’ view. Having parents as role models is linked to students’ greater ability to control their money, more frequent engagement in positive financial behaviors, and higher financial satisfaction. The financial habits that form during adolescence and emerging adulthood are likely to persist during adulthood. Knowing the relevant socialization factors during adolescence that lead to healthy financial behaviors helps us enhance young people’s financial and overall well-being.
FRONTIERS AND RECENT DEVELOPMENTS IN SELF-DETERMINATION THEORY

Kennon Sheldon  
University of Missouri (Columbia, USA)

Tamara Gordeeva  
Lomonosov Moscow State University (Moscow, Russia)

Abstract body. This symposium brings together researchers employing the Self-determination theory (SDT) perspective, to discuss current cutting-edge research. Four of the presenters are Russians or are affiliated with Dmitry Leontiev’s International lab at the Higher School of Economics in Moscow, showcasing an emerging Russian presence within SDT. Sheldon will compare the motivation of artists and business-people, showing that businesspeople are more extrinsically motivated than artists, but expect to become more intrinsic in the long term. Gordeeva will present data integrating SDT and attributional perspectives, to understand academic achievement in a novel way. Lynch will discuss the results of his qualitative and cross-cultural analyses of key SDT concepts. Chirkov will present his critique of statistical positivism, arguing for a case-based approach instead and presenting relevant data based in SDT. Guay will show that extrinsic and intrinsic motivations differ in the degree of specificity versus globality with which they predict academic performance in children.

Press paragraph. Dr. Dmitry Leontiev's "International Lab of Positive Psychology of Personality and Motivation" has been funded by the Russian government for the last five years. An important lab topic concerns Self-determination theory (SDT), and the integration of SDT with existential psychological perspectives and traditional Russian psychological perspectives. Professor Kennon Sheldon of the University of Missouri in the U.S., Senior Research Advisor to Leontiev’s lab, will present work comparing present-day and anticipated-future motivation, within both artists and business-people. Professor Tamara Gordeeva, at Moscow State University in Russia and also affiliated with Leontiev’s lab, will present research concerning the link between Autonomy and Attributional Style. Professor Martin Lynch of the University of Rochester in the U.S., a consultant to Leontiev’s lab, will unveil new qualitative/cultural research which extends SDT beyond its typical quantitative roots. Professor Valery Chirkov of the University of Saskatchewan in Canada, formerly a professor at Yaroslavl University in Russia but retrained in in the U.S., will critique key research methods used in SDT. Last but not least, Professor Frederic Guay of Laval University in Canada will discuss cutting-edge studies of academic motivation in schoolchildren, showing that intrinsic motivation is subject area-specific whereas external motivation cuts across subject areas.

General summary of the Symposium. There is no single theme which undergirds all five talks, except that all five are based in Self-determination theory. Thus the overarching theme is “Frontiers and recent developments in Self-determination theory.” Considering the extended background or theoretical framework of SDT: SDT is a macro-theory of human motivation which has been under development for almost 50 years. The theory has become increasingly popular and widely-applied; for example, the 7th International Conference in SDT will be held in Amsterdam in May 2019, and will be attended by more than 500 researchers. The theory is far-flung, consisting of six “mini-theories,” each of which addresses a different aspect of healthy (i.e. self-determined) motivation. Historically, the theory began with the discovery of the “intrinsic motivation undermining effect,” in which people lose their desire to engage in formerly enjoyable activities, after being rewarded or reinforced by external rewards, approval, or contingencies. This led to the “Cognitive evaluation” mini-theory. Later research concluded that motivations are not
simply either intrinsic or extrinsic; there are several gradations between. This led, in the 1980s and early 1990s, to the "Organismic integration" mini-theory. In the early to mid-90s, research turned to the key constructs underlying SDT, namely the most essential psychological needs underlying motivational processes. This led to the "Basic psychological needs" mini-theory. These are the three mini-theories being addressed by the presenters in this symposium; the other three mini-theories (Goal contents theory, Causality orientations theory, and Relational motivation theory) are less central and will not be addressed. Presenters will discuss new challenges and discoveries concerning each of the three most important mini-theories of SDT.

**BUSINESS-PEOPLE ARE MORE EXTRINSIC THAN ARTISTS, BUT NOT IN THE IMAGINED FUTURE**

Kennon Sheldon  
University of Missouri (Columbia, USA)

Stereotypes suggest that business-people have more extrinsic motives and values than artists, since business-people focus on making money, whereas artists focus on self-expression. However, these stereotypes have never been appropriately tested; instead, most personality research has compared artists to scientists, considering emotional and cognitive differences rather than motivational differences. We used Self-determination theory (SDT) to compare the current career motivations of all three groups. As another innovation, we also assessed participants’ motivations in the imagined future. Based on SDT’s organismic-theoretical assumptions, we hypothesized that businesspeople expect to become more intrinsic in the future. We tested this 3-way interaction (vocational type x motivation type x time-frame) in three studies. Studies 1 and 2 used undergraduate samples, focused on students majoring in the three targeted vocational areas. Study 3 used an mTurk sample, of people working in one of the three specified areas. Participants completed on-line surveys containing measures of their specific career motivations (ranging from extrinsic to intrinsic) and their global values (also ranging from extrinsic to intrinsic), both in the present and the future. In Study 1 business students, relative to art students, reported more external and less intrinsic motivations for their current majors, and aspired more to money, status, and appearance in the future. However there were significant three-way interactions such that the two groups were no different on intrinsic future aspirations. In Study 2 business students again had more external and less intrinsic career motivation. However, they were again no different in their intrinsic future aspirations, nor in their longer-term career motivations. Study 3 used a sample of mTurk workers and again replicated the basic pattern. Physical scientists and science students tended to have current and longer-term motivations lying midway between the art and business groups. Consistent with organismic perspectives, everyone aspires for a meaningful and enjoyable future; however, business types may put off these motivations in the present, whereas artistic types pursue them directly.
According to Sheldon (2002), self-concordant goals are goals which represent a people’s enduring interests and self-defining values. People who pursue self-concordant goals evidence higher subjective well-being, as shown in participants from both Western and non-Western cultures (Sheldon, Elliott et al., 2004). In a different literature, attributional style research (M. Seligman, C. Peterson) has found that tendencies to provide optimistic explanations of positive events (stable, global, internal) and negative events (unstable, specific, external) also predict well-being (Cheng, Furnham, 2001, 2003; Hu et al., 2015). We hypothesized that people might make more optimistic attributions about goal-outcomes when the goals are self-concordant, and that this tendency would mediate the link between self-concordance and well-being. Study 1 participants were 253 undergraduates in a psychology class at the University of Missouri. They received extra credit in exchange for their participation. Participants listed three life goals related to their career plans, then rated the self-concordance of those three goals. A newly developed measure based on the Attributional Style Questionnaire (ASQ, Peterson et al., 1982) assessed participants’ levels of optimism regarding imagined successes and failures in the goals. Finally, participants’ well-being was assessed. SEM analyses showed that self-concordance affected subjective well-being, as expected. More importantly, this relationship was mediated by optimistic (stable, global) attributions regarding imagined successful goal-completion and by optimistic (unstable, specific) attributions regarding imagined goal-failures. Overall, the model yielded a good fit to the data. In Study 2 we aimed to replicate the American sample results using a sample of Russian students (N=223). The same measures were used after appropriate translation and back-translation. Again, self-concordant goals affected subjective well-being, mediated by optimistic attributions regarding goals’ successful completion and optimistic attributions regarding failures in goals. The model yielded a good fit to the data. The results suggest that when people choose life-goals that fit them in a deep way, they derive resources including the ability to interpret goal-results in an optimistic way. This helps to explain why pursuing such goals makes people happy.
AT THE INTERSECTION OF MOTIVATION AND EDUCATION: USING QUALITATIVE METHODS TO STUDY KEY ISSUES IN SDT RESEARCH

Martin Lynch
University of Rochester (Rochester, USA)

Nailya R. Salikhova
Kazan Federal University (Kazan, Russia)

Self-Determination Theory (SDT) has enjoyed widespread growth as a theory of motivation, personality, and development over the past 30 years. Much of that growth and recognition stems as much from the rigorous nature of the theory’s empirical foundations as from the parsimony and elegance of the theory itself. Yet it is a fact that most of the theory’s empirical support has been quantitative in nature, with little attention paid to the possible contributions of a qualitative approach. The present paper details two recent, qualitative studies of motivation within the realm of education that address current, critical issues in SDT. Study 1 explores the question, “Might there be different basic needs in other cultures?” while Study 2 asks, “What is the experience of autonomy like for members of another culture?” Study 1 asked 195 practicing educators in Tatarstan, as local experts (both culturally and professionally), what they considered to be the essential ingredients for children’s healthy psychological development. The theme of relationships emerged as centrally important in the teacher-generated reports. In Study 2, 116 doctoral students, also in Tatarstan, described a situation in which they acted autonomously at university, a situation in which they acted non-autonomously, and the ways in which those experiences differed from each other. Results indicated that when acting autonomously, students experienced more positive emotional, intellectual, volitional, and temporal dimensions than when acting non-autonomously. Both types of situation were characterized by fear and a sense of usefulness, but only non-autonomous situations were characterized by feelings of futility. One of SDT’s most controversial claims has been the claim of universality (regarding basic needs, e.g.), and despite a growing body of cross-cultural, quantitative research providing support for the claim, questions remain. The two studies summarized here provide simple examples of how a qualitative design can push the boundaries of current understanding with respect to two central questions in that cross-cultural debate: might people in other cultures have different basic needs? What is the experience of autonomy like for people in another culture? Critiques and suggestions for further research are offered.
THE PARADIGM WAR CONTINUES: STATISTICAL POSITIVISM VERSUS CRITICAL SCIENTIFIC REALISM IN MOTIVATION RESEARCH

Valery Chirkov
University of Saskatchewan (Saskatchewan, Canada)

Jade Anderson
University of Regina (Regina, Canada)

It is a strong conviction of the authors that science can only progress through researchers continued reflections on and critical analyses of their paradigms and practices. Following this conviction, the presentation will compare two paradigms—statistical positivism and critical scientific realism—to study the academic motivation of university students. The reported studies aimed to integrate two motivation theories—the achievement goal theory and self-determination theory—in explaining students' academic motivation. The purpose of the project was to compare conceptually and empirically the advantages and disadvantages of quantitative studies driven by statistical positivism and provide an alternative with a case-based investigation driven by critical scientific realism. For the statistical study, researchers conducted a path analysis on a sample of 385 participants. They used validated questionnaires to measure the constructs proposed by the motivation theories: performance and mastery goals, autonomy and competence needs satisfaction, intrinsic, autonomous, and controlled motivation regulations, and three outcome measures: academic achievement, psychological well-being, and academic dedication. The realist study was based on theory-driven interviews of 12 purposefully selected participants. Their data were analyzed using within- and between-case analyses. The path model fitted the data well and supported some of the hypothesised associations. The interview study allowed researchers to build an alternative integrated model of academic motivation. These two models were compared based on the primary philosophical and methodological assumptions of the underlying paradigms. The presentation will conclude that the continued use of statistical positivism generates minimal new knowledge about the mechanisms of academic motivation. This paradigm should be replaced with the realist one and a case-based methodology that have a better chance to advance research and improve understanding of academic motivation. The presenters also admit that a further elaboration of the case-based methodology for motivation research is required.
AUTONOMOUS AND CONTROLLED MOTIVATIONS: DIFFERENTIATION BETWEEN SCHOOL SUBJECTS MATTERS TO PREDICT ACADEMIC ACHIEVEMENT

Fredric Guay
Julien Bureau
Laval University (Québec, Canada)

According to some motivational theories, such outcomes as achievement and performance are best predicted by motivational variables measured at the same level of generality. For example, a measure of motivation specific to math, and not a global measure of motivation at school, should be the best predictor of math achievement. Indeed, global measures do not consider the complexity and variation of self-perceptions, and this could impair the ability to understand and predict behavior. Various studies stemming from different motivational theories have applied these principles and have shown that a large portion of motivational variance is specific to school subjects. However, a survey of the field reveals a dearth in self-determination theory research testing the specificity principles and, consequently, limited knowledge of motivational dynamics. In this presentation, we uncover fundamental processes in the way each type of motivation (intrinsic, identified, introjected, external) toward various school subjects predicts outcomes in these subjects. Data were obtained from a study on adolescents’ academic achievement and motivation. The students were representative of those in grades 7, 8, and 9 attending the 423 French public high schools (Quebec, Canada). Participants were 1404 students (666 boys, 738 girls; Mage=13.74). Results from bi-factor ESEM examining differences in motivational quality within a subject (French, math, and English) showed that high general levels of motivation in math and English predicted achievement, and more so in the corresponding school subject. Intrinsic and identified motivations for a school subject were generally positively associated with achievement, but only in the corresponding school subject, whereas introjected and external regulations for most school subjects negatively predicted achievement in the corresponding school subject, but also in the other ones. The specificity of intrinsic and identified motivations and non-specificity of introjected and external regulations point toward various recommendations in school motivation research and practice. While assessment of autonomous motivations should be subject-specific, assessment of controlled motivations could be general with no loss of predictive power.
Abstract body. This symposium is devoted to topical issues related to the formation of health using methods of health psychology and the achievement of well-being. The specificity of this symposium is that it will present reports on both the theoretical positions of psychology with respect to changes in health, and on the real health of children and mothers. Finally, the curriculum for the master’s program in health psychology in Latvia will be discussed.

Press paragraph. The symposium is aimed at discussing the most pressing topics of modern health psychology. All speakers are members of the European Society of Health Psychology, representing two countries: Russia and Latvia. All speakers have a PHD degree, and the debater has a doctoral degree. The reports will discuss theoretical approaches to improving the quality of children's health as well as improving adult well-being by reducing the level of anomie.

General summary of the Symposium. A deterioration of health, which leads to a decrease in the quality of well-being, is one of the acute problems that is solved by methods of health psychology. The specificity of health psychology, the theoretical foundations of which will be taken as the basis for this symposium, is a description of the conditions under which a person will actively change his or her own behavior towards a healthy lifestyle. This problem should be solved at several levels: the assessment of health status and the reasons for its deterioration, the methods of influencing people of different ages to change their behavior, and the building of university masters training programs for working with people. All levels will be covered by the reports of this symposium, which will create a needed holistic picture of practical actions to improve the quality of well-being. The first report will present the theoretical foundations of health psychology, aimed at finding the psychological reservations of a person for a transition to a healthy lifestyle. In this work were used 54 first graders and different psychological and psychophysiological methods were used. The authors showed that only 24% of first graders have a well formed Inner Health Picture, which strongly correlates to performance of executive functions. The second report will present data on the health of children in the first two years of life, as well as correlations between their health, the health of their mothers and their psychological characteristics. This sample consisted of 100 mother-child dyads and it showed that the less factors of perinatal pathology there are in the mother, the more positive the prognosis with regard to the child’s health within the first two years of living is. The third report will show the influence of sensory flow perception on the formation to well-being. The study involved 240 participants and showed that the perception of sensory flow and the level of inhibitory processes, as a psycho-physiological mechanism, influence the inner position of a person. The nature of this influence is largely
determined by the degree of constructiveness of the chosen behavior pattern in the field of health formation. Forth report will be related to the analysis of the phenomenon of anomie and human well-being. In a sample consisting of 1,009 respondents aged 18 to 92 years using the European Quality of Life Survey, selecting from 258 questions given to Latvia the ones that refer to anomie (13 questions), subjective well-being (2 questions) and engaging in volunteering (6 questions). Authors showed that social participation is related with subjective well-being; social participation (volunteering) was negatively related to such dimensions of anomie as social isolation and meaninglessness, but not related to social distrust. Finally, the last report will be devoted to the application of research methods in teaching students of Riga Medical University under the Health Psychology program. A qualitative design study was conducted, including eight academic staff members using the open-ended questionnaire. Results indicated that academic staff involved in non-methodology courses included elements from three out of six facets of research: “find and generate”, “analyse and synthesise” and “communicate and apply” in their curriculum; however, only methodology courses included all six facets of research. Discussant: Elena Nikolaeva, PHD, Dr Sci, professor of the department of child development and family pedagogic of Herzen State Pedagogical University, Saint-Petersburg, Russian Federation, klemtina@yandex.ru

THE ROLE OF HEALTH PSYCHOLOGY IN CHILD HEALTH

Svetlana Burkova
Irina Shirokova
Herzen State Pedagogical University (Saint-Petersburg, Russia)

There is a large amount of research confirming that we need to begin taking care of our health from the earliest stages of ontogenesis. Moreover, in order for this care to be effective, we must examine the factors that affect children’s health. Psychological factors have a serious weight on it. In this article, we will discuss the internal health picture (how children self-perceive their health) – one of the most important psychological factors for children’s health and well-being. This is precisely the reason for the attention given in the article to how children self-perceive their health when they are starting school. The study involved 54 children (24 boys and 30 girls) aged of 7.9 ± 0.3 years in health groups 1 and 2. To reach our aim we had selected a set of techniques that allowed us to determine the level of their IHP formation and identify the features of the components included in their IHP structure (Nikolaeva, 2014 (modified)), self-attitude and differentiation of their imagined “Physical self” (Semenovich, 2002), as well as how they form their emotional attitude to health and illness (Vasilieva, Filatov, 2006). We also diagnosed inhibitory control with ReBos (Vergunov, Nikolaeva, 2014) and working memory with an interference test (Razumnikova, 2016). The dominant level of IHP in children was low formation (43%). Children with a low level of IHP have a higher differentiated perception of their body than children of high and medium level. An inverse relationship has been established between the level of development of the IHP and intensity of somatic experiences. In children with higher rates of IHP we found a presence of greater inhibitory control and larger working memory which was compared to a group of children with other levels of IHP. Thus, in the course of this proposed study, it was shown that only 24% of first graders have a well formed IHP, which is strongly correlated to performance of executive functions. This indicates that there is a need to work with children of this age towards the formation and maintenance of health. The study was financed by the Russian Foundation for Fundamental Research, project # 18-013-00323 a and 17-06-00166-a.
THE INFLUENCE OF THE MOTHER’S HEALTH ON CHILDREN’S HEALTH IN THE FIRST YEARS OF LIFE

Vera Merenkova
Bunin Yelets State University (Yelets, Russia)

The impact on the mother’s health and her child during pregnancy in the first two years of life is extremely important for understanding how the system of child’s health is maintained. We have evaluated the state of health of the mother and the child at birth, and the probability of the cancellation of diagnosis in the child at the end of the second year of life. The sample consisted of 100 mother-child dyads. The complex assessment of the children’s health status was based on the individual medical records. The mothers filled the questionnaire which evaluate the mother’s relation to her child during the first two years of life (Vereshagina, Nikolaeva, 2009) and the questionnaire aimed at assessing the emotional intelligence level (Liusin, 2006). There is a positive connection between the number of the diagnoses in the one- and the two-year-old children during their stay in the maternity ward and perinatal pathology factors of the mother (r=0.336, p≤0.001 for the first-year-old children; r=0.226, p≤0.05 for the second-year-old children).

But by the end of the second year of life, 60% of the children’s diagnoses were cancelled. The most widespread diagnosis of the child at birth is perinatal encephalopathy and syndrome of motor disorders.

Only 8% of the one-year-old children’s mothers and 14% of the two-year-old children’s mothers are almost healthy. It is shown that the less factors of perinatal pathology there are in the mother, the more positive the prognosis with regard to the child’s health within the first two years of living will be. Positive prognosis with regard to the one-year-old child’s health depends upon the acceptance of the child by the mother: the higher the value on the scale of acceptance-nonacceptance is, the better the child’s health is (F=6.829, p<0.003). Work is supported by RFFI by grant number 18-413-480007.
THE INFLUENCE OF SENSORY FLOW PERCEPTION ON THE FORMATION TO WELL-BEING

Oksana Elnikova
Vera Merenkova
Bunin Yelets State University (Yelets, Russia)

The sensorimotor integration and inhibitory control are important characteristics of the mental processes and provide all the functions associated with behavioral changes towards a healthy lifestyle. There is still no understanding of how these processes develop in ontogeny with different internal pictures of health and disease. The need for a study of the formation of non-constructive behavioral model in which people lose their health or aggravate their diseases, becomes obvious. One of the reasons is a certain psycho-physiological state the goal of our research is to describe the role of sensorimotor integration and inhibitory processes in the formation of health in people at different stages of ontogenesis. The study involved 240 subjects (aged 7 to 22). The IPH of children was evaluated by a questionnaire (Nikolaeva, 2014). To identify the degree of adaptation to the disease and the model of behavior in a situation of loss of health the TOBOL method was used (Wasserman et al., 2005). The parameters of sensorimotor reactions were evaluated using the method ReBos (Vergunov, Nikolaeva, 2014). Analysis showed the prevalence of unformed IPH in these subjects. Respondents with a formed IPH from the beginning of the execution of sensorimotor reactions made fewer gaps. The formation of the IHP was accompanied by increased control over the implementation of reactions, which was found by reducing the number of omissions. The IDP of the subjects characterized by a high level adaptation to disease, complicates the perception of sensory flow and the average reaction time and number of errors increases. IHP is an internal mental model, which not only predetermines a person's image of himself as a healthy person, but also has a psychophysiological basis in forming of a system for strengthening control on one's own actions. The perception of sensory flow and the level of inhibitory processes, as a psycho-physiological mechanism, influence the inner position of a person. But the nature of the influence is largely determined by the degree of constructiveness of the chosen behavior pattern in the field of health formation. Work is supported by RFFI by grant number 18-413-480007.
TOWARDS PRACTICE-BASED LEARNING ENVIRONMENT IN HEALTH PSYCHOLOGY EDUCATION

Kristīne Martinsone
Kristīne Šneidere
Rīga Stradiņš University (Rīga, Latvia)

Anita Pipere
Daugavpils University (Daugavpils, Latvia)

For the past decade schools and universities in Western Europe has started to introduce practice-based approach to education. This approach has been used also in psychology studies, especially at graduate level, thus, bridging the gap between theory and practice. Practice-based research asks for the nurturing environment that can be provided by a knowledgeable teacher and use of practice-based teaching methods that ensure not only development of professional skills, but also encourage sharing of knowledge, self-reflection and practicing communication skills. Even though it has traditionally been considered that research skills can be developed in methodology courses, aforementioned facilities that are essential for practice-based research are often taught and practiced in classes focusing on practical skills. The presented study aims to investigate types of tasks used in methodological and non-methodological classes for research skill development in health psychology studies in Rīga Stradiņš University. Nine academic staff members from Rīga Stradiņš University involved in teaching methodology and non-methodology classes in psychology branch (Mwork experience = 7.47 years) filled in an open-ended questionnaire related to the teaching methods used in their classes, asking to identify exact methods and tasks used for the development of students’ research skills. All data were analysed using qualitative content analysis method. Results from qualitative content analysis data were categorized and three main dimensions of tasks were identified: tasks focused on development of professional skills in supervised praxis (e.g. presenting cases from study praxis), tasks focused on development of professional skills in classes (e.g. simulations), and tasks oriented on research and dissemination skill development (e.g. literature analysis, presenting theoretical concepts). Our study indicated that tasks used in classroom settings aiming to develop research skills, also included methods needed to develop skills and competencies essential in practice-based research, while also maintaining some of the more traditional methods, such as literature analysis. However, to gain better understanding of practice-based research development in classrooms, further study investigating students’ views would be beneficial.
RELATIONS BETWEEN SOCIAL PARTICIPATION, ANOMIE AND SUBJECTIVE WELL-BEING

Kristine Martinsone
Riga Stradiņš University (Riga, Latvia)

The purpose of this research is to explore the relations between social participation, anomie and subjective well-being. Anomie is an individual psychological state in which a person experiences perceived normlessness (a perceived breakdown of the social order in which norms no longer regulate social conduct), social isolation (a loss of a sense of community) and meaninglessness (an absence or ambiguity of terminal goals, or the meaning of life, which can serve as prescriptions for behavior). These dimensions of anomie can relate with components of subjective well-being (overall satisfaction with life, general sense of happiness). Social participation (focus on the person’s involvement in activities which provide interactions with others in society or the community) is a factor which is related to dimensions of anomie and subjective well-being. In this study, the characteristics of social participation were focused on the volunteering concept, which is an unpaid free will action that manifests itself as a benefit to other people, nature, or animals. In the study, there was used the European Quality of Life Survey (2011-2012), selecting from 258 questions given to Latvia the ones that refer to anomie (13 questions), subjective well-being (2 questions) and engaging in volunteering (6 questions). Latvian sample consisted of 1,009 respondents aged 18 to 92 years (M= 52.04; SD= 19), from which 65% were women (n= 657) and 35% men (n= 352). Firstly, it was found that social participation is related with subjective well-being (r=.18; r=.20; p < .001). Secondly, it was found that social participation (volunteering) was negatively related to such dimensions of anomie as social isolation (r= -.15; p < .001) and meaninglessness (r= -.18; p < .001), but not related to social distrust. While doing voluntary work and helping others, a person develops a sense of belonging and awareness of new important goals. Thus social participation decreases anomie and positively affects subjective well-being. It should be further explored, how to ensure social inclusion opportunities for people more effectively.
EMOTIONAL REGULATION AND MANAGEMENT OF EMOTIONS IN MODERN SOCIETY

Svetlana Gurieva
Olga Tararukhina
Saint Petersburg State University (Saint Petersburg, Russia)

Kawabata Takeyasu
Ikeda Kazuhiro
Shokei Gakuin University (Tokio, Japan)

Kõiv Kristi
University of Tartu (Tallin, Estonia)

Abstract body. Emotions provide timely behavioral responses associated with decision making in personally significant situations and promote interpersonal communication. Emotional regulation contributes to changing the process of the emergence and flow of emotions, including such aspects of emotional regulation as: regulation in significant situations, the involvement of motivation in regulation, the explicit and implicit nature of the goal of regulation of emotions. Managing the emotional state in modern society involves solving the problem on several levels: intrapersonal, interpersonal, intergroup, intercorporate, intercultural; different approaches: “top down”, “bottom top”, “integration of two directions”; different scientific fields: cognitive, conative, affective; and affecting the conflicting behavioral consequences of managing emotions, both for the individual and for society as a whole. The intrapersonal level— negative emotions, emotional states will be considered by L.V. Kulikov; interpersonal / intergroup level— Professors Takeyasu KAWABATA, Kazuhiro IKEDA, Tomoko OKUDA; internal corporate level— O.V. Tararukhina; intercultural / international — S.D. Gurieva, Kristi Kõiv.

Press paragraph. In our symposium “Emotional regulation and management of emotions in modern society” it is planned to hear presentations by leading foreign (Japan, Estonia, USA / Russia) and domestic experts dealing with anger management, negative emotions, the formation of negative attitudes, followed by neutralization, emotional the level within the organization, the formation of emotional and evaluative attitudes towards foreigners and many other aspects. It is assumed that the logic of the speakers will be implemented at different levels, directions, but in the following sequence. L.V. Kulikov, in his speech, will present the results of a study of coping with negative feelings using corpus linguistic techniques. Professors Takeyasu KAWABATA, Tomoko OKUDA, Kazuhiro IKEDA will be introduced to the author’s method of studying negative emotions, causal interpretation of situations of frustration, internal and external levels of control. O.V. Tararurikhina will consider the process of formation and manifestation of emotionally-colored relationships at the intraorganizational level (cross-cultural differences), introducing into the scientific circulation the term “interpersonal professional relations”. Professor S.D. Guriev, relying on the results of many years of research, will present the results of the author’s methodology on the influence of attributive phenomena on the process of forming the emotional-evaluative system of relations (at interethnic / inter-ethnic levels). Prof. Kristi Kõiv having a wealth of practical experience in conducting international research, will show the process of forming negative attitudes towards foreigners and techniques to neutralize negative emotional attitudes.

General summary of the Symposium. Regulation of emotional behavior, emotional control, from the way of active suppression of negative emotions (anger, anxiety, etc.) to the way of their transformation (transformation) is an urgent and complex problem. The reasons for the need to study this problem are associated with the
transformation of modern society, competitive relations that become the dominant social life (A.L. Zhuravlev, E.A. Zhuravleva, 2002). The main goal is to study the relationship of emotional regulation and control of emotions with the peculiarities of a person’s social behavior in various situations. The priority task is to prevent and prevent the manifestation of various forms of aggressive behavior (violence, anger, anxiety, aggression, hatred, etc.). As a result of the discussion of the plenary reports, answers will be received to the most complex and controversial questions: what are the ways of responding to complex situations of human interaction in society; how in sociocultural ideas there is an understanding of what is accepted and what is forbidden in the expression of emotions; directly related to the manifestation of negative emotions in relation to themselves, close people, others, foreigners; as well as socially acceptable and expected forms of their manifestation, prediction of situations that provoke them. In the framework of the Russian-Japanese partnership between St. Petersburg State University and Hokkai Gakuin University (Japan), Takeyasu KAWABATA and Tomoko OKUDA will present the results of studying the aggressive behavior of modern youth (Russian and Japanese) in order to identify the socio-psychological predictors of aggressive behavior and depression factors. The focus is on the influence of sociocultural and psychological factors that influence the process of emotional regulation and behavior of modern youth. L.V. Kulikov in his speech will present the results of the study, the purpose of which is to identify semantic fields in descriptions of coping with negative feelings using corpus linguistics methods. The obtained data allow us to reveal a number of characteristics of the concept of coping in the language picture of the world. S.D. Gurieva will show the mechanism of formation and manifestation of emotional and evaluative judgments, attitudes, stereotypes in the system of attitudes towards oneself, to a representative of one’s group, and to other social and cultural groups. O.V. Tararukhina considers interpersonal professional relationships, accompanied, on the one hand, by the need to manage and control emotions in work situations, on the other hand, problems of emotional exhaustion, depression, loneliness. Kristi Kõiv will answer the questions of modern society—why and how negative attitudes are formed in relation to the category of “other”, “alien” and ways to neutralize negative attitudes towards foreigners. It is supposed to share professional knowledge, experience and a positive attitude for effective cooperation.
PSYCHOLOGICAL INDICATORS OF SOCIAL DIFFERENTIATION IN ETHNIC RELATIONS

The purpose of this article is to solve some problems of psychological indicators of social differentiation in ethnic relations and interactions. We have presented the importance understanding the ethnic attitudes, which consist of beliefs, sights, opinion of people concerning history and modern life of their ethnic generality and interrelations with other people in a sample of three ethnic groups. Methods: Data was collected among representatives in two cities of the Russian Federation: in Vladikavkaz and St.-Petersburg. Total 1140 participants estimated on mark scale degree of emotional appeal of statements, belonging to known/unknown poets. In the first -without installation, literary fragments for the estimation which authorship is not known are given. In the second — with installation, which was offered through the certain period of time, the above-stated references were offered for estimation, but with instructions of their author's accessory installation on a national identity of each of the offered literary fragments. MANOVA was used to test and effect of adjust, of an ethnic accessory or of a residence to estimate statements. two-factorial dispersive analysis shows without installation of significant distinctions it has not been revealed in statements estimations. However, the ethnic accessory and installation (without/installation) have shown that influence of ethnic installation significantly p<.001. It is possible to tell that influence of adjusting effect has appeared more strongly, than an ethnic accessory or a residence. The results show that the ethnic attitude is rather than a residence can be caused of social differentiation in modern society.

EMOTION REGULATION AND WELL-BEING

Emotion regulation is to control, modify, and manage emotional experiences and the expression of emotions. It is a key factor to regulate emotion for better life. That is, whereas emotion regulation promotes positive aspects of human living: interpersonal functioning, intimacy in close relationship, and personal well-being, it also causes psychiatric problems. This symposium focuses on the relationship between emotion regulation and psychological well-being in various angles such as retelling effect on negative experiences, emotion control in cognitive behavioral therapy, and self-injurious behavior and anger.
THREE BALTIC COUNTRIES AND RUSSIAN UNIVERSITY STUDENTS’ ATTITUDES TOWARD FOREIGNERS.

Kristi Kõiv
Tartu University (Tallin, Estonia)

The present study examines similarities and differences between Estonian (N=118), Latvian (N=101) and Lithuanian (N=101) university students’ attitudes towards foreigners. Open-end questionnaire data results using quantitative content analyze from a sample of 320 students revealed that that students’ conceptual definitions of foreigners differ from the common elements of definitions of foreigners. Three Baltic countries university students were generally open and tolerant toward foreigners in the area of individual differences evoked from cultural enrichment, but their attitudes show some variation depending on the nationality of respondents. Students in three Baltic countries were agree, that foreigners have influenced them more positive than negative way, but the reasons of influence was different: Lithuanians empathize more sympathy and helping behaviour and Estonian more enlargement of knowledge’s with increase of tolerance. Acceptance or un-acceptance of foreigners depends on the level — foreigners were more accepted in personal level and un-accepted in cultural level (violence, discrimination, religious extremism).

WORKPLACE RELATIONSHIPS DRIVE EMPLOYEE WELLBEING

Olga Tararukhina
Saint Petersburg State University (Saint-Petesburg, Russia)

Workplaces are often thought of as full of stress and politics, anywhere in the world. Recently, the impact of these factors on employee wellbeing is increased by more recent advancements in job automation and digitization, coupled with mobility and increased connectivity demands lead to individuals’ disconnection from their established long-term relationships. Better interpersonal relationships at work can help overcome these impacts. Conditions for that are available to any human being: meet each relationship partner’s needs at each time in the relationship. To further specify this approach, a cross-cultural study of employee satisfaction in workplace relationships with their immediate leaders, peers, and others in their organization as well as preferred kinds of relationships and needs at each stage of relationships, revealed cultural specificity in Russia and USA. Study demonstrates that congruent with the societal cultures, workplace relationships help increase wellbeing of employees in each of the two countries.
LEXICO-SEMANTIC ANALYSIS OF COPING

Leonid Kulikov
Saint Petersburg State University (Saint-Petersburg, Russia)

The aim of the study was to identify semantic fields in descriptions of coping with negative feelings using corpus linguistic methods. The obtained data allow us to reveal a number of characteristics of the concept of coping in the language picture of the world. The language picture of the world serves as a basis for understanding the environment as a factor determining the state of the subject. The linguistic picture of a person is the basis for the subject to understand his feelings, emotions, moods. The data for the lexical-semantic analysis were obtained using the Russian National Corps. Each search query included a verb to cope, its synonyms to cope — to overcome, to withstand, to endure, to overpower, to master and one of 26 senses (their list was determined by previous studies). The first ten with the highest frequency (indicated in parentheses) occurrences included: fear (165), tension (68), longing (40), fatigue (30), boredom (29), anxiety (10), disappointment (7), gloom (7), sadness (6), confusion (4). A comparison of the lexical-semantic fields of negative feelings was made.
ATTACHMENT BASED EARLY INTERVENTION FOR YOUNG CHILDREN WITH INSTITUTIONAL EXPERIENCE FOLLOWING SUBSTITUTE FAMILY CARE

Rifkat Muhamedrahimov
Saint-Petersburg State University (Saint-Petersburg, Russia)

Daria Chernego
University of Delaware (Newark, USA)

Mary Dozier
University of Delaware (Newark, USA)

Liliya Aslamazova
Adyghe State University (Maikop, Russia)

Abstract body. Institutional care has multiple negative developmental outcomes, and young children who have lived in baby homes in Russian Federation face challenges as they move into substitute family care. Five presentations at this symposium will describe 1) family and child characteristics associated with the substitute care breakdown experience; 2) Attachment and Biobehavioral Catch-up (ABC; Dozier, 2005), a 10-session home visiting evidence-based early intervention program, which was adapted to help substitute parents to interact with their post-institutionalized children sensitively; 3) effects of the ABC intervention program on parental sensitivity and children's attachment in St.Petersburg (RF) sample of substitute families; 4) executive functions in children with institutional experience; and 5) diurnal cortisol production among young children following orphanage care. These outcomes will be discussed and embed in the larger literature regarding the effects of intervention program on biobehavioral development of young children with early adverse experience.

Press paragraph. The topic of this symposium is the effects of the Attachment and Biobehavioral Catch-up (ABC; Dozier, 2005), a 10-sessions home visiting early intervention program with evidence of efficacy at the behavioral and biological level, which was adapted to help parents in St.Petersburg (RF) substitute families interact with their young post-institutionalized children sensitively. Speakers (presenting authors in parentheses) from the joint St.Petersburg (RF) – University of Delaware (USA) study team will present five interconnected themes concerning 1) family and child characteristics associated with the substitute care breakdown experience (Liliya Aslamazova, Associate Professor, Adyghe State University); 2) ABC intervention program and its effectiveness (Mary Dozier, Professor of Psychological and Brain Sciences, University of Delaware, USA); 3) effects of the ABC intervention on parental sensitivity and children's attachment in St.Petersburg (RF) sample of substitute families (Karina Tumanyan, Graduate student, St.Petersburg State University); 4) executive functions in children with institutional experience (Iuliia Korshina, Graduate student, St.Petersburg State University); and 5) diurnal cortisol production among young children following orphanage care (Daria Chernego, Researcher, St.Petersburg State University). Each speaker will discuss the study results and embed them in the larger literature regarding the effects of intervention program on biobehavioral development of young children with early adverse experience.

General summary of the Symposium. Research data on developmental outcomes in postinstitutionalized children demonstrate that institutional settings, usually characterized by inadequate caregiving environment are associated with dramatic delays in physical, cognitive, and socio-emotional development (Nelson et al., 2007; Rutter et al., 2010; IJzendoorn et al., 2011; The St.Petersburg-USA Orphanage Research Team, 2008; McCall et al., 2016). For the last decade, significant changes associated with the reduction in the number of...
institutions for infants and young children and the transfer of most of these children to substitute families occurred in the Russian Federation child welfare system. At the same time there is lack of evidence-based intervention programs for accompanying substitute families, and the percentage of children that were returned to institutions is substantial. Attachment and Biobehavioral Catch-up (ABC; Dozier, 2005), a 10-session home visiting early intervention program with evidence of efficacy at both the behavioral and biological level was adapted to help foster parents in St.Petersburg (RF) interact with their young post-institutionalized children sensitively. The intervention was expected to enhance substitute mothers’ behavioral and young children’s behavioral and biological outcomes.

Presentations at this symposium will describe the early outcomes from a joint St.Petersburg (RF) – Delaware (USA) study assessing parental sensitivity in St.Petersburg sample of substitute and biological families, as well as attachment, executive functioning and diurnal cortisol production in young children in substitute families who participate in ABC intervention relative to children living in substitute families who did not participate in ABC program, children in institutions, and children in their biological families. These outcomes will be embedded in the larger literature regarding the effects of intervention program on biobehavioral development of young children with early adverse experience.

FAMILY AND CHILD CHARACTERISTICS ASSOCIATED WITH THE SUBSTITUTE CARE BREAKDOWN EXPERIENCE

Rifkat Muhamedrahimov
Saint-Petersburg State University (Saint-Petersburg, Russia)

Elena Vershinina
Russian Academy of Sciences (Moscow, Russia)

Liliya Aslamazova
Adyghe State University (Maikop, Russia)

The reverse side of the dynamically developing process of family placement of children in Russia is the problem of their secondary returns. Studies examining the experience of returning children from substitute families reveal its causes (Osipova, 2008; Palacios, 2012), the severity of the psychological consequences of returns (Kuftyak, 2012), as well as the positive effect of psychological support on family functioning (Allen, Vostanis, 2005; Dozier, 2005). This research is aimed at studying the features of children and socio-demographic characteristics of substitute families in connection with their refusal to continue the parenting of foster children. The study participants were substitute families raising a foster child (group 1 – 182 families), and refused to continue parenting (group 2 – 19 families) with the subsequent return of the child to the organization for orphans or transfer to another substitute family. The study was conducted using the methods of “Standardized interview for parents”, “List of traumatic experiences of the child” (Oslo, 2006). Analysis of obtained data was carried out using Fisher’s test, Mann-Whitney test, binary logistic regression with calculation of odds ratio (OR) and its 95% confidence limits. Results show that the strongest contribution to substitute family breakdown is made by degree of child’s traumatic experience ($\chi^2 (7, N=201)=84.67$, $p<0.001$; $OR=2.73$, $\beta=1.0$, $SE=0.37$, $p=0.007$) and minimum participation of the family in the intervention program ($\chi^2(2, N=201)=41.04$, $p<0.001$; $OR=1.78$, $\beta=0.59$, $SE=0.19$, $p=0.002$). Obtained data expands ideas about the functioning of substitute families who have taken children with significant traumatic experience, and indicate the need to improve quality of psychological and social support to substitute families as an important factor in prevention of secondary returns.
ATTACHMENT AND BIOBEHAVIORAL CATCH-UP EARLY INTERVENTION PROGRAM FOR CHILDREN AND PARENTS IN FOSTER FAMILIES

Rifkat Muhamedrahimov  
Varvara Anikina  
Maria Solodunova  
Saint-Petersburg State University (Saint-Petersburg, Russia)  
Mary Dozier  
University of Delaware (Newark, USA)

During 2012-2018 the number of young children in institutions in the Russian Federation has decreased, and the number of substitute families (foster, adoptive) has increased. This was possible due to a number of State Acts aimed at providing each child with a family. Often children living in institutions have delays in physical, cognitive, social, emotional development and behavior problems. This might be one of the reasons for the increased number of called "secondary refusals" when the child goes back to an institution or another foster family. So, programs for supporting substitute families are very needed. One of the programs proven its effectiveness is Attachment and Biobehavioral Catch-up (ABC) Early Intervention Program, developed by the group of researchers of M. Dozier (University of Delaware, USA). This approach is based on the attachment theory and consists of ten 1 hour long home visits once a week. The main targets are nurturing the child, following the child’s lead, and avoiding frightening behavior toward the child. Each of 10 visits has its own target, and the separate attention is paid to the parent-child interaction. For improving interaction, the parent coach makes so called in-the-moment comments, approximately 60 comments during 1 hour visit. The group of M. Dozier has done a number of studies aimed at ABC approach evaluation, and the results showed the improved both behavior and neurohumoral characteristics in children; moreover the long-term effect of ABC program was shown. We see that ABC program can be used for supporting Russian substitute families taking young children for several reasons, i.e. for facilitating the adaptation process for both family and the child; for forming more secure attachment relationships; for improving parenting and thus influencing positively child and parent mental health, — all of it aimed at family support and prevention of social and emotional problems in the long run. In order to do that the group of researchers of Saint-Petersburg State University and University of Delaware have started the pilot study of the effectiveness of ABC program for St. Petersburg (RF) substitute families with the aim of its future implementation in Russia.
EFFECTS OF THE ABC INTERVENTION PROGRAM ON PARENTAL SENSITIVITY AND CHILDREN’S ATTACHMENT IN ST. PETERSBURG (RF) SAMPLE OF SUBSTITUTE FAMILIES

Karina Tumanian  
Saint-Petersburg State University (Saint-Petersburg, Russia)  

Mary Dozier  
University of Delaware (Newark, USA)

Young children who have lived in institutions in Russian Federation are at risk for a range of negative developmental outcomes as a result of abuse, neglect and institutional experience. Nevertheless, there is a lack of evidence-based intervention programs for these children as they move into substitute (adoptive and foster care) families. Attachment and Biobehavioral Catch-up (ABC) is a short-term research-based intervention program created by Mary Dozier from University of Delaware, USA for vulnerable children and their parents. The ABC intervention program consists of 10 manualized sessions provided by a coach in the families’ homes, and aims to enhance sensitive parental behavior, to help parents following the child’s lead, and to enhance children’s attachment security and self-regulation. The current study examined the effectiveness of the ABC Intervention program on parental sensitivity and children’s attachment in the sample of Saint-Petersburg (RF) substitute families for children with early institutional experience.  

Parental sensitivity during the semi-structured mother-child play interaction was coded using scales adapted from the NICHD Observational Record of the Caregiving Environment (ORCE; NICHD ECCRN, 1996). The attachment quality was assessed using the Strange Situation Procedure (Ainsworth et al., 1978). Participants of the research included 30 parent-child dyads divided in two groups: substitute families received either the ABC Intervention (n=16) or available for substitute families in Saint-Petersburg intervention (n=14), which consists of one-time consultation with psychologist focusing on child development. This presentation at the symposium will describe the early outcomes on the effects of the ABC intervention program on parental sensitivity and children’s attachment in comparison with the effects of the usually available one-time consultation intervention program. The study outcomes will be embedded in the larger literature regarding the effects of intervention program on parental sensitivity and children’s attachment security. We expect that the results of Saint-Petersburg study will be used to improve the developing in Russian Federation system of multidisciplinary support for substitute families.
EXECUTIVE FUNCTIONS IN CHILDREN WITH INSTITUTIONAL EXPERIENCE

Iuliia Korshina
Marina Vasilyeva
Saint-Petersburg State University (Saint-Petersburg, Russia)

Elena Vershinina
Russian Academy of Sciences (Moscow, Russia)

Mary Dozier
University of Delaware (Newark, USA)

Rearing in institutional care is inevitably manifested in dramatically poor developmental outcomes, including severe deficits in executive functions (EF). It is well documented that EF impairments are prevalent in children with institutional experience as in the baby home conditions, and in the substitute family. To eliminate negative effects of early life adversity special intervention programs are needed. Those programs should be provided considering the context of relationships between a child and his primary caregiver as quality of early relationships is essential for EF’s skills development. To date, the most effective program for children with institutional experience is ABC (Attachment and Biobehavioral Catch-up (Dozier, 2005)). ABC is an evidence-based early intervention program for young children with maltreatment experience living in foster families in the USA, which focuses on the development of secure attachment and self-regulation capacities in children. The objective of the present study was to examine the EF development in young children with institutional experience and to evaluate the effect of ABC program on EF skills in children living in substitute families in Russian Federation.

Methods. Subjects were 4 groups of children (22—48 months) from: baby homes (n = 20), substitute families before (n = 9) and after (n = 9) participation in ABC program and biological families (n = 12). Two EF tasks were administered: snack delay and gift task (gift wrapped and gift delay).

MANCOVA, ANCOVA were used in data analysis. Results revealed children reared in baby homes and substitute families (before participation in ABC program) demonstrated significant deficits in EF skills when compared to their peers from biological families. Children living in substitute families showed significant improvements in EF performance after participating in the early intervention program in comparison with results before the ABC program. Results emphasize specific high-order cognitive processes may be dramatically impaired by early life adversity. Significant EF deficits remain evident even after the child’s placement to family care. An evidence-based early intervention program (ABC) is needed to ameliorate EF problems and to initiate a cascade of beneficial events for children and their parents in the Russian Federation.
DIURNAL CORTISOL PRODUCTION AMONG YOUNG CHILDREN FOLLOWING ORPHANAGE CARE

Daria Chernego  
Saint-Petersburg State University (Saint-Petersburg, Russia)

Kristin Bernard  
Stony Brook University (Stony Brook, NY, USA)

Christiana Martin  
Mary Dozier  
University of Delaware (Newark, USA)

Young children living in institutional settings often show a range of deficits in social, physical, and cognitive functioning. Whereas the diurnal production of cortisol has been examined among post-institutionalized children in a number of investigations, studies of children continuing to live in institutions are limited. In this study, we examined differences in diurnal cortisol production between institutionally-reared and family-reared children in the Russian Federation at two time-points. Children were recruited from institutions (Baby Homes) with improvement of some conditions (i.e., reduced caregiver/child ratio and training in responsiveness for caregivers). We assessed wake-up and bedtime cortisol among 73 children living in Russia, with 52 institutionally-reared (n = 31 at time 2), and 21 family-reared (n = 18 at time 2). The time from initial assessment to follow-up averaged 3.5 and 4.2 months for institutionally-reared and family-reared groups, respectively. Caregivers collected saliva samples from children twice daily (within 30 minutes of waking and immediately before bedtime) during a 3-day period. Samples were assayed using a high sensitivity salivary cortisol enzyme immunoassay kit (Salimetrics, LLC). Institutionally-reared children showed a blunter wake-up to bedtime slope than family-reared children at both time 1 and time 2, with significantly higher cortisol levels at bedtime. These findings highlight the deleterious effects of institutional care on children’s developing neuroendocrine regulation.
THE HEXACO MODEL OF PERSONALITY: EUROPEAN STUDIES

Marina Egorova
Lomonosov Moscow State University (Moscow, Russia)

Abstract body. The HEXACO personality model, which was developed in the context of lexical studies, was derived empirically in the late 1990s and includes six broad domain scales whose acronym is the basis for the name of the model: Honesty–Humility (H), Emotionality (E), eXtraversion (X), Agreeableness vs. Anger (A), Conscientiousness (C), and Openness to Experience (O). The model has been reproduced through studies in various countries and various languages, and is a revision of the five-factor personality model. Over the two decades comparable diagnostic questionnaires have been developed in different countries. The model has been used actively in both fundamental and applied studies, and it has been valuable in the analysis of a wide range of problems, from assessing academic achievement and management effectiveness to evaluating problem behavior and socially undesirable personality traits. This symposium focuses on the results of empirical research into the HEXACO model of personality structure.

Press paragraph. Symposium organizers: Reinout E. de Vries (Vrije Universiteit Amsterdam / University of Twente) and Marina Egorova (Lomonosov Moscow State University) HEXACO Personality, Three Nightmare Traits, and Organizational Attractiveness Reinout E. de Vries Vrije Universiteit Amsterdam, Amsterdam, The Netherlands Effects of HEXACO traits and level of provocation on attentional biases Bojana Dinić, Snežana Smederevac University of Novi Sad, Faculty of Philosophy, Department of Psychology, Novi Sad, Serbia HEXACO personality model: Relationships with obsessive-compulsive and depressive symptoms in a Spanish community sample. General summary of the Symposium. The subject matter of the symposium relates to three interconnected aspects of the analysis of the HEXACO model, which represent key directions in HEXACO research over two decades. First of all, in order to use the model in experimental research, it was necessary to develop adequate methods for diagnosing it. This was the first stage of HEXACO research in different countries (for example, Lee, Ashton, 2004; De Raad et al., 2014; Romero et al., 2015). Second, the appearance of a cross-language six-dimensional model of personality (HEXACO) proposed by M. Ashton and K. Lee inevitably had to result in a revision of assumptions regarding the relation between basic dimensions of personality and personality traits. It is no surprise that researchers were particularly interested in the Honesty-Humility factor-level trait, since the basic personality structure had not previously specified a factor related to moral aspects of behavior. Studies showed that the new personality structure that determined behavioral strategies was useful for understanding the role played in the overall personality structure by negative traits such as the Dark Triad (Lee, Ashton 2005; Book et al., 2015), the Dark Tetrad (Book et al., 2016), status-driven risk taking (Lee, Ashton, 2010), mate retention tactics (Holden et al., 2014), right-wing authoritarianism and social dominance.
orientation (Lee et al., 2010; Leone et al., 2012), and bullying and aggression (Book et al., 2012; Farrell et al., 2017; Dinić, Smederevac, 2018). Third, the six-factor personality structure was viewed as a new personality predictor for achievement (for example, Hilbig, Zettler, 2009; Zettler, Hilbig, 2010; De Vries, van Gelder, 2015).

**HEXACO PERSONALITY, THREE NIGHTMARE TRAITS, AND ORGANIZATIONAL ATTRACTIVENESS**

Reinout E.de Vries  
Vrije Universiteit Amsterdam (Amsterdam, Netherlands)

Organizations can suffer a great deal from employees who are low on Honesty-Humility, Conscientiousness, and Agreeableness, the so-called ‘Three Nightmare Traits’ (TNT). Preventing TNT employees to be attracted to the organization, may be a first line of defense in trying to prevent negative organizational outcomes in the long run. In this presentation, first of all I will focus on the background of the TNT using the HEXACO personality model, the situational affordances model, and the Situation-Trait-Outcome Activation (STOA) model. Second, I will present findings from a within-subject multi-organizational scenario study (N = 200), in which the relation between TNT personality and organizational attractiveness is investigated in eight scenarios that vary in the extent to which an organization has characteristics that are theorized to be desirable—or not—to potential TNT employees. Findings are discussed and practical suggestions are offered to thwart the expression and effects of these traits during attraction, selection, socialization, production, promotion, and attrition.
EFFECTS OF HEXACO TRAITS AND LEVEL OF PROVOCATION ON ATTENTIONAL BIASES

Bojana Dinić
Snežana Smederevac
University of Novi Sad (Novi Sad, Serbia)

According to hypervigilance hypothesis, traits related to aggression should be related to higher biases towards aggressive stimuli, i.e. slower reaction time on these stimuli. However, according to (schema) inconsistency hypothesis, opposite pattern should be found and biases would be occur towards stimuli unrelated to activated aggressive schema, i.e. to neutral or ambiguous stimuli. These hypotheses could not be seen as opposite if situational factors were introduced. We assumed that in no-provocation conditions hypervigilance hypothesis should be confirmed, and in provocation conditions — inconsistency hypothesis. The aim of this research was to examine effects of HEXACO traits and level of provocation on attentional biases. The focus was on traits related to aggression, such are Honesty-Humility and Agreeableness in the forefront, as well as Emotionality and Conscientiousness. The HEXACO-100 was applied to the 226 students, which were randomly assigned in one of the four provocation conditions: high-, low-, and two types no-provocation conditions in order to address previous concerns regarding validation of no-provocation condition. For induction of provocation Taylor Aggression Paradigm was applied. After exposure to this experimental manipulation, students participated in the emotional Stroop task in which successively three types of word were presented: neutral, agreeable, or aggressive. Results showed that low Honesty-Humility was related to biases towards aggressive stimuli, regardless of level of provocation. However, effect of Conscientiousness depended on the level of provocation. Lower levels of Conscientiousness were related to biases towards aggressive stimuli in no-provocation condition, but towards neutral stimuli in low-provocation condition. In high-provocation, there were biases towards neutral stimuli, i.e. reaction times were slower for all stimuli. Surprisingly, Agreeableness showed no significant effects. Results indicated that moral domains of personality were related to attentional biases towards aggressive content, but distinction between consistent personality trait effect (Honesty-Humility) and situational depended (Conscientiousness) could be made. Results highlight the role of Honesty-Humility in cognitive biases.
Current psychiatric diagnostic criteria proposed by the WHO (i.e., ICD-11) has turned from one categorical to a dimensional approach to better understand personality disorders. However, the potential relevance of personality dimensions in explaining other mental disorders, as depression (DEP) and obsessive-compulsive disorder (OCD), has yielded inconclusive results. The aim of this study was to provide data about the relationships between the HEXACO personality dimensions with OCD and DEP symptoms.

Method. A sample of 354 community individuals (64.3% women; M=33.88, SD=14.09 years) completed the HEXACO, the Beck Depression Inventory-II (BDI-II), and the Clark-Beck Obsessive-Compulsive Inventory (C-BOCI). From this sample, three groups were extracted: the DEP group included 21 individuals with subthreshold scores on the BDI-II (BDI-II≥18; 15 women; M=35.25, SD=15.26 years), the OCD group included 29 participants vulnerable to the disorder (C-BOCI≥25; 16 women; M=35.31, SD=15.60 years), and the non-clinical group included 31 subjects (17 women; M=37.74, SD=12.66 years) with low scores in both the BDI-II and the C-BOCI. The three groups did not differ on socio-demographic variables (age, gender, studies, and socio-economic level).

The Conscientiousness dimension explained 33% of BDI-II score in the DEP group, whereas low Extraversion and low Agreeableness explained 35% of C-BOCI score in the OCD group. The two at-risk to psychopathology participants differed from the non-clinical in all the personality dimensions, with the only exception of Honesty-Humility. The associations found between DEP and OCD symptoms with the HEXACO personality dimensions are highly consistent with the clinical presentation of the two disorders, which might be useful in clinical practice.
PROSOCIALITY AND HELPING BEHAVIOR WITHIN THE HEXACO MODEL — TWO-STUDY REPORT

Anja Wertag
Iva Šverko
Toni Babarović
Institute of Social Sciences Ivo Pilar (Zagreb, Croatia)

The HEXACO model accommodates important constructs that are beyond the space of classical Five Factor and Big Five models, including different forms of prosociality and altruism. Namely, in the HEXACO model, general prosocial versus antagonistic orientation is located between Honesty-Humility, Agreeableness and Emotionality factors, and each of these traits is linked to different form of prosocial behavior, which covers a broad range of actions that are intended to benefit others rather than oneself (such as cooperating, sharing, giving, helping, and comforting others). Apart from investigating the direct relations between personality traits and specific forms of prosociality, it is interesting to do it also indirectly, for example, by assessing the relations of personality traits and career preferences. Therefore, the aim of this report is to investigate relations between HEXACO traits and prosociality as well as some preferences for social careers in two independent studies. The first study aimed at investigating relations between HEXACO traits and prosociality on 680 college students. The data was collected on-line, using HEXACO-60 and Prosocial Personality Battery. Results of hierarchical analyses confirmed that Honesty-Humility, Agreeableness and Emotionality were most strongly related to prosociality as well as specific forms of it, reflecting theoretically meaningful relations. The second study explored the relations between HEXACO traits and social career preferences on a sample of 981 students at the end of their high school education. HEXACO-60, Personal Globe Inventory-Short and Values Scale-Short were administered on-line. It was observed that altruistic work values and interests in helping occupations can be best predicted by Emotionality and Honesty-Humility traits. On the other hand, values and interests that belong to more general social domain were best predicted by Emotionality and Extraversion. Taken together, the findings of this report provide additional insights in relations of HEXACO traits and prosociality, emphasizing the importance of HEXACO traits in explaining prosocial and helping behavior.
THE STRUCTURE OF THE RUSSIAN HEXACO PERSONALITY INVENTORY

Marina Egorova  
Lomonosov Moscow State University (Moscow, Russia)

The six-factor HEXACO model of personality structure, developed as a result of lexical studies, represents a revision of the five-factor model and includes Honesty–Humility, Emotionality, Extraversion, Agreeableness, Conscientiousness, and Openness to Experience. Ashton and Lee began efforts to develop a questionnaire that could be used to diagnose the personality traits described by the six-factor model back in 2000. Work was conducted concurrently in various countries and resulted in the formulation of comparable diagnostic methods. The HEXACO-PI-R inventory consists of 100 items and makes it possible to assess 6 factor-level traits and 25 facet-level traits. The structure of the 100-item Russian HEXACO-PI-R was the subject of the analysis. The study included two samples, one with 571 respondents (aged 16–84, 58.5% women) and another with 1,275 respondents (aged 16–79, 65.4% women). For part of the second sample, observer-reports were obtained in addition to self-reports. The results were correlated with the Big Five and the Dark Triad in order to assess convergent validity. Internal consistency reliability (alpha-Cronbach) for facet-level traits obtained for the 6 factors in the two samples were in the .70–.85 range. Correlation between factor-level traits averaged .11. Average correlation in assessing convergent validity equaled .59. Exploratory factor analysis (EFA) of the 100 items of the inventory confirmed its six-factor structure. Facet-level analysis (EFA of the 16 items comprising each factor-level trait, principal component analysis, varimax and oblimin rotation) yielded simple structures that support the hypothesized structure of the six factors. Confirmatory factor analysis (CFA) of the structure of each of the 6 factors was used to check three models: the first presumed a single latent factor for all 16 items comprising a facet; the second presumed four latent factors and correlations between four facets of a factor-level trait; the third presumed four first-order latent factors and one second-order factor that determined all four first-order factors. The results correspond partly to the second and partly to the third model: i.e., they do not refute expectations about the structure of each of the six factors, but they demonstrate a certain violation of the orthogonality of the facets.
HEXACO AND NEGATIVE PERSONALITY TRAITS

Marina Egorova
Lomonosov Moscow State University (Moscow, Russia)

The interest in research into negative personality traits — which was always a part of research into individual differences — was never a defining one for the subject and methodology of the research. However, analysis of the studies conducted over the past two decades shows that the indifferent attitude to antisocial deviations of the personality sphere is becoming a thing of the past. This largely reflects changes in perceptions of the basic personality structure that have occurred thanks to lexical studies. These studies have demonstrated that the personality trait domain is better described with the six-factor HEXACO model of personality structure and have introduced a new Honesty–Humility factor to the basic model of personality structure. Honesty–Humility is clearly linked with socially desirable behavior. Individuals with high scores in Honesty–Humility abide by moral norms regardless of the probability of punishment for violating the norms, and they are not prone to seek attention in public and become the object of praise and compliments, even if deserved.

The opposite pole of the factor correlates with demonstrativeness, lack of discrimination in means, and disregard for conventional norms and for the interests of others. Our study (>1,400 respondents, aged 16–79) analyzes the role of negative personality traits in the six-factor structure of factor-level traits. The analysis focused on the correlation of factor- and facet-level traits diagnosed using the 100-item Russian HEXACO-PI-R with basic values, the Dark Triad, Right-Wing Authoritarianism, Free Will and Determinism, Social Desirability, Ambiguity Tolerance–Intolerance, Sensation Seeking, Resilience and Life Satisfaction. The results of multivariate analysis show that negative personality traits have various correlations with all factor-level traits. At the same time, Honesty–Humility and Extraversion best explain the variation in negative personality traits related to violations of moral norms; Conscientiousness is most closely related to the variation in negative personality traits linked with rigidity; and Openness to Experience, low Conscientiousness, and low Emotionality are linked in particular with variation in negative personality traits related to disinhibition. The correlation between the links is mediated by Resilience and Life Satisfaction.
A LARGE-SCALE META-ANALYTIC INVESTIGATION OF THE HEXACO PERSONALITY INVENTORY (-REVISED)

Ingo Zettler
University of Copenhagen (Copenhagen, Denmark)

Isabel Thielmann
Benjamin E. Hilbig
University of Koblenz-Landau (Landau, Germany)

Morten Moshagen
Ulm University (Ulm, Germany)

In the last decade, the HEXACO Model of Personality has been used increasingly in personality and applied research. The vast majority of corresponding empirical studies have relied on a version (most commonly, 60-item, 100-item, or 200-item version) of the HEXACO Personality Inventory-Revised or its very similar predecessor, the HEXACO Personality Inventory (both referred to as HEXACO-PI-R in the following). To date, however, meta-analytic information on the HEXACO-PI-R is sorely missing. In a large-scale meta-analytic investigation, we addressed this gap by investigating internal consistencies, intercorrelations, and self-observer agreement of the HEXACO factors, as well as links to demographic variables. In our literature search, we included documents providing empirical results with regard to the HEXACO-PI-R up to October 2017. Across the analyses and HEXACO factors, the number of considered studies and the sample sizes differ, reaching $309 \leq k \leq 321$ and $243,066 \leq N \leq 247,364$ for the meta-analyses on the intercorrelations in self-ratings, for instance. Overall, we conducted several analyses, the most central ones of which will be presented. Across the analyses, results support the validity of the HEXACO-PI-R. In general, generalized internal consistency estimates were good, intercorrelations low, self-observer agreements high, and links to demographic variables in line with theoretical expectations. Discrepancies from the generally supportive findings for the HEXACO-PI-R, as well as important differences between different HEXACO-PI-R versions—considering both differences in the number of items and different language versions—will be presented. Our meta-analytic investigation supports the usefulness of the HEXACO-PI-R, in its different length and language versions, to assess a six-factor structure of personality in line with the HEXACO model. Moreover, it allows deriving recommendations for further improvement as well as open questions that will be presented finally.
METHODS OF COGNITIVE IMPAIRMENT AND ASSISTANCE TO CHILDREN AND ADULTS IN CORRECTIONAL PEDAGOGY AND PSYCHOTRAUMATOLOGY STUDY

Oksana Zashchirinskaia  
Saint Petersburg State University (Saint-Petersburg, Russia)

Udo Hagedorn  
Psychiatric and psychotherapeutic clinic (Berlin, Germany)

Elena Nikolaeva  
Herzen State Pedagogical University (Saint-Petersburg, Russia)

Abstract body. The Symposium is devoted to the methods of studying and correcting cognitive impairment. It is expected to present the results of studies of cognitive mechanisms of information processing and decision-making normally developing children and with intellectual disabilities. The speakers will present an analysis of the peculiarities of understanding of different formats texts by school students and students depending on age, clinical diagnosis and their individual experience. To register a process of perception used eye-tracker (eye-tracker). The reports will present the data on the formation of the mental model in preschool children 5-7 years and its correlation with cognitive decision-making mechanisms. Some reports reveal the possibility of using modern methods of studying cognitive impairment in ergo — and trauma therapy. The method of analysis of complex and psychotraumatic relations between people is shown. The results of the research are applicable in the field of correctional, clinical psychology and psychotraumatology.

Press paragraph. The relevance of the theme of the Symposium is due to the importance of studying the understanding of texts of varying degrees of complexity and correction of cognitive impairment in children at different stages of ontogenesis. Understanding the text, instructions-the basis of many human activities and interpersonal communication. At the same time, the mechanisms that promote and facilitate qualitative understanding are currently not sufficiently disclosed. Speakers from different countries (Germany, Russia, Bulgaria) will try to discuss the most problematic points of understanding and the possibility of its correction in children with mental retardation.

General summary of the Symposium. In the first report of Oksana Zashchirinskaia (Department of Pedagogy and Pedagogical Psychology, Saint Petersburg University, Saint-Petersburg, Russian Federation, zaoks@mail.ru) provide data on the understanding of texts by children with intellectual disabilities. It will describe the factors that complicate the process of understanding and facilitate it. In the second report, Hagedorn Udo (Psychiatric and psychotherapeutic clinic, Charité, Berlin, Germany, U. Hagedorn@alexianer.de) demonstrate the role of imaging in the treatment of cumulative trauma in the interpersonal process. In the third report, Veselina Kirilova (Varna, Bulgaria, The Center of psychology, veselina.kirilova@mail.ru) will present a comparative analysis of the treatment of cumulative injury in Russia and Bulgaria. In the fourth report of Natalja Medina Brakamonte (Department of Pedagogy and Pedagogical Psychology, Saint Petersburg University, Saint-Petersburg, Russian Federation, mbna@yandex.ru) will present the results of the assessment and the creation of conditions for the well-being of children. Discussant Elena Nikolaeva (Herzen State Pedagogical University, Saint-Petersburg, Russian Federation, klemtina@yandex.ru) will present its assessment of the reports made.
THE METHOD OF OCULOGRAPHY IN THE STUDY OF THE UNDERSTANDING OF TEXTS OF DIFFERENT VISUAL COMPLEXITY OF STUDENTS WITH MENTAL DISORDERS

Oksana Zashchirinskaia
Saint Petersburg State University (Saint-Petersburg, Russia)

The aim of the study was to identify and characterize the relationship of perception and understanding, defined by the example of images and texts with different degrees of blur of stimulus material. To identify patterns of efficiency of perception and understanding of texts and images of varying degrees of complexity, students used images and texts with different degrees of blurring of stimulus material. The study involved 25 students aged 19 to 25 years. Research methods included a survey and content analysis. The method of oculography (eye-tracking) was applied. Only used 15 incentives to 78 texts and images. The results of the study showed that the analysis of texts and comics for students is characterized by fixation on important for understanding the details and characters of the plot. The subjects identify key image fragments for a common understanding of their content. The psychophysiological aspect of the process of recognition of nonverbal patterns affects the success of the projective identification of the end of the pictorial story. A survey of 120 students aged 9-10 years with varying degrees of decline in intelligence showed that when reading and analyzing texts, the degree of clarity of the texts has an impact on the understanding of the read. The number of visual fixations increases with difficulty recognizing words and reduces the contextual understanding of the read. An important result is the assessment of the importance of volitional efforts for effective text recognition. The data obtained allow us to say that the integral visual and textual images based on the system analysis of stimuli in young people arise.

Conclusions.

Strong-willed regulation of cognitive processes in normative developing children and adolescents allows them to identify the main parts of images and key words for understanding visually perceived information constructs when reading texts. For students with intellectual disabilities is characterized by fixation on emotionally colored parts of the images, low pertinence in the analysis of test fragments, improving the relevance of the search for meaning based on social intelligence.
SPECIALIZED METHOD OF VISUALIZATION IN TRAUMA THERAPY OF CHILDREN AND ADULTS

Udo Hagedorn
Psychiatric and psychotherapeutic clinic (Berlin, Germany)

In the context of clinical, psychiatric and psychological care of patients it is especially important and efficient to visualize difficult relations and relational structures with the help of a visualization method. We have created the visualization tool «Sieben schlaue Köpfe» (eng. «seven clever heads»). The user is able to conceptualize his own relational structures with the use of “face-stamps” with associative expressions in combination with colored pencils to draw the individual relations. With this method the user receives a better understanding of his own situation and an overview displayed on the paper. The method of analyzing complex and traumatic relationships between people is applicable in the field of pedagogical and clinical psychology, family counselling, individual counselling and traumatology. We conducted a study of 77 women and 8 men (Russia — Germany — Bulgaria) who have experienced cumulative trauma of interpersonal relationships. The age of the examined patients ranged from 18-25 years — 9.4%, 26-35 years — 30.6%; 36-45 years — 45.9%; 46-55 years — 9.4%; 56-65 years — 4.7%. The results showed that the following characteristics of the trauma process with a certain factor weight were dominant: manifestations of depression (factor weight — 0.737), memories of images (0.676), the desire to retire (0.640), flashbacks (0.633), a return to discomfort (0.630), frequent fright (0.617). In terms of providing clinical and psychological assistance to patients, visualization of important people in our lives and difficult relationships between close people is particularly effective. Working with color and shape reveals all the features of relationships that develop with relatives, children, colleagues, partners. Special attention is paid to the structural mapping of relationships, human communication systems, feelings and analysis of emotions. The systemic effect of this method is based on the necessary "micro-solutions", which are taken in the process of self-image creation of relationships with people. It is associated with a General associative self-perception in situations of communication. The method of analysis of complex and psychotraumatic relations between people is applicable in the field of pedagogical and clinical psychology, family and individual counseling, in psychotraumatology.
METHODS OF STUDYING CUMULATIVE PSYCHOTRAUMA: ON THE EXAMPLE OF CLINICAL AND PSYCHOLOGICAL STUDY OF THE MENTAL STATE OF ADULTS FROM RUSSIA AND BULGARIA

Oksana Zashchirinskaia  
Saint Petersburg State University (Saint-Petersburg, Russia)

Veselina Kirilova  
Psychological Center (Varna, Bulgaria)

Psychological trauma is very common in the modern human population, has certain causes and consequences for the functioning and adaptation of the individual. Based on the analysis of theoretical sources, the specific features of cumulative traumatic experience in interpersonal relationships were considered. The aim of the empirical study is the characteristics of experiencing traumatic experiences in adults in Bulgaria and Russia.

Materials and methods. The study involved 85 participants. Subjects filled out informed consent, a demographic questionnaire. The methods of the study are the «Post-Exercise Reaction Scale», «Baseline Belief Scale» and «Status Assessment Scale, Interviews on Complex Posttraumatic Stress Disorder» (according to G. Fisher). Mathematical and statistical methods of analyzing empirical data were used—content analysis, factor analysis, and analysis of the reliability of differences. The respondents identified three main types of psycho-trauma of interpersonal relationships: trauma of betrayal (divorce, treason, insult at work, theft and separation); trauma resulting from violence (mental and physical); trauma of loss (death of loved ones and death of animals). Psychotrauma due to external events arose after car accidents, fires and snake bites. The specificity of traumatic experience forms the features of experiences, manifested in the features of interpersonal contacts, the specific of self-perception, the features of post-traumatic manifestations. Features of injuries associated with interpersonal relationships (loss, betrayal, etc.) determines the features of post-traumatic reaction: stable emotional States with feelings of guilt, anger, irritation, the specifics of victimization and self-destructive behavior. The experience of traumatic experience is manifested in people from two countries in 1) the process of social disadaptation; 2) the peculiarities of the emotional state; 3) the perception of yourself and your social environment. For Russians are characterized by a more trusting relationship with others, the adoption of their own destiny, belief in good and justice. The same for Bulgarians and Russians is the presence in feelings of feelings of guilt and shame.
METHODS OF ART-PEDAGOGICAL INFLUENCE ON EMOTIONAL INTELLIGENCE OF CHILDREN IN EDUCATIONAL ENVIRONMENT

Oksana Zashchirinskaia  
Natalia Brakamonte  
Saint Petersburg State University (Saint-Petersburg, Russia)

The method of art-pedagogical influence allows you to develop and adjust: the ability to recognize and control your feelings; the ability to understand and accept your feelings; the ability to use your emotions for the benefit of yourself and others; to recognize and recognize the feelings of others, to imagine yourself in their place (for example, empathy); the ability to communicate with children, adults (parents, teachers). The longitudinal study was conducted on the basis of preschool organization for 4 years. The sample consisted of 20 families with one and two children aged five years. The method of art pedagogy included game therapy, art therapy and psychogymnastics, including training to improve parent-child relationships, creating a favorable atmosphere in the group (11 classes with a set of exercises), various developmental individual classes for children, consultations for parents. Psychodiagnostics: conversation, observation of child-parent relationships, individual observation of children and in the group, the questionnaire of parental attitudes, the test "strategy of family education", drawing tests, anxiety test. In 30% of the surveyed families there is a moral and physical abuse of the child, including by one parent or by older children; in 40% of cases the parents are divorced or unmarried, but nevertheless both are involved in the upbringing of children; 30% of children are underdeveloped. In the transforming experiment 60% of children, 45% of them—within 1-3 years, of them 22.2% —within three years. 80% of children revealed anxiety and problems with communication, behavior. There is a significant relationship between the indicators of anxiety in the child and the style of education in the family, the relationship of the parent to the child. Systematic work both with children and together simultaneous work with parents allows to reveal the most vulnerable sides of manifestation of emotion from both sides. Joint execution of exercises, modeling, drawing, elements of applied art allow expressing feelings both in the process of work, and at the time of obtaining the result and its evaluation. The experience of joint experiences has a positive impact on the construction of communication in the future.
ON THE VARIETY OF AUTOBIOGRAPHICAL MEMORIES:
MAPPING THE FIELD

Abstract body. Autobiographical Memory (AM) is a uniquely human cognitive device which provides a database for the self-concept and self-esteem, contributes to our feeling of self-coherence over time, and predicts the occurrence of personal events that might happen in the future. Recently, our understanding of AM has provided a starting point for the study of event memory, broadly defined. This symposium brings together researchers who are leading this next wave of AM-inspired event-memory research and in so doing provides a state-of-the-art overview of developments in the area. In particular, the speakers will address the following topics: flashbulb memories, vicarious memory, non-believed memories, memory for fictional events, prospective memory, and lab-based imitation of Compressed Life Review.

Press paragraph. Autobiographical Memory (AM) provides a database for the self-concept and self-esteem, contributes to our feeling of self-coherence over time, and predicts the occurrence of personal events that might happen in the future. Recently, our understanding of AM has provided a starting point for the study of event memory, broadly defined. This symposium brings together five researchers who are leading this next wave of AM-inspired research and in so doing provides a state-of-the-art overview of developments in the area. Jennifer Talarico (Lafayette College, USA) will present a cross-cultural study examining flashbulb memories for the Fukushima nuclear disaster among three European samples. Giuliana Mazzoni (University of Hull, UK) describes a research investigating with non-believed memories, i.e. memories which are believed to have never occurred. The research described by Norman Brown (University of Alberta, Canada) will compare personal-event memories, vicarious-event memories and fictional-event memories. Arnaud D’Argembeau (University of Liège, Belgium) will share the data on personal goals and subjective sense of realness of future autobiographical events. Veronika Nourkova (Lomonosov Moscow State University, Russia) will talk about the first lab-based study focused on extreme manifestation of autobiographical memory — Compressed Life Review, i.e., the experience of having “your life flash before your eyes.”

General summary of the Symposium. Autobiographical memory is a uniquely human mnemonic system that forms a network of mental representations of personal experiences and integrates them into an overarching life story. Much effort has been devoted to explore this cognitive device for processing self-relevant information. However, the phenomenology of autobiographical memories varies in multiple dimensions: some memories are vivid and others dim; some are emotionally intense and others lack emotional content; some are convincing and others uncertain; some are strictly about one’s own activities and others focus on other people; some are culturally universal and others are culturally specific. This diversity calls for a new generation of autobiographical memory research, expanding the methodological repertoire and that
is also producing novel empirical findings which would increase our understanding of a broader class of relevant psychological phenomena. The proposed symposium aims to shed light on the nature and functions of the various forms of autobiographical and autobiographical-like memories from partly competing theoretical perspectives (e.g., Self-memory System, Life-script Theory, Transition Theory, Cultural Dynamic Theory). Five speakers will give talks at this symposium. J.M. Talarico will present a cross-cultural study examining flashbulb memories among three European samples. G. Mazzoni will report the results of studies that have detailed the characteristics and behavioral consequences of holding non-believed memories. The research described by N. Brown will compare personal memories, vicarious memories and fictional memories. A. D’Argembeau will share the data on personal goals and subjective sense of realness of future autobiographical events. V. Nourkova will talk about the first lab-based study focused on extreme manifestation of autobiographical memory — Compressed Life Review, i.e., the experience of having “your life flash before your eyes.”
NATURE AND IMPLICATIONS OF NON-BELIEVED AUTOBIOGRAPHICAL MEMORIES

Giuliana Mazzoni
University of Hull (Kingston upon Hull, United Kingdom)

Autobiographical memory is a powerful system that supports both the creation of a personal history and personal identity, on one hand, and the successful negotiation of everyday life tasks, on the other. Typically, personal memories have a recollective quality (i.e. being able to travel back to the time of the experience, relive it, etc) that provide information about the reality of the experience they represent. However, this is not always the case. In a seminal work (Mazzoni et al, 2010) it was found that at least 20% of the population report at least one personal memory which is no longer believed in. In other words, the event represented in the memory is believed to have never occurred by the same individuals who hold the memory. Here I report the result of a number of studies that have detailed the characteristics of these memories, the processes that are possibly involved in their creation and in the belief withdrawal, as well as the consequences of having memories for personal events that never occurred. Summarizing briefly the results of these studies, non-believed memories can be about very mundane as well as rather bizarre events, they maintain a recollective quality that is equal to true memories, they tend to be more negative, the events refer mainly to childhood, and the decision to stop believing in them occurs mainly during adolescence. In addition, there are several types of non-believed memories. What we called the ‘classic’ type is characterised by high recollective qualities and low belief. Others vary in the degree of the initial recollective quality or belief. We also examined the reason for withdrawing the belief, observing that the main factor is social feedback, followed by the realization of a mismatch between the content of the memory and other elements in the personal biography. Finally, these studies have shown that holding a non-believed memory has consequences for behaviour and decision-making. The results of these studies will be discussed in light of a potential dissociation between recollection and belief in occurrence in autobiographical memory.
BELIEF IN OCCURRENCE FOR FUTURE AUTOBIOGRAPHICAL EVENTS

Arnaud D’Argembeau
University of Liège (Liège, Belgium)

The ability to imagine events that might happen in one’s personal future—referred to as episodic future thinking—has received much attention in recent years. Research has shown that memory provides the sources of details for imagining events, but questions remain as to what gives the subjective sense that an imagined experience belongs to one’s personal future. Based on previous research on metacognitive appraisals in autobiographical memory, we proposed that episodic future thinking involves, in varying degrees, a subjective sense that an imagined event will materialize in the future (belief in occurrence) and a feeling of “pre-experiencing” the future (autonoetic experience). Recent studies suggest that these cognitive feelings depend on the sensory-perceptual characteristics of mental representations (e.g., vividness) and their integration with autobiographical knowledge (e.g., by linking imagined events to personal goals and expectations about one’s life). In this talk, I will present two studies that aimed to better understand this role of autobiographical knowledge. The first study manipulated degrees of belief in occurrence across imagined events. Participants were asked to imagine three types of events: personal future events associated with high and low degrees of belief in occurrence, and experimenter-provided fictive events. The results showed that events that were associated with high belief in occurrence were judged more important for personal goals. In a second study, we investigated further the influence of goals on cognitive feelings when imagining events. Participants were asked to imagine future events associated with self-concordant goals (what they want to achieve) or non-self-concordant goals (what they have to achieve). We found that self-concordant events were associated with higher belief in occurrence and autonoetic experience than non-self-concordant events. Taken together, these findings suggest that the perceived “reality” of imagined future events depends on their integration with personal goals. This subjective sense of realness may in turn play a key role in motivation and successful goal pursuit.
ME, YOU, AND HARRY POTTER: ON THE ORGANIZATION AND RETRIEVAL OF PERSONAL-EVENT MEMORIES, VICARIOUS-EVENT MEMORIES, AND FICTIONAL-EVENT MEMORIES

Norman R. Brown
Liangzi Shi
University of Alberta (Edmonton, Canada)

It is common to assume that fictional-event memory, vicarious-event memory and personal-event memories are processed in much the same way. The present study examined this widely accepted, but little investigated assumption. To do this, we selected well-established autobiographical memory (AM) methods (timed word-cued and event-cued event retrieval, retrieval-strategy menus, event-pair relation menus) and used them to compare directly AM with (a) vicarious memory (VM) and (b) Potterbiographical memory—event knowledge gained from the Harry Potter (HP) series. In general, performance in the HP and VM conditions was very similar to performance in the AM condition. Specifically, direct retrieval was common when participants responded to word cues (~60%) and even more common when they responded to event cues (~80%). Moreover, directly-retrieved memories were recall much more rapidly (~3.5 sec), on average, than ones that required participants to generate additional cues (~12.5 sec). In all three conditions, event cues often elicited cluster-mates (i.e., participants indicated the cued and cueing events were causally related, part of the same plot line, or that one subsumed the other) and events in clustered pairs were judged to have occurred closer together in time that events in non-clustered pairs. However, it turned out clustering was more common in the HP condition (75%) than in the AM condition (65%) or the VM condition (67%). In addition, we found that HP event pairs (75%) and VM event pairs (74%) were more likely to refer to the same individuals than AM event pairs (63%). Taken together, these findings support the notion that personal-event memories, vicarious-event memories and fictional-event memories are retrieved and organized in a similar manner and suggest that observed differences reflect mnemonically relevant ways in which life fails to imitate art.
CLARIFYING THE ROLE OF SOCIAL IDENTITY IN FLASHBULB MEMORY FORMATION

Jennifer M. Talarico
Lafayette College (Easton, USA)

Flashbulb memories are vivid, confidently-held, long-lasting memories for the personal circumstances of learning about an important public event. Because not all public events are remembered this way, a critical question is determining which event characteristics predict the development of flashbulb memories. Many existing theories of flashbulb memory formation suggest that the key event feature of "importance" is determined, in part, by social group membership (e.g., Berntsen, 2009; Wang & Aydin, 2017). I will argue that it is not simply relevance to one's social group but also whether an event is congruent with pre-existing beliefs and/or popular opinion that influences if flashbulb memories are likely to result. In support of this claim, I will present evidence from a cross-cultural study examining flashbulb memory prevalence among individuals from three European countries. First, I will examine how the Fukushima nuclear disaster, specifically, is evaluated and remembered by each group. Due to the prominence of nuclear energy in ongoing political discussions in Germany and the Netherlands, participants from both countries should have found the event to be relevant. However, while the disaster was congruent with German beliefs about the dangers of nuclear energy, it was incongruent with broad Dutch support for nuclear power. In contrast, energy policy is not a dominant issue in Danish political discourse and therefore, the Fukushima disaster should not have had particular salience to the Danes. Evaluations of event importance, consequentiality, and emotion will be assessed as will the resulting memory characteristics of vividness and confidence among all three groups. Second, I will demonstrate how spontaneously generated flashbulb memories differ as a function of nationality. Although we expect some events to be common across all three groups (e.g., the September 11th attacks in the U.S.), other events are likely to be recalled by citizens of each country exclusively (e.g., the Berlin Christmas market attack for Germans, the Koninginnedag parade attack on the royal family for the Dutch, and the Utøya massacre for Danes). Although more directly related to the dimension of relevance than congruence, these data should speak to the influence of social identity on individual memory processing.
THE COMPRESSED LIFE REVIEW: ON EXTREME MANIFESTATION OF AUTOBIOGRAPHICAL MEMORY

Veronika Nourkova
Lomonosov Moscow State University (Moscow, Russia)

The Compressed Life Review (CLR) is an intriguing mental phenomenon implying extreme manifestation of autobiographical memory (AM). Although the CLR may be interpreted as a kind of metaphor or a retrospective memory illusion, this experience of having “your entire life flash before your eyes” is typically associated with survivor’s self-reports after life-threatening situations. This latter point indicates that the CLR phenomenon might be of high adaptive value. The scientific research of the CLR in the real life situations has been confounded both by methodological limitations and by trivial ethical reasons. As a result, next to nothing is known to date about neither cognitive mechanisms nor brain activity patterns, which underlie the CLR. To overcome this challenge we developed a first lab-based experimental technique aimed for eliciting the CLR with no risk to participants. This novel technique consists of parallel presentation of audio stimulus addressing to an individually composed set of self-defining memories. In our previous studies we have demonstrated that significant minority of naïve participants after perceiving such a stimulus reported an illusion of “total recall”. 20 trained volunteers participated in eye-tracking study and a half of them also passed through fMRT scanning. In the experimental condition the participants listened to a 6-voices “choir” of verbal references to their self-defining memories. In the control conditions they were presented either single or doubled, or quadrupled AM references or, additionally, the same combination of neutral words. The CLR stimulus triggered a lower number and enhanced duration of fixations, together with a lower number, amplitude, and speed of saccades than all control conditions except for the condition of the recollection of a single autobiographical episode. In other words, eye movements in the CLR condition were found to closely match the gaze patterns in typical memory retrieval. These data suggest that the CLR stimulus evokes memory, not the orienting response to complex stimuli. The examination of fMRI data revealed, that the CLR stimulus engages a network of predominately left lateralized and medial brain regions. We detected statistically significant regional activations consistent to the network of regions activated across AM imaging studies. The reported study was funded by RFBR according to the research project № 19-013-00387
EVIDENCE IN SCHOOL PSYCHOLOGY: WHAT COUNTS?

Christopher Arnold
British Psychological Society/ DECP (Rye, United Kingdom)

Bohumíra Lazarová
Masaryk University (Brno, Czech Republic)

Mojca Juriševič
University of Ljubljana (Ljubljana, Slovenia)

Jose Antonio León
Universidad Autónoma de Madrid (Madrid, Spain)

Abstract body. Psychology has been applied in educational settings for more than a century. Increasingly professionals are being asked to justify and be accountable for their work. These key questions are being addressed by using evidence of efficacy from studies in practical situations. This seminar will present two different, but complementary themes. First there is a discussion about what kind of evidence is used in this area, second there are three examples of the use of evidence to both justify the work and improve the efficacy of the interventions. The case studies are drawn from a range of European locations including the Czech Republic, Slovenia, Spain, UK, Hungary and Eire. The audience will be invited to consider what constitutes evidence in their work settings.

Press paragraph. Bohumíra Lazarová and will present research from the Czech Republic considering the data from a survey undertaken in the Czech Republic and Slovenia. It looked at how they use research from other sources as well as how they carry out research in applied settings. Jose Leon from Spain will present a study on reading competence in adults with intellectual and developmental disability when they read texts with different complexity. This study uses evidence collected in a standardized way to consider how such students can be helped to improve their reading competence. The results are impressive with some students attaining levels normally associated with university students. Christopher Arnold will present a method of gathering evidence about local conditions which cause risks to young people dropping out of education (also known as Early School Leavers. The project has been used in 5 EU locations to provide evidence to identify young people at risk of leaving education early and implement preventative strategies to reduce the incidence. The cost:benefit analysis will be presented.

General summary of the Symposium. The need to account for the work of psychologists in education by using evidence of efficacy is growing in many countries. This is leading to a debate about the different kinds of evidence which can be used. This seminar will present examples of different kinds of evidence used in educational settings across six nations. The appropriate use of research can be very cost effective particularly when the benefits are measured systematically. The studies will include methods to improve literacy amongst students with disabilities, a method to analyse risk factors leading to young people dropping out of education and how to use this information to target resources in a preventative manner, and a study in two nations which considers educators’ uses of research and research methods.
IS THE PRACTICE OF PSYCHOLOGISTS IN EDUCATION EVIDENCE-BASED?

Mojca Juriševič
University of Lubliana (Lubliana, Slovenia)

Mirka Lazarová
Lazarová Bohumíra
Masarykova Univerzita (Brno, Czech Republic)

The Evidence-based practice (EBP) movement has become an important feature of health care policy in many European countries and requires new approaches in professional areas such as nursing, social work, psychotherapy, education and also, all applied fields of psychology. Evidence-based practice is an integration of science and practice. It should be based on the most up to date valid and reliable research findings and reduce the gap between theory and practice. In social sciences and in psychology in education as well, we often face fluid and uncertain nature of knowledge and school psychologists are struggling with uncertainty and doubts about the effectiveness of their interventions. The supporters of the idea of EBP point to many benefits: increase of effectiveness through the institutionalized of standardized rational procedures, professionalism and transparent accountability. To widen the concept of EBP into school counseling service is one of the common efforts of the SC EFPA Psychology in Education. At first, we ask ourselves, how the reality looks in the individual countries to get the "evidences" about using evidence-based interventions in school psychological practice. In the symposium, we are presenting and comparing selected data from a survey realized in Czech Republic and, Slovenia. We asked psychologists in education about their experience with the use of research findings or standardized guidelines (created at the local or national level), if/how their carry out the different kinds of empirical research, and how they evaluate the meaningfulness and effectiveness of their interventions. We were also interested in the fact how they perceive the support from different subjects or stakeholders in relation to EBP issues, and what their educational or other needs in the given area are. Finally, at the symposium we are going to open the discussion based on the presented comparative study and formulate the ways how the SC EFPA Psychology in Education can support psychologists in education in their effort to base their interventions on the empirical evidences and enhance the quality of psychological practice in education.

A STUDY ON READING COMPETENCE IN ADULTS WITH INTELLECTUAL AND DEVELOPMENTAL DISABILITY WHEN THEY READ TEXTS WITH DIFFERENT COMPLEXITY

Jose Antonio León
Universidad Autónoma de Madrid (Madrid, Spain)

The aim of this study was to analyze the level of reading competence in adults with Intellectual and Developmental Disability (AIDD) in Madrid Region. They read several texts of different lexical and semantic complexity. Sixty-one adults with intellectual disability and 31 undergraduate university students took part in this study. The results showed that AIDD improve their performance in reading comprehension tasks when the necessary time and supports are available. Thus, if a greater amount of time is available, the performance of a significant part of the AIDD improves considerably, in some cases getting close to the performance of university students. The education level of AIDD was decisive in their performance in the different tests.
A PREVENTATIVE APPROACH TO REDUCING DROPOUT RATES — COLLECTING THE EVIDENCE

Christopher Arnold
Itl Principal Psychologist (Rye, United Kingdom)

Early school leaving (ESL) is an expensive waste of human resources and results in much poorer outcomes for the young people involved. The EU allocated 21 billion Euros a year for the Youth Guarantee Programme whilst an estimated 153 billion Euros represent the cost of youth unemployment across the Union. The costs of preventing youth Drop out are much less than those of interventions designed to restore the young person into any kind of economically active role. This research builds on studies carried out initially in the UK. Local statistics are gathered to assess what contextual factors represent a risk for young people which might lead to dropping out. It collects evidence which enables services to screen populations in order to identify the most risky young people. This allows the services to target their resources to the most vulnerable. The method has been used successfully in 5 EU locations (via an Erasmus+ grant). The paper will discuss the method of analysis and the results of the programme.

ENVIRONMENTAL PSYCHOLOGY. NEW APPROACHES TO TRANSITION TOWARDS A SUSTAINABLE FUTURE

Elena Sautkina
Lapina Sofia
National Research University Higher School of Economics (Moscow, Russia)

Stuart Capstick
Cardiff University (Cardiff, United Kingdom)

Maria Ojala
Örebro University (Örebro, Sweden)

Bonnefoy Barbara
Paris Nanterre University (Paris, France)

Abstract body. Today, the problem of global environmental change is becoming of an unprecedented importance as society is increasingly facing its psychological, health, social, demographic and economic consequences. By addressing such constructs as environmental awareness, environmental concern, environmental values and norms, nature connectedness and behaviour change, the role of Environmental Psychology role is to analyse and indicate levers of successful transition towards a sustainable future. We discuss cutting-edge research on the topics of climate change perceptions and potential for individual action, climate change worry as a catalyst of pro-environmental action, sustainable food consumption and its links with well-being, environmental policies as tools for behaviour and attitude change, and factors driving enterprises to adopt pro-environmental practices. In doing so, we use various theoretical perspectives, different methodologies including longitudinal, national and cross-national studies conducted in eight countries and three continents, and varying populations ranging from general public to children and chief executives.

Press paragraph. Today, the problem of global environmental change is becoming of an unprecedented importance as society is increasingly facing its psychological, health, social, demographic and economic consequences. In these circumstances,
Environmental Psychology research plays a major role in helping to resolve the clock-ticking task of minimising the destructive impact of human activity on our common environment. This symposium brings together environmental psychologists from different countries to present and discuss new theoretical, methodological and practical approaches in Environmental Psychology, and reflect upon levers of transition towards a sustainable future. Dr Stuart Capstick (Cardiff University, UK) will talk on ‘Public perceptions of climate change worldwide and the potential for individual action’. Dr Maria Ojala (Örebro University, Sweden) will present on ‘Climate change worry among early adolescents: A sign of empowerment or of low well-being?’. Dr Barbara Bonnefoy (Paris Nanterre University, France) will talk on ‘Nature connectedness, sustainability and wellbeing: an exploratory study of food consumption’. Dr Elena Sautkina (Higher School of Economics, Russia) will present on ‘Habit Disruption, Behaviour Spillover and Policy Spillover Effects of the English Plastic Bag Charge’. Sofia Lapina (Higher School of Economics, Russia) will present on ‘Psychosocial factors of senior executives’ preparedness to introduce pro-environmental practices in their companies’.

General summary of the Symposium. Today, the problem of global environmental change is becoming of an unprecedented importance as society is increasingly facing its psychological, health, social, demographic and economic consequences. In these circumstances, Environmental Psychology research plays a major role in helping to resolve the clock-ticking task of minimising the destructive impact of human activity on our common environment. By addressing such constructs as, for example, environmental awareness, environmental concern, environmental values and norms, nature connectedness and behaviour change, the role of Environmental Psychology is to analyse and indicate levers of successful transition towards a sustainable future. The aims of this symposium are: (1) bring together environmental psychologists from different countries to present and discuss new theoretical, methodological and practical approaches to enabling sustainable transitions; (2) stimulate cross-paradigm and cross-cultural dialogue on these common topics that affect our countries; and (3) further draw attention of the European Psychology community generally, and of the Russian Psychology community in particular, to the fact how our discipline can theoretically and practically contribute to resolving the pressing global issues of environmental change. We will discuss cutting-edge research on the topics of climate change perceptions and potential for individual action, climate change worry as a catalyst of pro-environmental action, sustainable food consumption and its links with well-being, environmental policies as tools for behaviour and attitude change, and factors driving enterprises to adopt pro-environmental practices. In doing so, we use various theoretical perspectives, different methodologies including longitudinal, national and cross-national studies, conducted in different cultural contexts totaling eight countries and three continents, and varying populations ranging from general public to children and chief executives.
HABIT DISRUPTION, BEHAVIOUR SPILLOVER AND POLICY SPILLOVER EFFECTS OF THE ENGLISH PLASTIC BAG CHARGE

Elena Sautkina
National Research University Higher School of Economics (Moscow, Russia)

Gregory Thomas
Emily Wolstenholme
Wouter Poortinga
Cardiff University (Cardiff, United Kingdom)

Plastic bag charges are popular and easy-to-implement policy instruments that can successfully reduce plastic bag use, a common waste-related habit, and a cause of environmental pollution. Based on the behaviour spillover theory, it can be expected that benefits of bag charges may go even further, in that changes to this behaviour may lead to changes in other environmental behaviours and attitudes. This paper examines habit disruption, behavior spillover and policy spillover effects of the plastic bag charge, a mandatory five pence (US$0.06/€0.06) charge introduced in England in October 2015 for customers to use single-use plastic bags. Combining a longitudinal survey from representative samples (n=1,230), observations of customers’ bag use in major supermarkets (n=3,762), and longitudinal in-depth interviews (n=43), we investigated behavioural and attitudinal responses to the charge. Results were triangulated and validated using these different methodologies. Results of surveys, observations and interviews show that people in England substantially reduced their plastic bag use within one month after the charge was introduced. The charge was efficient in disrupting the automaticity of plastic bag use habit, and acted as an important ‘thought-trigger’. Changes in plastic bag use, however, did not predict changes in other environmental behaviors, meaning that no behavior spillover effect was found. Research participants articulated the lack of further changes as an impossibility to ‘become eco-warriors overnight’. In addition, results of surveys and interviews indicated the increase in support for the bag charge after its introduction. Increased support for the bag charge, in turn, predicted greater support for other charges to reduce plastic waste, suggesting a ‘policy spillover’ effect. Interview participants articulated these changes explaining that the bag charge acted as a catalyst to raise a wider waste awareness. We conclude on a broad and positive effect of the English plastic bag charge, which appears to have acted as a successful habit disruptor and catalyst of environmental awareness. These findings can be used to develop other behavior change policies and interventions in the environmental area, as well as contribute to current debates on behavior and attitude spillover effects.
PUBLIC PERCEPTIONS OF CLIMATE CHANGE WORLDWIDE AND THE POTENTIAL FOR INDIVIDUAL ACTION

Stuart Capstick
Cardiff University (Cardiff, United Kingdom)

The recognition by members of the public of the reality, human causation, and importance of climate change varies substantially around the world. At the same time, the need for national and international efforts to reduce emissions is becoming ever more pressing, in light of the growing body of climate science that stresses the diminishing opportunities to avert the worst effects of climate change. Whereas some steps can be taken by governments alone, it is becoming clear that future emissions reduction will require public engagement and participation to be effective. Changes to environmentally-significant behaviours are required at the individual level, for example in relation to personal transportation and diet. In addition, wider participation in challenging the social silence around this topic, and more collective responses, are required to enable more complete societal transitions. The study examines determinants of individuals' perceptions and actions on climate change, and offers recommendations for promoting public engagement in different parts of the world. I present findings from analyses of two large international survey datasets, obtained in 2016. These are the European Social Survey (n=42,000 across 23 countries) and the Low-Carbon Lifestyles and Behavioural Spillover (CASPI) project (n=7,000 across 7 countries) which between them cover 28 countries, including China, India, Brazil, Germany, the Russian Federation, and the UK. I use multi-level regression analyses to assess the extent to which personal concern and perceived personal obligation to address climate change, are determined by individual-level variables (including personal values and socio-demographic factors) and country-level variables (including GDP, and degree of individualism-collectivism). In contrast to arguments which have been made from a 'post-materialist’ standpoint, I posit that economic and environmental vulnerability are important drivers at the national level. I also predict that personal values are important for promoting action, but that their influence varies depending upon national context. I make some specific proposals for promoting public engagement in different parts of the world. These include the need to encourage more 'public sphere' action in parts of the world where this is necessary but limited at present, to an emphasis on specific behavioural actions in places where these are currently lacking.
CLIMATE CHANGE WORRY AMONG EARLY ADOLESCENTS: A SIGN OF EMPOWERMENT OR OF LOW WELL-BEING?

Ojala Maria
Örebro University (Örebro, Sweden)

Wheeler Kathryn
University of Essex (Essex, United Kingdom)

Climate change anxiety and climate change worry are concepts that have emerged in the media and the general debate in many countries during recent years. Surveys confirm that many, particularly the young, are concerned about climate change. There are, however, remarkably few studies, that from a scientific perspective have studied what role climate change worry plays in young people's life. Children and adolescents are said to be particularly vulnerable to psychological stress associated with climate change and are also important to include in climate change mitigation, since they are both citizens of today as well as society’s future decision makers. This survey study explored if climate worry can be seen as a motivational force or if it is related to disempowerment and low well-being among Swedish early adolescents. The first aim was to investigate if there are significant relations between climate change worry and other negative emotions (pessimism, guilt, distrust) in relation to the climate problem, on the one hand, and climate efficacy and subjective well-being, on the other. The second aim was to investigate the relative importance of worry, pessimism, guilt, and distrust, with gender and climate change knowledge as control variables, in predicting these dependent variables. The sample consisted of 293 participants with a mean age of 12 years. The study was performed during regular school hours in the classroom. Teachers were not present, and the questionnaire was administered by test leaders. The results show that worry had a significant positive relation with both a feeling that you can influence climate change, but also with general negative affect. Worry, however, had no significant relation to life satisfaction. In regression analyses, pessimism, guilt and distrust were more potent negative predictors of well-being than worry. Worry was a positive predictor, while pessimism was a negative predictor of climate efficacy, when controlling for the other variables. These results are discussed in relation to theories about affective intelligence and micro and macro worry, theories that emphasize the adaptive and sometimes positive role of worry and the difference between worry and pessimism. Implication for climate change communication and education are elaborated upon.
CONNECTEDNESS TO NATURE, SUSTAINABILITY AND WELLBEING:
AN EXPLORATORY STUDY OF FOOD CONSUMPTION

Barbara Bonnefoy
Paris Nanterre University (Paris, France)

This paper aims to investigate the relationship between sustainable food consumption and wellbeing. In particular, we explore the links between wellbeing, food consumption and the feeling of being connected to nature. Connectedness to nature is defined as a sense of unity with nature, characterised in particular by the distinction between the feeling of belonging to the ecosystem and that of observing the ecosystem (Mayer & Frantz 2004). Schultz (2002) describes it as "the importance according to which an individual includes nature in their system of cognitive representation of the Self". Psychological well-being and optimal functioning are predicated on autonomy, competence, and relatedness (Deci & Ryan, 2000). Previous research shows a close relationship between well-being and nature connectedness (Howell, 2011) and between the type of diet (omnivores vs. vegetarians) and the topics of the representation of human domination of nature (Allen, Wilson, Ng, Dunne, 2000). Our study explores these links, comparing different populations: vegans, vegetarians, omnivores and flexitarians. We measured the type of diet (Vegan Marketing 2014), wellbeing (Ryff, 1989), and nature connectedness (Nisbet, Zelenski & Murphy, 2009) in a sample of 365 French people aged from 18 to 61 (M = 27.28, SD = 10.00). Results revealed that different types of diet characterises the participants, especially in terms of their attitudes and reasons behind their diet choice. We also found positive links between food consumption style and wellbeing. Specifically, vegetarians and vegans have expressed greater levels of autonomy than omnivores and flexitarians. In particular, on the social dimension, scored lower than omnivores and flexitarians. On the dimensions of wellbeing, we have not found differences between the different groups of participants. As expected, vegetarians and vegans felt, to a greater extent, connected to nature, and they also mentioned more frequently than others the need to protect the environment. The evidence that this study provides offers ways to continue the important discussions on relationships between food consumption, well-being and sustainability.
PSYCHOSOCIAL FACTORS OF SENIOR EXECUTIVES’ PREPAREDNESS TO INTRODUCE PRO-ENVIRONMENTAL PRACTICES IN THEIR COMPANIES

Sofia Lapina
Elena Sautkina
National Research University Higher School of Economics (Moscow, Russia)

Modern companies often have a dissonance between short-term profits based on the business-as-usual approach, on the one hand, and sustainable growth objectives which prioritise green investment and the implementation pro-environmental practices, on the other. Considerable research exists on the promotion of pro-environmental behavior at an individual level, but there is a lack of evidence regarding the psychosocial factors which drive senior executives to operate their businesses in line with the principles of sustainable development, encourage pro-environmental practices and use the approach of environmental co-benefits in their companies. This study aims to explore psychosocial factors of senior executives’ preparedness to introduce pro-environmental practices in their enterprises. To investigate these questions, we use expert interviews, semi-structured interviews and document analysis. In the first phase of this research, in order to gather background information, we interview a group of experts from environmental organisations and analyse documents. In the next phase, we investigate psychosocial dimensions of preparedness: cognitive, behavioral and affective. To investigate the cognitive dimension, we study senior executives’ environmental norms and values, their knowledge in the field of pro-environmental practices, regulative norms of sustainable development and attitudes to environmental co-benefits. For behavioural measures, we evaluate their preparedness to introduce pro-environmental practices in their enterprises and willingness to continue the already existing ones. For affective measures, we examine responses to climate change and environmental degradation (expected negative affect) and to implementation of actions aiming to address these issues (positive affect).

Currently, at the first phase of our research, we will present and discuss results at the conference. Psychosocial factors that affect preparedness of senior executives to implement pro-environmental practices in their companies will be discussed in the light of today’s challenges of transition to sustainable futures. We believe that the proposed holistic approach in terms of cognitive, behavioral and affective dimensions will help to shed light onto understanding.
THE FAST AND THE FURIOUS: A LOOK AT RELATIVE DEPRIVATION IN TIMES OF SOCIAL CHANGE

Ann Beaton
Université de Moncton (Moncton, Canada)

Roxane de la Sablonnière
University of Montreal (Montreal, Canada)

Serge Guimond
Laboratoire de psychologie sociale et cognitive (Clermont Ferrand, France)

Galina Gorborukova
American University of Central Asia (Bishkek, Kyrgyzstan)

Natalie Rinfret
École nationale d'administration publique (Quebec, Canada)

Abstract body. Relative deprivation (RD) refers to discontent following invidious social comparisons. Researchers in this symposium offer a unique perspective to RD theory. Their work will show how the experience of RD arises at critical points in time to produce psychological and behavioral outcomes. A longitudinal study conducted by Dr. de la Sablonnière demonstrates how dramatic social change affects the trajectory of temporal RD among Kyrgyz citizens. Dr. Gorborukova reveals how the collective memory of a traumatic event in Kyrgyzstan affects the integrity of a cultural identity. Dr. Guimond draws upon RD theory to account for the rise in populism among a representative sample of French citizens. In a study conducted among young professional women, Dr. Beaton shows how the experience of RD will incur harm at different points in their career. The implication of a time sensitive perspective to RD theory is presented.

Press paragraph. People determine their relative status by comparing themselves to others. Yet, in a world that changes at a face and furious pace, the result of this comparison will vary over time. This symposium gathers researchers from different countries who draw upon Relative Deprivation (RD) to account for discontent due to unfavorable comparisons that occur at critical points in time. Dr. de la Sablonnière and her associates evaluate shifts in temporal RD to understand the experience of Kirghizstan citizens during dramatic social change. Dr. Gorborukova and her colleague show how collective trauma experienced by Kyrgyz citizens can lead to a general crisis of their cultural identity. In a study conducted with French citizens, Guimond and his colleagues reveal the significance of the experience of RD to account for the rise in support for a right wing political party. RD is a concept used by Dr. Beaton and her associates to explain how young professional women react to gender and age-based inequalities at different moments of their career path. In sum, these studies help to understand how people confronted with social change draw upon RD to make sense of their place in the world. Dr. Natalie Rinfret is Chairperson for this symposium.

General summary of the Symposium. Relative Deprivation (RD) refers to discontent following invidious social comparisons and accounts for psychological and behavioral outcomes (Smith, Pettigrew, Pippin, & Bialosiewicz, 2012). RD emerges from different forms of social comparisons, whereby the self (Personal RD) or the ingroup (Collective RD) is viewed as disadvantaged. In its early inception, Runciman (1966) explained that RD can arise at different points in time. Remarkably, few RD studies incorporate temporality to account for responses to social change. The objective of the symposium is to offer a unique time sensitive perspective to RD theory. In a longitudinal study conducted by Dr. de la Sablonnière and her associates,
temporal collective relative deprivation (TCRD) was assessed prior to and following social upheaval in Kirghizstan. Findings demonstrate that TCRD shifts dramatically in the wake of a revolution. Dr Gorborukova and her colleague further delve into the meaning citizens of Kyrgyzstan give to historical disadvantage. These researchers demonstrate how a traumatic past can impair a coherent cultural identity. Dr Guimond and his colleagues turn to RD to explain the rise in populism in France. Among a representative sample of French citizens, these researchers examine how the experience of deprivation relative to immigrants accounts for voting preferences for a right wing party, over and beyond Personal RD and prejudice. RD is a gauge of perceived inequality and Dr. Beaton and her associates examine how temporal Personal RD harms young women in the course of their career. Temporal Personal RD due to age or sex-based inequalities is associated with psychological disengagement and low self-worth. The symposium will conclude with the importance of integrating a time sensitive approach to RD theory.

REVISITING OUR HISTORY: WHAT PREDICTS CHANGES IN PERCEIVED HISTORY ONE YEAR AFTER A REVOLUTION IN KIRGHIZSTAN

Ann Beaton
Université de Moncton (Moncton, Canada)
Roxane de la Sablonnière
Mathieu Caron-Diotte
University of Montreal (Montreal, Canada)
Nazgul Sadykova
American University of Central Asia (Bishkek, Kyrgyzstan)

Temporal collective relative deprivation (TCRD) is a feeling of dissatisfaction stemming from a negative comparison of a group’s situation over time. Recent research has underlined the importance of assessing TCRD over a group’s history or trajectories. Dramatic social changes, rapid changes disrupting a society’s institutions and normative structures, could make individuals revise their TCRD trajectories. We predict that, after some time, a significant number of individuals will display a different TCRD trajectory than the one they displayed immediately after a change. A longitudinal study was conducted in Kirghizstan immediately after the Tulip Revolution and one year after. Kirghiz (N = 166) responded to measures of TCRD over important historical periods. Joint trajectory analyses indicated that 35% of individuals shifted from a trajectory of low TCRD to one with higher TCRD levels. Individuals who strongly identified to Kirghiz were more likely to display a trajectory characterized by low TCRD at both times.

Dramatic social change affects millions of people every day. Researchers put forward the argument that if one makes sense of a traumatizing past, the clarity of his present identity will be higher as compared to another person who does not have a clear knowledge of his or her group’s past (de la Sablonnière & Taylor, 2014). Such results were found in many research settings such as Aboriginal people. The present paper is an attempt to study the role of collective memory in cultural identity within the context of dramatic social change with a qualitative design. The research data was gathered in Kyrgyzstan. A total of 20 in-depth interviews were conducted. Results show that contradictory processes are observed within Kyrgyz society, which indicates a general crisis of cultural identity among the majority of the population. The pivotal role of cultural memory in trauma is discussed.
COLLECTIVE RELATIVE DEPRIVATION, ETHNIC PREJUDICE AND SUPPORT FOR THE EXTREME-RIGHT

Serge Guimond
Kamilla Khamzina
Karolina Urbanska
Université Clermont Auvergne (Clermont Ferrand, France)

Research has shown that Personal Relative Deprivation (PRD) is important to predict individualistic responses whereas Collective Relative Deprivation (CRD) is usually more predictive of group responses (Tougas & Beaton, 2012). Extending previous work, this presentation will discuss more recent research studying the relative importance of CRD and PRD to account for ethnic prejudice and voting for the extreme-right (Anier, Guimond & Dambrun, 2016; Urbanska & Guimond, 2018). Among a representative sample of the population of France (N = 1001), we find that those who perceive their ingroup, the French, to be worse off than the outgroup, the immigrants, are more likely to support the FN, the extreme-right wing party. Moreover, this effect is obtained regardless of the level of ethnic prejudice of the participants, and regardless of their level of PRD. The possibility of using RD theory to account for rising populism in Europe is discussed.

DOES TIME HEAL ALL WOUNDS? THE DIFFERENTIAL BURDEN OF AGE AND GENDER-BASED INEQUALITIES AMONG YOUNG PROFESSIONAL WOMEN

Ann Beaton
Université de Moncton (Moncton, Canada)

Francine Tougas
Natalie Rinfret
École nationale d'administration publique (Québec, Canada)

When do sex and age-based inequalities harm young professional women during their career path? While sexism represents a chronic experience for young women, ageism is more fleeting. This study examines the reactions of young women to sexist and ageist discrimination at different moments of their career. Based on the Psychological Disengagement Model (Tougas et al., 2005) we predict that the impact of age, rather than sex-based inequalities, on the reactions of women will be most important in the past and present moments of their career and less important as they consider their career prospects.

Young women in Human Resources completed measures of temporal relative deprivation (past, present, future) based on ageist (n = 150) or sexist (n = 153) discrimination, psychological disengagement and self-esteem. Results of structural invariance analysis support predictions. We address the implications of the burden of age and gender discrimination for young professional women.
SOCIAL INTELLIGENCE IN EDUCATION — CHALLENGING PROBLEMS AND CURRENT STUDIES

Eugene Subbotsky
Lancaster University (London, United Kingdom)

Olga Chesnokova

Julia Martirosova

Sergei Molchanov
Lomonosov Moscow State University (Moscow, Russia)

Abstract body. The symposium addresses the role of social intelligence (SI) in education. Issues are addresses such as assessment of SI in preschool and schoolchildren by means of practically applicable tests, coordination between SI and moral values in competitive activities, the distinction between morally positively and morally negatively oriented SI, assessing the role of SI of educationalists as a part of their professional competence, establishing the age trends and individual differences in the development of SI in children, dealing with the ambivalent relationships between the teachers and socially intelligent children in their classrooms, assessing the role of children's SI in the children's subsequent social climbing, pinpointing differences and common points between SI and theory of mind, and developing programs of enhancing SI in a classroom.

Press paragraph. The symposium discussed current trends and recent studies on the role of social intelligence in education. Eugene Subbotsky raised the issue of compatibility between social intelligence and morality. Olga Chesnokova, Eugene Subbotsky and Julia Martirosova presented a new method of express diagnostics of social intelligence in preschool and primary school children. Sergey Molchanov and Kyrill Kirsanov discussed the role of social intelligence in professional orientation. Julia Martirosova and Olga Chesnokova talked on interaction of children with different levels of social intelligence in a situation of forced conflict of interests.

General summary of the Symposium. As children spend most of their time in school with dynamic social environment, there is no better place to develop social intelligence and emotional literacy. Social intelligence (SI) develops from experience with people and learned from success and failures in social cooperative and competitive settings. By SI we understand the person’s ability to understand and consciously influence the communicative intentions of other people, with the aim of achieving the person’s goals, based on general orientation in the current situation of communication and the ability to predict the intentions and actions of the competitors in the situation of insufficient resources and unclear outcomes of the communicative exchange. SI is important in any professional activity that involves cooperation or/and competition. In behavioural economy and business studies SI has long been a part of mainstream research and training in business skills. Moreover, studies have shown that a child’s success in education can be boosted by the child’s the ability to work in teams, by cooperating with the members of one’s own team and effectively competing with the team of the opponents. However, unlike in the business studies, in educational studies the role of SI has been declared mostly theoretically. There is a shortage of experimental and educational studies of SI in children, and theoretical understanding of SI in educational studies is in need of improvement. The studies on SI that exist, and even the application programmes on SI in education, remain detached from actual educational practices in kindergartens and schools. This makes it necessary to reassess our knowledge of SI in the context of recent psychological studies on children’s cognitive development and the realities of modern preschool and school education. In four individual presentations, the following issues will be discussed: -- Assessment of SI in preschool and schoolchildren by means of...
practically applicable tests; -- Theoretical coordination between SI and moral values in competitive activities; -- Assessing the role of SI of educationalists as a part of their professional competence; -- Establishing the age trends and individual differences in the development of SI in children; -- Assessing of and dealing with the frictions between the teachers and socially intelligent children in their classrooms; -- Assessing the role of children’s SI in the children’s subsequent social climbing; -- Developing programmes of enhancing SI in a classroom.

6. Speakers’ titles, full names, affiliations, countries, and contact details. -- Dr Olga Chesnokova Moscow State University, Department of Psychology, Russia, olgach1234@googlemail.com -- Julia Martirosova Moscow State University, Department of Psychology, Russia, martirosova@gmail.com -- Dr Eugene Subbotsky Lancaster University, United Kingdom, e.subbotsky@lancaster.ac.uk -- Dr Sergey Molchanov Moscow State University, Department of Psychology, Russia, s-molch2001@mail.ru -- Kirill Kirsanov Moscow State University, Department of Psychology, Russia, kirkirsanov@gmail.com

7. Individual abstracts submissions for proposed symposium Presentation 1. Play diagnostic method of social intelligence in preschool and elementary school children Olga Chesnokova, Eugene Subbotsky & Julia Martirosova Moscow State University, Department of Psychology, Russia The aim is to present a new method of diagnostic of social intelligence in preschool and elementary school children. The advantage of this method over traditionally employed questionnaires and pictures is that it does not rely on the mature symbolic function. Preschool and elementary school children find it difficult to adequately react to these questionnaires. In contrast, the presented method employs a simple play situation easily accessible to 6-12 years old children. This situation allows a sensitive assessment of degrees of social intelligence in children while engaging them individually in an exciting play. The situation puts a player before a choice a best strategy of solving a problem through a simple report of necessary information (which in fact brings the child in a satiation of a looser) or inventing an unconventional way. The situation involves conflict of interests and the possibility of achieving the desired goal indirectly while not applying to direct deception at the same time. Presentation 2. Are social intelligence and morality compatible? The case of a child’s adaptation to a classroom community Eugene Subbotsky Lancaster University, United Kingdom The presentation’s aim is to discuss compatibility between social intelligence and morality. The talk addresses the issue by suggesting that the ability to cheat is not only a necessary skill for winning in competitive games (e.g., chess or football games), but it is also vital for early moral development, as it provides the child with the freedom to consciously choose between moral (unselfish oriented) and non-moral (selfish-oriented) ways of action. Experiments have shown that, given the opportunity to cheat to adults without the danger of being caught, most preschool children would go for it. However, in the child’s later development deliberate cheating becomes a violation of the moral norm of honesty. As a result, in their subsequent development the children are confronted with a choice of either developing non-pragmatic moral behaviour, or keep violating moral norms whenever they think that they will not be caught on their cheating (pragmatic moral behaviour). Those of the children who choose the rout of non-pragmatic moral behaviour, can still develop SI, by using their understanding of other people’s minds and avoiding cheating at the same time (positive SI). In contrast, those children who opted for pragmatic moral behaviour, start consciously using their ability to cheat for attaining their selfish goals in their interactions with other people (negative SI). Examples of positive and negative SI actions of children in the classroom community are presented and discussed. Presentation 3. Interaction of children with different levels of social intelligence in a situation of forced conflict of interests Julia Martirosova & Olga Chesnokova Moscow State University, Department of Psychology, Russia In the experiment 9 and 12 year old participants took part in an induced conflict of interests, organized as a cooperative-competitive game. The significant age differences in styles of dyadic interactions in an induced conflict of interests were found. Results indicated that a style of interaction with partners and total outcome of
the game were partly predicted by a level of social intelligence and a child’s ability to manipulate others’ behaviour. Participants with high level of social intelligence and achievement motivation more often preferred to cooperate with their partners than participants with the law level of SI. Children who had orientation towards social superiority and had a high level of SI most often used pseudo-cooperative style of communication in the beginning but shifted towards cooperative style later, whereas children with high orientation towards social superiority and average SI used to stick to the pseudo-cooperative style throughout testing. Children who exhibited competitive style of behaviour tended to show low or average level of SI. Presentation 4. Social Intelligence as a facilitator of the career decision-making process in youth in Russia Sergei Molchanov, Kyrill Kirsanov & Olga Chesnokova Moscow State University, Department of Psychology, Russia In many studies have been shown that Emotional Intelligence perspective have implications for the perception of risk related to specific career options, amount and kind of self-exploration individuals will engage in, and how information related to career choice will be processed. SI also plays a key role at the very beginning of any job process and career choice but it wasn’t investigated in details. Drawing from career construction and positive youth development perspectives, this study explores, among 54 Russian students-psychologists , the relationship between Social Intelligence (SI) and Career decision self-efficacy (CDSE) . Career decision self-efficacy (CDSE) refers to confidence in one’s ability to successfully perform decision-making tasks, including gathering occupational information, selecting goals, making plans for the future, and problem solving (Betz, Klein, & Taylor, 1996). These results suggest that SI and professional values warrant further investigation as factors that may contribute to adaptive career progress among youth. The study was supported by the Russian Foundation for Basic Research under the project 18-013-01067A.

PLAY DIAGNOSTIC METHOD OF SOCIAL INTELLIGENCE IN PRESCHOOL AND ELEMENTARY SCHOOL CHILDREN

Olga Chesnokova
Lomonosov Moscow State University (Moscow, Russia)

Eugene Subbotsky
Lancaster University (London, United Kingdom)

Julia Martirosova
Lomonosov Moscow State University (Moscow, Russia)

The aim is to present a new method of diagnostic of social intelligence in preschool and elementary school children. The advantage of this method over traditionally employed questionnaires and pictures is that it does not rely on the mature symbolic function. Preschool and elementary school children find it difficult to adequately react to these questionnaires. In contrast, the presented method employs a simple play situation easily accessible to 6-12 years old children. This situation allows a sensitive assessment of degrees of social intelligence in children while engaging them individually in an exciting play. The situation puts a player before a choice a best strategy of solving a problem through a simple report of necessary information (which in fact brings the child in a satiation of a looser) or inventing an unconventional way. The situation involves conflict of interests and the possibility of achieving the desired goal indirectly while not applying to direct deception at the same time.
ARE SOCIAL INTELLIGENCE AND MORALITY COMPATIBLE? THE CASE OF A CHILD’S ADAPTATION TO A CLASSROOM COMMUNITY

Eugene Subbotsky
Lancaster University (London, United Kingdom)

The presentation’s aim is to discuss compatibility between social intelligence and morality. The talk addresses the issue by suggesting that the ability to cheat is not only a necessary skill for winning in competitive games (e.g., chess or football games), but it is also vital for early moral development, as it provides the child with the freedom to consciously choose between moral (unselfish oriented) and non-moral (selfish-oriented) ways of action. Experiments have shown that, given the opportunity to cheat to adults without the danger of being caught, most preschool children would go for it. However, in the child’s later development deliberate cheating becomes a violation of the moral norm of honesty. As a result, in their subsequent development the children are confronted with a choice of either developing non-pragmatic moral behaviour, or keep violating moral norms whenever they think that they will not be caught on their cheating (pragmatic moral behaviour). Those of the children who choose the rout of non-pragmatic moral behaviour, can still develop SI, by using their understanding of other people’s minds and avoiding cheating at the same time (positive SI). In contrast, those children who opted for pragmatic moral behaviour, start consciously using their ability to cheat for attaining their selfish goals in their interactions with other people (negative SI). Examples of positive and negative SI actions of children in the classroom community are presented and discussed.

INTERACTION OF CHILDREN WITH DIFFERENT LEVELS OF SOCIAL INTELLIGENCE IN A SITUATION OF FORCED CONFLICT OF INTERESTS

Olga Chesnokova
Julia Martirosova
Lomonosov Moscow State University (Moscow, Russia)

In the experiment 9 and 12 year old participants took part in an induced conflict of interests, organized as a cooperative-competitive game. The significant age differences in styles of dyadic interactions in an induced conflict of interests were found. Results indicated that a style of interaction with partners and total outcome of the game were partly predicted by a level of social intelligence and a child’s ability to manipulate others’ behaviour. Participants with high level of social intelligence and achievement motivation more often preferred to cooperate with their partners than participants with the law level of SI. Children who had orientation towards social superiority and had a high level of SI most often used pseudo-cooperative style of communication in the beginning but shifted towards cooperative style later, whereas children with high orientation towards social superiority and average SI used to stick to the pseudo-cooperative style throughout testing. Children who exhibited competitive style of behaviour tended to show low or average level of SI.
SOCIAL INTELLIGENCE AS A FACILITATOR OF THE CAREER DECISION-MAKING PROCESS IN YOUTH IN RUSSIA

Sergei Molchanov
Kyrill Kirsanov
Lomonosov Moscow State University (Moscow, Russia)

In many studies have been shown that Emotional Intelligence perspective have implications for the perception of risk related to specific career options, amount and kind of self-exploration individuals will engage in, and how information related to career choice will be processed. SI also plays a key role at the very beginning of any job process and career choice but it wasn't investigated in details. Drawing from career construction and positive youth development perspectives, this study explores, among 54 Russian students-psychologists, the relationship between Social Intelligence (SI) and Career decision self-efficacy (CDSE). Career decision self-efficacy (CDSE) refers to confidence in one’s ability to successfully perform decision-making tasks, including gathering occupational information, selecting goals, making plans for the future, and problem solving (Betz, Klein, & Taylor, 1996). These results suggest that SI and professional values warrant further investigation as factors that may contribute to adaptive career progress among youth. The study was supported by the Russian Foundation for Basic Research under the project 18-013-01067A.
RESEARCH ON ADULT LESBIAN, GAY, BISEXUAL, AND TRANSGENDER MINORITY STRESS AND MENTAL HEALTH CONCERNS

Sharon Horne  
University of Massachusetts Boston (Auburndale, USA)

Dirk Krantz  
University of Trier (Trier, Germany)

Nadeshda Arontschik  
Russian LGBT Network (Moscow, Russia)

Evgeny Osin  
Moscow Higher School of Economics (Moscow, Russia)

Reynel Alexander Chaparro Clavijo  
National University of Colombia (Bogota, Colombia)

Abstract body. This symposium will cover three contributions on Lesbian, Gay, Bisexual and Transgender research focusing on mental health and minority stress research concerns. The first paper describes a research study of 1095 Russian LGBT adults exploring the impact of minority stress on mental health concerns and finding a strong relationship between discrimination and internalizing behaviors; the second paper delves into interventions in mental health care by psychologists through qualitative research exploring interventions used by out and non-disclosing practitioners in Colombia; the third presentation will focus on research on attitudes toward LGBT individuals in Russia, and how social attitudes play an important role in mental health and minority stress. At the conclusion, there will be discussion of minority stress and managing stigma among LGBT populations.

Press paragraph. This symposium will cover three contributions on Lesbian, Gay, Bisexual and Transgender research focusing on mental health and minority stress research concerns. The first paper describes a research study of 1095 Russian LGBT adults exploring the impact of minority stress on mental health concerns and finding a strong relationship between discrimination and internalizing behaviors; the second paper delves into interventions in mental health care by psychologists through qualitative research exploring interventions used by out and non-disclosing practitioners in Colombia; the third presentation will focus on research on attitudes toward LGBT individuals in Russia, and how social attitudes play an important role in mental health and minority stress. Chair: Sharon G. Horne, Ph.D. Presentation 1: Dirk Krantz (University of Trier, Germany)Nadeshda Arontschik (Russian LGBT Network, Russia) Evgeny Osin (Moscow Higher School of Economics, Russia) Presentation 2: Authors: Reynel Alexander Chaparro Clavijo, Mónica Natali Sánchez Nitola, Ángela María Vargas Rodríguez National University of Colombia Igor Ramon Lopes Monteiro, Bárbara Gonçalves Mendes, Federal University of Minas Gerais (Brasil) Presentation 3: Sharon G. Horne, Ph.D. University of Massachusetts Boston & Meredith R. Maroney, M.S. & Julie Koven, M.S.Ed., M.Phil.Ed.
social attitudes play an important role in mental health and minority stress. At the conclusion, there will be discussion of minority stress and managing stigma among LGBT populations.

Paper One: Title: Minority stress among Russian lesbian, gay, bisexual, and transsexual people in young and middle adulthood Dirk Kranz (University of Trier, Germany) Nadeshda Arontschik (Russian LGBT Network, Russia) Evgeny Osin (Moscow Higher School of Economics, Russia) Abstract: Background: This research aims to examine the impact of minority stress on mental health problems in a sample of Russian LGBT people in young and middle adulthood (18 to 50 years; N = 1095). Method: As minority stress indicators we considered measures of anticipated and experienced discrimination, internalized homo/transphobia, and concealment of minority status (or, put the other way around, outness of sexual/gender identity). As mental health indicators we considered internalizing problems (anxiety and depression) as well as externalizing problems (alcohol/drug misuse and risky sexual behavior). Findings: Hierarchical regressions indicate that the specific minority group explains relatively little variance in mental health variables, except for risky sexual behavior (gay men are by far the most risk taking group). Discrimination, whether anticipated or experienced, shows a very strong relationship with internalizing problems and a weaker relationship with externalizing problems. Internalized homo/transphobia is equally and substantially related to both internalizing and externalizing problems. Only the degree of outness shows a weak (and ambivalent) relationship with the mental health indicators. Discussion: The results are compared to those of previous studies while considering the specific Russian context. Interventions in/out of the closet as a gay psychologist in mental healthcare in Colombia. A qualitative approach Authors: Reynel Alexander Chaparro Clavijo, Mónica Natali Sánchez Nitola, Ángela María Vargas Rodríguez National University of Colombia Igor Ramon Lopes Monteiro, Bárbara Gonçalves Mendes, Federal University of Minas Gerais (Brasil) Background: A dichotomy heterosexual vs. other identities and a directionality of care from heterosexual (with an intermediation of heterosexual allies) to other identities, as well as matching LGB identities, is noted in the research related to mental HCP. With a predominance of heterosexist view of LGB care, there is a lack of research oriented to identify the different and interactive strategies that gay psychologists use to intervene in mixed heteronormative mental health settings. In the context of a wide qualitative research in mental healthcare and professional psychologist in Bogotá — Colombia (National University of Colombia ethical committee approval: B.VIE-FCH-020-2017), the specific interventions of a self-reported gay psychologist in different context of health care interventions appears as an emerging topic to explore through a comparative qualitative multiple cases analysis in eight interviews selected, taking into account four in and four out self-reported gay psychologists.

Methods: A first approximation to the interviews with an open coding inductive analysis (Strauss, 1987), with subsequent case analysis meetings and content-analytic summaries (Miles, Huberman & Saldaña, 2014) were conducted during the analysis of the categories. Findings: Main findings are oriented to describe different action repertoires as well as heterotherapeutic interventions, in the light on institutional and cultural heterosexism in the recent Colombian context of LGBT normative advances. Discussion: This research proposes a contribution to understand mixed heteronormative healthcare contexts and its effects in the dynamics of participation and interventions of self-reported gay psychologist in Colombia. Also, suggest a reflection about how the actions from the closet complement or contrast with training manuals and LGBT affirmative practices, developed and related from foreign perspectives. References: Miles, M.B., Huberman, A.M. & Saldaña, J. (2014). Qualitative data analysis: A methods sourcebook. Sage, London. Strauss, A. L. (1987). Qualitative analysis for social scientists. New York, NY, US: Cambridge University Press. Doi:10.1017/CBO9780511557842 Paper 3: Title: Attitudes Toward Gay and Lesbian Individuals in Russia: An Exploration of the Interpersonal Contact Hypothesis and Personality Factors Authors: Sharon G. Horne Sharon G. Horne, Ph.D.
Professor, Counseling and School Psychology, University of Massachusetts Boston Meredith R. Maroney, M.S. Doctoral Student, University of Massachusetts, Boston Elizaveta Zagryazhskaya, Clinical Psychologist, Psychology Department, Moscow State University M.V. Lomonosov Julie Koven, M.S.Ed., M.Phil.Ed. Doctoral Student, University of Massachusetts Boston Background: Negative attitudes toward Gay, Lesbian, Bisexual, and Transgender people in Russia are common, and may have become more prevalent due to recent policy changes. This study explored whether interpersonal contact and personality characteristics predicted Hateful Attitudes Toward GLB people and Endorsement of GLB Rights. Method: The design of the study included 154 heterosexual undergraduate students in Moscow and Volgodonsk who were surveyed about their attitudes toward GLB people as well as their personality characteristics assessed with the NEO-FFI. Findings: Results suggested that Moscow students held less hateful attitudes and endorsed greater GLB Rights than Volgodonsk students. Women were also more favorable toward GLB Rights than men. In terms of Hateful Attitudes, having GLB friends or acquaintances was a negative predictor of Hateful Attitudes, while neuroticism and conscientiousness were positive predictors. In conclusion, living in a large urban area, knowing GLB individuals, and low levels of neuroticism and conscientiousness appeared to be associated with positive attitudes toward GLB people in Russia, however, personality characteristics and knowing GLB people did not appear to relate to endorsement of GLB Civil Rights. Discussion: Current sociopolitical policies such as the propaganda ban, and historical censure of GLB rights during the Soviet era, may impact how “out” GLBT Russian people can be, particularly outside of large urban centers, and may reinforce general lack of support for GLBT Civil Rights in the Russian population.

MINORITY STRESS AMONG RUSSIAN LESBIAN, GAY, BISEXUAL, AND TRANSSEXUAL PEOPLE IN YOUNG AND MIDDLE ADULTHOOD

Dirk Kranz
University of Trier (Trier, Germany)

Nadeshda Arontschik
(Moscow, Russia)

This research aims to examine the impact of minority stress on mental health problems in a sample of Russian LGBT people in young and middle adulthood (18 to 50 years; N = 1095). As minority stress indicators we considered measures of anticipated and experienced discrimination, internalized homo/transphobia, and concealment of minority status (or, put the other way around, outness of sexual/gender identity). As mental health indicators we considered internalizing problems (anxiety and depression) as well as externalizing problems (alcohol/drug misuse and risky sexual behavior). Findings: Hierarchical regressions indicate that little variance in mental health variables, except for risky sexual behavior (gay men are by far the most risk taking group). Discrimination, whether anticipated or experienced, shows a very strong relationship with internalizing problems and a weaker relationship with externalizing problems. Internalized homo/transphobia is equally and substantially related to both internalizing and externalizing problems. Only the degree of outness shows a weak (and ambivalent) relationship with the mental health indicators. The results are compared to those of previous studies while considering the specific Russian context.
INTERVENTIONS IN/OUT OF THE CLOSET AS A GAY PSYCHOLOGIST IN MENTAL HEALTHCARE IN COLOMBIA. A QUALITATIVE APPROACH

Reynel Alexander Chaparro Clavijo
Igor Ramon Lopes Monteiro
Bárbara Gonçalves Mendes
(Federal University of Minas Gerais -Brasil)

A dichotomy heterosexual vs. other identities and a directionality of care from heterosexual (with an intermediation of heterosexual allies) to other identities, as well as matching LGB identities, is noted in the research related to mental HCP. With a predominance of heterosexist view of LGB care, there is a lack of research oriented to identify the different and interactive strategies that gay psychologists use to intervene in mixed heteronormative mental health settings. In the context of a wide qualitative research in mental healthcare and professional psychologist in Bogotá — Colombia (National University of Colombia ethical committee approval: B.VIE-FCH-020-2017), the specific interventions of a self-reported gay psychologist in different context of health care interventions appears as an emerging topic to explore through a comparative qualitative multiple cases analysis in eight interviews selected, taking into account four in and four out self-reported gay psychologists. A first approximation to the interviews with an open coding inductive analysis (Strauss, 1987), with subsequent case analysis meetings and content-analytic summaries (Miles, Huberman & Saldaña, 2014) were conducted during the analysis of the categories. Main findings are oriented to describe different action repertoires as well as heterotherapeutic interventions, in the light on institutional and cultural heterosexism in the recent Colombian context of LGBT normative advances. This research proposes a contribution to understand mixed heteronormative healthcare contexts and its effects in the dynamics of participation and interventions of self-reported gay psychologist in Colombia. Also, suggest a reflection about how the actions from the closet complement or contrast with training manuals and LGBT affirmative practices, developed and related from foreign perspectives. ATTITUDES TOWARD GAY AND LESBIAN INDIVIDUALS IN RUSSIA: AN EXPLORATION OF THE INTERPERSONAL CONTACT HYPOTHESIS AND PERSONALITY FACTORS

Julie Koven
University of Massachusetts Boston (Boston, USA)

Negative attitudes toward Gay, Lesbian, Bisexual, and Transgender people in Russia are common, and may have become more prevalent due to recent policy changes. This study explored whether interpersonal contact and personality characteristics predicted Hateful Attitudes Toward GLB people and Endorsement of GLB Rights. The design of the study included 154 heterosexual undergraduate students in Moscow and Volgodonsk who were surveyed about their attitudes toward GLB people as well as their personality characteristics assessed with the NEO-FFI. Results suggested that Moscow students held less hateful attitudes and endorsed greater GLB Rights than Volgodonsk students. Women were also more favorable toward GLB Rights than men. In terms of Hateful Attitudes, having GLB friends or acquaintances was a negative predictor of Hateful Attitudes, while neuroticism and conscientiousness were positive predictors. In conclusion, living in a large urban area, knowing GLB individuals, and low levels of neuroticism and conscientiousness appeared to be associated with positive attitudes toward GLB people in Russia, however, personality characteristics and knowing GLB people did not appear to relate to endorsement of GLB Civil Rights. Current sociopolitical policies such as the propaganda ban, and historical censure of GLB rights during the Soviet era, may impact how “out” GLB Russian people can be, particularly outside of large urban centers, and may reinforce general lack of support for GLB Civil Rights in the Russian population.
SUBSTANCE USE AND MENTAL HEALTH AMONG NON-HETEROSEXUALS IN THE CZECH REPUBLIC

Michal Pitoňák
Pavla Chomynová
National Institute of Mental Health Researcher (Prague, Czech Republic)

International evidence shows that non-heterosexuals (i.e. people who self-identify as lesbian, gay, or bisexual and those engage in same-sex sex) are at greater risk for substance use and mental health issues as a consequence of minority stress compared with the heterosexual population. Aims: The aim of this paper was to estimate the proportion of people who identified as non-heterosexuals in the Czech Republic and compare their substance use and mental health status with the heterosexual population. Two samples of the general population aged 15+ years surveyed within the Czech National Survey on Substance Use in 2016 in randomly selected households (N1=3,601, F2F interviews) and from Internet pool (N2=1,000, CAWI). Prevalence of substance use, mental health status (MHI-5 scale) and satisfaction with life (SWLS scale) were analysed by respondents’ self-reported sexual behaviour and orientation (heterosexuals versus non-heterosexuals). Logistic regressions were applied to evaluate the differences between groups. Adjustment for basic sociodemographic characteristics (gender and age) was performed. Based on the survey results, 2.8% of adults identified as non-heterosexual in F2F survey (including 0.5% lesbians or gays and 2.3% bisexuals) and 7.2% in online/CAWI survey (3.2% and 3.9% of lesbians/gays and bisexuals, respectively). Non-heterosexuals identified in both samples were more likely to experiment with (illicit) substance use in the last 12 months (OR=1.66 in F2F survey, 95% CI: 1.00–2.76; and OR=4.51 in CAWI survey, 95% CI: 2.50–8.13), more often experience mental health problems (OR=2.42, 95% CI 1.43–4.08; and OR=1.61, 95% CI 0.90–2.88, respectively), and were slightly less satisfied with their lives (OR=0.83, 95% CI 0.49–1.39; and OR=0.43, 95% CI 0.19–1.00, respectively) compared to heterosexual population. Non-heterosexuals represent a vulnerable group from the perspective of substance use and psychological distress. Programs targeting the health and well-being of non-heterosexuals should pay special attention to substance use and mental health issues in this group.
BALINT GROUPS - EFFECTIVE METHOD OF HELP FOR HELPING PROFESSIONALS

Anzhela Avagimian
(Russia)

Günther Bergmann
(Germany)

Georgiy Kostyuk
(Russia)

Asya Barberyan
(Armenia)

The importance of socioeconomic-type professions, represented by doctors, psychologists, social workers and teachers, has increased in recent years, with the personality of a specialist, as a means of professional activity, as the most important variable of social practice in these areas.

Today, specialists are facing the syndrome of professional burnout as an inevitable type of occupational deformation, which is traced in their personal relationships, their competence as practicing researchers and in their professional treatment of clients.

Balint movement has been spreading throughout Europe since the mid-twentieth century. At the European Congress, psychologists from all over the world will have a chance to share their Balint work experience, and we, in turn, will discuss our achievements in this area. The expertise of helping professionals is a crucial factor in the wellbeing of their patients, but even top professionals need the help and collegial support that the Balint groups can provide.
INTERCULTURAL RELATIONS IN CONTEMPORARY EUROPE AND BEYOND

Fons Van De Vijver
Nadezhda Lebedeva
National Research University Higher School of Economics (Moscow, Russia)

Byron Adams
Tilburg University (Tilburg, Netherlands)

John W. Berry
Queen’s University (Kingston, Canada)

Snežana Stupar-Rutenfrans
University College Roosevelt (Utrecht, Netherlands)

Abstract body. This symposium is devoted to research on issues relevant for intercultural relations in contemporary multicultural societies, including multiculturalism, cultural distance, discrimination, and tolerance. The researches from different countries will present results of their studies in comparative way in order to reveal common and specific trends in intercultural relations, its predictors and outcomes. Some presenters will report new data on intercultural relations in post-communist countries and regions (Russia, Georgia, Tajikistan, Crimea, North Caucasus). Other presenters will talk about studies on multiculturalism and outgroup distance in different ethnically diverse countries in other parts of the world. An important theme will be predictors of intercultural relations, such as in a study on multiculturalism in 17 multicultural societies. The findings, their potential universality, and practical implications will be discussed.

Press paragraph. The symposium deals with an issue many multicultural societies need to grapple with: adequate relationships between their ethnic groups (including prejudice and discrimination). The various presentations take multiculturalism (accepting, respecting, and supporting diversity) as a starting point. Using data from dozens of countries, Nadezhda Lebedeva, John Berry, Snežana Stupar-Rutenfrans, Byron Adams, and Fons van de Vijver illustrate how in many countries inclusive policies produce better outcomes for immigrants and better relationships between groups. The currently popular discourse in many countries that emphasizes exclusion, discrimination, and incompatibility of cultures is likely to produce the opposite results.

General summary of the Symposium. The symposium describes current models of ethnic relations diverse societies (and their corollaries). Prevailing theoretical models that are used will be multiculturalism models, acculturation models, contact theory, identity models, and country models of multicultural policies. Data from dozens of countries will be presented. A recurrent theme in the symposium presentations is the link between policies (multicultural or otherwise) and outcomes (intergroup relations, personal and social identity, well-being, etc.). It is the central tenet of the symposium that these outcomes do not exist in a vacuum but are moderated by multiple factors, including local and national policies vis-à-vis the ethnically diverse composition of the population. An underlying theme of the symposium is the striking tension between the negative and often even hostile discourse of populism in many countries and the conditions that are required to develop or maintain harmonious intergroup relations in society.
THREE MODELS OF INTERCULTURAL RELATIONS IN POST-SOVIET COUNTRIES

Fons Van De Vijver  
Nadezhda Lebedeva  
Victoria Galyapina  
Zarina Lepshokova  
Tatiana Ryabichenko  
National Research University Higher School of Economics (Moscow, Russia)

We present three models of Post-Soviet development in terms of their dealing with cultural diversity: ‘nation — state model’ (Latvia), ‘pragmatic model’ (Azerbaijan), and ‘post-conflict model’ (Tajikistan). The goal of this study was to evaluate three hypotheses of intercultural relations: multiculturalism, contact, and integration among majority members and the ethnic Russian minority group in post-soviet countries and regions (18 ethnic groups, N = 5270) using MIRIPS research methodology. Data processing was carried out using path analysis for each ethnic group separately. Tests of the three hypotheses of intercultural relations in different post-soviet countries and regions confirmed most of these hypotheses and identified contextual features, which are essential for confirming these three hypotheses: the concordance/discordance of acculturation preferences of majority and migrants/minorities (pragmatic model vs nation-state model); the ethnic/religious distance (post-conflict model); the high level of ethnic heterogeneity (high intensity of intercultural contacts); the lack of imposed assimilation (nation-state model). The results are discussed, the recommendations for their implementation are provided.
MULTICULTURALISM HYPOTHESIS ACROSS CULTURES

John W. Berry
Queen’s University (Kingston, Canada)

The multiculturalism hypothesis was proposed by Berry, Kalin and Taylor (1977) to identify the relationship between feeling secure and confident in one’s place in society, and the acceptance of those of other ethnocultural backgrounds. The hypothesis derives from a statement in the Canadian multiculturalism policy that asserts that such confidence is a prerequisite for mutual accommodation among all persons living in culturally-plural societies. The converse of this hypothesis asserts that when individuals’ sense of their place is threatened by discrimination or rejection, then mutual hostility will result. Such a sense of security may exist with respect to a person’s culture (including language, beliefs), economic situation (employment, housing) and personal situation (attacks, insults). Much research has examined the validity of this hypothesis that has generally provided support. Most recently an international study (Berry, 2017) sampled individuals (including immigrants, ethnocultural group members, and sojourners) from both dominant and non-dominant groups in 17 societies. The results indicate that in the majority of samples (81%), a relationship was present between feelings of security and positive tolerance of others (low prejudice), and the acceptance of multicultural ideology (valuing diversity and equity). The implication of this hypothesis, and the support for it, is that the promotion of multiculturalism (including the value of sustaining diverse groups that have an equitable place in the plural society) is the best way to proceed to achieving the goal of social harmony, inclusion and cohesion. In contrast, contemporary moves to undermine the value of diversity and to exclude those who are culturally different will lead to lower levels of security and to mutual conflict. Berry, J.W., Kalin, R. & Taylor, D.M. (1977).

MULTICULTURAL ATTITUDES MEDIATE THE RELATION BETWEEN PERSONALITY AND PERCEIVED ETHNIC OUTGROUP DISTANCE IN THE NETHERLANDS

Fons Van De Vijver  
(Maidenwell, Netherlands)

We focus in the current study on the psychological mechanisms behind intergroup attitudes in ethnically diverse societies, specifically multiculturalism and perceived outgroup distance. Specifically, we propose and test a model in which multiculturalism mediates the link between the Big-Five personality factors and perceived outgroup distance among different ethnic groups in the Netherlands. The data set was collected using the LISS online panel (Longitudinal Internet Studies for the Social Sciences; www.lissdata.nl) among four different ethnic groups (from low to high in terms of ethnic hierarchy): Turkish/Moroccan Dutch, Antillean/Surinamese-Dutch, Mixed Western immigrants, and Dutch majority group members. Our sample comprised 3743 majority Dutch participants and 545 participants from other ethnic groups (first-, second-, and third-generation immigrants). Attitudes toward multiculturalism in Dutch society were assessed using 10 items from the Multicultural Attitude Scale (MAS; Breugelmans & Van de Vijver, 2004). The 14-item Perceived Outgroup Distance Scale (an adaptation of the Perceived Cultural Distance Questionnaire; Suanet & Van de Vijver, 2009) was used to assess perceived outgroup distance. A set of 50 items was selected of the International Personality Item Pool (IPIP) Big-Five Factor Markers (Goldberg, 1992), consisting of 10 items for each Big-Five factor: extraversion, agreeableness, emotional stability, openness, and conscientiousness. The multigroup path analysis supported a model in which in all groups multicultural attitudes mediate the relation between personality traits, education level, and age as antecedents, and outgroup distance as outcome; age was the only antecedent that also had a direct effect on outcome. Education was positively related to multiculturalism in the groups high in the hierarchy and unrelated in the groups low in the hierarchy. The association between multicultural attitudes and outgroup distance was negative and stronger for the groups higher in the ethnic hierarchy; hierarchy was unrelated to outgroup distance. Groups higher in the hierarchy scored lower on multicultural attitudes. We conclude that multicultural attitudes and outgroup distance are important for understanding intergroup dynamics in ethnically diverse societies. Future research might benefit from information on how multiculturalism, as a general variable, translates into specific social perceptions such as stereotypes in specific ethnic groups (including the differences between the groups).
IDENTITY, INCLUSION, AND WELL-BEING OF EMPLOYEES IN GERMANY, INDONESIA, THE NETHERLANDS, AND SOUTH AFRICA

Byron G. Adams
Christina Meyers
Tilburg University (Tilburg, Netherlands)

Lusanda Sekaja
University of Johannesburg (Johannesburg, South Africa)

How others treat people has a significant influence on their sense of identity as well as on their general well-being. These relationships may be considered particularly meaningful at work. People seek inclusion at work, which means that they want to find a balance between both belonging to the organization and maintaining their independence (their sense of uniqueness). In this study we examine a) the importance of inclusion and identity for well-being at work (i.e. work engagement, burnout, and self-efficacy) and b) whether there are similarities and differences across Western and non-Western contexts. The sample for this study comprises employees from Germany, Indonesia, the Netherlands, and South Africa. They completed the Experiences@Work questionnaire, which contained measures of inclusion, identity (personal, work, gender, ethnic, and religious identities) and well-being (work engagement, burnout and self-efficacy). Multi-group path analyses using AMOS software will be used to assess the relationships between variables. This study will provide insight into how inclusion may be associated with different identity aspects and how these may inform well-being within the context of work. As organizations seek to engage their employees, this may provide valuable insight into which identity aspects are essential for promoting work engagement, reducing burnout, and enhancing self-efficacy. Also, whether there are differences and similarities in how inclusion and identity relate to well-being may relationships, and the implications which need to be accounted for across different national contexts, with some contexts more multicultural than others.

Populism is on the rise in many countries and the demise of the multiculturalism has been announced by politicians in various countries. Yet, empirical data suggest otherwise. I will first describe the intricate relations between multicultural policies, discourse, media, and attitudes. I will then focus on immigrant policies (in their own right and as proxies of immigration climate). Two types of studies will be discussed that have addressed the role of policies (notably the Migrant Integration Policy Index, MIPEX) in multicultural societies: educational outcomes of students at primary and secondary schools and well-being among adults. It is concluded that the evidence suggests that policies matter for both types of outcomes and that inclusive climates yield better immigrant outcomes (and probably more harmonious intergroup relations). Discussant Klaus Boehnke, Jacobs University, Germany, Higher School of Economics, Moscow, Russian Federation.
HUMAN ENVIRONMENTS AS A RESOURCE FOR PSYCHOLOGICAL WELL-BEING

Sofya Nartova-Bochaver
Boris Irkhin
National Research University Higher School of Economics (Moscow, Russia)

Mati Heidmets
Tallinn University (Tallinn, Estonia)

Milana Khachaturova
National Research University Higher School of Economics (Moscow, Russia)

Iryna Kryazh
V. N. Karazin Kharkiv National University (Kharkiv, Ukraine)

Abstract body. The current symposium is devoted to the study of environmental and eco-social resources of the people’s positive functioning (maintenance of psychological well-being and morality). This subject is very topical and especially important in the conditions of the today’s hectic civilization with its ultra-fast pace of life and a lack of respect for natural, social, and sometimes human resources. The additional reason for the symposium is high interest in non-drug means of maintaining mental health. To substantiate environmental educational programs, psychotherapeutic techniques and methods of the unguided self-help, it is necessary to investigate the efficiency of environmental impact on and predictive role for the positive personal phenomena. Current symposium considers nature, home, and the whole planet as independent variables, and empathy, morality, coping strategies, while environmental attitudes are considered dependent ones.

Press paragraph. Research teams from three countries (Estonia, Russia, and Ukraine) will present their most recent studies on the person-environment interaction in different environments (natural, home, and planet). They investigated environmental antecedents and psychological subsequences (effects for personality and well-being). Nartova-Bochaver will present her talk titled “Human’s positive attitudes to the plant world and moral motives”. Irkhin has prepared a presentation titled “Environmental identity as a factor of empathy with nature and people”.

Heidmets will make a presentation titled “Emotionally attached to the whole planet, is it possible?” Kryazh will make a report titled “Trust and nature connectedness as antecedents of subjective wellbeing in people with high environmental concern”. Khachaturova will present her talk titled “The home environment as a resource of constructive coping behaviour in youth”. The main idea linking together all the presented studies is the way of finding patterns of interaction between environments and people and, in addition, specification of its positive effects for personalities.

General summary of the Symposium. Interest in environmental psychology research has been growing worldwide for many reasons: because of environmental degradation, the search for environmental resources to strengthen health and psychological well-being, etc. We have chosen the theories of person-environment interaction as our general theoretical framework. In more detail, we based on the nature connectedness theory (Meyer & Frantz, 2007; Kaplan & Kaplan, 1989; Elings, 2006), ecological ethics theory (Opotow & Clayton, 2003), environmental identity theory (Clayton, 2003), place attachment theory (Lewicka, 2011), the concept of biophilia (Wilson, 1984), and on the multilevel synergetic theory of people-home interaction (Nartova-Bohcaver et al., 2016). The main idea of this symposium is to present contemporary models and perspectives that make some sensible predictions concerning the
People have always been attracted to plants because the vegetable world supplied them with food, material for housing and heating. This attachment is however not only of the consumer interest: studies show that interaction with plants also makes a great contribution to the preservation of physical and mental health, the maintenance of psychological well-being, and the experience of aesthetic pleasure (Capaldi et al., 2017; Chistopol'skaya et al., 2017; Elings, 2006; Howell et al., 2012; Huss et al., 2018; Kaplan & Kaplan, 1989; Sharafadina, 2011). At the same time, the contribution of attitudes to plants to moral seems to be contradictory: thus, environmental identity impacts empathy with nature more strongly than to social empathy (Clayton et al., 2019). The current study is aimed at investigation into connection between attitudes to plants and moral motives. We assumed that the more positive the attitude to plants, the higher the level of moral motives. The survey was conducted on the Russian sample; 257 participants (students from Moscow universities, 199 female, Mage = 21.1, SDage = 2.5), were recruited. The following tools were used: a questionnaire “People and Plants” (Muhortova, Nartova-Bochaver, 2015) consisting of 32 items and five sub-scales (Joy, Esthetics, Experience of interaction with plants, Closeness to nature, and Ecology) and Moral Motives Model scale (Janoff-Bulman & Carnes, 2013) including 30 items and six sub-scales (Self-restraint, Not harming, Social order, Self-reliance (industriousness), Helping / fairness, and Social justice). As expected, all parameters of positive attitudes to plants, except Experience, were strongly positively connected with moral motives. Moreover, multi-regression analysis allowed developing some (however not very strong) models. Thus, Self-restraint motive is predicted by Ecology variable, Helping / fairness by Ecology, Social justice by Esthetics and negatively by Closeness to nature, Not harming by Esthetics, Social order – by Esthetics and Experience. Two last connections are also stronger in female respondents. The obtained results are discussed referring to the Reverence for Life ethics by Schweitzer, Universalism value by Schwarz, and Psychology of Moral Expansiveness by Crimston et al. (2016). Supported by RFBR, Project 19-013-00216.
EnvironmenTal identity (EID) is one of the multiple personal identities, it demonstrates the extent to which people perceive themselves as a part of nature, incorporated in it and defined by it (Clayton, 2003). As previous research show, EID strongly predicted various personal phenomena like psychological well-being or social, political, and ecological attitudes (Matsuba et al., 2012; Olivos & Aragonés, 2011; Scopelliti et al., 2018; Tam, 2013; Watson, Hegtvedt, Johnson, Parris, & Subramanyam, 2017). At the same time, little is known about how EID is related to positive and humanistic traits and attitudes. While empathy is a base of positive and moral attitudes to other life forms, it hosts significant theoretical potential for clarifying complex topic of human-nature relationships. Our study investigates the connection between EID and empathy with nature and people. We expected that 1) EID may be positively connected with empathy with nature and people, and 2) its predictive role for empathy with nature may be stronger than for empathy with people. Our tools were: Environmental Identity scale (Clayton, 2003) and Interpersonal Reactivity Index (IRI) (Davis, 1983). 200 respondents, students from Moscow universities (84% females, Mage = 22.5, SDage = 6.2), participated in the study. Descriptive statistics, correlation and multi-regression analyses were used. According to our expectations, EID was positively connected with both types of empathy but predicted environmental empathy stronger than social empathy (R² = .33 compared to R² = .09) which fully confirmed our second hypothesis. Our results have shown that EID might be a very strong but not universal predictor of positive attitudes to nature and society. It may happen that in the situation of choice people with a high level of EID would prefer natural objects to people. The results encourage looking for mediators of connection between natural identity and empathy. The outcomes are explained referring to the biophilia hypothesis by E. Wilson (1984), to the Theory of basic human values by Sh. Schwarz (1992), and to research on moral inclusion (Opotow, 1993), moral boundaries (Bastian et al., 2012; Laham, 2009), and moral expansiveness (Crimston et al., 2016). Supported by RFBR, Project 19-013-00216.
EMOTIONALLY ATTACHED TO THE WHOLE PLANET, IS IT POSSIBLE?

Mati Heidmets
Tallinn University (Tallinn, Estonia)

Environmental psychologists, while dealing with the place attachment issues, have moved their attention to the multiple attachment, especially to the emotional ties person may have with the quite distant areas and territories. M. Lewicka (2011) is asking: do nowadays people also feel attached to the higher level places — cities, regions, the whole Earth? And does this higher level of attachment happen in expense of local places — home, neighbourhood — or in addition to them? Taking the inevitable global impact of the environmental issues, including climate change into account, environmentalists are asking: can individuals form relations of belonging and stewardship to the whole Earth, even in expense of national interests (Devine-Wright, Price, Leviston, 2015)? Those are important questions. As our everyday life becomes more and more globalized, does the mental border-building and emotional bonding to places follow this trend or remains traditionally home and neighbourhood centered? In 2018, an empirical study in Estonia was carried out to assess the strength in five levels of place attachment: neighbourhood, village/city, country, Europe, and the whole Earth, as well as to study the relations between these levels of attachment. The results of this internet-based survey (N = 528) indicated: more than half of respondents are reporting emotional bonding to the distant areas, such as Europe or the whole Earth; strong positive correlation emerged between five presented levels of attachment (r ranged from 0.29 to 0.71), which follows that relations between different levels of attachment are not contradictory but complementary. The results are in line with the findings of Devine-Wright, Price, Leviston (2015) in Australia and are presenting some hints how the human’s environmental attachment and emotional bonding to multiple places may be constructed. It seems to be constructed not by confronting local and global areas but by adding the new (wider and distant) layers to the older (more home-centered) attachment units. Growing emotional attachment with the wider areas, up to the whole planet, may be considered as important social resource while trying to find joint solutions to the really global issues, such as security, climate change or pollution.
THE HOME ENVIRONMENT AS A RESOURCE OF CONSTRUCTIVE COPING BEHAVIOUR IN YOUTH

Sofya Nartova-Bochaver  
Milana Khachaturova  
National Research University Higher School of Economics (Moscow, Russia)

In the following paper we discuss the resource approach to coping behavior. This approach assumes the existence of specific resources that help a personality to overcome difficulties (Folkman & Lazarus, 1998; Frydenberg, 2004; Belinskaya, 2009). We emphasize that parameters of the home environment (home attachment, functionality and relevance of the home environment) can be considered major resources of a personality’s coping in youth (along with different resources of coping behaviour — personal, cognitive, social, cultural and others). They are the underlying parameters forming a home environment image levels (Nartova-Bochaver et al., 2016). The sample consisted of 344 participants (267 females and 77 males), students of different faculties of the Higher School of Economics. We used the Functionality of the Home Environment Questionnaire, the Relevance of the Home Environment Questionnaire, the Home Attachment Questionnaire, and the Ways of Coping Questionnaire. The results of the factor analysis allowed us to select a positive image of the home environment based on the parameters of functionality and the relevance of the home environment, as well as home attachment. These parameters are an important resource for coping behaviour in youth. The results of the correlation analysis showed that a positive image of the home environment is correlated with efficient strategies of self-control, seeking social support, planned problem solving, and positive reappraisal, and also with an inefficient strategy of confrontation ($r = .452$, $r = .412$, $r = .516$, $r = .391$, $r = .394$, $p < .05$). Our results are consistent with several prior investigations. When young people are confronted with difficulties, a positive home environment helps them to relax and provides the environmental resources to think about these problems, accept their responsibility, reappraise the situation, and find the way to overcome difficulties and solve problems constructively (Jorgensen & Stedman, 2001). But for all that, the confrontation strategy is correlated with a positive image of the home environment. Our results show that an extra high level of home attachment can be dysfunctional in youth. In a young person the dependence on the home environment may stimulate the feeling of hostility towards the outside world and other people and force them to prefer confrontation.
TRUST AND NATURE CONNECTEDNESS AS ANTECEDENTS OF SUBJECTIVE WELLBEING IN PEOPLE WITH HIGH ENVIRONMENTAL CONCERN

Iryna Kryazh
V. N. Karazin Kharkiv National University (Kharkiv, Ukraine)

Environmental concern is an important condition for people to solve global environmental problems, hence the task of informing people about the depth of these problems. However, this can lead to increased environmental anxiety and reduced subjective wellbeing. M. Ojal’s research (2005, 2012) shows that the meaningfulness of life and existential emotions such as trust, hope, and anger, can serve as a buffer against reducing subjective wellbeing in adolescents. A number of studies have revealed a positive relationship between psychological wellbeing and connection with nature, the theoretical basis of which is given by the concept of biophilia (Wilson, 1984).

Hypothesis: the combination of strong environmental concern with high subjective wellbeing is supported by trust, sense of coherence, and nature connectedness.

The sample: 207 adults (123 female). The questionnaire contained: brief measure of nature relatedness (Nisbet, Zelenski, 2013), Inclusion of nature in self (Schultz, 2002), Lexington attachment to pets scale (Johnson, Garrity, Stallones, 1992), Orientation to Life Questionnaire (Antonovsky, 1987), Methodic of examining trust/distrust to the world, to other people and to oneself. (Kupreichenko, 2008), Environmental concern scale (Kryazh, 2013), life satisfaction scale (Diener, Emmons, Larsen & Griffin, 1985), Scale of subjective wellbeing (Perrudet-Badoux, 1988). Clustering on dimensions "Environmental concern" and "Subjective wellbeing" identified five groups of respondents, in two of which was showed the highest levels of concern but significantly different levels of subjective wellbeing. Comparison of groups showed that among respondents with high environmental concern, those of them who scored high on subjective wellbeing had higher level sense of coherence, trust (p < .001), inclusion of nature in self, nature relatedness (p < .05), and general attachment to pets (p = .067) than those who scored low on subjective wellbeing.

Multiple regression analysis revealed that trust, sense of coherence, and inclusion of nature in self-support subjective wellbeing, neutralizing the potential negative effects of environmental concern, which is important in both contexts: conservation psychology and health psychology.
CITIZENSHIP ATTITUDES AND DIMENSIONS OF THE ‘NEW AUTHORITARIANISM’ IN EUROPE: AN EXPLORATORY STUDY

Beata Krzywosz-Rynkiewicz
University of Warmia and Mazury in Olsztyn (Olsztyn, Poland)

Kerry Kennedy
The Education University of Hong Kong (Hong Kong, China)

Katinka Dancs
University of Szeged (Szeged, Hungary)

Kristi Koiv
University of Tartu (Tartu, Estonia)

Sandra Rone
Riga Management University (Riga, Latvia)

Abstract body. Nowadays we can observe democracy retreating and autocracy gaining in many countries in the world. Authoritarian governments of 20th. century usually began with a military coup and dictators gained power by force. The current backsliding of democracy seems result from the erosion of democratic values (such as individual rights, freedom of expression, etc.) and citizens’ attitudes. The wave of this new authoritarianism of the 21st century thus undermines even well-established democracy democracies and threatens their core values. What is more, the phenomena is not confined to a single country or region. In this context European challenges are particularly important. V-Dem Annual Democracy Report 2018 (V-Dem Institute, 2018) revealed significant decrease democracy indicators (media harassment and censorship, freedom of discussion, civil society organisations’ repressions etc.) and in few European countries (e.g. Poland, Hungary, Lithuania, Slovakia) democracy has been shaken. In this symposium an attempt will be made to identify empirically the dimensions of the new authoritarianism, especially in relation to the citizenship attitudes and activities of young adults. We assume that current European citizenship attitudes and activities will be related to the way young people currently perceive democracy and the challenges it faces from the new authoritarianism. The above issues will be discussed, based on empirical data, in international researchers team: Beata Krzywosz-Rynkiewicz — symposium convenor (Poland), Kerry Kennedy — discussant (Hong Kong), Kristi Koiv (Estonia), Katinka Dancs and Laszo Kinyo (Hungary), Sandra Rone (Latvia)

Press paragraph. The research to be reported is based on the citizenship model by Zalewską and Krzywosz-Rynkiewicz (2011), inspired by Kennedy’s citizenship concept (2006) including three forms and 8 dimensions of citizenship: Passive Citizenship (National Identity and Patriotism), Semi-active Citizenship (Civic Virtues and Loyalty to the laws and rules) and Active Citizenship (Social, Political, Action for Change and Personal activity). We see the need to extend this model by examining aspects of citizenship related to the new authoritarianism: by: Media harassment, Media censorship, Media Bias, Freedom of discussion, Civil society organisation repression, Electoral management body autonomy, Opposition parties autonomy, Academic and cultural expression, Free activity of civil society organizations, Vote Buying Election intimidation, Election registry (V-Dem report (2018).

General summary of the Symposium. Using the Citizenship Behavior Questionnaire plus a new Democracy Indicator scale, about 2 350 students aged 19-28 from 7 European countries were surveyed in 2018-19. Comparison of three groups of countries — post-Soviet Union states united to EU (Latvia, Lithuania, Estonia), post-Soviet Union satellites united to UE (Poland, Hungary) and Post-Soviet states not-united to UE (Ukraine and
Moldova) will be reported at two levels: perception of democracy and citizenship attitudes and activities. In addition profiles of citizenship attitudes and activities and their relationship to perceptions of the democracy indicators will be analyzed. This research opens up new perspectives on the nature of democratic development in the current political environment, the way it is perceived by sampled of Eastern European youth and leads to an assessment of democracy as part of Europe’s future.

**YOUNG ADULTS’ PERCEPTION OF DEMOCRACY AND THEIR CITIZENSHIP ATTITUDES: POLISH EXAMPLE**

Beata Krzywosz-Rynkiewicz  
University of Warmia and Mazury in Olsztyn (Olsztyn, Poland)

There are a set of syndrome of democracy backsliding in Poland like monopolization of public media, taking control over judiciary, compliance with the constitution, freedom for NGOs (e.g. WOSP). In the same time nationalistic movements are taking on meaning (e.g. play the primer role in demonstrations on public holidays). The analysis of condition of democracy in relation to new authoritarianism is necessary. In the paper young adults assessment of democracy indicator in relation to their citizenship activity will be presented. 360 students aged 19-28 were examined by Citizenship Behaviour Questionnaire by Zalewska & Krzywosz-Rynkiewicz (2011) and scale of democracy indicators by V-Dem report (2018). Three kind of results will be presented: (1) young adults perception of democracy indicators, (2) profiles of young adults democracy behaviours and (3) relationship between perception of democracy and citizenship activity.

**YOUNG ADULTS’ PERCEPTION OF DEMOCRACY AND THEIR CITIZENSHIP ATTITUDES: ESTONIAN EXAMPLE**

Kristi Koiv  
University of Tartu (Tartu, Estonia)

During the early years of the 2000s young people in Estonia were increasingly alienated from mainstream politics, but nowadays a new media was proposed as a mean vehicle for new forms of civic engagement for young people (e.g. Kaun, 2013). In a democratic, European-oriented transformation with a focus on a more liberal economy, a research question was evoked: How have Estonian young adults constructed their citizenship attitudes and perception of democracy indicators? 360 university students aged 18-30 were examined by Citizenship Behaviour Questionnaire by Zalewska & Krzywosz-Rynkiewicz (2011) and scale of democracy indicators by V-Dem report (2018). Estonian data were analysed from three study areas: (1) young adults perception of democracy indicators, (2) profiles of young adults’ democracy behaviours and (3) relationship between perception of democracy and citizenship activity.

The task of the Discussant is to review the presentations, identify issues for further discussion and suggest ways to move the research agenda forward. Given the focus on the democracy and authoritarianism as part of current political discourse it is envisaged that discussion will focus on the future of politics in a context where citizens’ rights will be limited and where participation will come with a cost.
YOUNG ADULTS’ PERCEPTION OF DEMOCRACY AND THEIR CITIZENSHIP ATTITUDES: THE CASE OF HUNGARY

Katinka Dancs
Kinyó László
University of Szeged (Szeged, Hungary)

According to V-Dem Report (2018) Hungary is one of the countries which become more autocratic in the past years. Previous international comparative studies confirmed that Hungarians are among the most passive ones in Europe regarding political and civic activity. In the past decades Hungary went over several changes but the lack of civic engagement and low willingness to vote is permanent. Political socialization studies confirm the reproduction of passivity and alienation. The present study focuses on the attitudes of university students aged 18-29 examined by Citizenship Behaviour Questionnaire.

YOUNG ADULTS’ PERCEPTION OF DEMOCRACY AND THEIR CITIZENSHIP ATTITUDES: LATVIA

Sandra Rone
Mara Vidnere
Latvia University (Riga, Latvia)

There are a set of syndrome of democracy in Latvia like oposition parties autonomy, barriers to political parties, multiparty elections, the electorate’s low faith in government and the low electorate’s participation in the elections. Will be reflected in correlations of Democratic forms with types of civic activity. In the paper young adults assessment of democracy indicator in relation to their citizenship activity will be presented. 360 students aged 19-28 were examined by Citizenship Behaviour Questionnaire by Zalewska & Krzywosz-Rynkiewicz (2011) and scale of democracy indicators by V-Dem report (2018). Three kind of results will be presented: (1) young adults perception of democracy indicators, (2) profiles of young adults democracy behaviours and (3) relationship between perception of democracy and citizenship activity.
RELATIONSHIP TO WORK OF EMERGING ADULTS IN PRECARIOUS SITUATIONS: GENDER AND INTERSECTIONALITY

Valérie Cohen-Scali  
Conservatoire National des Arts et Métiers (Paris, France)

Guðbjörg Vilhjálmsdóttir  
University of Iceland (Rekjavik, Iceland)

Jacques Pouyaud  
University of Bordeaux (Bordeaux, France)

Abstract body. Increasing precariousness of jobs along with other developments on the labor market have deleterious effects on mental and physical health as well as on the identity of individuals. Young people are particularly affected by the bad quality of work and poor working conditions. It is important to know more about the diversity of the work situations and relationship to work of emerging adults who are in a precarious situation. The aim of the presented research is to identify and to compare the perceived situation of work and life among emerging adults in five countries. The objective is also to know more about their work situation, what they think and how they perceive it. Most of the presented research are conducted in accordance with a socio-constructivist perspective, a life design approach (Nota and Rossier, 2015, Savickas, et al., 2009) and use as the psychology of working theory (Blustein, 2006)

Press paragraph. Young people are particularly affected by the bad quality of work and poor working conditions all around the world. It is important to know more about the diversity of the work situations and relationship to work of emerging adults who are in a precarious situation. The aim of the research is to identify and to compare the perceived situation of work and life among emerging adults in different parts of the world (France, South Africa, Switzerland, Italy, Iceland). The objective is to know more about their work situation, what they think and how they perceive it. Most of the presented research are conducted in accordance with a socio-constructivist perspective, a life design approach (Nota and Rossier, 2015, Savickas, et al., 2009) and use as the psychology of working theory (Blustein, 2006) as theoretical framework.

The presentations enlighten the role of school path, familial and cultural contexts using a gender and intersectionality approach. Presentations identify the main obstacles and difficulties emerging adults have to face regarding their socio-economic and cultural contexts. The symposium gathers monographic or comparative data and underlines both common aspects and specificities in the relationship to working and career paths of emerging adults who live in different parts of the world.

General summary of the Symposium. Increasing precariousness of jobs along with other developments on the labor market have deleterious effects on mental and physical health as well as on the identity of individuals, as considerable research has shown in the last decade. Young people are particularly affected by the bad quality of work and poor working conditions. It is important to know more about the diversity of the work situations and relationship to work of emerging adults who are in a precarious situation. This symposium presents data collected in five different countries. Most of the presented research are conducted in accordance with a socio-constructivist perspective, a life design approach (Nota and Rossier, 2015, Savickas, et al., 2009) and use as the psychology of working theory (Blustein, 2006). The aim of the research is to identify and to compare the perceived situation of work and life among emerging adults in different parts of the world. The objective is to know more about their work situation, what they think and how they perceive it. The presentations enlighten the role of school path, familial and cultural contexts using a gender and intersectionality approach.
Presentations identify the main obstacles and difficulties emerging adults have to face regarding their socio-economic and cultural contexts. The symposium gathers monographic and comparative data and underlines both common aspects and specificities in the relationship to working and career paths of emerging adults of different parts of the world. The first presentation untitled "French emerging adults, qualified or not, in vulnerable situations: life-design, relationship to work and occupational integration" is presented by Laurence Cocandeau-Bellanger, Soazig Disquay-Perot, Angel Egido, Catholic University of Angers-Cnam-CRTD, Hesam Université — France. This presentation starts from the observation that in France, many youth adults drop out from Higher education without diploma. Their aim is to understand the process of identity construction and relationship to work of these populations of emerging adults, two research were conducted in France. Biographical interviews with 28 young people were realized. 14 Biographical interviews are completing their master’s degree and 14 are in the labour market with a low or no qualification. A thematic content analysis has been conducted. The first results reveal two elements of differentiation. The first one relates to the relationship to work. The attitudes regarding work of unskilled young people are strongly connected with the circumstances which have lead them to do this work, while young graduates have a specific professional project based on meetings with significant others. The second element relates to the meaning of work. The work activity of unskilled young people make meaning when they learn and develop skills on the workplace while the students find meaning the their situation through their vocational plans. The role of both elements will be discussed. The second presentation is untitled "Group career construction counselling with students from disadvantaged communities" and signed by Pr.Kobus G. Maree, from the University of Pretoria. The presentation deals with group career construction counselling. The aim is to Investigate the usefulness of drawing on participants’ scores achieved on an interest inventory and their career-life stories to promote their chances of studying successfully. The method used is a non-experimental, group, integrative qualitative-quantitative, design to construct data (the JuniorTukkie Project). Drawing on subjective factors (stories) as well as objective factors (scores) ensured the use of multiple data sources to advance triangulation. Participants were helped to identify key life themes and connect 'obvious' and 'less obvious' information. The investigation demonstrated the effectiveness of the integrative style of career construction counselling implemented. Replication of the research with small and large groups of participants is needed to promote the generalisability of the findings. Involving a control group and including other quantitative and qualitative instruments in future research will be considered. The third presentation is untitled "Emerging precariousness" from the inside: Low qualified young adults’ narratives about job insecurity" by Jonas Masdonati, Jérôme Rossier, Laurence Fedrigo, and Robin Zufferey, researchers at University of Lausanne, Switzerland. This research starts from the idea that in a labor market increasingly composed of high skilled jobs, low qualified young adults often have to face job insecurity and arduous transitions from school to work. Their communication is based on a qualitative thematic analysis of semi-structured interviews with 15 low qualified and precarious young workers in Switzerland. More specifically, it focuses on how they narrate their subjective experience of job insecurity. Results showed that job insecurity was associated with poor work conditions and the feeling of benefiting of limited career perspectives. Participants also attributed their precarious situation to difficulties in the economic, physical and psychological health, migration, or family spheres. The study suggests that career counseling with emerging adults entering the labor market should focus both on the individual and the contextual levels, and aim to prevent a sort of "emerging precariousness". The fourth presentation is untitled "Career stories of Italian young adults in precarious situations and their inclusive and sustainable aspects" by Laura Nota, Maria Cristina Ginevra, Sara Santilli, Ilaria Di Maggio & Salvatore Soresi, from the University of Padova, Italy. The authors observe that the threats or challenges that people are coping with
Fundamental aspects of well-being and meaningful work are a basis for self-respect. Finding decent work is a challenge for emerging adults who have no formal training after compulsory education and they often find themselves in temporary low-paid jobs. The paradox they are facing is that they need to continue their education in order to attain their career goals, but re-entering the school system is not any easier now than when they were younger. The hindrances they have met are financial, educational or an over-rigid school structure. When work is considered indecent it is mainly due to low salaries. The participants that are parents have had housing difficulties and many still live in their childhood homes.

The symposium will be concluded by Pr. Jacques Pouyaud and Valerie Cohen-Scali as discussants.
GROUP CAREER CONSTRUCTION COUNSELLING WITH STUDENTS FROM DISADVANTAGED COMMUNITIES

Kobus G. Maree
University of Pretoria (Pretoria, South Africa)

Group career construction counselling. Investigating the usefulness of drawing on participants' scores achieved on an interest inventory and their career-life stories to promote their chances of studying successfully. A non-experimental, group, integrative qualitative-quantitative, design was used to construct data (the JuniorTukkie Project). Drawing on subjective factors (stories) as well as objective factors (scores) ensured the use of multiple data sources to advance triangulation. Participants were helped to identify key life themes and connect 'obvious' and 'less obvious' information. The investigation demonstrated the effectiveness of the integrative style of career construction counselling implemented. Replication of the research with small and large groups of participants is needed to promote the generalisability of the findings. Involving a control group and including other quantitative and qualitative instruments in future research should be considered.

EMERGING PRECARIOUSNESS” FROM THE INSIDE: LOW QUALIFIED YOUNG ADULTS’ NARRATIVES ABOUT JOB INSECURITY

Jonas Masdonati
Jérôme Rossier
Laurence Fedrigo
Robin Suffrey
University of Lausanne (Lausanne, Switzerland)

In a labor market increasingly composed of high skilled jobs, low qualified young adults often have to face job insecurity and arduous transitions from school to work. Our communication is based on a qualitative thematic analysis of semi-structured interviews with 15 low qualified and precarious young workers in Switzerland. More specifically, it focuses on how they narrate their subjective experience of job insecurity. Results showed that job insecurity was associated with poor work conditions and the feeling of benefiting of limited career perspectives. Participants also attributed their precarious situation to difficulties in the economic, physical and psychological health, migration, or family spheres. The study suggests that career counseling with emerging adults entering the labor market should focus both on the individual and the contextual levels, and aim to prevent a sort of "emerging precariousness".
CAREER STORIES OF ITALIAN YOUNG ADULTS IN PRECARIOUS SITUATIONS AND THEIR INCLUSIVE AND SUSTAINABLE ASPECTS

Laura Nota
Cristina Ginevra
Sara Santilli
Llaria Di Maggio
University of Padova (Padova, Italy)
Cohen-Scali Valérie
Conservatoire National des Arts et Métiers (Paris, France)

The threats or challenges that we are coping with are related to increasing inequalities, the polarization of work, the technological progress which is modifying or reducing existing jobs in all sectors of the economy and the proliferation of precarious employment (Nota et al., 2018). The Life Design approach views uncertainty and identity construction as natural features of careers (Savickas et al., 2009). This theory stresses that careers are unpredictable and encompass more life design domains that only the work domain from which people construct their identity (van Vanien, Koen, and Klehe, 2015). Based on Life Design approach, will be presented the 'Inclusive and sustainable future Interviews' answers (Soresi, Nota, Santilli, Di Maggio, Ginevra, 2018) conducted with a group of Italian youth unemployed to elicit the views of the future and inclusive and sustainable theme that are then related to their current career problem.

THIS IS NOT A FUTURE JOB. REPRESENTATIONS OF DECENT WORK AMONG YOUNG PEOPLE WITH LOW EMPLOYMENT SKILLS

Guðbjörg Vilhjálsdóttir
University of Iceland (Rekjavik, Iceland)

Access to decent work is a fundamental aspect of well-being and meaningful work is a basis for self-respect. Finding decent work is a challenge for emerging adults who have no formal training after compulsory education and they often find themselves in temporary low-paid jobs. The results from 10 semi-structured interviews with low-skilled people from age 20 to 24 in Iceland are reported. Results showed that participants do not consider their current job as a future job, although most of them find it decent. What they see as their future job requires further education. The paradox they are facing is that they need to continue their education in order to attain their career goals, but re-entering the school system is not any easier now than when they were younger.

Abstract body. The symposium 'Psychology and religion' has several interconnected objectives. 1. To clarify methodologically the question how there may be the branches of psychology oriented toward and based upon the definite confessional religions. 2. To discuss what may be a concrete specific features of corresponding to these confessions psychological theoretical considerations. 3. To describe and discuss what are the real practical approaches oriented to Islam and Christian confessions. 4. To compare Muslim and Christian psychological approaches and to discuss whether their common features may be described as 'spiritual dimension' of general psychology and can be included to the scientific psychology. 5. To understand what may be the theoretical benefit for general psychology approach to take into account such a theoretical and practical confession oriented approaches.

Press paragraph. The symposium participants are: Boris Bratus, Doctor in Psychology, Professor of Psychology department of Lomonosov MSU
and the dean of Psychology department of Russian Orthodox Church University. Bagus Riyono, President of International Association of Muslim Psychologists Yogyakarta, PhD in Psychology, Professor of Gadjah Mada University, Yogyakarta. Pavlova Olga, PhD in Pedagogy, Chairman of the Association of Psychological Assistance to Muslims, Associate Professor at the Department of Cross-Cultural Psychology and Psychological Problems of Multicultural Education, Moscow State University of Psychology and Education, Member of the International Association of Islamic Psychology; Member of the International Association for the Psychology of Religion (IAPR) deputy editor-in-chief of the journal "Minbar. Islamic Studies". Krichevets Anatoly, Doctor in Philosophy, Professor of Psychology department of Lomonosov MSU and Psychology department of Russian Orthodox Church University. Dalgatov Magomed, Doctor in Psychology, the head of Psychology department of Dagestan State University in Pedagogic (Mahachkala), the presidium member and the Head of Dagestan branch of the Russian Psychological Society.

**General summary of the Symposium.** Religious confessions give psychology a request for the practices focused on work related to this confessions. For example it is psychotherapy of people belonging to a given denomination. Therapeutic methods using with such a people should be consistent with the client’s ideas about what is acceptable for one’s confession. Also, the client’s idea of the desired therapy results to a large extent depends on the value orientation prevailing in this denomination.

Often the client is inclined to trust only the therapist belonging to the same denomination. Psychological work with religious radicals also requires the special qualification of consultant. Really the tendency to radicalism is often determined by psychological factors and needs of correction by psychological means, but as the practice of working with radical Islamists shows, the effectiveness of psychological work with them is directly related to the level of religious education of a consultant, since client’s rationalizations of one’s behavior have the form of religious ‘dogmas’ and need of criticism based upon sacral texts. Thus, the need of some special training of a practical psychologists is obvious. The symposium will thoroughly discuss the examples of such a challenges in Islamic and Christian psychology, being proposed in the symposium speaker presentations. On the other hand, there is an obvious need of the theoretical psychology development, which is not value-neutral. Since the mid-20th century, attempts have been made to build psychology based upon universal values (A. Maslow) or upon the secular values of Western culture (existential psychology and psychiatry). Practices associated with such approaches deal with spiritual dimension of human existence, but the General cultural (i.e. acceptable to all cultures) conceptual apparatus in this area is quite modest and vulnerable to criticism. From the point of view of the symposium participants, the appeal to the theological and practical concepts developed in different religious confessions, followed by methodological analysis of similarities and differences in spiritual practices (since this analysis will be carried out in interaction of representatives of various confessional-oriented psychological approaches) will be useful for the development of psychological theories.
UNDERSTANDING THE ‘FITRAH’ OF HUMAN BEING FROM THE QUR’AN AND THE NEW SCIENCE OF PSYCHOLOGY

Riyono Bagus
Universitas Gadjah Mada (Yogakarta, Indonesia)

‘Fitrah’ is a term in Arabic that has the meaning as the origin, the true nature, and also the purpose of human existence. The knowledge of ‘fitrah’ is the foundation of all human affairs. The World Social Science Report 2010 by UNESCO concluded that the fundamental problem of social science today is the absent of “generally accepted model of humanity”. This study explains how the new science of psychology found the proof of human ‘fitrah’ that is in accordance with the message from the Qur’an.

The method used in this study is meta-ethnography. The study conducted by deep understanding on the existing reports and theories to find the themes emerge from the theses. There are three themes that emerges as a results of a meta-ethnographical study on the works of Riyono (2012), Barlette (2016), Brown (2015), and Yuniardi (2018). These three themes are freedom-responsibility, uncertainty, and vulnerability. Human freedom is found to be supported not only philosophically, but also by the study of the brain activity. Uncertainty is found to be the reality of life that denying it will be the beginning of all psychological problems. Vulnerability is found to be the key to happiness. The three themes found in this study create a foundation to build the new science of psychology that integrate knowledge from various sources including holy book, fenomenological science, positivism science and neuro-science. This study propose a new hope in the field of psychology in order to become a comprehensive human science.
PSYCHOLOGY OF ISLAM AND MUSLIMS: RUSSIAN DISCOURSE

Pavlova Olga
Moscow State University of Psychology and Education (Moscow, Russia)

Scientific understanding of topics related to the psychology of Russian Muslims requires interdisciplinary research of all social, cultural, medical, theological, historical, and psychological factors that affect it. The context of “realization of religion in a person or piousness” (embodiment or manifestation of ideal religion in each real person) is very important for psychologists. In Russia targeted research and practical psychological activities in the Muslim community are carried out by the specialists of the Association of Psychological Assistance to Muslims created in 2017. An annual scientific-practical conference “Islam: psychological stability as the basis of personal and social well-being” held in Moscow, round tables on the most critical issues, refresher courses and seminars, webinars and online discussions are held as part of association’s activities. It’s important to carefully select research tools and carefully interpret results of a empirical research, since the vast majority of modern psychological methods which are aimed at studying religion, religious identity and religious fundamentalism are created for a Christian research sample or consider religion from a secular point of view. In this regard, the methods must be adapted for the Muslim research sample and when interpreting the results, the Islamic view of a Muslim person should be taken into account. The Association of Psychological Assistance to Muslims in Russia is aimed at solving the problem of applying scientific approaches to the psychological counseling of Muslims. For a deep understanding of the psychology of a Muslim and, accordingly, the implementation of psychological counseling in the Islamic paradigm, it is necessary to rely on the ideas of the personality development that have been formed in Islam. The specifics of Islamic psychological counseling should be given sustained attention. What amount of Islamic knowledge should a professional psychological counselor have in order to provide psychological support to a Muslim? Can an Islamic psychologist be a non-practicing Muslim? Or practice other religion? Or can he be an atheist, who takes into account the religious identity of his client? Currently these questions are debatable. In its work, the newly-established Russian Association relies on the experience of foreign colleagues, first of all, International Association of Islamic Psychology and International Association of Muslim Psychologist.

CHRISTIAN PSYCHOLOGY: HISTORY AND MODERNITY

Boris Bratus
Lomonosov Moscow State University (Moscow, Russia)

The term ‘Christian psychology’ was coined in the middle of the 19th century. St. Theophan the Recluse is widely recognized as the founding father of this form of thought. However the dialog between the Church and psychology has emerged far earlier: first courses in psychology were taught in the Kiev-Mohyla Academy since the 17th century. The Soviet authorities have stalled the development of this current of thought for a long time. Cultural, historical, and methodological foundations of Christian psychology are now a subject of discussions. We understand this foundations as an important part of the psychological theory and practice. It has to be discussed the relations of Christian, Muslim, and other confessional psychology with other branches of psychology, it is necessary to define the borders between pastoral and psychological counselling. It is interesting to find the possible contribution of confessional branches of psychology to solving current theoretical and practical cases.
THE METHODOLOGICAL BASIS OF PSYCHOLOGY ORIENTED TO RELIGIOUS CONFESSIONS

Krichevets Anatoly
Lomonosov Moscow State University (Moscow, Russia)

The psychology of the personal existence cannot be developed outside of any value systems. The fact that human development can take place in different cultural environments with different outcomes does not mean that psychology can focus only on the common part of these development variations, even if one can be found. The situation is not better with so-called universal human values, which may be criticized as being not common to all people. As an example, we can consider the psychology of education, which primarily discusses the definite forms of education and training of children — the West World forms of education. Although the generalizability of these forms can be questioned in the reflection or in the comparison with other traditions of education, nevertheless that does not negate its value in a certain (West) culture. Similarly, the psychology of spiritual development, although it cannot be based on any universal system of reference points, can propose the variants based on sustainable systems of spiritual development — religious confessions — which can and should generate corresponding to them forms of psychological knowledge. The question of how "universal" the resulting systems will be, how they can support each other, and what such confessional-oriented psychological enterprises can give the main "trunk" of the psychological "tree", which they are branches of, cannot be solved without trying to develop all these confessional forms, such as Christian, Muslim, Buddhist, and any other ones.

PSYCHOLOGICAL WELL-BEING IN THE CONTEXT OF RELIGIOSITY

Dalgatov Magomed
Dagestan State Pedagogical University (Mahachkala, Russia)

The problem of the relationship of psychological well-being and religiosity of the individual over a long period of time in the scientific community cause heated debate and heated debate. Some scientists (in particular Z. Freud) argue that the religiosity of a person negatively affects the subjective well-being and emotional state of a person. However, numerous studies conducted in recent decades, mainly in foreign psychology show that religious activity in General has a positive effect on the psycho-emotional state of a person. The problem of human psychological health and well-being in the context of the Islamic religion has recently become relevant, as well as other psychological aspects. Studies of Islamic-oriented psychologists M. Badri, O. S. Pavlova. K.I. Nasibullova also shows that religious identity has a positive impact on some components of psychological well-being, in particular, psychological stability of a person. Our study in the framework of the RGNF project "Value-semantic sphere and socio — normative behavior of the individual in secular and religious education" (№16-06-01089) on a sample of students of secular and Islamic educational institutions (N-450) allowed us to conclude that the religiosity of the individual is an important factor of psychological well-being. The data of our study showed that students of Islamic educational institutions are more pronounced such components of psychological well-being as self-acceptance, acceptance of others, emotional comfort (optimism, balance), internal control (I am the master of life and situation), life satisfaction, emotional saturation of life relative to their peers secular educational institutions. Thus, the picture of the world and the person in it set by the religious doctrine, peculiar to people with internal orientation of religion (Mature, internal religiosity) provides meaningfulness of life of believers, gives effective coping strategy of behavior, and finally promotes development of psychological well — being of the person.
ETHICAL ASPECTS OF THE EXPERT WITNESS: PITFALLS AND HOW TO AVOID THEM

Anne Andronikof
Paris Nanterre University (Paris, France)

Bohumila Baštecká

Abstract body. Psychologists can be called as expert witnesses both in the civil Courts, to evaluate a cognitive or affective prejudice affecting a victim of an accident or in child custody cases, and in the penal Courts. In that case, psychologists are usually asked to perform a thorough personality assessment so as to determine the responsibility of the alleged offender, their dangerousness (risk of recidivism), the possibilities and modalities of social rehabilitation, but also the credibility of the alleged victim. Although the systems of Justice are different between countries, it appears that the same kinds of pitfalls await expert witnesses, and numerous complaints are logged against psychologists. Based on case presentations, this symposium analyses the usual errors committed by professionals as expert witness and provides some clues to avoid them.

Press paragraph. Psychologists can be called upon by lawyers or judges to perform personality assessment in the context of civil proceedings or penal lawsuits and a recent European review of the complaints lodged against psychologists has shown that this is the field of practice most often criticized. Based on the analysis of real cases, this symposium describes the specific ethical difficulties and dilemmas facing expert witnesses and issues recommendations for avoiding the pitfalls in this field of practice. The speakers are either expert witnesses themselves or members of Ethical Committees in their respective countries: Anne Andronikof, Ph.D., Professor emeritus, expert witness and member of the EFPA Board of Ethics, France. (Chairperson) Christian Mormont, Ph.D., Professor emeritus, expert witness in Belgium. Bohumila Baštecká, Ph.D., Professor, member of EFPA Board of Ethics; and Hedvika Boukalová, Professor, Charles University, members of the Ethical Committee of the Czech-Moravian Psychological Society, Czech Republic. Alla Shaboltas, Ph.D., Professor, member of the EFPA Board of Ethics; and Sergei Gorbatov, Ph.D. associate Professor, St.Petersburg State University, Russian Federation. Henk Geertsema, Healthcare psychologist, Center for Decision Making Capacity, Amsterdam University Medical Center, Amsterdam, The Netherlands, Convenor of the Board of Ethics (EFPA).

General summary of the Symposium. In the framework of the EFPA Board of Ethics, a recent review across countries of the type of complaints lodged against psychologists has shown that one of the most frequent occurs in the area of Justice, when a psychologist is required to perform personality assessment for the Courts. Psychologists can be called as expert witnesses both in the civil Courts, to evaluate a cognitive or affective prejudice affecting a victim of an accident, but mainly in child custody cases, and in the penal Courts. In that case, psychologists are usually asked to perform a thorough personality assessment so as to determine the responsibility of the alleged offender, their dangerousness (risk of recidivism), the possibilities and modalities of social rehabilitation, but also the credibility of the alleged victim. Although the systems of Justice are different between countries, it appears that...
the same kinds of pitfalls await expert witnesses. This symposium, composed of expert witnesses and members of ethics committees from different countries, will address this issue through the standpoint of the Codes of Ethics of these countries which, although slightly different in their formulations, have a consensual approach of the problem. Real cases are presented and problematic aspects of the reports from psychologists are analysed. The objective of this symposium is to alert the psychologists who serve as expert witnesses to the hazards in this area of practice and help them to use their discernment in the best interest of their client, thus avoiding being sued for malpractice and bringing discredit to the profession.

You are divorcing and wish to share custody of your children with your ex-spouse, but the latter does not agree. How will the Judge determine which decision is in the best interest of the children in custody disputes? You are accused of a criminal offense, but you deny being guilty. What type of evidence will the Court take into account? These, among many others, are instances in which a psychologist will be called upon for an expert assessment, and the psychologist is faced with several ethical dilemmas, of which they are not always aware of.

Core questions are: do evidence-based tools exist for measuring parental competence — and if not, on what criteria will psychologists base their recommendation to the Judge? Is the psychologist sufficiently aware of the necessity to remain neutral, i.e. not take sides? In a penal case, will the psychologist treat the assessed person as possibly innocent and avoid mounting scenarios to explain a deed that might have not been committed by this person? Other ethical questions also arise: has the psychologist thoroughly explained his mission and enabled the assessed party to refuse being assessed? Will the psychologist be sufficiently cautious, and respectful of the assessed party private life in the report? The presenters in this symposium have all been confronted with these questions, either as expert witnesses or as members of ethical committees which constantly have to deal with complaints against expert witness psychologists. They will present and analyse problematic case reports and pinpoint the most common deviations from the ethical code of conduct for psychologists, so as to increase awareness of the pitfalls of expert witness practice, which in turn will increase the necessary introspective reflexion on ethical aspects of our various roles as psychologists.
The complaints against psychologists who serve as expert witnesses reflect both societal and professional challenges. The aim of the paper is to point out some of them and to ask how to improve the ethical awareness in psychological expert witness practice. Overview of the complaints against psychologists—expert witnesses in the context of Czech Republic. The Czech complaints against psychologists—expert witnesses are almost exclusively from child custody domain. They raise several questions: What are appropriate instruments for assessing the "relationship climate" of the family? Is it possible to tell anything about family relationships without seeing and assessing the whole family? Are there any valid psychological tools to assess the applicability of joint custody? Or is the use of psychological expertise in joint custody context only the buck-passing procedure how to handle political decision? The dissatisfaction of people with the inappropriate power of expert witness in child custody context seems to be the reason of new phenomenon (and new type of complaints). Dissatisfied party of the child custody litigation pays for "counter-opinion" or "second expertise" done by another psychologist. There are also some suggestions from public that psychological expertise plays often unfavourable role in litigations concerning legal competence. Not knowing both Convention on the Rights of Persons with Disabilities and the WHO ICF attitude, psychologists become only servants of judges’ wishes, stereotypes and prejudices. The practice of psychological expert witness is hugely influenced by political decisions based on human and citizens’ rights. The appropriate role of psychologists and their expertise in the changing societal context is discussed.
ETHICAL ISSUES OF PSYCHOLOGICAL EXPERTISE IN FORENSIC PRACTICE ON SPOUSES DISPUTES ABOUT CHILD CARE AND PARENTING IN RUSSIA

Alla Shaboltas
Sergei Gorbatov
St Petersburg State University (Saint Petersburg, Russia)

The current forensic practice in Russia is associated with several difficulties for the experts in following professional ethical principles in conducting psychological expertise. There is a lack of local research and regulatory documents on ethical issues for forensic practice. In their activities experts consider as ethical base the Code of ethical principles for psychiatric expertise or basic ethical principles for psychology in general. At the same time the forensic expert actions conducted by psychologist are very specific and differ from psychiatrist’s actions or actions of psychotherapist and counsellor. The expert’s activity is not focused on helping components and the client is not considered as a person who needs psychological help or treatment. Expertise as an instrument for clarifying the truth of specific case puts on the expert several limitations and creates dual professional position towards ethical requirements such as respect, beneficiary, “no harm” etc. Expert-psychologist should defend the interests of the subject which are defined in abstracto and very wide.

From the other side expert’s actions are defined by the tasks of forensic expertise as part of criminal or civil investigation. The expert should act in the interests of the law and the institute which have appointed the expertise. From psychological point of view the interests of the subject and law could not match. The subject could be exposed to psycho diagnostic procedures following court or prosecutor’s decision, without voluntary consent. Data collected in expertise could be disclosed which could lead to the potential harm for person. The most acute ethical dilemmas appear during expertise in civil investigations, such as parental disputes about children after divorce. This expertise differs from others due to emotional and conflictual components. The task of investigation increases the risks for psychologists of emotional and professional involvement in subject’s situation and taking the personal responsibility for the child’s future. Psychologist could mix therapeutic and expert roles which inevitably lead to bias in data interpretation. There is an urgent need in developing ethical regulations for forensic practice. The speakers will share their experience of dealing with the most difficult cases from Russian forensic psychological expertise practice.
PSYCHOLOGICAL ANALYSIS BY EXPERT WITNESSES BASED ON ALLEGED CRIMINAL OFFENSES OR COMPLAINTS: A FAULTY CONDUCT WITH SERIOUS CONSEQUENCES

Anne Andronikof
Paris Nanterre University (Paris, France)

Christian Mormont
Liege University (Liege, Belgium)

In countries where Justice is regulated by the Statute Law (as opposed to Common Law) criminal cases are first investigated by a Judge whose task is to gather all elements of evidence and defence before the case is submitted to the Court. Expert reports are ordered by the investigative Judge during that preliminary phase. The usual mission entrusted psychologists is to assess the personality of the suspect, while respecting their presumed innocence, a legal right retained until proven guilty. A recent analysis of psychological reports produced by expert witnesses in Belgium has found many formulations that manifest a dramatic ignorance of the code of ethics for psychologists. It is frequent to see that psychologists describe the suspect, say as a paedophile (which is a medical diagnosis and not a penal category) based on the filed charge of sexual offense on a minor instead of on elements independent from the charge itself. Thus the assessed person is given as guilty and paedophile. By doing so, the psychologist does not respect the necessary neutrality and objectivity, nor ethical methods of psychological assessment, nor the concepts recognised by the scientific community, nor, evidently, the presumption of innocence. We will discuss in detail these problematic and alas frequent aspects of expert witnesses reports in reference to the code of ethics.
EXISTENTIAL PERSPECTIVES IN HEALTH

Peter la Cour
Center for Complex Symptoms, Frederiksberg Hospital (Copenhagen, Denmark)

Miriam Boehmer
University of Bern (Bern, Switzerland)

Gry Stalsett
MF Norwegian School of Theology, Religion and Society (Oslo, Norway)

Bernadette Voetter
Schnell Tatjana
University of Innsbruck (Innsbruck, Austria)

Abstract body. This symposium highlights the existential dimension in health from several methodological perspectives. 1) A theoretical overview and critique of the biopsychosocial model of health, and an introduction of a four-dimensional model of health. 2) A controlled randomized trial of a meaning-making intervention with chronic pain patients, which resulted in substantial changes in the intervention group’s mental and existential health, and pain acceptance. The third presentation focuses on crises of meaning, reporting prevalence scores and a general increase of crises of meaning since the beginning of the millennium. Moreover, evidence for a high predictive power of crises of meaning for suicidality is presented. The fourth contribution reports longitudinal data on the effect of crises of meaning on the well-being of highly gifted individuals. Fifth, a case study is presented that describes how topics such as meaning, freedom and isolation are addressed in an existential treatment model (VIVA). It shows their intricate connection with early life stories and their expression in pathological affect. A concluding discussion ensues.

Press paragraph. The biopsychosocial model of health has been in use for several decades. Although its potential has not been exhausted yet, its shortfalls are visible. One of them is the ignorance of existential matters, touching upon questions such as the meaning/lessness of life. In this symposium, we will highlight the existential dimension in health from several methodological perspectives. We start with a theoretical overview and critique of the biopsychosocial model of health, and an introduction of a four-dimensional model. This is exemplified by a controlled randomized trial of a meaning-making intervention with chronic pain patients, which resulted in substantial changes in the intervention group’s anxiety, depression, crises of
meaning, and pain acceptance. The third presentation focuses on crises of meaning. It reports prevalence scores of crises of meaning for adults living in Germany and Austria, suggesting a general increase of crises of meaning since the beginning of the millennium. This is of particular importance given the (also reported) predictive power of crisis of meaning for suicidality. The fourth contribution presents longitudinal data over a period of four years. It analyzes effect of crises of meaning on the well-being of highly gifted individuals, and reveals differential mediation effects by resilience and self-control. The fifth contribution describes, by way of a case study, an established existential treatment model (VIVA) that addresses topics such as meaning, freedom and isolation by showing their intricate connection with early life story and cultural patterns, and their expression in — often pathological — affect. The symposium is wrapped up by the first presenter who will review the contributions from the broader perspective of an inclusion of the existential dimension in health, inviting the audience to join the discussion.
CRISES OF MEANING: PREVALENCE, CAUSES, CONSEQUENCES

Tatjana Schnell
University of Innsbruck (Innsbruck, Austria)

While positive consequences of meaningfulness are being explored in a huge body of research, the phenomenon of a crisis of meaning is largely ignored. Rather than by the absence of meaningfulness, a crisis of meaning is characterized by the painful experience of a lack of meaning. It has been associated with a vanishing of personal resources such as hope, self-efficacy, resiliency, and self-regulatory processes, while anxiety, depression, and pessimism are high. In this presentation, findings from two studies are introduced: 1) A study of 595 adults in Austria and Germany (mean age 35), assessing point-, 5-year and life-time-prevalence of crises of meaning (separately for gender and age groups), and subjective reasons for their occurrence. 2) A study of 300 school pupils (mean age 17), measuring the participants’ crisis of meaning, depression, and suicidality. The first study revealed an 11% point-prevalence of crisis of meaning among all participants (no gender effect). Age effects were large ($\chi^2 (2) = 15.74, p < .001$): in the youngest group (15-29, n=325), 16% suffered from a crisis of meaning; 10% of those aged 30-50, n=147), and 3% of those aged 51-86 (n=120). Five-year-prevalence was 40%, life-time-prevalence 29% (no gender effects). Both the youngest and middle-aged group reported a life-time-prevalence of 32%. Of the oldest group, 20% had suffered from a crisis of meaning at some point in their lives. The most frequently mentioned trigger was a critical life event (44%), followed by a phase of transition (36%). Twenty percent mentioned ‘no specific event’ as causation. Findings from the second study highlight the distinctness of crisis of meaning and clinical depression, and prove crisis of meaning to be a significant predictor of suicidality independently of depression. The findings show an important role of crises of meaning in the prediction of suicidality. They reveal an increase of crises of meaning over time, compared to data from the start of the millennium. They also indicate a thought-provoking cohort effects, with crises of meaning being less prevalent in the lives of those who are 50 or older as of today.
THE BIOPSYCHOSOCIAL MODEL REVISITED: THE FOUR-DIMENSIONAL MODEL OF HEALTH

Tatjana Schnell
University of Innsbruck (Innsbruck, Austria)

Peter la Cour
Center for Complex Symptoms, Frederiksberg Hospital (Copenhagen, Denmark)

The biopsychosocial model of health was formulated nearly 40 years ago, making room for psychology in physical health and reflecting constructive medical thinking at that time. Although the original model may seem loosely structured in modern eyes, the use of the model has been comprehensive and the need for an inclusive model of health has been persistent. Critique of the model has also been comprehensive, aiming at several serious inconsistencies and misconceptions within the model. Here, we review the original biopsychosocial model, select critique points, the main advantages, and the suggested coverage of the model. Two major critique points are addressed: an incomplete understanding of systems theory and the lack of a dimension for the existential/subjective. Integrating holistic models from outside medicine, a modern model of health comprises four dimensions: biological, social, psychological, and existential. A restructured and modernized version of an inclusive model of health is presented in two steps. The first step addresses complex systems theory and suggests health dimensions be seen in a spiral movement, ever changing and connected in time. The second step covers the integration of the existential/subjective as a dimensional perspective. The suggested name of the model is the Four-Dimensional Model of Health (FDM), and it is presented as a heuristic tool for use in health education. The model represents a possibility for rethink the relations between psychology and health in a more comprehensive way.
A NEW MEANING-ORIENTED INTERVENTION AND CHRONIC PAIN: A RANDOMIZED CONTROLLED TRIAL WITH THE SOURCES OF MEANING CARD METHOD

Tatjana Schnell
Miriam Boehmer
University of Innsbruck (Innsbruck, Austria)

Cognitive Behavioural Therapy is considered the basic contemporary approach for chronic pain, but has recently been criticized as being too limited, insufficient and sometimes ineffective when treating chronic pain patients. Furthermore, salient existential perspectives are sparsely or not at all integrated into CBT. We thus suggest adding a meaning-oriented intervention to chronic pain treatment, the Sources of Meaning Card Method (SoMeCaM). This study tested its effectiveness. We conducted a randomized controlled trial with 42 chronic pain patients, comparing an intervention group (standard care and participation in a meaning-oriented approach, the SoMeCaM) with a control group (standard care). Both groups were evaluated at baseline, 1 (t1) and 2 months (t2) after the intervention. Depression, anxiety, pain acceptance, satisfaction with life, meaningfulness, crisis of meaning, pain medication and pain intensity were assessed as outcome measures. Evaluation questions were given to the participants after the intervention session, to get more insights into patients’ feelings, thoughts and deliberations prompted by the method. Within and between-group comparisons showed significant treatment effects at t1. The intervention group showed lower levels of anxiety, depression and crisis of meaning, and higher levels of pain acceptance. The effects of pain acceptance and anxiety were sustained to t2. The quantitative evaluation of the intervention indicated a high acceptance of the method. Our preliminary research supports the importance of existential approaches in the therapy of chronic pain.
This study explores how existential meaning making, and emotions are wired together, formed in relationships with significant others and therefore also related to how we perceive the world and even God. Existential themes are created differently within the individual person, emotionally colored by early relational history with significant others, culturally formed and often burdened by rigid narrative interpretations creating less healthy «systems of meaning making». The main theoretical foundation for this project is drawn from psychoanalytic object relations theory, existential psychology, modern affect theory, and narrative psychology. The research question was to explore multiple layers of information enveloped in a very troubled psychiatric patient's choice of metaphors and how this process of inquiry would increase the patient’s ability to mentalize and thereby contribute to symptom relief. Prior to admission, at post-treatment, and at one-year follow-up, Olav completed the Symptom Check List-90 Revised, the Beck Depression Inventory, and the Inventory of Interpersonal Problems. Olav’s pre-treatment assessment scores were all in the severe range. The semi-structured Affect Consciousness Interview (ACI) where employed. Affective associations to mother, father and God where included. Narrative history was taken, and key metaphors was mapped through language, narrative writing, patient’s self-presentation and paintings. At one-year follow-up on the BDI and SCL-90, Olav achieved reliable change. Also, at one-year follow-up, Olav achieved reliable improvement in interpersonal functioning. This case study illustrates the importance of validating a patient’s deep existential longings and listening carefully to the patients’ existential meaning making and affectively charged metaphors. He could explore his own metaphors and gradually alter the associated affects and transform his rigid and destructive belief system. This study reveals the importance of addressing metaphors as a therapeutic way of overcoming a "psychic equivalent mode" and through this process achieve symptom relief and experiences of increased freedom and meaning in life.
CRISIS OF MEANING, SUBJECTIVE WELL-BEING AND THE MEDIATING ROLE OF SELF-CONTROL AND/OR RESILIENCE AMONG GIFTED ADULTS

Bernadette Voetter
Tatjana Schnell
University of Innsbruck (Innsbruck, Austria)

Intelligence holds the potential for a happy and fulfilled life. Nonetheless, Highly Intellectually Gifted adults are at a higher risk to suffer from an existential crisis. This session explores the relationship between crisis of meaning and subjective well-being over time, via multiple mediators (e.g., self-control and resilience) among two gifted groups. Longitudinal data (4-year-period) was obtained from 152 gifted adults. Two aspects of giftedness have been considered: intellectually giftedness and academically high achievement. Representatives for the Intellectually Gifted (n=100; 55% female, mean age: 43 years) were members of the high IQ society Mensa from Germany and Austria. The membership criterion is an IQ>129. Representatives for the Academically High Achievers (n=52; 29% female, mean age: 57 years) were Austrian academic award winners, who are characterized by a documented history of outstanding success in school and university, up to PhD-level. The data highlight differences between the two gifted groups. Results suggest that resilience mediates the effect between crisis of meaning and subjective well-being among Highly Intellectually Gifted Adults. Almost 50% of the variance in subjective well-being was explained by this mediation model among Highly Intellectually Gifted. While self-control mediates the relationship between crisis of meaning and subjective well-being among Academically High Achievers. Over 70% of the variance in subjective well-being was explained by the mediation model among Academically High Achievers. The findings demonstrate differences between the two gifted groups regarding two positive psychological factors that might be beneficial for their subjective well-being. The findings might help to explain why some gifted individuals manage to make the most out of their potential and live extraordinarily happy and meaningful lives, while others have troubles finding their place in life. We will discuss implications of our findings, possible reasons for the group differences and suggestions for further research on existential matters among gifted individuals. Center for Complex Symptoms, Center for Social Medicin, Frederiksberg Hospital Scientist Discussion.
VALUE TRANSMISSION AND IDENTITY FORMATION IN A CULTURAL CONTEXT

Tatiana Ryabichenko
National Research University Higher School of Economics (Moscow, Russia)

Klaus Boehnke
Bremen International Graduate School of Social Sciences (BIGSSS) (Bremen, Germany)

Abstract body. The double symposium is devoted to the discussion of the relationship between value preferences and identity formation as moderated by cultural context. Processes of intergenerational as well as peer-to-peer transmission are in focus when examining cross-cultural similarities and differences. Ways how change in value preference profiles and identity formation processes are intertwined are being addressed from various perspectives: lifespan development dynamics, parent-offspring transmission, cross-national and cross-temporal comparisons, as well as behavioral and well-being outcomes. Conceptually all contributions are linked in one way or another to the Schwartz Value Circumplex. Offering empirical evidence on the link between value change and individual as well as group identity formation is the core task of the symposium.

Press paragraph. Social and political transformations change the world, making it ever more culturally complex. An important challenge for social psychologists is to explore how these changes are reflected in people’s attitudes, behaviors, identities, and value preferences, and how social change affects value transmission. The symposium includes seven papers. J. Cieciuch’s opening contribution, “Values and Personal Identity—Towards a Comprehensive Framework of the Relationships,” sets the stage for the symposium when offering conceptual ideas on the linkage of value preferences and identity formation. Secondly, E. Daniel and colleagues, speak on “School Values and Student Attitudes and Behaviors”. The paper shifts the focus to the adolescent years of identity formation. J. Belić contributes a paper titled “Negotiating Personal Values in a Complex Social World: Well-being Implications for Emerging Adults”. The paper looks at the interaction of value preferences of emerging adults with the values of their social environment. K. Boehnke presents a paper on “Subjective
Perspectives on Value Transmission: Insights from a Multi-Wave Longitudinal Study’. The paper offers data from a longitudinal study on values and value transmission in Germany in the period from 1999 to 2017. T. Ryabichenko and N. Lebedeva give a paper on “Acculturation Profiles and Psychological Adaptation of Russians in Georgia and Latvia”. The paper focuses on the interplay between identities, acculturation preferences, and well-being of Russians in different contexts. R. Tecklenburg and M. Boehnke offer a paper on “Changing Values Through Immigration? German Core Values in the Neighborhood Context.” Their results shed light on the relationship between migration and value change in an immediate life context. P. Boski and M. Baran present a paper titled “Humanist Value Orientation and Dehumanization in the Context of Immigrant/Refugee Acceptance.” The focus here is on the relationship between a humanist value orientation and attitudes towards acceptance of immigrants.
VALUES AND PERSONAL IDENTITY — TOWARDS A COMPREHENSIVE FRAMEWORK OF THE RELATIONSHIPS

Jan Cieciuch
University of Zurich (Zurich, Switzerland)

Values are usually defined as beliefs about the importance of transsituational goals. According to Schwartz’s model (Schwartz, 1992), values form a circular structure. As every circular model, the Circle of Values can be also described by using some basic dimensions (like for example values with a personal-focus vs. values with a social focus and self-protecting values vs. growth values). Personal identity in personality and developmental psychology is usually seen as a cognitive structure that defines oneself, pointing out what is most important in the self-definition of oneself and describes how a person answers to the question ‘Who am I?’. In the Erikson-Marcia tradition, two main dimensions are usually differentiated that are the basis for shaping personal identity: exploration and commitment. Several models were developed to describe how the personal identity is shaped and how does it operate based on these dimensions, like for example Marcia’s identity statuses model (Marcia, 1966), the model of three identity-processing styles (Berzonsky, 1989), the three-dimensional model of identity formation (Crocetti, Rubini, & Meeus, 2008) or the model of five identity processes (Luyckx et al., 2008). Recently the Circumplex of Identity Formation Modes was proposed that aims at integrating many models of personal identity formation in the Erikson-Marcia tradition (Cieciuch, Topolewska, 2017). Interestingly (1) both definition of values and identity use the category of the importance and (2) both the Circle of Values and the Circumplex of Identity Formation Modes are circular models where two basic dimensions can be differentiated. However, to date very little research was done to integrate knowledge on personal identity and knowledge on values. During the presentation we (1) propose a theoretical framework for possible integration of the Circle of Values with the Circumplex of Identity Formation Modes within a broader model of personality: The Circumplex of Personality Metatraits (Strus, Cieciuch, 2017) that enables the integration of various constructs and models developed within many sub-disciplines of psychology and (2) present empirical data that shows the usefulness of this integration.
Values are broad motivational goals that describe desirable end states (e.g. achievement, creativity; Sagiv & Roccas, 2000; Schwartz, 1992). Values of organizational are important characteristics of organizational cultures, directing norms, regulations, and behaviors (Arieli, 2017). Importantly, one study found that schools may be differentiated by their values, and these values guide behaviors within the school (Daniel, Hofmann-Toufigh, & Knafo, 2013). School values are especially important given the role of schools in education and cultural transmission. However, little is known regarding school values and their role in directing student behavior. The current study investigates school values, measuring them using two mediums: declared school vision statements, and values of teachers in the school. In Study 1, N = 95 school vision statements were collected from school websites and coded for value content. Weak Confirmatory Multi-Dimensional Structure Analysis (MDS) indicated that school values are inter-related similarly to individual values, as described by the value theory of Schwartz (1992). Values most important in school vision statements were self-direction, benevolence, and security. Values least important in school vision statements were hedonism, power, and stimulation. Religious schools valued universalism less, and tradition more than non religious schools. In Study 2, teachers’ values (N = 568 teachers, N = 51 schools), were measured using the Portrait Values Questionnaire (PVQ 40, Schwartz et al, 2001). School values were computed as the aggregate of values of teachers in the school. Values most important in schools were benevolence, self-direction, and universalism, and values least important were power, tradition, and stimulation. Pearson correlations indicated that students in schools characterized by power values were less socially involved, and had more negative relationships between students, and between students and teachers. Students in schools characterized by self-direction reported more tolerance and less exposure to indirect violence. Indirect violence was also associated with less benevolence and more tradition within the school. Last, the association between socio-economic status of students in the school and their grades in English and mathematics standardized tests were partially mediated by the tradition values within the school. The results suggest that values may be meaningful school-climate indicators, that predict student outcomes.
NEGOTIATING PERSONAL VALUES IN A COMPLEX SOCIAL WORLD: WELL-BEING IMPLICATIONS FOR EMERGING ADULTS

Tatiana Ryabichenko
National Research University Higher School of Economics (Moscow, Russia)

Klaus Boehnke
Bremen International Graduate School of Social Sciences (BIGSSS) (Bremen, Germany)

According to Jeffrey Arnett, emerging adulthood is a newly arisen life period in which young people (18–29) tend to explore possibilities rather than settle. While exploring, emerging adults are engaging with many different social contexts in which they simultaneously try to establish, question, and reestablish their identity and values as the core aspect of it. Every social context privileges expressing certain values and/or punishes expressing the conflicting ones, which makes having values congruent with one’s environment psychologically desirable (i.e. person-environment fit). However, reconciling the sometimes different values of the various environments we inhabit is demanding, and studies have not addressed the relationship between these complex negotiations with multiple, sometimes conflicting, environments, and subjective well-being. This presentation will therefore focus on the interaction of values of emerging adults with the values of their social environments with regard to their subjective well-being outcomes. To do that, the study investigated congruity of emerging adults’ values with their immediate social contexts (i.e. familial, scholastic, professional, romantic, and peer groups), differentiation of their value priorities across social roles they occupy, and the impact these two have on emerging adults’ subjective well-being. The survey is conducted through a mobile application game designed and launched for these purposes. The sample consists of emerging adults from Serbia and the data collection process is still ongoing (planned N=500). Participants played the game and reported their subjective well-being, importance of different values for their immediate social contexts, and the importance of values for the social roles they play in these contexts. As preliminary results suggest, it is likely that congruence of values with social contexts contribute to emerging adults’ subjective well-being depending on contexts’ importance and function. However, so far we have found little support with regard to the relationship between value differentiation and subjective well-being. Implications of the results for emerging adults’ identity will be discussed.
SUBJECTIVE PERSPECTIVES ON VALUE TRANSMISSION: INSIGHTS FROM A MULTI-WAVE LONGITUDINAL STUDY

Klaus Boehnke
Bremen International Graduate School of Social Sciences (BIGSSS) (Bremen, Germany)

During the high time of the Cold War with its deployment of nuclear missiles by both superpowers (US, Soviet Union) in the then divided Germany in the early to mid-1980s, a longitudinal study was started with a core sample of 241 youthful sympathizers and activists of the West German peace movement. On average participants then were 14 years of age (with a range from 8 years to 23 years). Between 1985 and 2017 ten waves of data gathering were undertaken, interspersed by 3 ½ years each. From Wave 5 (1999) onwards (participants were then on average 28 years of age), a measure of the ten original Schwartz values was included in the study’s questionnaire. Participants were asked to indicate their preferences with regard to one item for each value selected from the original Schwartz Value Survey. They were also requested to indicate how they perceive their parents’, their friends’ and their partner’s preferences for the very same values. The data set, thus, allows engaging in cross-lagged panel analyses to test whether there is a pattern of transmission across time: Do perceived values of significant others influence own values at a later time? Do own values relate to perceived value preferences of significant others at a later time? Obviously, data allow quasi-causal interpretations, as these are real longitudinal data. At the same time, all data come from one source, the originally peace-prone participants of the study. This means that all findings only pertain to subjective perceptions of the value preferences of significant others and oneself. However, according to the Thomas theorem (“What is perceived to be real is real”) these subjective perceptions may very well reflect real transmission. Empirical results suggest that typically friends seem to be perceived as closest to one’s own values, with parents typically second and the partner least similar. As for ‘causation,’ perceived parental values seem to have more impact on later value preferences of the self than vice versa. Implications of these findings for value transmission research will be discussed.
The study examines the relationships of acculturation profiles and psychological adaptation of Russians in two post-Soviet countries: Georgia and Latvia. Participants were 312 Russians in Georgia (M = 31.11; SD = 14.57) and 335 Russians in Latvia (M = 43.16; SD = 21.22). Using latent profile analysis that represented person-oriented approach to different types of identity and acculturation preferences we identified three groups of individuals. The first group was identified as culture maintenance or exclusive acculturation group (N = 125). The second group (N = 456) consisted of biculturally oriented individuals. The third group (N = 66) represented a diffuse profile (N = 66) that combined individuals with medium scores in all parameters assessed. Subsequent ANCOVA analysis with region and group as independent variables, age and gender as covariates, and self-esteem as dependent variable revealed significant main effect of group. Region and group interaction was also significant. ANCOVA with satisfaction with life as dependent variable revealed significant main effects of region and group, while region and group interaction wasn’t significant. The results are discussed from the perspective of the contexts of acculturation of Russians in the two countries.
CHANGING VALUES THROUGH IMMIGRATION? GERMAN CORE VALUES IN THE NEIGHBORHOOD CONTEXT

Rena Tecklenburg
Mandy Boehnke
Bremen International Graduate School of Social Sciences (BIGSSS) (Bremen, Germany)

In Germany, the recent political and public discourse is marked by a discussion about a German “Leitkultur” and the boundaries of (cultural and social) integration. Among others, a fear of a decline of so-called core German values seems to have gained impetus with the increased number of refugees as migration waves in Germany, especially the recent refugee migration consist of individuals who were raised in cultures with different views on, e.g., gender roles, family structure (see also Boehnke, Deutsch & Boehnke, 2016). Against this background, our study aims to investigate the relationship between immigration to Germany and societal value change. Our study is especially interested in finding out whether value preferences in Germany changed over the last decades and whether possible changes are linked to immigration. First descriptive analyses for Germany show only moderate change of values over the last three decades with value shifts towards secular values. As we assume a possible reason for the missing link might lie in the broad country level, we focus in this study on the municipal level. Using data based on a representative survey of over 2000 individuals in 78 of the 88 districts of Bremen we conduct a multilevel analysis to understand which factors determine value change most. One assumption is that a higher proportion of migrants in a district is accompanied by a shift towards values of the migrants’ country of origin. The dependent variable value consensus (Schwartz and Sagie, 2000) will be based on data from the European Social Survey. Results will shed light on the relationship between migration and value change, extended by the comparison of value consensus of both, the country of origin and the country of residence.
HUMANIST VALUE ORIENTATION AND DEHUMANIZATION IN THE CONTEXT OF IMMIGRANT/REFUGEE ACCEPTANCE. MEDIATING ROLE OF AFRICAN ACTOR ACCULTURATION IN POLISH CULTURAL CONTEXT

Paweł Boski
Maria Baran
SWPS University of Social Sciences and Humanities (Warsaw, Poland)

Humanist orientation appears in cross-cultural literature on values in GLOBE (2004) project; it has also been researched in Polish culture context. Schwartz’s self-transcendent values (Benevolence and Universalism) cover this axiological domain too. Humanism does not postulate a distinction between benevolent close relations and universalist prosocial approach though; rather, concern for others and forgiveness are its key constructs. A separate, but theoretically connected research field is that of dehumanization. Immigrants and refugees are often dehumanized in political rhetoric. It goes on logical grounds, that scoring high on humanism should attenuate outgroup dehumanization. What is important for our studies, Schwartz demonstrated that in morally inclusive cultures, personal universalist values predicted positive attitudes towards immigrants. The main goal of our project was to investigate the relationship between humanist value orientation, infra-/humane emotions attributable to Poles (ingroup) and Africans (outgroup), perceptions of an acculturating African actor in Poland, and attitudes towards acceptance of immigrants from recent, post-2015, wave. Studies were based on three national representative samples (N=3 300). First a new scale of Neo-Humanism was tested as a measuring device. It subsumes a 7-facet (e.g. forgiveness, prosocial sensitivity, charity, gentleness, friendship), one factor dimension of excellent psychometric qualities. Two scales of negative and positive consequences of immigrant acceptance were also prepared beforehand, during the peak of European crisis, 2015-2016. We used mixed methods in testing main research hypotheses. Next, to the three types of scales mentioned above, an experimental component was included. It consisted of three versions of a video, portraying acculturation of an African immigrant/sojourner residing in Poland. Our findings revealed: 1. A direct \[\text{Humanism} \rightarrow \text{Immigrant acceptance}\] effect mediated by: 2. Positive (anti-dehumanizing) emotions attributable to out-groups (Africans); and 3. Favorable perception of a Polish-African acculturating video-recorded actor. 4. Ingroup members had also higher affective traits attributed by fellow Poles but with negative consequences for immigrant acceptance. Poland is known in Europe today for its government reluctance to accept immigrants. The paradox is that humanist values which prevail in this culture’s landscape, and especially among religious people, favor opening the country’s doors for people in need, and protect them from dehumanization.
PSYCHOLOGICAL BASIS OF INTERCULTURAL COMMUNICATION IN HIGHER EDUCATION

Elena Mahmutova
Elena Voevoda
Moscow State Institute of International Relations MFA of Russia (Moscow, Russia)

Abstract body. In recent years there has been a shift in the theory of professional education, which has far-reaching implications. Intercultural dimension in professional culture of the future specialist is believed to be a very important issue. The ability of the specialists to ensure a shared understanding by people of different cultural backgrounds and identities is recognized as part of professional culture. They should be able to better understand, interpret and negotiate various phenomena in the sphere of their professional communication. Such phenomena as border-crossing and changing places give rise to plenty of research on the intercultural dimension in higher education. The academic adjustment of international students to the host culture and educational environment of the university is receiving increasing attention. Psychological, social and linguo-cultural kinds of adaptation of international students are being approached from different perspectives. The symposium assumes discussion of the psychological bases of cross-cultural communication in the higher education.

Press paragraph. The symposium is devoted to the psychological and pedagogical bases of cross-cultural communication in the higher education. Developing professional culture of the specialist in the students of different trends is a complicated process, as students should adjust to new university culture. The following subjects will be the main directions of discussion: specifics of acquisition of cross-cultural competence by students foreign affairs specialists (Mahmutova Elena), problem of internationalization of university education from use of English-language communication (Voevoda Elena), empathy as a psychological phenomenon in the context of developing professional culture of the specialists and intercultural communication in their professional sphere (Kostikova Lidia), issues of development of cross-cultural competence in students of speciality “Public and Municipal Administration” (Chuganskaya Anfisa), programs of development acceptance in the cross-cultural environment in vocational training of teachers: on the example of work of the Museum (Kotler Igor).

General summary of the Symposium. At the end of the 20th — beginning of the 21st centuries the development of globalisation processes and integration had an impact on education, which acquired a wide international dimension. Important professional quality of modern heads, teachers and managers [Voevoda, 2016; Mahmutova, Valitova, 1997; Barrett, Byram., Lazar, Mompoint-Gaillard, 2014; Byram, Golubeva, Han, Wagner, 2017] became existence of cross-cultural competence. In theoetiko-methodological concepts of the analysis of modern processes of education at the higher school the importance of the concept “cross-cultural competence” is noted. In M. Barrett’s works 14 main components of ethnocultural and cross-cultural competence were allocated. This model and methodologically close to it formed a basis for creation of empirical researches of cross-cultural competence at training of specialists of the different directions of the higher education. The purpose of a symposium is discussion of psychology and pedagogical mechanisms of development of cross-cultural competence when training students of the different directions. An important question of a symposium is presence of the general psychological and specialized for each of the directions of preparation of approaches to development of cross-cultural competence in students. So, the research conducted on students of the international relations is presented in Mahmutova E. report. Voevoda E. opens a perspective of internationalization of education and questions of teaching programs in
SPECIFICS OF ACQUISITION OF CROSS-CULTURAL COMPETENCE BY INTERNATIONAL RELATIONS STUDENTS

Elena Mahmutova
Moscow State Institute of International Relations MFA of Russia (Moscow, Russia)

Having carried out the teoretiko-methodological analysis of literature on models of ethnocultural and cross-cultural competence, we chose M. Barrett’s model [Barrett, 2018] as the fullest and operationalized research model. Studying of differences in representation of cross-cultural competence of group of the Russian girls and young men who are getting higher education within the specialty connected with cross-cultural interaction became a main objective of a research. For realization of the purpose the following tasks were formulated: • To construct the plan of a research of ethnocultural competence within the Russian selection; • To choose the group of respondents answering a research objective; • To prepare necessary material for carrying out questioning and to interview respondents; • To carry out statistical processing of the obtained data; • To interpret the obtained data and to draw conclusions. Within the plan of a research two analysis stages were formulated: 1. The analysis of components of ethnocultural competence within the generalized M. Barrett’s model [Barrett, 2018] in group of girls and young men; 2. Specification of components of ethnocultural competence by factorization of empirical data of group of girls and young men for correlation of theoretical model of cross-cultural competence and features of structure of elections of the Russian respondents.

According to the purposes and tasks research hypotheses were formulated: Hypothesis 1: there are significant differences in components of ethnocultural competence of group of the Russian girls and young men of 18-19 years. Hypothesis 2: there are differences in factorial structure of ethnocultural competence of group of the Russian girls and young men.
EMPATHY AS A PSYCHOLOGICAL PHENOMENON IN THE CONTEXT OF DEVELOPING INTERCULTURAL COMMUNICATION OF STUDENTS

Lidia Kostikova
Ryazan State University (Ryazan, Russia)

In recent years there has been a radical shift in the theory of professional education, which has far-reaching implications. Intercultural dimension in professional culture of the future specialist in international relations is believed to be a very important issue. The ability of the specialists in international relations to ensure a shared understanding by people of different cultural backgrounds and identities is recognized as part of professional culture. They should be able to better understand, explain, comment, interpret and negotiate various phenomena in the sphere of their professional communication. Developing professional culture by performing intercultural training through foreign language teaching to future specialists in international relations is an urgent issue. In the modern world, education is seen as a crucial factor of social development and a “soft power” tool in global competition. The world community considers learning and teaching foreign languages as one of the values of education because linguistic diversity is definitely an essential element of cultural diversity. The purpose of the study is to bring into prominence the issue of empathy, which is underrepresented in the theory of psychology and professional pedagogy and is underscored in the current foreign language teaching practices. The study is mainly based on observation and deals with cultural and linguistic patterns of empathy in the context of cross-cultural communication in the professional sphere at an English class. To analyze possible ways of developing university students' empathy as a part of their professional culture we drew our attention to literature. Analyzing texts of English fiction, many students can imagine the feelings of the character, possible difficulties, feelings and emotions, and become more empathetic. It is also interesting to see if the students are aware of their own level of empathy and how they can assess it.
For most of the students choosing English-language programs, this language of training is not native; for successfully mastering the program they need to have communicative competence in English.

It is evident that international students face problems of institutional, sociocultural, psychological, pedagogical and cognitive character connected with language barrier; differences in curricula; new corporate culture; new university requirements and rules; new forms of teacher–student communication; absence of research experience accepted in the host country; choice of research supervisor and topic of master thesis. A suggested list of potential research supervisors is sometimes regarded by students as restriction of freedom of choice, at the same time it is necessary to consider that at the initial stage of training, students experience difficulties in the independent choice of the supervisor.

International students do not always understand the meaning of this or that term and feel shy to ask their peers or the professor so as not to demonstrate their seeming language failure. One more difficulty for students is presented by research methodology. Students feel culturally confused when they face new requirements for structuring the paper, style of scientific prose, perception of terminology, etc.

We analyze the reasons that make lecturers refuse teaching courses in English and suggest that they need special advanced training other than training of lecturers at English language departments. Another problem that needs considering is selection and use of teaching materials and, what is more, creation of own teaching materials in English.

In conclusion, we argue that irrespective of all the difficulties, English language programmes create a possibility of broad exchange of scientific ideas and practical projects.
Recently in the USA there was a new trend of the use of the word "acceptance" (acceptance) instead of "tolerance" (tolerance), meaning that Americans do not "stand" each other, and "accept". Together with it, in the United States the idea of "melting pot", melting copper, turns into the theory of "salad". "Salad" lives alone life while each its component has the right to a certain identity. In conclusion, it should be noted once again that the commission is public institution of the State of New Jersey which allocates funds for its maintenance. Staff of New Jersey created this commission to carry out the education act in the field of the Holocaust and genocide and results of the embodiment of this idea are obvious. A large number of school students and students of colleges get acquainted with this tragic page of history of mankind that helps to grow up people tolerant, respecting others, regardless of their skin color, religion, nationality and all other features. The State of New Jersey is the most densely populated and one of the most multinational states of the USA, by results of a population census of 2010 live 8.8 million inhabitants, the speaking more than 130 languages and having various racial, ethnic, religious and cultural origin here. The Museum of human rights headed by me, freedoms and tolerances which is a part of the centers supervised by the commission in 2013 held a seminar in the Bloomfield school district for teachers. In a seminar we mentioned different aspects on the subject interesting us and gave two lectures: one about the Holocaust and the second about the Armenian genocide. During preparation of our program, during its carrying out and during discussion of results, we were once again convinced what serious significance teachers attach to the Holocaust subject as instrument of education of tolerance among pupils. And it is clear: the racial structure of high school includes Bloomfield 30% belykh, 30% of black, 30% of Spanish-speaking and 10% Asians. By the way, the Jewish pupils at school very insignificant quantity that once again shows that the Holocaust subject became all-American long ago.
DEVELOPMENT OF CROSS-CULTURAL COMPETENCE IN STUDENTS OF SPECIALTY "PUBLIC AND MUNICIPAL ADMINISTRATION"

Anfisa Chuganskaya
Institute of problems of artificial intelligence, RAS (Moscow, Russia)

Modern society is filled with various transformational processes. Migration of people between continents and in the countries reaches the considerable sizes. In Russian Federation, [The general results of population shift of Russia (updating of 19.05.2017)] the number of the arrived people made 4.13 million in 2016 within Russia, among them 2.04 million people — in regions and 2.089 million from other regions of our country. From foreign countries in 2010 to Russian Federation there arrived 0.191 million people (3 times less, than in 2016). This clearly demonstrates the level of importance of issues of ethnocultural dialogue and understanding of cultural values of the people in society [Chuganskaya, 2009].

We addressed the analysis of professional activity of public servants in Russia. Public servants act as professional group in which direct work activity is mediated by moral criteria, social norms, humanistic values. There is a significant influence of values in professional activity of public servants. On the one hand, it is personal values of each of representatives of the public servants. And this personal factor makes a contribution to a way of implementation of professional activity. On the other hand, it is valuable standards which are set by the most professional activity of public servants.

In earlier conducted investigations on identification of the factors affecting valuable structure of representations of public servants in regions of Russia it was revealed that government employees with length of service less than 1 year are focused on satisfaction of personal interests, are purposeful, rational, they have low indicators of tolerance. Government employees with an experience more than 10 years are directed to constructive interaction, are tolerant to other views. It is expedient to note the importance of understanding of the valuable components caused by ethnocultural features as one of the competence of public servants.
PSYCHOSEMANTIC RESEARCH IN STUDYING PERSONALITY

Olga Mitina
Victor Petrenko
Lomonosov Moscow State University (Moscow, Russia)

Abstract body. Symposium brings together researchers representing 3 different countries and working in the field of cognitive psychology that studies psychosemantics (attribution of meaning). Presentations will report results of experimental studies that investigated the impact of individual differences including clinical conditions, cognitive abilities and personality traits on semantic perception.

Press paragraph. The present research is conducted within the conceptual framework of psychosemantics. Drawing from findings in language and thought research and deriving methodological insights from the works of Charles Osgood and George Kelly, psychosemantics seeks to describe and explain systems of meanings, both individual and collective. The psychosemantic approach acknowledges the existence of subconscious, implicit categories of perception, thus allowing to overcome the limitations of traditional self-report methods. Shulamith Kreitler, Israeli psychologist, educator. Achievements include research in psychooncology, theory of cognitive orientation, the system of meaning; research in theory of the experiencing of art. Olga Mitina, works in Lomonosov Moscow State University, dept. of Psychology. Fields of interests: psychosemantics, quantitative psychology, synergetics, psychodiagnostics, cross-cultural psychology, political psychology. Nina Nizovskikh, works in Humanitarian State University, dept. of psychology, Kirov. Field of research: psychosemantics, personality, adolescence and youth psychology, values. Victor Petrenko, member of Russian Academy of science, chief of Laboratory in Lomonosov Moscow State University, dept. of Psychology. Fields of interests: psychosemantics, psychology of religion, art psychology, problems of consciousness.

William Sulis, Department of Psychiatry and Behavioral Neurosciences, McMaster University, Canada. Fields of interests: Collective Intelligence, Collective Dynamics, Synchronization in Complex Systems, Mathematical Psychology, Study of Unconscious and Context Dependent Process in Psychotherapy and Dementia. Irina Trofimova, Department of Psychiatry and Behavioral Neurosciences, McMaster University, Canada. Fields of interests: neuroscience, synergetics, psychometrics, temperament, cognition, clinical psychology.

General summary of the Symposium. Symposium brings together researchers working in the field of cognitive psychology that studies psychosemantics (attribution of meaning). Presentations will report results of the following studies: 1)The method “Fairy Semantic Differential”, during which a respondent should assess a number of fairy-tale characters according to a set of personal characteristics, is designed for the individual work of a psychologist with children 4—10 y.o. An analysis of the child’s attitude to fairy-tale characters allows us to determine indicators which characterize the level of cognitive complexity in interpersonal perception, the degree of socialization. 2)The study of sex and temperament-related biases in attribution of meaning to most common words used Projective Semantic method, i.e. analysis of estimations of chosen neutral/abstract concepts and basic adjectives bipolar scales. Analysis was conducted using 24 contrast temperament groups, as well as contrast sex groups using Canadian, Russian and Chinese samples. Individual, gender and cultural differences were found. Sex and temperament biases in meaning attribution indicated a possible contribution of biological factors in people's semantic perception and this supports embodiment in cognition theory. 3)FET framework is based on the neurochemical model Functional Ensemble of
Temperament, presenting consistent individual differences as deriving from the interplay between neurotransmitter systems. Using perspectives from psychiatric practice and previous studies, this presentation links the action of dopamine system to attribution of significance and the action of serotonin system to the subjective feeling of capacities. When these systems go out of balance, symptoms of psychosis and depression are reported. 4) Approach of S.Kreitler will be presented in 3 different studies. One dealt with a cognitive task—planning. Three planning tasks and the Meaning Test were used. The 2nd study dealt with a personality trait—extraversion. 5 extraversion scales and the Meaning Test were used. The third study dealt with an emotion—anxiety. The Meaning Test and two anxiety scales were used. The findings yielded a set of meaning variables related significantly positively or negatively with the target variable and demonstrated the role of meaning in cognition, personality, emotions. 5) In the N.Nizovskikh study analysis of value-motivational structure was done. The psychosemantic study of life principles allowed comprehensively exploring the internal personality position. For these purposes personal motives were attributed to life’s principles of personality.
“FAIRY SEMANTIC DIFFERENTIAL”: THE METHOD AND RESULTS OF USING

Olga Mitina
Victor Petrenko
Tatiana Menchuk
Lomonosov Moscow State University (Moscow, Russia)

Mahbuba Iskhakova
Branch of Lomonosov Moscow State University in Tashkent (Tashkent, Uzbekistan)

The method "Fairy Semantic Differential", during which a respondent should assess a number of fairy-tale characters according to a set of personal characteristics, is designed for the individual work of a psychologist with children 4—10 years old. Personality characteristics, according to which the characters are evaluated, are formulated in terms understandable to young respondents, i.e. these are the words that parents, teachers use when dealing with children of this age. The set of personages can change depending on popularity among children. An analysis of the child’s attitude to this or that fairy-tale character allows us to determine the specificity of his (her) moral-value sphere. The method also allows evaluating of real adults, who are significant for the child (parents, teachers, etc.) Comparison of fairy-tale characters’ ratings with those of a significant adult makes it possible to reveal the specifics of the child’s attitude to this adult. An analysis of the child’s attitude to this or that fairy-tale character allows us to determine quantitative indicators that can be calculated using the data of the answering the questionnaire. These indicators characterize the level of cognitive complexity in interpersonal perception, the degree of socialization, self-esteem. Several formulas for calculating these indicators will be presented. For each indicator normative intervals are calculated. These intervals allow making conclusions about level of cognitive complexity and socialization for a subject during personal counseling. The results of cross-cultural studies conducted in Moscow, Tashkent and Baku among children 4—10 years old will be presented. 900 children took part in the research in three countries. In all countries age dynamics of these indices were analyzed. There were some general and some specific results determined adult-child relations which take place in the countries. It was shown that the cognitive complexity of interpersonal perception, determined by the method "Fairy Semantic Differential" is significantly higher among girls, socialization increases with age, is significantly higher among girls than among boys. Self-esteem has two aspects: self-acceptance and critical attitudes. The last one has tendency increase with age. Examples of individual semantic space will be presented. Funded by grant RSF № 17-18-01610.
MEANING: ITS NATURE AND PSYCHOSEMANTIC FUNCTIONS

Shulamith Kreitler
Tel-Aviv University (Tel-Aviv, Israel)

The purpose is to describe the theory of meaning by Kreitler and Kreitler and to illustrate its functions in cognition and personality. Meaning is defined as a pattern of cognitive contents, focused on a referent, and characterized by a set of specific variables (called meaning variables) describing the contents, type and form of relations between the referent and the contents, forms of expression and referent shifts. Major assumptions are that meaning is communicable, complex, includes a lexical-interpersonal part and a subjective-personal part, and that individuals differ in their tendencies to use the meaning variables. The variables used characteristically by an individual can be assessed by the Meaning Test and constitute the individual’s meaning profile. The major hypothesis of the presented studies is that the individual’s meaning profile is related to cognitive functioning and personality traits. Three studies will be presented briefly. One dealt with a cognitive task—planning. The 120 participants were administered three planning tasks and the Meaning Test. The second study dealt with a personality trait—extraversion. The 100 participants were administered five extraversion scales and the Meaning Test. The third study dealt with an emotion—anxiety. The 82 participants were administered the Meaning Test and two anxiety scales. The interrelations between the meaning profile and the target variables were analyzed by correlations and analyses of variance. The findings yielded a set of meaning variables related significantly positively or negatively with the target variable—planning, extraversion, or anxiety. The sets of meaning variables related to planning, extraversion or anxiety provided insights into the nature and functioning of these target variables and demonstrated the role of meaning in cognition, personality, and emotions.
THE STUDY OF THE «INTERNAL PERSONALITY POSITION»: PSYCHOSEMANTIC METHOD

Nina Nizovskikh
Vyatka State University of Humanities (Kirov, Russia)

The concept of “internal personality position” is one of the system-forming of the notion of V. S. Mukhina’s concept on the phenomenology of the development and existence of the personality. The internal personality position is determined by “bodily sense of self, an experience of connectedness of body, psyche and spirit, as well as the sense of personality inherent in man” (Mukhina, 2008). The life principles as a means of self-development (Nizovskikh, 2010) correlation with the concept of the “internal personality position”. The psychosemantic study of life principles allows to comprehensively explore the internal personality position. For these purposes we use the psychosemantic method of the attribution the motives to the life’s principles of personality (N. Nizovskikh, V. Petrenko). The essence of the method: the construction of the semantic space on the basis of the procedure attributions by the respondents the motives to the own life’s principles. The respondents rating each of their principles of life in terms of their possible motives by using the six-point scale. The formation of the scale of measurement is as follows: the participant formulates the own life’s principles (in the quantity of 35). After that, respondents rate in points how much they follow each life principle by virtue of one or another motive: “a material interest”, “love to another person”, “self-development”, “the fear of condemnation by others”, “because of religious beliefs”, etc. There is a total of 50 recorded motives. The matrix of individual data (35x50) is processed by using the factor analysis. Number of received factors shows cognitive complexity in the field of “philosophy of life” of person. The content of the obtained factors reflects the characteristics of the inner position personality of the respondent’s. The interpretation of the content of the extracted factors, the construction and analysis of the semantic spaces, the advisory interviews with respondents are the important parts of the study. The longitudinal studies of the internal personality position, carried out at intervals of 5-10 years, are of interest for understanding the genesis of the individual.

SEX AND TEMPERAMENT BIASES IN MEANING ATTRIBUTION

Irina Trofimova
McMaster University (Hamilton, Canada)

The aim of the study was to investigate sex and temperament-related biases in attribution of meaning to most common words. Projective Semantic method using estimations of neutral/abstract concepts and basic adjectives bipolar scales (similar to Osgood Semantic Differential method) was applied in 24 contrast temperament groups, as well as contrast sex and age groups using Canadian, Russian and Chinese samples. Males in all three samples attributed more positive estimations to sensational concepts and more negative estimations to routine- or reality-related concepts, in comparison to females. People with stronger endurance and tempo, and with higher emotionality differed dramatically from other temperament groups.

Cultural differences were also found. Sex and temperament biases in meaning attribution indicate a possible contribution of biological factors in people’s semantic perception and this supports embodiment in cognition theory. It also shows deficiency of lexical approach methods in studying structure of psychological individual differences.
COGNITIVE BIASES RELATED TO PSYCHOSIS AND DEPRESSION: FET PERSPECTIVE.

William Sulis
McMaster University (Hamilton, Canada)

The neurochemical model Functional Ensemble of Temperament (FET) summarized neurotransmitter’s functionality in terms of regulation of consistent behavioural patterns. This model highlighted the role of dopamine in assigning priorities to behavioural elements, which, in pathology of semantic perception, might emerge as psychosis and paranoia. The FET model also described the role of serotonin in endurance and the role of opioid receptor systems in emotional dispositions — i.e. the systems implicated in depression. This presentation reports literature review of the findings on the links between neurochemical systems implicated in psychosis and depression, and how it affects semantic perception of individual. The reported findings are based on the studies in clinical psychology, psychiatry and neurochemistry and support the FET hypothesis.

PSYCHOSEMANTIC ANALYSIS OF DANCER’S IMAGE AMONG REPRESENTATIVES OF DIFFERENT DANCE STYLES

Olga Mitina
Mirzhalol Mirsaidov
Lomonosov Moscow State University (Moscow, Russia)

In the study the categorial structure of perception of dancer image among various dance styles representatives and its features were described. The study involved dancers with at least 3 years of dance experience between ages of 16-38 years, for whom dancing was dominant activity, formally or informally. The following methods of data collection were used: 1. Psychosemantic method of multiple identifications to find out the categorial structure of dance phenomenology perception; 2. Psychosemantic method of multiple identifications using Sh. Schwarz’s Portrait value questionnaire as list of primary items; 3. Life satisfaction scale — identifying the indicator of life satisfaction level; 4. FAD-Plus, determining scores in Fatalistic Determinism, Free Will, and Unpredictability; 5. Procrastination questionnaire; 6. Sensations seeking scale; 7. “Dark triad”. Results: We revealed stereotypes and autostereotypes representations belonging to dancers of various dance styles about the value systems among their colleagues in the same dance style or other ones. Classical ballet dancers rate themselves as very conformal. Their inner position was confirmed by outside opining which was got from Representatives of other dance styles. On the scale of “Conformism, rules” and “Adherence to traditions”, contemporary dance representatives are rated by all dancers as less conformal and not adhering to traditions. Representatives of folk dance consider classical ballet to be the most immodest dance, compared to the estimates of other dance styles representatives. Representatives of classical ballet evaluate themselves as quite modest, compared to dancers of other styles. This, we believe, is due to the popularization of other dance styles through the media in a different way compared to classical ballet. Classical ballet acts as a more restrained, sophisticated and elite dance style, which, in our opinion, influences the perception of ballet dancers as less modest and restrained. Representatives of classical ballet demonstrate an inverse correlation of such scales as “procrastination”, “independence of thought”, “independence of actions” with the scale “psychopathy”, and also the indicator “psychopathy” negatively correlates with the scale “life satisfaction”. Representatives of ballroom dancing believe that the level of personal safety positively correlates with the level of narcissism. Funded by grant RSF № 17-18-01610.
PLASTICITY IN THE REPRESENTATION OF ONE’S OWN BODY AND ITS SURROUNDING SPACE: ADAPTIVE AND MALADAPTIVE EFFECTS

Cari-Lène Mul
Flavia Cardini
Jane Aspell
Eleonora Vagnoni
Anglia Ruskin University (Cambridge, United Kingdom)
Ana Tajadura-Jimenez
Universidad Carlos III de Madrid (Madrid, Spain)

Abstract body. Our ability to maintain a coherent sense of bodily self despite continuous changes within and outside our body relies on the highly flexible multisensory representation of the body, and of the space surrounding it. The flexibility of these representations is crucial to adequately interact with the external world. This symposium will show recent results on how these representations flexibly change: (a) during pregnancy, (b) as a function of one’s own attachment style, (c) in people with autism spectrum disorders and (d) by the induction of body illusions. Importantly, the symposium will also present cases of disrupted bodily representations — such as in people suffering from eating disorders and chronic pain — and will demonstrate that, thanks to its high plasticity, a coherent bodily representation can temporarily be ‘restored’ or reset through the use of multisensory body illusions, improving participants’ body image and reducing their experience of pain.

Press paragraph. In the symposium each speaker will provide new insights about the plasticity of the multisensory representation of the body, and of the space surrounding it, the Peripersonal Space (PPS). Ms Mul, is a final year psychology PhD student. She will present two studies providing evidence for differences in interoceptive processing and multisensory bodily representation in autism. Dr Cardini is a Cognitive Neuroscientist, interested in the neural changes during pregnancy. Her talk will shed light on the adjustment of the PPS boundaries throughout pregnancy. Dr Vagnoni is a Cognitive Psychologist whose research is mainly focused on the effects of emotion in shaping the PPS. Her talk will unveil how the distinction between peripersonal and extrapersonal space is modulated by our attachment style. Dr Aspell is a Cognitive Neuroscientist and will present evidence for distortion of body representation in chronic pain patients. Specifically she will discuss how, by altering body representation through multisensory illusions, patients’ experience of pain can be reduced. Dr Tajadura-Jimenez’s research combines perspectives of psychoacoustics, cognitive neuroscience and human-computer interaction. She will present their work focusing on understanding how sound-based technologies could be used to alter people’s perceptions of their body, their emotional state and their motor behaviour patterns.

General summary of the Symposium. The perception of one’s body as one’s own — the so-called sense of body ownership — is an essential feature of human experience (Graziano & Cooke, 2006). Research on self-consciousness shows that the feeling of body ownership, as well as the sense of being located within the boundaries of that body, is fundamentally underlined by a congruent and cohesive integration of different sensory inputs into a multimodal mental representation of one’s own body (Blanke, 2012). On one side our brain shows a great ability to maintain a coherent and consistent sense of bodily self despite continuous changes occurring within and outside our body. This reflects the high plasticity that characterizes the neural representation of the body and of its surrounding space, the Peripersonal Space (PPS). In line with this assumption, neuropsychological, neuroimaging and behavioural data have highlighted the presence of both slow, long-term neuroplastic changes that are associated with expertise, or
that simply reflect developmental processes, and more rapid updates of the body representation that occur during the continuous interaction with the external world. However, this high plasticity in the mental representation of one’s own body can have maladaptive effects. Indeed, it has been shown that when the brain attempts to integrate incongruent information about the body, a distortion in its neural representation might occur. Under extreme circumstances, this alteration can eventually induce chronic pain.

This symposium aims at first, presenting behavioural and electrophysiological findings showing adaptive and maladaptive changes in the representation of one’s own body and of the PPS. Second, given the multisensory nature of our sense of body ownership, the symposium will show how multisensory bodily illusions could be used to restore coherence in a previously disrupted bodily representation, both in people suffering from eating disorders and in those suffering from chronic pain.

THE HEARING BODY: SHAPING MENTAL BODY-REPRESENTATION WITH SOUND FOR EMOTIONAL AND PHYSICAL HEALTH

Cari-Lène Mul
Anglia Ruskin University (Cambridge, United Kingdom)
Ana Tajadura-Jiménez
Universidad Carlos III de Madrid (Madrid, Spain)

People, through their bodily actions, receive sensorimotor information which their brain integrates to form mental representations of one’s body appearance and capabilities. Auditory contributions to mental body-representations, and the subsequent impact on behaviour and bodily feelings, remain largely unexplored. In our recent studies we showed that sound feedback on one’s actions can alter body-representation, and in turn enhance positive emotions and change motor behavior. For instance, we demonstrated that altering walking sounds leads people to perceiving themselves as thinner/lighter, happier and walking more dynamically. We will present three subsequent studies where we investigated potential opportunities of this sound-driven bodily illusion to support wellbeing or therapy in three different populations/contexts: exertion in healthy population (study 1; N=37); and distortions of body-representation in people with eating disorders (study 2; N=15) and in people with complex regional pain syndrome (study 3; N=12). We asked participants to use a gym step (Study 1) or walk in place (Studies 2 and 3) under three real-time manipulations of their walking sounds differing in frequency spectra: Low frequency "heavy" condition, High frequency "light" condition and Control condition. We measured changes in body-representation with a body visualizer tool, by monitoring gait, and with a questionnaire on bodily feelings. For these three measures we analysed the main effect of the within-subject factor sound condition. Findings: Results from Study 1 demonstrated how altered footsteps not only affect people’s body perception, bodily feelings and patterns of physical activity during simple walking but also during exertion exercise: participants represented their bodies as thinner in the high frequency “light” sound condition, with associated changes in gait (applied force, stance time, acceleration, cadence) and bodily feelings (feeling quicker, lighter, feminine, finding exercise easier). Results from Study 2 and 3 with participants with clinical distortions in body-representation suggest that sound feedback may have an effect on the represented body, but the effect varies with type of body distortion and body image concern. We will discuss these results in terms of malleability of body-representations and highlight the potential opportunities for enhancing body-representation in clinical conditions and people’s adherence to physical activity.
DIFFERENCES IN INTEROCEPTIVE PROCESSING AND BODILY SELF-CONSCIOUSNESS IN AUTISM

Cari-Lène Mul
Flavia Cardini
Jane Aspell
Anglia Ruskin University (Cambridge, United Kingdom)

The most basic sense of self — bodily self-consciousness — arguably arises from interoceptive processing and multi-sensory integration. Previous research has indicated differences in sensory processing and self-processing in Autism. We investigated if there are differences in interoceptive processing and bodily self-consciousness due to multi-sensory integration differences in autism. Study 1 investigated interoception with a self-report measure, interoceptive accuracy with a heartbeat perception task, and a neural index of interoception — the heartbeat evoked potential — measured with EEG, in 21 participants with high-functioning Autism and 25 healthy control participants. Study 2 investigated bodily self-consciousness with 2 multi-sensory paradigms, the full body illusion and an audio-tactile peripersonal space task, in 22 participants with high-functioning Autism and 29 healthy control participants. Results of study 1 showed that participants with autism had significantly lower self-reported interoceptive awareness on the dimension of attention regulation of the Multisensory Assessment of Interoceptive Awareness questionnaire, significantly lower accuracy when counting their own heartbeats without having a finger on their pulse, and their heartbeat evoked potential showed a significantly less pronounced negative amplitude during the time window of 200ms to 350ms after the QRS-wave of their heartbeat in the central region of the brain. Results of study 2 showed that participants with autism were significantly less susceptible to the full body illusion in terms of self-location and self-identification. Only control participants experienced the illusion on these measures, but participants with autism did not. Participants with autism showed a significantly smaller peripersonal space with a sharper (steeper) boundary than control participants. These results suggest that people with autism have attenuated interoceptive abilities and altered bodily self-consciousness due to differences in multi-sensory integration. These differences occur on multiple levels of interoceptive processing and different multi-sensory modalities. They may provide additional explanations for certain behaviours and characteristics seen in people with autism.
EVIDENCE FOR ALTERED BODY REPRESENTATION IN CHRONIC PAIN PATIENTS

Cari-Lène Mul
Jane Aspell
Anglia Ruskin University (Cambridge, United Kingdom)

Chronic pain is a growing health concern but is notoriously hard to treat and poorly understood. Given evidence that pain experience is linked to multisensory integration of body signals, there is interest in using body ownership illusions for reducing chronic pain. In the present study, we investigated whether patients’ experience of chronic pain could be reduced by full body illusions (FBIs) that cause participants to dissociate from their own body.

Eighteen participants with a range of chronic pain conditions (including sciatica, osteoarthritis, fibromyalgia, muscular pain, IBS and back pain) viewed their own ‘virtual’ bodies via a video camera and head-mounted display for two minutes. In the ‘back-stroking FBI’, their backs were stroked with a stick while they viewed synchronous or asynchronous stroking on the virtual body and in the ‘front-stroking FBI’, they were stroked near their collarbone while viewing the stick approach their field of view in a synchronous or asynchronous fashion. Illusion strength and pain intensity were measured with self-report questionnaires. We found that full body illusions were experienced by patients with chronic pain and further, that pain intensity was reduced by an average of 37% after illusion (synchronous) conditions. These findings add support to theories that high-level multisensory body representations can interact with homeostatic regulation and pain perception. These data demonstrate the potential of such illusions for the management of chronic pain.
MATERNAL BRAIN GAIN: ENLARGED REPRESENTATION OF THE PERIPERSONAL SPACE IN PREGNANCY

Cari-Lène Mul
Flavia Cardini
Jane Aspell
Anglia Ruskin University (Cambridge, United Kingdom)

Our ability to maintain a coherent sense of self despite continuous changes occurring within and outside our body stems from the high plasticity that characterizes the neural representation of the body at multiple time scales. Plastic changes can also occur in the representation of the space immediately surrounding our body: the so-called peripersonal space (PPS), i.e. the interface between the body and the environment (Rizzolatti et al., 1997).

This special region of space is constantly monitored by the brain because only within its boundaries can we reach and act upon objects. Recently, it has been shown that the boundaries between far and near space are highly flexible. A critical stage in life, when extremely rapid and noticeable changes in body size and shape occur, is pregnancy. Given the magnitude and rapidity of the bodily changes occurring during pregnancy, we expected them to be coupled with a likewise rapid plastic reorganization of the neural representation of the body and its surrounding space. Therefore, in the present study we used a well-known audio-tactile task adapted from Canzoneri et al. (2012) to measure the PPS boundary in a group of pregnant participants three times: at their 20th gestational week (N=37), at their 34th gestational week (N=28) and 8 weeks postpartum (N=20). In order to rule out any effect of task repetition, a control group of non-pregnant women was tested at the same time intervals (N=19, N=17, N=15 respectively). By running, for each testing session, a mixed ANOVA we compared the PPS boundary across the two groups. Results show that at the beginning of their pregnancy and a few weeks after giving birth, pregnant women did not show differences in their PPS size as compared to the control group. Interestingly however, at the advanced stage of pregnancy, the PPS of pregnant women was larger than the controls'. We therefore conclude that during pregnancy our brain adapts to the sudden change in body size and shape, by expanding the representation of the space around us, possibly in order to protect the vulnerable abdomen from bumping against objects.
THE INFLUENCE OF ATTACHMENT STYLE ON THE DIFFERENTIATION BETWEEN PERIPERSONAL AND EXTRAPERSONAL SPACE

Cari-Lène Mul
Eleonora Vagnoni
Anglia Ruskin University (Cambridge, United Kingdom)

The brain represents the space close to the body, termed as peripersonal space (PPS) (Rizzolatti, Scandolara, Matelli, & Gentilucci, 1981), differently from the space far from it, the extrapersonal space. PPS represents the space within which we grab and manipulate objects without moving towards them, but also a bubble around our body that creates a margin of safety relative to approaching dangers (Graziano & Cooke, 2006). The space around our body is also the space where interactions with others occur. Recently, the role of social context and social interactions have begun to be examined in relation to the PPS representation (Heed, Habets, Sebanz, & Knoblich, 2010; Teneggi, Canzoneri, di Pellegrino & Serino, 2013). However, given that the perception of social variables themselves may depend on individual differences or, prior beliefs about interpersonal relating (von Mohr and Fotopoulou, 2018), we examined whether key individual differences (dispositional factors) about such beliefs moderated our effects. One influential way of conceptualizing such individual differences is adult attachment style, which according to attachment theory (Main et al. 1985) consist of internal working models of relationships based on early experiences with the caregiver, which remain relatively stable across the lifespan (Waters et al. 2000). Method 48 female participants were asked to complete a visuo-tactile task (adapted from Canzoneri et al., 2012). Half of the participants completed the social version of PPS task (with a person sitting in front of them), whereas the other half completed the non-social version of the PPS task. At the end of the task participants were asked to complete the Experiences in Close Relationships-Revised (ECR-R; Fraley et al., 2000). Multilevel modelling showed that attachment style influences the segregation of PPS and extrapersonal space differently in the social versus non-social condition. Participants with higher attachment anxiety, differentiated less between PPS and extrapersonal space in the social condition. Given that higher attachment anxiety is characterized by worrying about rejection/abandonment (Ravitz et al., 2010), we speculate that the merging between PPS (self) and extrapersonal (other) space showed by participants with high attachment anxiety might underpin their need of closeness.
AGE FEATURES OF PSYCHOLOGICAL DIAGNOSIS IN CLINICAL PSYCHOLOGY

Natalia Zvereva
Mental Health Research Center; Moscow State University of Psychology and Education (Moscow, Russia)

Maria Aleksandrovich
Pomeranian University in Słupsk (Słupsk, Poland)

Susanne Schlüter Müller
Klaus Schmeck
Psychiatric University Hospitals Basel (Basel, Switzerland)

Mariia Zvereva
Mental Health Research Center (Moscow, Russia)

Abstract body. Significance of proposed symposium theme: it is necessary to observe general principles of psychological diagnostics in clinical psychology, working “independently” of age and in connection with growing up and aging features, requiring special adaptation to them. This concerns diagnostic ways, tools and methods in different age periods (procedure, temporary and other subtleties). Problems of diagnostics tools are common to all working in clinical psychology, regardless of country, exact specialty of worker, etc. Necessary to discuss both tasks that unite us (international, generally accepted tests, questionnaires), and special diagnostic tools, reflected needs of separate country concerning age, culture and psychopathology of persons. Key points in work of modern clinical psychologists are global transition periods — from preschool to school age, in adolescence and involution, associated with elderly and senile age. Discussion will be devoted to basic work methodology, multidisciplinary experience of clinical psychologists and physicians in anticipation of ICD 11.

Press paragraph. The symposium concerns problem of psychological aspects of age specify in diagnostic and treatment of patient with mental and psychopathological diseases. Therefor we invite psychologists and doctors to make their presentation devoted to different aspects of common theme. Age Specificity of Clinical and Psychological Diagnosis Natalia Zvereva PhD Federal State Budgetary Scientific Institution Mental Health Research Center, Moscow State University of Psychology and Education, Moscow, Russia Irina Roshchina PhD Federal State Budgetary Scientific Institution Mental Health Research Center, Moscow State University of Psychology and Education, Moscow, Russia The Edinburgh Picture Test — a Tool for Measuring Reasoning Skills Of Preschool Children — in International Practice of Psychologists Maria Aleksandrovich, PhD Pomeranian University in Słupsk, Poland Joanna Kamykowska, PhD Pomeranian University in Słupsk, Poland. Early Intervention in Adolescent BPD Patients Susanne Schlüter-Müller, MD Psychiatric University Hospitals Basel, Switzerland. Early Detection of Adolescent Bpd According to the New Dimensional Models in DSM-5 and ICD-11 Klaus Schmeck, Prof. MD Psychiatric University Hospitals Basel, Switzerland. The Experience of Adaptation and Using of Adult Diagnostic Tools on the Adolescent Sample Maria Zvereva, PhD Federal State Budgetary Scientific Institution Mental Health Research Center, Moscow, Russia Svetlana Voronova Federal State Budgetary Scientific Institution Mental Health Research Center, Moscow, Russia.

General summary of the Symposium. Symposium goal is to present problems of psychodiagnostic in clinical psychology and its branches in multidisciplinary common work in order to help people of differ ages with mental diseases. First presentation (Zvereva N, Roshchina I., Russia)
tells about main principles founded quality and quantity assessment of individual features patient on different stages of ontogenesis. Second report (Aleksandrovich M. Kamykowska J., Poland) connected with results of adaptation psychometric tool Edinburgh Picture Test (EPT) for assessment of intellectual operations of young children (5-8 years old) with different kinds of ontogenesis in Belarus, Russia and Poland. The main aim of presentation is to make a short overview of Edinburgh Picture Test (EPT) as tool for measuring reasoning skills of preschool children. Next two reports have been prepared by colleagues from Switzerland, they are MD in Psychiatric University Hospitals Basel. The first one (Schlüter-Müller S. Switzerland) is devoted to investigation and treatment of adolescents with BPD. She has adapted the basic psychodynamic treatment techniques of Transference Focused Psychotherapy (TFP) for use in adolescents in integration with psychoeducation, family interventions and behavioral interventions according to approach AIT (Adolescent Identity Treatment). The next report (Schmeck K, Switzerland) concerns personality disorders in adolescence as medical conditions which need some diagnostic tools for assessment according to Alternative Model of Personality Disorders (DSM 5) and ICD-11. These are tests AIDA and LoPF elaborated in Switzerland and adopted in some countries. Last report is prepared by young Russian investigators (Zvereva M., Voronova S.). It tells about problems of adaptation different foreign tools from experimental and personality psychology to the purpose of clinical psychology of adolescents. The idea of symposium is to compare aging features in clinical psychodiagnostic. This way of discussion seems good.
AGE SPECIFICITY OF CLINICAL AND PSYCHOLOGICAL DIAGNOSIS

Natalia Zvereva
Irina Roshchina
Moscow State University of Psychology and Education (Moscow, Russia), Mental Health Research Center (Moscow, Russia)

Analysis problems of psychodiagnostics in clinical psychology ontogenetic aspect. Clinical psychology of the XX c has special interest in scientific research and testing procedures of young patients (first ontogenesis stages—childhood and adolescence). Many methods have been developed for diagnosing cognitive, motivational and personal sphere of patients with neuropsychic pathology in childhood. This clinical psychological diagnosis relies on Vygotsky concept of "social situation of development". Development crises, leading activity, family specifics, training options, clinical features of disease, etc. are evaluated. Nowadays, boundaries of adolescence are expanding; subcultures are emerging that require differential diagnosis with abnormal development. On the other side clinico-psychological diagnosis of elderly patients is connected with the thesis of LS Vygotsky— "development never stops". Many parameters concerning “social situation of development” in old age individual differences influence in cognitive and personality sphere in mental patient, components of the aging crisis, leading activities, compensatory mechanisms of personality, problems of adaptation to rapidly changing social conditions and experiencing a situation of uncertainty, social problems of disability and so on) are not sufficiently studied. Tasks using in clinical and psychological diagnosis may be similar when working with patients of different ages. Comprehensive qualitative syndrome analysis of the results of clinical and psychological diagnostics in the work of a clinical psychologist is a necessary principle in working with patients of different ages (A.R. Luria, B.V. Zeigarnik). The same applies to combination of nomothetic and idiographic approaches into work of clinical psychologists. Psychological testing young and elderly patients have to take into consideration the prevalence of types of neuropsychiatric pathology in different ages (mental retard in early age, affective pathology and dementia in later age). Frequency of suicide increases significantly in adolescence and elderly/old age, which requires special work to prevention, diagnosis and rehabilitation. Some diagnostic techniques in clinical psychology can be used both in wide age range and special ones. In this diagnosis one must pay attention to combination of this two branches of diagnose and use adapted well-known international methods and techniques that take into account the cultural and historical specifics of the country.
Aim short overview of Edinburgh Picture Test (EPT) — measure reasoning skills of preschool children and assessment of using EPT by psychologists in Russia, Belarus and Poland. Content Original version of EPT (1985) was developed for use with children aged 6:6 to 8:3 and enables assessment of general reasoning ability (in the form of RQ — Reasoning Quotient) in children. EPT includes 5 subtests and each subtest includes ten tasks. So the test consists of 50 tasks plus eight training tasks. It takes approximately 25 minutes to do EPT tasks, and the entire test can take up to 1 hour. There are also approximate time frames for each subtest (from 2:5 to 6 minutes). EPT serves mainly for screening. Its reliability was considered high (ρKR20 = 0.892). During adaptation of EPT in Belarus test expands age norms to 5:0-8:3 (Aleksandrovich, 2004). Adaptation process also revealed that test can also be used to assess particular intellectual operations of older preschoolers, although the English version does not offer this option. Reliability of this adaptation was evaluated using the alternative version method (τxy = 0.86, p = 0.001). Tool’s validity was also considered high. Process of EPT adaptation in Poland (Aleksandrovich, Kamykowska, 2017) shown, that EPT is valid (medium and high correlation - r Pearson- between the subtests of EPT) and reliable tool (α Cronbach was close to 0.8 in all the subscales, excluding subscale 2. Classification), which can be used to assess particular intellectual operations of older preschoolers. Psychologists of Russian, Polish and Belarusian confirmed that EPT allows to assess both level of general reasoning ability and level of development of specific intellectual operations of healthy preschool children (Aleksandrovich, 2004; Aleksandrovich, Kamykowska, 2016), children with mental dysontogenesis (Зверева et al., 2015), children with cerebral palsy (Aleksandrovich, 2004), children with hearing impairment and deafness (Aleksandrovich, 2004; Любимова, Басилова, 2015), speech disorders (Aleksandrovich, 2004), children with autism spectrum disorder (Козорез, Зверева, 2005). Resume. EPT is reliable and valid tool, which has no verbal material and can be used in international psychological practice for individual and group assessment of reasoning skills of preschool children.
EARLY INTERVENTION IN ADOLESCENT BPD PATIENTS

Susanne Schlüter-Müller
Psychiatric University Hospitals Basel (Basel, Switzerland)

We have adapted the basic psychodynamic treatment techniques of Transference Focused Psychotherapy (TFP) for the use in adolescents and have integrated these techniques with psychoeducation, family interventions and behavioral interventions to the manualized treatment approach AIT (Adolescent Identity Treatment). To demonstrate the efficacy of AIT we conduct a controlled clinical multicenter study in comparison with DBT-A that is seen as a well-established method for the treatment of adolescent BPD. This presentation will focus on the description of the treatment method AIT and the first results of our psychotherapy study. Since October 2015 we perform a controlled process-outcome study with pre-post-follow-up-assessments and a strong focus on video-based analyses of the therapeutic process using established methods from psychotherapy process research (rupture episodes and change moments). With the use of wearable biosensors we assess psychophysiological arousal of both patients and therapists and connect these data to interactional processes and specific moments in therapy. Study centers of this multicentre trial are Basel (AIT), Heidelberg (DBT-A) and Santiago de Chile (AIT). In this presentation the theoretical background and the specific AIT techniques and strategies for the treatment of personality pathology in adolescents are presented using video case examples for illustration. The first results of our psychotherapy process-outcome study are described. The focus will be on the analysis of rupture episodes and change moments in relation to the use of AIT specific techniques. Early intervention for Borderline Personality Disorder (BPD) is essential to prevent psychosocial failure and the long-lasting need for clinical care. The treatment approach AIT is useful to improve the identity development and the psychosocial functioning of adolescents suffering from BPD.
EARLY DETECTION OF ADOLESCENT BPD ACCORDING TO THE NEW DIMENSIONAL MODELS IN DSM-5 AND ICD-11

Klaus Schmeck
Psychiatric University Hospitals Basel (Basel, Switzerland)

Since recently most clinicians and researchers have viewed personality disorders as medical conditions that, even with an origin in childhood and adolescence, should not be diagnosed before adult life. With the revisions in DSM-5 (Alternative Model of Personality Disorders) and ICD-11 it is now accepted that personality disorders can be diagnosed already in young people and that dimensional models are essential to describe personality pathology properly. Early detection of disturbed personality functioning in adolescents requires reliable and valid assessment instruments that are developed or adapted for this age group. In this presentation an overview is given on questionnaires that can be used to assess disturbed personality functioning in general and Borderline Personality Disorder in special. Methods: After a review of currently available assessment instruments the psychometric properties and the clinical usefulness of three newly developed self-rating questionnaires will be presented: AIDA (Assessment of Identity Development in Adolescence; Goth & Schmeck, 2018), LoPF-Q 12-18 (Level of Personality Functioning; Goth & Schmeck, 2018) and OPD-CA-2-SQ (Operationalized Psychodynamic Diagnosis Axis Structure; Goth & Schmeck, 2018). All instruments have been tested in large clinical and non-clinical samples in Switzerland, Germany and Mexico. All three instruments show excellent reliability scores ranging from .87 to .94 (AIDA, LoPF-QA, OPD-CA-2-SQ). At the same time all instruments are able to differentiate between adolescents with Borderline PD and adolescents from the normal population with effect sizes ranging from 1.7 (OPD-CA-2-SQ) to 2.2 (AIDA). In young people disturbed personality functioning as well as early starting Borderline PD can be detected reliably and validly with the use of different instruments that have been developed in the last years.
THE EXPERIENCE OF ADAPTATION AND USING OF ADULT DIAGNOSTIC TOOLS ON THE ADOLESCENT SAMPLE

Zvereva Mariia
Mental Health Research Center (Moscow, Russia)

Voronova Svetlana
Mental Health Research Center (Moscow, Russia)

Analysis of foreign adapted diagnostic tools (questionnaires and psychological tests) for investigation of adolescents in clinical psychology. Content. Adolescence is a crisis stage of personal development. Any events occurring with teenagers have positive or negative impact. There are various manifestations of developmental abnormalities that need to be diagnosed competently. Increasing and complicating pace of modern life leads to changing age limit for establishing diagnosis of personality disorders mainly determined in adulthood. So we have many of diagnostic tools designed for adult people (>18). The removal of age restrictions in manifestations of personality disorders indicates the same etiology of PD in adolescence as in adults. For diagnostics, it’s expedient to adapt existing, tested and working methods, not to create new tools. Procrastination is a personal factor which formed during crisis of adolescence. This age-specific phenomenon as the marker of personality development can be fixed in personality structure and have further negative impact. First signs of procrastination appear between 11th grade and beginning of learning in the institute. Prerequisites of the procrastination were laid earlier, in the middle and high school. It is necessary to identify the beginning of this process at earlier age stages in order to be able to correct destroyed development of adolescents with personal pathology.
DEVELOPMENT OF SCIENTIFIC AND PRACTICAL ASPECTS OF SCHEMA THERAPY IN EASTERN EUROPE

Natalia Gegel
Moscow Institute of Shema Therapy (Moscow, Russia)

Ilona Krone
Riga’s Centre of Psychiatry and Narcology (Riga, Latvia)

Pavel Kasyanik
Schema Therapy Institute in Saint-Petersburg (Saint-Petersburg, Russia)

Natalya Dikova
Institute of Practical Psychology of the State University HSE (Higher School of Economics) (Moscow, Russia)

Abstract body. Schema Therapy (ST) is a relatively new integrative therapeutic evidence-based approach developed in the 1990s by Dr Jeffrey Young. Cognitive and behavioural techniques are the core aspects of treatment, but the model gives equal weight to emotion-focused work, experiential techniques and the therapeutic relationship. It has proven highly effective in treating a number of mental health issues, including difficult-to-treat personality disorders, given the substantial burden on patients and society. ST is delivered as a cost-effective in-patient or outpatient treatment with the intention of bringing about full recovery. ST rapidly gaining popularity in Europe and the United States. During the last seven years interest in this method has grown in Russia. The symposium incorporates the latest scientific findings and original researches in ST in Eastern Europe and offers a range of practical emotion-focused and experiential techniques to use in therapy with complicated cases.

Press paragraph. Schema Therapy is one of the CBT third wave innovative therapies that have developed specifically for treating personality disorders and other complex, chronic clinical presentations. Personality disorders are highly prevalent in clinical settings posing a significant burden on the individual, their families and partners, health care systems and society as a whole. ST shows promise for substantial improvements in psychiatric symptoms of this patients, impulsive behavior and quality of life. The main idea is that dysfunctional mindset people have about themselves, others and the world, which is formed during childhood, and following unhealthy life patterns are the basis for personality disorders. The four main concepts in the Schema Therapy model are: Early Maladaptive Schemas (self-defeating, core themes or patterns that are kept repeating throughout whole lives), Schema Domains (categories of emotional needs of a child), Coping Styles (ways a child adapts to damaging childhood experiences), and Schema Modes (moment-to-moment emotional states). Within the frame of symposium, we will discuss existing research and practice-oriented highlights in the area of individual, group and couples schema-therapy among Russian speaking professionals. Symposium speakers are doctors and clinical psychologists, educators with academic degrees, certified schema-therapist, members of the International Society of Schema Therapy.

General summary of the Symposium. Schema Therapy is a comprehensive approach deriving from cognitive behavioral therapy for the treatment of chronic personality problems. ST combines aspects of cognitive, behavioral, psychodynamic, attachment and gestalt models. Number of randomized controlled trials, case series, open pilot studies demonstrated decreases in all symptoms, quality of life increasing, as well as low treatment drop out. The aim of the symposium is to promote public awareness of the ST approach and consolidate clinical specialists from Eastern Europe. The reports will highlight future development of individual, group and couples ST in scientific studies and clinical practice. In the first
presentation will be provided an overview of the existing research in ST as conducted in the Russian speaking population. We will discuss future directions for the scientific and practical aspects of Schema Therapy in Russia. Next there will be shared experience and results from pilot study using Group Schema Therapy at the Day care centre setting in the depressed patients. The important step of therapeutical process is case conceptualization. It is necessary for understanding and applying main concepts of ST. We’ll provide certain requirements and various forms of interactive case conceptualization designed for psychoeducation purposes. Emotional dysregulation will be presented as a clinical and psychological problem of patients with personality disorder traits. Standard schema-therapy techniques will be described, including authorial practical 3-steps approach for teaching emotional regulation skills. The study of emotional co-regulation in married couples will represent a correlation between early maladaptive schemas, schema modes and various indicators of satisfaction of marital interaction. The ways of decreasing the distress from dysfunctional family relationships, revising emotions connected with traumatic childhood experience and creating healthy adaptive behavioral strategies will be discussed.

THE GROWTH OF RESEARCH IN THE AREA OF SCHEMA-THERAPY AMONG RUSSIAN SPEAKING PROFESSIONALS

Natalia Gegel
Alexandra Yaltonskaya
Darya Maryasova
Moscow Institute of Schema Therapy (Moscow, Russia)

Schema Therapy is an integrative method of treatment for personality disorders as well as chronic affective disorders that was invented by American psychologist Jeffery Young and has been actively used in Western countries since 1990. During last thirty years a large body of scientific research has proved the effectiveness of the method. Data demonstrating the reliability of the theoretical model has been collected over this period. In 2012 Schema Therapy was introduced to the Russian professional community through training with western specialists. During the last seven years interest in this method has grown in Russia with original research now conducted. In this presentation we will provide an overview of the existing research in Schema Therapy as conducted in the Russian speaking population. In addition we will discuss further areas of development for the scientific and practical aspects of Schema Therapy in Russia.
VIDEO FEEDBACK IN THE SCHEMA THERAPY

Natalia Gegel  
Moscow Institute of Shema Therapy (Moscow, Russia)

Ilona Krone  
Riga’s Centre of Psychiatry and Narcology (Riga, Latvia)

According to previous research videotaping is a valuable tool for improving the effectiveness of clinical training and supervision (e.g., Bernard & Goodyear, 2014; Topor, 2017). So far using video materials, has not been very common in psychotherapeutic work (Briggie et al., 2016). Several researches have described experience with videotaping for treating social phobia (Warnock-Parkes et al., 2017) and improving parent–child interaction e.g. Pempek, 2011). Some authors have mentioned that usage of visual materials enhance the understanding of nuanced aspects of non-verbal communication (Steele et al. 2014). The first research that combines photo and home—video for Schema therapy has been published recently (Koffert et al., 2019). It indicates, that the client feels validated when experiencing the video watching together with the psychotherapist and seeing himself from outside, which gives the patient a good opportunity to observe the hidden hints in their reaction. Thus, working with videos during the session may also enhance the activation of emotions.

This apparently builds a basis for increasing client’s self-awareness and self-reflection instead of avoidance (Koffert et al., 2019). The goal of video project (Krone, Yaltonskaya, Maryasova, Gegel & Tatarenko) is to develop scientifically proven techniques by using basic principles of Schema therapy (emotional needs and re-parenting), which should lead to increased self-awareness and should strengthen more functional schemas and modes.

INTERACTIVE CASE CONCEPTUALIZATION AS INTERVENTION IN SCHEMA THERAPY

Natalia Gegel  
Moscow Institute of Shema Therapy (Moscow, Russia)

Pavel Kasyanik  
Schema Therapy Institute in Saint-Petersburg (Saint-Petersburg, Russia)

New Schema Therapy Case Conceptualization Form introduced in 2018 is a major development in Schema Therapy clinical practice. It helps clinicians increase understanding of the patients and various disorders from a Schema and Mode perspective. Although the new Case Conceptualization form provides aid in the choice and thoughtful use of schema therapy intervention strategies it is not designed for sharing with the patients even on the psycho education stage of treatment. For these purposes more simple and experssional forms of case conceptualization are used. They include brief Problem Analysis form (J.Farrell, I.Shaw, 2013), various graphic presentations of the Modes dynamics, “Colored Circles” technique, Mode cards, puppets, figurines, “Sand Play” boxes, even role plays and dramatization. Case conceptualization as intervention helps to provide better understanding of the Modes processes for the patients and gives them experience of control over Modes. Presentation includes certain requirements and various forms of interactive case conceptualization.
USING SCHEMA-THERAPY MODE MODEL TO TRAIN EMOTIONAL REGULATION SKILLS

Natalia Gegel  
Moscow Institute of Shema Therapy (Moscow, Russia)  
Natalya Dikova  
Institute of Practical Psychology of the State University HSE (Higher School of Economics) (Saint-Petersburg, Russia)

Emotional dysregulation characterizes several psychological disorders such as personality disorders, anxiety or mood disorders, and its treatment is a crucial point for therapy success. Emotional regulation allows us to interact in a functional way with ourselves and others in different situations, while emotional dysregulation leads to dysfunctional reactions, identified with dysfunctional modes in schema therapy. Teaching emotional regulation skills is an essential part of treatment of emotional dysregulation. In schema therapy modes are described as intense emotional states linked to patterns of thinking, feeling, and behaving based on a set of specific needs. Modes are usually activated by external stimuli or internal states, they are transient by definition and may comprise both adaptive and maladaptive responses. In this presentation will be shared experience of using mode model and schema-therapy techniques to train emotional regulation skills.

EMOTIONAL REGULATION IN DISSATISFIED MARITAL COUPLES

Natalia Gegel  
Moscow Institute of Shema Therapy (Moscow, Russia)  
Tatyana Gorbolskaya  
Mental Health Center (Moscow, Russia)

We can present a pilot study of emotional co-regulation in 43 married couples (or 86 respondents) divided in 2 groups: the Control Group (Satisfied Spouses — SS) and a Group of couples with some kind of manifestation of marital dissatisfaction (Dissatisfied Group of Spouses — DS) The main focus of the study was on the severity of Early Maladaptive Schemas and Schema Modes (EMS) and Schema Modes (SM) in 2 abovementioned groups of married couples and between spouses in the group of Disadvantaged couples are given. Using the Spearman coefficient, a correlation was made between Early Maladaptive Schemas (EMS), Schema Modes (SM) and various indicators of satisfaction of marital interaction.
CULTURAL-HISTORICAL APPROACH TO OVERCOMING LEARNING DISABILITIES

Tatiana Akhutina  
Lomonosov Moscow State University (Moscow, Russia)

Yulia Solovieva  
Puebla Autonomous University (Puebla, Mexico)

Carla Anaute  
Center of Diagnosis and Rehabilitation of Children with learning disabilities CINAPSI (San Paolo, Brazil)

Abstract body. The goal of the symposium is to discuss how the cultural-historical approach to analysis of mental development and overcoming learning disabilities is implemented in Brazil, Ecuador, Mexico, and Russia. Psychologists and neuropsychologists will share their experience in working with typically developing children and children with developmental disabilities: learning difficulties and attention deficit hyperactivity disorder (ADHD). All speakers proceed from the idea of the social origin of higher mental functions and the importance of social context in development and education. Their practice and experimental research are based on Vygotsky’s ideas about the interaction between education and development as well as Vygotsky-Lurian concept of systemic and dynamic organization of higher mental functions.

Press paragraph. The authors of the presentations are psychologists and neuropsychologists, participating in clinical practice, scientific research, and teaching in universities in their countries. Yulia Solovieva is a director of Master Program in Neuropsychological Diagnosis and Rehabilitation of Puebla Autonomous University in Mexico. She and Luis Quintanar will tell about neuropsychological remediation of school-age children with learning disabilities. Carla Anaute coordinates the assessment and remediation of children with developmental problems in the center CINAPSI in San Paolo, Brazil. She will share her experience in remediating children with ADHD. Martha Cobos and colleagues work at a recently opened Master Program in Neuropsychology at University Azuay in the city Cuenca, Ecuador. They will discuss their results of assessing attention in 6- and 12-year-old children, who come from public and private schools in both urban and rural areas. Tatiana Akhutina and Natalia Pylaeva work in Laboratory of neuropsychology of Psychology Department of Lomonosov Moscow state university. They will show results of implementations of the remediation programs for children with learning disabilities created and applied by Natalia Pylaeva and Maria Guliaeva.

General summary of the Symposium. The reports of the symposium are based on the historical-cultural approach to psychology and neuropsychology. In child neuropsychology the Vygotsky- Lurian principles of social genesis, systemic structure, and dynamic organization of higher mental functions determine the necessity of considering a child’s neuropsychological syndrome, psychological age, dominant motives of activity, acquisition level of intellectual and practical actions, and the zone of proximal development. The purpose of the symposium is to confirm efficiency of the diagnostic and remedial work, based on the Vygotsky-Lurian theoretical postulates and their practical implementations. In the first report T. Akhutina, N. Pylaeva and M. Guliaeva will answer the question: how neuropsychological work could be organized in elementary school. They will demonstrate the results of group and individual work with children who struggle in school. Yu. Solovieva and L. Quintanar will discuss a case of a 9-year-old girl from a public Mexican school with learning disabilities as a consequence of poor regulation and control of voluntary activity. The data of neuropsychological assessment before and after remediation will be discussed. C. Anaute will present a case study of a 7-year-old child with ADHD. The positive involvement of the
child in the joint activity and accessible tasks within the zone of proximal development permitted to mostly overcome patient’s difficulties during 6-month intervention. The presentation of M. Cobos and her colleagues will show the data of assessing selective attention in Ecuadorian schoolchildren of urban and rural schools. Their results can be used for preventing learning disabilities at school age. All presentations of Symposium consider the relevance of broader integration between psychology, neuropsychology and pedagogy during assessment and remediation of schoolchildren with cognitive deficits. Such integration might be achieved on the basis of cultural-historical approach.

**NEUROPSYCHOLOGICAL SUPPORT OF PRIMARY SCHOOL CHILDREN**

Tatiana Akhutina  
Natalia Pylaeva  
Lomonosov Moscow State University (Moscow, Russia)  
Maria Guliaeva  
School №1540 (Moscow, Russia)

Russian neuropsychologists in primary school, particularly in inclusive education classrooms, have three main aims regarding a particular child: to identify strengths and weaknesses in the development of higher mental functions (HMF), to identify learning difficulties and their mechanisms, and to develop an effective intervention strategy. They achieve the first aim using a battery of neuropsychological tests for 6-9-year-old children, which is an adaptation of Luria’s methods for children (Akhutina et al., 2016). The second aim is fulfilled through “tracking diagnostics” that is observation of children’s behavior and analysis of their school assignments (Akhutina, Pylaeva, 2012). Achievement of the third aim requires developing a strategy of remedial intervention carried out by a neuropsychologist in cooperation with teachers. The purpose of our presentation is to confirm the efficiency of diagnostic and remedial work, based on the Vygotsky-Lurian theoretical postulates and their practical implementations. The Vygotsky-Lurian principles of neuropsychology include the principles of social genesis, systemic structure, and dynamic organization of HMF. According to these principles, remedial-developmental intervention implemented with the help of an adult involves the use or formation of functional systems consisting of preserved components and a weak one. Such interaction takes into account dynamics of internalization, the weak component of child’s functional systems, and emotional participation of a child. Optimal interaction is based on constant balance of adult’s intention to give a more difficult task along with minimal assistance as well as providing sufficient help for avoiding mistakes. That is why it is very important to have tasks that can be easily changed in complexity according to the difficulties of the child. Such methods are applied in our work. In our presentation, we will discuss the organization of the neuropsychological help in one of Moscow primary schools (the neuropsychologists N.M. Pylaeva and M.A. Guliaeva). The results of neuropsychological assessment before and after school year will be presented. The HMF dynamics of children who received more or less intensive remediation will be compared.
CORRECTION OF LEARNING DISABILITIES BASED ON NEUROPSYCHOLOGICAL SYNDROME ANALYSIS AND PRINCIPLES OF ORGANIZATION OF ACTIVITY

Yulia Solovieva
Luis Quintanar
Puebla Autonomous University (Puebla, Mexico)

Tatiana Akhutina
Lomonosov Moscow State University (Moscow, Russia)

The theoretically driven methods for correction of learning disabilities should be developed on the basis of precise clinic assessment and diagnosis. Such kind of diagnosis includes determination of neuropsychological syndrome with precise reasons for learning disabilities. Correction principles should also be considered. The goals of our study include application of the main principles of neuropsychological correction at school age based on organizing child's activity. These principles are: consideration of a neuropsychological syndrome, patient's psychological age and dominant motives of activity, acquisition level of intellectual and practical actions, and zone of proximal development. A case of a 9-year-old girl from a public school with learning disabilities is reported. The girl underwent neuropsychological assessment at the Clinic Service of University Hospital of Master Program in Neuropsychological Diagnosis and Rehabilitation of the Faculty of Psychology of Puebla Autonomous University. Qualitative neuropsychological assessment revealed a severe deficit in regulation and control of voluntary activity, which greatly influenced the acquisition of school concepts. The motivation for learning was extremely poor. The girl had significant difficulties in writing and reading. The correction program proposed for the student included tasks that took into account not only affected brain mechanisms, but also aspects of the patient’s motivation, personality, and psychological age. The program was applied in 69 individual sessions (1 hour each). The results showed significant improvement of executive functions and important positive changes in school motivation. During final assessment, the girl was able to perform tasks, which had not been accessible for her during initial assessment. Consideration of the proposed principles permits to establish methodological relation between clinical neuropsychology, developmental psychology and cultural-historical approach to child's development. We stress the importance of considering the whole activity and personality of a child with learning disabilities instead of standard training of isolated disturbed functions. It is concluded that principles of the cultural-historical approach to development, including the zone of proximal development, internalization and the phased step-by-step formation of actions, are useful for child neuropsychology.
SELECTIVE ATTENTION IN SCHOOLCHILDREN IN URBAN AND RURAL AREAS IN THE CITY OF CUENCA-ECUADOR

Alexandra Bueno-Pacheco
Martha Cobos Cali
Universidad del Azuay (Cuenca, Ecuador)

The aim of this research is to compare attentional patterns between 6 and 12 year-old children, who come from public and private schools in both urban and rural areas. The underpinning assumption of this study is that attention is the fundamental basis for any cognitive activity and the generation of new learning processes. Thus, its early assessment is pivotal. Selective attention was assessed in a sample of 838 school children from the city of Cuenca, Ecuador, considering the characteristics of the type of school and geographical area to which they belong. A short-term computerized test was used to determine the number of correct answers and the equivalent percentile according to the child’s age. The study found that boys and girls in urban schools, whether private or public, show better performance in attention than those attending rural schools. This difference may be owed to a greater access to stimulation, facilitated by a better socioeconomic stratum. Also, it’s important to notice the lack of studies in this field with the use of national standardized tests, so these results become a significant contribution for the social science in our country.

THE PROCESS OF REMEDIATION: A CASE STUDY

Tatiana Akhutina
Lomonosov Moscow State University (Moscow, Russia)

Carla Anauate
Center of Diagnosis and Rehabilitation of Children with learning disabilities CINAPSII (San Paolo, Brazil)

Remediation is fundamental for treating children with learning disabilities. This lecture describes the methods used in the practical case study aimed at enhancing the development of underdeveloped functions. The main task of remediation is to build, together with the patient, a creative work integrating mediation elements which make sense and compose the universe of the child. Presentation of a 6-month intervention in a case study of a 7-year-old child with ADHD assumption. The data of the initial and final neuropsychological examinations are used to illustrate the quantitative and qualitative changes in the dynamics of the child’s higher mental functions. The results were significant, the final neuropsychological examination indicated the development of several higher mental functions and a hypothetical diagnosis of ADHD was removed. This remediation process used the zone of proximal development in which an adult made external actions, in a material plan, taking into account the level of development of the child; during training these actions were internalized, becoming a verbal logical plan. Making sense and having meaning enhances the remediation process which is internalized by the child following through towards improving or overcoming the learning disabilities.
PSYCHOLOGY OF CONSCIOUSNESS AND SELF-CONSCIOUSNESS

Garnik Akopov
Samara State University of Social Sciences (Samara, Russia)

Jennifer Kerzil
Université Catholique de l'Ouest à Angers (UCO) (Angers, France)

Abstract body. The idea of multidimensionality of consciousness (V.Petrenko) and a typological approach (G.Akopov) to the formulation of the problem of consciousness and various solutions which make it possible to streamline the many existing theories of consciousness. The methodological program of V. Panov analyzes the main paradigms of research on consciousness. V. Nourkova builds the theoretical basis of the phenomenon of self-awareness in the space of such categories of memory as semantic memory, episodic memory, and autobiographical memory. A. Prusak's research presents new data showing the results of a guided self-awareness development by means of “tools” allowing students to communicate with a referent person and use autonomous self-help reflection. The original program for the study of child consciousness is presented in the study of J. Kerzil; the author considers the features of identification and identity of children by skin color. Studies of consciousness, implemented in the methodological and experimental plans are presented.

Press paragraph. The topic of consciousness today is acquiring a wide meaning in various spheres of human life. On the one hand, there is significant progress in studying the problem of “Brain and Consciousness” and bringing a number of solutions obtained in this plan to concrete practical applications, on the other hand, new technologies for manipulating mass and individual consciousness. The number of deviant manifestations of consciousness (phenomena of extremism, terrorism, "shooters", etc.) is increasing. In connection with the processes of globalization, religious, ethnic and national consciousness is being subjected to serious metamorphosis. Hence, the ever growing interest of scientists to the problems of consciousness. The scientific topics of the symposium “Psychology of Consciousness and Self-Consciousness” organically integrate fundamental and applied practical tasks. Of particular interest may be questions and decisions related to the distinction of conscious and unconscious acquisition of knowledge, experiences, actions and actions by a person; the multiplicity of theoretical models of consciousness and the possibility of their classification, as well as practical use. The symposium “Psychology of Consciousness and Self-Consciousness” is attended by well-known scientists such as: A. Agafonov (Russia), G. Akopov (Russia), V. Panov (Russia), J. Kerzil (France), V. Nourkova (Russia), A. Prusak (Israel) and others.

General summary of the Symposium. Modern technologies define new possibilities for solving the traditionally difficult problem “Brain — Consciousness”. The idea of multidimensionality of consciousness (V. Petrenko) and a typological approach to the formulation of the problem of consciousness and various solutions (G. Akopov) make it possible to streamline the many existing theories of consciousness. In this context, the correspondence between theories and aligned categorical (conceptual) spaces is determined. The methodological program of V. Panov analyzes the epistemological limitations of the problem of human consciousness; as a result, it becomes necessary to analyze the problem of consciousness in the context of epistemological, ontological and transcendental thinking paradigms. A. Agafonov show that awareness is a result of choice and realization of one of models of understanding that are provided by cognitive unconsciousness. V. Nourkova builds the theoretical basis for the phenomenon of self-
awareness in the space of such categories of memory as semantic memory, episodic memory, autobiographical memory, justifying its approach to the logic of the evolution of the human psychological system. A. Karpov and T. Voronova establish a direct connection of self-consciousness, namely, the level of reflection with the peculiarities of the organization of the inner world of a person, with self-organization and self-regulation. A. Prusak presents new data showing the positive results of guided self-awareness development (as exemplified in learning) by means of psychological "tools" allowing students to communicate with a referent person and use autonomous self-help reflection. The original program for the study of children's consciousness is presented in a study of J. Kerzil: the author examines the features of children's perception of people with different skin color, as well as the identification and self-identification of children in social groups that are homogeneous and heterogeneous on racial grounds.
CONSCIOUSNESS AS A MENTAL PHENOMENON: GNOSEOLOGICAL, ONTOLOGICAL AND TRANSCENDENTAL PARADIGMS

Victor Panov
Psychological Institute of Russian Academy of Education (Moscow, Russia)

1. Consciousness is the highest form of development of the human psyche. From this it follows that the phenomenon of consciousness as an object of psychological research is secondary in relation to the phenomenon of man. Therefore, without defining what a person is, we cannot define the phenomenon of consciousness. 2. But man is the subject of biological life, the subject of social life, the subject of spiritual life, and I also add the subject of psychical life. Therefore, the definition of consciousness in psychological research depends on what kind of human essence (biological, social, spiritual or psychical) we will take as a prerequisite for our reasoning about consciousness. And then we get different theories of consciousness: physiological, social, anthropological-christian and others. 3. Our reasoning about consciousness, as an object of study, also depends on the way we think. But the way of thinking is a part of consciousness, because without awareness of consciousness as a phenomenon, there is no way of thinking, through which it is realized as a phenomenon and as an object of research. 4. We cannot understand the nature of consciousness being in the reality of the phenomenon of consciousness itself. Consequently, it is necessary to make such a paradigm analysis of our way of thinking, which would allow us to consider the phenomenon of consciousness within the framework of different paradigms of thinking. As a result, three paradigms of psychological research of consciousness are found: gnostic, ontological and transcendental. 5. The gnostic paradigm: consciousness, as a product of the development of the psyche, is explored using the mode of thinking, which is another product of the development of the psyche. As a result, the process of generating consciousness, as a phenomenon under study, and the process of generating a way of thinking, as the means of this research, do not fall into the object of research. 6. Ontological paradigm: the subject of research are the stages of formation of consciousness as the highest form of development of the psyche. For example, within the framework of the ecopsychological approach to the development of the psyche, it is regarded as a becoming form of being. Then the formation of consciousness appears as a sequence of development of the psyche from mental processes to the mental state, and from the mental state to the structure of consciousness and consciousness as a whole. 7. Transcendental paradigm: what transcendental principles can allow us to explicate the phenomenon of consciousness as an object of study?
SKIN COLOR PERCEPTION AND SELF-CONSCIOUSNESS IN YOUNG CHILDREN: A STUDY IN TWO FRENCH PRESCHOOLS

Garnik Akopov
Samara State University of Social Sciences (Samara, Russia)

Jennifer Kerzil
Université Catholique de l’Ouest à Angers (UCO) (Angers, France)

Researchers generally agree that babies (from 0,3) perceive color much before being able to name it (around 4.5). Gérard, Bilinski and Dugas (1989) have found that children are able to recognize and categorize colors from 3,5 years old. In the USA, social psychologists have long been interested in the perception of skin-color in children (black vs white), while in Europe, most experiments (mostly in cognitive science) have focused on objects’ color perception (blue, red, yellow and green). Yet, in France, in terms of skin-color, there is a majority group (whites) and minority groups (different skin-colors from light to dark brown). In America, authors have shown the effects of skin-colors in terms of racial attitudes (Kowalski, 2003 ; Williams, Boswell and Best, 1975) and concluded that children with darker skin-color have lower self-esteem (Rosenberg and Simmons, 1970). According to Piaget (1932), a child comes to discover himself through a progressive comparison of his own body with other people’s bodies, starting from his parents and peers. Thus, our study aims to assess young children’s skin-color perception and its consequences. The methodology was based on directive interviews and a material composed of different photographs. The children, aged from 3 to 6, went to two different schools: a white majority school located in the country side (N= 51) and a diverse school located in a suburban neighborhood (N=35). Children were asked “which color are you?”, “which color is he or her?”, had to categorize pictures (4 women, 4 men, 4 children from 4 ethnical groups — Arabic, Asian, European and African) and answer to questions about skin-color and babies. The results show that children in the predominantly white school acquire a knowledge of their own and other children’s skin-color later than children who live and attend school in a diverse environment. It also shows that, even when they are from mixed couples, children have difficulties to imagine that a white or black woman can have a baby with a man who does not have the same skin-color. In light of these findings, we discuss the impact of skin-color differences among adopted children.
QUALIA, CONSCIOUSNESS AND COGNITIVE UNCONSCIOUSNESS

Garnik Akopov
Samara State University of Social Sciences (Samara, Russia)

Andrei Agafonov
Samara National Research University (Samara, Russia)

The scientific paper addresses the fundamental issues of study of phenomenology of consciousness: problem of explanatory gap and cognitive meaning of awareness. The author assumes that phenomenal and qualitative aspects should be differentiated under analysis of phenomenon of awareness. Analysis of phenomenal plan of consciousness involves explanation of empirical effects (effects of activity of consciousness) due to this theoretical reconstruction of logic of conscious activity becomes possible. Study of psychomechanics of consciousness is possible from position “from third person”. Also, act of awareness not only allows to acquiring representative knowledge (“knowledge about”) but is always definitely and directly experienced by man. Qualia — “how this is experienced” — provides subjective evidence of human experiences at every moment of time and is most important characteristic of awareness. Qualitative experience can be thought only from position “from first person”. Why and for what qualia appears? What is cognitive meaning of awareness, if most of mental processes occur in dark of unconscious psyche? How roles are distributed between consciousness and cognitive unconsciousness? The speaker will offer their versions of answers to these questions. On basis of accumulated experimental data the author will show that awareness is result of choice and realization of one of actual models of understanding which are provided by cognitive unconsciousness.

PROMOTING STUDENT SELF-AWARENESS IN THE LEARNING PROCESS BY MEANS OF “CORRESPONDENCE WITH PROFESSOR” — A DIDACTIC REFLECTIVE TOOL FOR SELF-HELP

Garnik Akopov
Samara State University of Social Sciences (Samara, Russia)

Anna Prusak
Oranim Academic College of Education (Tivon, Israel)

Contemporary life raises a lot of questions to which textbooks provide no answers. Therefore, teaching students how to find answers by themselves is invaluable. The author’s didactic reflective tool “Correspondence with Professor” encourages students to write a letter to an imaginary Professor and detail their learning difficulties, then they write a reply (to themselves) on behalf of the Professor and thus discover by themselves how to cope with the difficulties. Research has shown that realizing what the difficulty is, searching for ways to overcome it and using the reflective questionnaire promote students’ self-help habits and improve students’ self-awareness. The tool allows students to solve learning problems, provides them with a new line of reasoning and conducting a dialogue with themselves; it helps students find inner resources. Students thus become a powerful factor in success and character building, and the ability to cope consciously with the challenges that life poses.
REFLEXIVITY AS A DETERMINANT OF THE HUMAN INNER WORLD STRUCTURAL ORGANIZATION

Garnik Akopov
Samara State University of Social Sciences (Samara, Russia)

Anatoly Karpov
Yaroslavl State University named after P.G.Demidov (Yaroslavl, Russia)

Tatyana Voronova
Irkutsk State Medical University (Irkutsk, Russia)

The property of reflexivity is considered as a determinant of the human inner world structural organization. A flexible adaptation strategy of low-reflexive and medium-reflexive individuals is stated, it determines the compensatory need to preserve individuality, and determines the high significance of this value.

Highly reflexive individuals tend to have a less valuable attitude to their own uniqueness due to a more objective and prognostic evaluation of their own personality. Qualitative differences in the inner world structure with high, medium and low levels of reflection has been established on the basis of the structural-psychological analysis. Based on the divergence and convergence index calculations of the system, the principal and qualitative inner world systems heterogeneity, characterized by different levels of reflexivity, has been proved. It has been shown when the reflection level changes the qualitative transformational inner world structure changes are noted. Based on the system organization index calculations, it has been established that the inner world structure is the most consistent and stable at a high level of reflection. It is stated that as the reflexivity level grows, the movement from homeostasis to heterostasis organization and the tolerance to the psychological heterostasis state increase in the inner world system. The determining role of reflection lies in the influencing not only the severity of its individual structural components but also influencing the entire inner world structure. At the high reflection level, the inner world structural organization becomes more complex, without sacrificing the stability and sustainability of the system. At the same time, frequent mutual transitions from a steady psychological homeostasis state to an unstable heterostasis state of are performed in the inner world system, activating the system self-organization processes and generating psychological neoformations, that ensure the return of the system to a stable homeostasis state. It is ascertained, that the inner world system, at the high reflection level, gains the ability to generate inconsistency in itself, as well as to enrich and structure itself independently, and to generate consistency, at the same time preserving the general stability and sustainability.
AUTobiographical Memory: A Precise Response to a Call for Self-Consciousness

Garnik Akopov
Samara State University of Social Sciences (Samara, Russia)

Veronika Nourkova
Lomonosov Moscow State University (Moscow, Russia)

From an evolutionary perspective, three long-term memory subsystems appear successively in response to specific demands. The basic memory subsystem is semantic memory, which aims to create a schematic mental map of the world. The adaptive mode of semantic memory functioning is schematization, which consists in emphasizing regularities and deleting irregularities from encoded events. The next memory subsystem is episodic memory, which emerged in highly developed species and provides an opportunity to maintain an authentic but relatively short-lasting record of recent incidents. The veracity of episodic memory makes individual behavior more flexible by taking into account situational mismatches with the general model without hasty correction.

Whereas semantic memory is an evolutionary predecessor of episodic memory, the latter is certainly not the last step in evolution of human memory. The development of mankind challenged human memory with a set of new problems unique in its complexity and impossible to solve by a semantic/episodic dual system. The culture demands that a person should be subjectively responsible for his/her own actions in the distant past and guided by goals addressed to a distant future. This situation results in the need to cultivate a qualitatively different form of memory preceding a manifestation of self-consciousness. Autobiographical memory, being a unique human memory system, provides a scaffold for grounding self-esteem in accessible autobiographical experiences and awareness of personal continuity on a life-long time scale. These functions are future-oriented, with a main focus on constant progress in achieving new goals not attainable in the past and in maintaining social responsibilities extending beyond the current situation. It should be noted that, being phylogenetically new, autobiographical memory is exclusively the product of cultural evolution. We speculated that the optimal strategy for autobiographical memory functioning would be to introduce an inaccuracy to allow for gradual memory enhancement. The more successful a person remembers his/her own past, the more optimistic s/he will be about future self-efficacy, and hence, more challenging goals might be set and achieved. In accord with this assumption, empirical data indicate a clear positive bias in autobiographical memory. We termed this strategy for autobiographical memory functioning positive construction. The reported study was funded by RFBR according to the research project No 19-013-00387.
THE CONCEPT OF INTONATING CONSCIOUSNESS
Alla Toropova
Moscow Pedagogical State University (Moscow, Russia)

The development of the idea of operationalization of the category “experiencing” led us to an understanding of the psychological importance of distinguishing the observed phenomenon “intonating”, which gives an understanding of the way the experience mark is formed and the individuality of the individual’s experience turns into the mental language tool of humanity for preserving experiencing in the intonation signs and symbols. The psychological concept of the intonating phenomenon can be expounded in terms, the main ones among which are: The intonating phenomenon is a form of the primary mental activity of consciousness included in all mental functions, as their explication for themselves and others. The intonating consciousness forms a layer of metalinguistic non-verbal signs that are used in the process of various types of communication, in verbal communication, in targeted and indefinite-targeted expression of experiences. We consider it both as a pre-language, and as a pre-layer (meta-level) of language consciousness, the basis for the development of non-verbal cultural languages and ethno-linguistic forms of consciousness, including musical-language consciousness. An intonated experience provides a primary preverbal categorization of sensory experience based on the emotionally experienced understanding of meaning of this situation for a given subject with his unique personal and generic experience of intonated experiencing, that impact psycho-semantic structure of his mind.
THE MULTIDIMENSIONALITY OF CONSCIOUSNESS AS A PROBLEM OF MODERN PSYCHOLOGY: THE TYPOLOGY OF APPROACHES AND THE CONSTRUCTION OF A SYSTEM OF CATEGORICAL SPACES

Garnik Akopov
Samara State University of Social Sciences (Samara, Russia)

The relevance of this issue is associated with a significantly increasing "gap" between the neurocognitive and sociocultural foundations of consciousness research, the potential possibilities for excessive pragmatization of scientific knowledge and their dehumanization (artificial intelligence, transhumanism, manipulation for "the good", etc.). Substantially complicating the solution of the problem is the inclusion of the consciousness itself in the used spectrum of research organization methods (including neurocognitive methods), qualitative analysis and interpretation. The reflection of the problem of consciousness in the language and the implicit regulation of the processes of cognition, through traditionally designed language discourses, can be manifested by comparing the conceptual (categorical) spaces of consciousness research in multilingual scientific cultures. Contemporary experimental studies of consciousness mainly affect the lower layers of consciousness. The higher mental functions that constitute the most important regulative part of consciousness remain unexamined. The construction of a universal paradigm of consciousness involves a new theoretical and practical understanding of the phenomenon of consciousness. The typologization of the problems of consciousness and the corresponding construction of categorical spaces will allow us to contaminate the natural-science and sociohumanitarian lines of consciousness research, to compare the temporal specificity of the English-speaking (from the 60's to 1996 and further annually to 2021) and Russian-language terminology in the field of scientific research of consciousness, and to create the basis of modern informatization of the problem. The typological approach to the analysis of the problem of consciousness, including the logical relevance of the content and methods of research, will make it possible to systematize the existing variety of problematizations of consciousness in such topical dimensions as: unitarity-interdisciplinarity, scientism-sociohumanitarianism, pragmatism (technologicalism) — value dominant, etc. That determines the new applications in the areas of social, group and individual consciousness.
THE INTERCONNECTION OF REFLEXIVITY AS A PHENOMENON OF CONSCIOUSNESS WITH THE STAGES OF FORMATION OF AGENCY

Panov V.I.
Laboratory of ecopsychology of development and psychodidactics, Psychological Institute of Russian Academy of Education (Moscow, Russia)

Kaptsov A.V.
Department of personnel management, Samara Humanitarian Academy (Samara, Russia)

Kolesnikova E.I.
Department of philosophy, Institute of Humanities and Technologies (Samara, Russia)

Reflexivity is a fundamental feature of subject’s consciousness, ensuring the unity of self-actualization and self-regulation during the development of professional activities. We have hypothesized about the interconnection of reflexivity with the stages of formation of agency. An ecopsychological (ontological) model of the formation of agency has been developed (V.Panov).

Reflexivity was determined by questionnaire (A. Karpov). The diagnostics of the stages of the formation of agency was carried out according to the authors’ method (V.Panov, A. Kaptsov, E. Kolesnikova).

The selection consisted of first-year students of a technical university (71 students, average age 18.1 y.o., Sd = 0.87). This sample is the best indicator of the problem being studied, since at this age a person, as a subject of his/her own professional activity, is just beginning to form, and the role of reflection is unlikely.

Cluster analysis of the stages of formation of agency showed that each student has an individual profile of the expressiveness of the stages of formation of agency. In this selection four types of profiles were highlighted, the most numerous (35%) characterized by high stages of formation of the agency «observer», «master», «expert», «creator» with an average level of the stage «apprentice» and «learner».

For each type, a non-parametric correlation of the Tau-Kendall reflexivity indexes and stages of formation of agency was carried out. For example, for the most common type with reflexivity the «learner» stage is interconnected which be indicative of representatives of the type as active students who are focused on the result of educational activity. It should be noted that the majority of interrelations are observed in the case of finding the stage of formation of agency in a certain optimized zone, located between the high and low levels of expressiveness of other stages. Most likely, the correlation of reflexivity with the stages of the formation of agency shows the stage at which a person focuses own attention in the direction of development and control of own intellectual resources.

Work is executed at financial support RFBR, grant 17-06-00871.
MODERN EDUCATION AND THE DEVELOPMENT OF SOCIAL CONSCIOUSNESS OF STUDENTS

Garnik Akopov
Samara State University of Social Sciences (Samara, Russia)

Dimitri Lubovsky
Moscow State University of Psychology and Education (Moscow, Russia)

The main characteristics of modern education are considered in the aggregate of subsystems (preschool, primary, etc.). The continuity factor is determined in the development of learning, creative, cooperative, leadership, professional and value consciousness. In the context of continuity, the structure, relevant competences and personal educational results of educational standards of different levels are analyzed. On the basis of the socio-communicative concept of consciousness (G.Akopov), a range of possibilities is predicted for the development, development, and purposeful formation of the social consciousness of students. As the main personal characteristics, ensuring the subjective inclusion of students in the educational process, the direction, structural, content and dynamic features of the internal position of participants in the educational process are considered. Analyzed the characteristics of the internal position of students, acting as a prerequisite for the continuity of individual educational trajectories.
CONCEALABLE STIGMATIZED IDENTITIES: BEING DISABLED, GAY, FEMALE SYRIAN REFUGEE, OR INDIVIDUAL WITH BIPOLAR DISORDER IN TURKEY

İdil Işık
İstanbul Bilgi University (İstanbul, Turkey)

Robert A. Cleve
The Chicago School of Professional Psychology (Chicago, USA)

Faruk Ceylan
İstanbul Bilgi University (İstanbul, Turkey)

Lindi Herrin USA Chicago, IL
The Chicago School of Professional Psychology (Chicago, USA)

Abstract body. This symposium focuses on concealable stigmatized identities of people with disadvantages in Turkey by blending the perspectives from work/organizational psychology and clinical psychology. The aims include creating the sense of meaning-making of experiences for individuals with a disability and bipolar disorder in work settings; it elaborates how the Syrian refugee women and LGBTQ individuals form their identity in wider social settings of Turkey. How the visible and invisible individual characteristics shape the social identities of these disadvantaged groups and how they experience the process of decision making in disclosing their identities are the two major foci that the proposed symposium addresses.

Press paragraph. The proposed symposium entitled as "Concealable Stigmatized Identities (CSI) in Turkey: Being Disabled, Gay, a Female Syrian Refugee, or Diagnosed with Bipolar Disorder" focuses on CSIs of people with disadvantages in Turkey. The team from Istanbul Bilgi University, Turkey and The Chicago School of Professional Psychology, USA organizes the symposium. There are four presentations based on empirical studies on CSI conducted in Turkey. İdil Işık will talk about the work life of disabled people, the physical/social barriers in organizational settings in the presentation entitled "Disabled Employees Challenge Stigmatization in Turkey: Being Disabled is not "a Social Identity." Robert Cleve’s presentation title is "Disclosure Decisions for CSI: LGBTI Culture". He will explore the disclosure decisions of sexual identity for gay individuals through sexual rights discourse. Faruk Ceylan with his research on "The Stigma of Being an Employee with Bipolar Disorder in Work Life in Turkey" will investigate the work-related experiences of employees with bipolar disorder. Finally, "CSI: Female Syrian Refugees" entitled presentation by Lindi Herrin will highlight the recognition of the identity as a refugee and asylum seeker in Turkey by referring to the forced migration literature and need for re-examination the decision process for silencing versus disclosure of CSIs.

General summary of the Symposium. İdil Işık, Ph.D. will chair the symposium. The findings from four empirical studies conducted in Turkey with the individuals who hold membership in the formerly mentioned stigmatized social identities will be presented. Robert Cleve, Ph.D. will present the process for gay youth sexual identity disclosure. Faruk Ceylan's research highlights the stigmatization of people with bipolar disorder in work settings. The social identity of being an employee with a physical disability will be opened to discussion by İdil Işık. Lindi Herrin, Ph.D. explores the refugee women’s lived experiences in Turkey. The symposium theme will be framed by the multi-layer characteristic of social identity and the need for interventions taking intersectionality (both at diverse social identities level and transdisciplinary level) as a reference point. Robert Cleve will take the discussant role.
to elaborate further the potential interventions to be designed for organizational and wider social settings to decrease stigmatization of concealable identities. We will emphasize that as work/organizational psychology has the power to carry a preventive role to create inclusive professional settings, clinical psychology provide interventions to decrease the burden these people experience every day.

DISCLOSURE DECISIONS FOR CONCEALABLE STIGMATIZED IDENTITIES: LGBTI CULTURE

The decision to disclose a concealable stigmatized identity (CSI) is a complex process, which requires a careful cost/benefit analysis including a variety of factors (Quinn & Chaudoir, 2010). CSI can be defined as any group, which shares experiences of stigmatization and discrimination once revealed. The culture of LGBTI individuals is explored within the broader context of heteronormativity and the potential consequences, which can be experienced across a continuum of outcomes. In countries that question the legality of being of gay or engaging in gay ‘behaviors’ those consequences can include imprisonment, harassment or death, violating basic human rights and freedoms. It is critical that the consequence of disclosure is carefully weighed against any potential benefits in work and social settings. In order to explore this topic, within the LGBTI culture, disclosure decisions of sexual identity for gay males potentially impacting life trajectory were informed through a process of sexual rights discourse in the context of socioculturally formulated constructs was conducted across a 2 year period. Three cohorts of 36 gay-identified males ranging in age from 18-21 (12 from each) in Sao Paulo, SP, Brazil, Chicago, IL, U.S. and Istanbul, Turkey voluntarily participated in in-depth interviews lasting one to one and half hours. Qualitative research using a grounded theory design cultivated meaningful data collection and permitted an iterative method of interviewing and informed the analysis process. This ultimately ensured preliminary/focused coding and emergent thematic descriptors across the three cohorts. Thematic formulation framed through social constructivist and transformative psychological paradigms resulted in eight factors determined to mediate internally, eight, which were relationally mediated, and six, which affected the decision for future disclosures. The utilization of unique cultural cohorts allowed for preliminary understanding in differences and additionally allowed for the development of a discourse concerning sexual rights and the health of shared experiences assisting in developing recommendations for best practice policies, intervention, mentoring and supporting young gay males. References Quinn, D. M. & Chaudoir, S. R. (2010). Revealing concealable stigmatized identities: The impact of disclosure motivations and positive first-disclosure experiences on fear of disclosure and well-being. Journal of Social Issues, 66(3), 570-584.
Recognition as a refugee has direct implications on life and well-being. The decision to disclose an identity, which falls under the broader rubric of a concealable stigmatized identity, of which refugee and asylum seeker is contained in a critical process for the individual or family. The forced migration literature references the difficulties involving trust yet there is minimal knowledge directly from asylum seekers. Re-examining silencing versus disclosure is necessary as non-Western cultures’ norms differ. My current qualitative research through purposive and snowball sampling encompassed interviews of 15 Syrian women in Istanbul, between the ages of 18-55 years who had left Syria due to the recent conflict. Women are the largest refugee population and have specific needs apart from the larger refugee category in which they are placed. MAXQDA software was used for data organization, and the logic of grounded theory provided direction for data collection and analysis. This research suggests that the participants disclosed information regarding status dependent on their immediate needs as they admitted to misrepresenting statuses and selective divulgence of information due to fears of ethnic discrimination, social exclusion, and lack of access to necessary services. Specific factors were revealed which impact the disclosure process including gender roles and cultural values. Refugees developed assumptions based on their current contexts and had expectations due to previous experiences coupled with the systems’ role in fostering motives or reasons to disclose (Herrin, 2018). Trust may be a strategic issue regarding personal gains that override risks or an altruistic act as morals are involved with the decision. The latter coincides with the beliefs of participants regarding “karam” or a sense of generosity and goodwill which can impact decision-making. Experiencing protracted conflicts contribute to the lack of predictability and trust placed in others and divulging information may be used against refugees which have been depicted within this research. Published Doctoral Dissertation.
THE STIGMA OF BEING AN EMPLOYEE WITH BIPOLAR DISORDER IN WORK LIFE IN TURKEY

İdil Işık
Faruk Ceylan
İstanbul Bilgi University (İstanbul, Turkey)

Today, people diagnosed with psychological disorders still feel obligated to hide their status from third parties, groups, or institutions because of the threat of social exclusion. This study aims to investigate the work-related experiences of employees with bipolar disorder as a concealable stigmatized identity. Even if it is worth elaborating on how the working conditions, work settings, and professional interrelationships affect employees with bipolar disorder, the literature is limited. Being identified as “bipolar” by third parties in work settings is perceived as a risk due to the possibility of being dismissed, demoted or refrained from promotions. A few studies in Turkey on stigma toward bipolar people in the general population do not bring enough understanding on specific workplace experiences. Our study is the first initiative in Turkey on the work life experiences of employees living with bipolar disorder. The individuals diagnosed with bipolar disorder (type 1&2) participated in semi-structured in-depth interviews (n=10; n_male =6; age range=25-48; n_employed=5).

Transcribed interviews were analyzed via MAXQDA qualitative data analysis software incorporating the analytic principles of Interpretative Phenomenological Analysis. The emerging master themes are: “stigma”, “process of sharing the illness with colleagues”, “importance of prophylactic treatment”, “effects of manic/depressive phases on work”, “side effects of medication”, and “triggers of attacks in work environment”. We see that the majority of participants worry about disclosing their diagnosis and ongoing treatment because of the potential consequences of stigma. There is doubt if their performance or failures would be attributed to their psychological status. The pity and excessive sentiment displayed from third parties are further mentioned as a risk. The participants believe that colleagues and managers would be more sensitive to the side effects of the medication and to the slight changes in their mood. This presentation will illustrate how the anxiety caused by these perceived threats set barriers for the inclusion of people with psychological problems into work life and how organizations should form a social setting where prejudice and discrimination related to psychological disorders are controlled.
DISABLED EMPLOYEES CHALLENGE STIGMATIZATION IN TURKEY:
BEING DISABLED IS NOT “A SOCIAL IDENTITY”

İdil Işık
İstanbul Bilgi University (İstanbul, Turkey)

This study particularly focuses on the work life of people with orthopedic and visual impairment. The physical and social barriers in organizations and social misconstruction of disability as performance inhibiting characteristic restricts the inclusion of well educated, and motivated talent within the workforce. İnan, Peker, Tekiner, Ak, and Dağlı (2013) reported that 78.3% of the disabled population in Turkey is not present in the workforce; and the present study aims to research how disabled people experience organizational processes, what challenges they face and how these affect their identity. The semi-structured interviews were conducted with 22 disabled employees currently working (N=22, men=13; age range=27-50; n_Orthopaedic Impairment=15, n_Visual Impairment=8). Inductive qualitative content analysis was applied via the MAXQDA software. The "reluctance to see disability as an identity" emerged as the strongest theme. The majority emphasized that they do not feel continuous resentment of being disabled. Data highlights their "conscious or unconscious desire for overlooking" their physical challenges; but they struggle with "being overlooked" by the authorities, employers, and society. The second crucial theme is "receiving society’s pity". They certainly want a social environment that treats them like an “adult”, not like a "child" since this brings prejudice regarding their competencies and causes discrimination. The participants mentioned that discrimination differs depending on the disabled person’s education and job status. The non-qualified job holders are more exposed to assaultive language sometimes to the extent of harassment. For white-collar workers, discrimination is more in the form of restricting and withdrawing secured labour rights. Participants emphasized that they like working hard; contrary to misbeliefs, their willingness to work is not lower, but they demand improvement in working conditions. They strongly advocate for disabled-friendly workplaces, and they are prepared to fight against stigmatization since they now have more access to education and more visibility across a variety of social settings. Francisco Machado
Maia University Institute (ISMAI) Auxiliary (Maia, Portugal)

Renata Glavak Tkalić
Institute of Social Sciences Ivo Pilar (Zagreb, Croatia)

Abstract body. Interpersonal relationships are key part of every human being’s life. Close relationships help to delay mental and physical decline, and are better predictors of long and happy lives. That is why studying human relationships will always be a significant body of research. The primary goal for this symposium is to present five studies on interpersonal acceptance and rejection in different contexts. Specifically, areas explored concern interpersonal acceptance and relationships in educational settings, within the family, and in adult intimate relationships. The topics that are covered are perceived maternal and paternal rejection and their long-term consequences, the importance of teacher’s perceived acceptance, the perceived closeness in intimate relationships. Those studies cover topics in different age groups – from 8 years old children until old age. Each of the presentations included in the symposium reveals an important aspect of interpersonal relationships. Contributions as these can have significant implications for parents, teachers, educators, clinicians.

Press paragraph. “Living Better Together: Interpersonal Acceptance-Rejection Across Contexts” is a symposium dedicated to interpersonal relationships as a key part of every human being’s life. Research studies on interpersonal acceptance and rejection in educational settings, within the family, and in adult intimate relationships will be presented. The studies cover topics in different age groups – from 8 years old children until old age. Researchers from three European counties (Bulgaria, Portugal and Croatia) and a South American country (Colombia) will take part. The presentations in the symposium are: 1. Nadia Koltcheva, Liubomir Dlalev (Bulgaria) – Does Perceived Maternal and/or Paternal Rejection in Childhood have Long-term Consequences in Adulthood? 2. Nadia Koltcheva, Margarita Stankova (Bulgaria) — Parental Acceptance-Rejection and Externalized Behaviour Problems in Elementary School Children 3. Francisco Machado, Carla Peixoto, Carlos Vale (Portugal) — The Role of Perceived Teacher Acceptance on Student’s Resiliency, Classroom Social Climate and Academic Success 4. Renata Glavak Tkalić, Anita Vulčić-Prtorić, Andreja Zoroja (Croatia) — Perceived Parental Acceptance — Rejection in Childhood, Personality Characteristics and Anxiety in Interpersonal Relationships in Adulthood 5. Karen Ripoll-Núñez (Colombia) — Relational Self-Regulation and Perceived Closeness in Cohabiting and Married Couples in Colombia.

General summary of the Symposium. “Living Better Together: Interpersonal Acceptance-Rejection Across Contexts” is a symposium that will present several research studies on interpersonal acceptance and rejection in educational settings, within the family, and in adult intimate relationships are included. The studies are within the framework of R.Rohnr’s Interpersonal Acceptance-Rejection Theory (IPARTheory) (Rohner, 2018). According to IPARTheory perceived parental acceptance or rejection in childhood has a major influence on...
adults’ personality, psychological adjustment and many other mental health-related issues. Rohner and Britner (2002) identified three universal groups of correlates (1) depression and depressed affect; (2) behaviour problems, including conduct disorders, externalizing behaviours, and delinquency and (3) substance (drug and alcohol) abuse. Three of the studies further explore those correlates in children and adults (Koltcheva & Djalev, Tkalić, Koltcheva & Stankova) and in different countries (Bulgaria and Croatia). Koltcheva and Djalev’s research reveals correlations between perceived rejection in childhood and depression, anxiety, aggressive behaviour, heroin and tobacco addiction in Bulgarian population. Tkalić research examines this relationship with personality characteristics and anxiety in Croatian people. Koltcheva and Stankova explore the interrelationship between perceived parental acceptance-rejection and externalized behaviour problems in elementary school children. Machado et al. studied the connection between Portuguese student’s perceived acceptance by their teachers and constructs as school success, student’s resiliency level, and their perception of classroom social climate. Ripoll-Nuñez focused on intimate relationships in heterosexual married and cohabitating couples. She is evaluating the association between their self-regulation and perceived closeness. Each of the presentations reveals an important aspect of interpersonal relationships. All of them advance in an important way our knowledge of interpersonal acceptance-rejection. Rohner R. (2018) Introduction to Interpersonal Acceptance-rejection Theory (IPARTheory), Methods, Evidence, And Implications, https://csiar.uconn.edu/introduction-to-partheory/ Rohner, R. P., & Britner, P. A. (2002). Worldwide mental health correlates of parental acceptance-rejection: Review of cross-cultural and intracultural evidence. Cross-Cultural Research, 36, 16-47.
This paper presents results of several related studies that focus on the investigation of various correlates of parental acceptance-rejection in childhood that occur later in adult life. The studies were conducted within the framework of Ronald Rohner's Interpersonal Acceptance-Rejection Theory (IPARTheory), according to which perceived parental acceptance or rejection in childhood has a major influence on adults' personality, psychological adjustment and many other mental health-related issues. Rohner and Britner (2002) identified three universal groups of correlates: (1) depression and depressed affect; (2) behaviour problems, including conduct disorders, externalizing behaviours, and delinquency and (3) substance (drug and alcohol) abuse. We investigated the following representatives of these groups in the Bulgarian population: depression, anxiety, aggressive behaviour, heroin and tobacco addiction. A total of 245 subjects, aged 18 to 80 years (M=32.88, SD=11.95), participated in the studies. 105 (42.86% of all) were male, and 140 (57.14%) were female. Most of the subjects were Bulgarians (69.80% of all), and few were Turks (1.63%) and Armenians (0.41%). We used several questionnaires for data collection: Parental Acceptance-Rejection Questionnaire/Control for Adults (PARQ/C, Adult), long form, both Mother and Father Versions; Self-Rating Depression Scale (SDS); Self-Rating Anxiety Scale (SAS), and Aggression Questionnaire (BP-AQ). Most of the results obtained support the theory's postulates.

Experiencing both maternal and paternal rejection in childhood has influence on risk behaviours later in life and it relates significantly to depression (maternal — r=0.52, p<0.05; paternal — r=0.61, p<0.05), clinical depression (maternal — $\lambda (5, 96)=0.67$, p=0.00; paternal — $\lambda (5, 98)=0.39$, p=0.00), anxiety (maternal — r=0.46, p<0.05; paternal — r=0.38, p<0.05), aggressive behaviour (maternal — r=0.56, p<0.05; paternal — r=0.66, p<0.05), and tobacco addiction (maternal — $\lambda (5, 54)=0.33$, p=0.00; paternal — $\lambda (5, 54)=0.33$, p=0.00), but not to heroin addiction (maternal — $\lambda (5, 56)=0.33$, p=0.18; paternal — $\lambda (5, 546)=0.97$, p=0.92). Most of our findings are consistent with the results of other studies. They raise also new questions regarding the different long-term effects of mother and father's perceived rejection. Key words: acceptance, rejection, depression, anxiety, aggressive behaviour, heroin addiction, tobacco addiction, IPARTheory.
According to Ronald Rohner’s Interpersonal Acceptance-Rejection Theory (IPARTH), perceived parental rejection and other forms of interpersonal rejection appear to be major predictors of almost all forms of behaviour problems, including conduct disorder, externalizing behaviour, delinquency.

Perceived rejection by parents is identified as a risk factor regarding children’s wellbeing and psychological adjustment and vice versa, perceived parental acceptance is a protective factor of various kind of risk behaviours. The aim of this report is to present an empirical study of interrelationship between perceived parental acceptance and rejection and externalized behaviour problems in elementary school children. The sample consists of 104 subjects — 52 children and 52 parents. Children are between 8-11 years of age (M=9,46; SD=0,67), 30 (57,7%) girls and 22 (42,3%) boys. Two assessment instruments were used: (1) the Bulgarian adaptation of the two versions (Mother Version and Father Version) of Parental Acceptance-Rejection Questionnaire for school children (PARQ/C, Child), (2) the Bulgarian adaptation of the parental version of Child Behaviour Checklist for ages 6-18 (CBCL/6-18). Our results confirmed the research hypotheses and are in line with the IPARTH theory main postulates. Perceived parental rejection of both parents — the mother ($r=0,591$, $p<0,000$) and the father ($r=0,578$, $p<0,000$) — has a positive correlation with the children’s externalized behaviour. All the correlations between the scales measuring perceived maternal and paternal rejection (hostility/aggression, indifference/neglect, undifferentiated rejection) and the scales of externalized behaviour problems (rule-breaking behaviour, aggressive behaviour) correlate significantly. Perceived acceptance (warmth/affection) by both parents (mother — $r=-0,600$, $p<0,000$; father — $r=0,503$, $p<0,000$) correlates negatively. The results are discussed within the framework of IPARTH and other body of research studing similar constructs. The results can be of practical value regarding consultations of families with children with externalized behaviour problems, variety of programmes for parents, the importance of father figure in child’s life. Key words: acceptance, rejection, externalized behavioral problems, elementary school children, parent-child relationships, IPARTH, aggressive behavior.
THE ROLE OF PERCEIVED TEACHER ACCEPTANCE ON STUDENT’S RESILIENCY, CLASSROOM SOCIAL CLIMATE AND ACADEMIC SUCCESS

Francisco Machado
Carla Peixoto
Carlos Vale
Maia University Institute (ISMAI) (Maia, Portugal)

Throughout their development youth face a wide variety of challenges, namely career related, that they must deal. And to deal with these developmental challenges they need to have significant sources of social and emotional support as well an adequate set of social, emotional and academic skills. In this schools play an important role, through the work that teachers, as significant figures and behavior models, do with their students, to promote their social, emotional and academic skills. The quality of the interpersonal relationships established between teachers and students, namely in classrooms, contribute not only for their academic success and behavioral adjustment, but also to build strong foundations for future psychological adjustment. Thus, the objective of our research was to analyze the connection between student’s perception of being accepted by their teachers and school success, their resiliency level, as well as their perception of classroom social climate. To achieve our objective we applied the Teacher Acceptance-Rejection Questionnaire (TARQ, Rohner, 2005), the Classroom Processes Inventory (IPSA, Bastos, Barbosa, Oliveira, & Dias, 2009), the School Success Profile (SSP, Bowen & Richman, 2005) and the Child and Youth Resilience Measure (CYRM-28, Liebenberg, Ungar & Vijver, 2012), to a sample of 223 high school students, with ages between 12 and 18 years old. Our results showed that student’s perception of being accepted by their teachers was significantly associated with higher levels of resiliency, higher levels of engagement and satisfaction with school and a more positive perspective of classroom processes. Also, we found that lower levels of teacher rejection, when associated with high levels of school engagement and satisfaction, predict higher levels of resiliency. Our results underline the importance of teacher acceptance for the promotion of positive school climate, resiliency and school success, which in turn are variables widely, associated to academic achievement in scientific literature. Which means that educational intervention aimed to promote school success and social and emotional development should focus on improving the quality of relationships between teachers and students, namely in terms of warmth expression.
PERCEIVED PARENTAL ACCEPTANCE — REJECTION IN CHILDHOOD, PERSONALITY CHARACTERISTICS AND ANXIETY IN INTERPERSONAL RELATIONSHIPS IN ADULTHOOD

Renata Glavak Tkalić  
Institute of Social Sciences Ivo Pilar (Zagreb, Croatia)

Anita Vulić-Prtorić  
University of Zadar (Zadar, Croatia)

Andrea Zoroja  
(Zagreb, Croatia)

The aim of the study was to examine the relationship between perceived parental acceptance-rejection in childhood, personality characteristics and anxiety in interpersonal relationships in adulthood. The research was carried out in Zagreb, Croatia among 235 graduate university students (61% females), aged between 20 and 30 years (M=23.11, SD=1.508). Respondents completed Parental Acceptance-Rejection Questionnaire (Mother and Father Versions, short forms), adult Personality Assessment Questionnaire (short form), Interpersonal Relationship Anxiety Questionnaire, and Personal Information Form. Anxiety in interpersonal relationship was negatively correlated with perceived parental warmth-affection, and positively with perceived parental hostility-aggression and indifference-neglect, and father’s undifferentiated rejection. Furthermore, it was positively correlated with hostility-aggression, negative self-esteem, negative self-adequacy, emotional unresponsiveness, emotional instability, and negative world view. Results of hierarchical multiple regression analyses indicated that, after controlling for age, gender and parents’ educational level, perceived indifference — neglect from father, negative self-esteem and negative self-adequacy made significant independent contribution to interpersonal relationship anxiety. Results are discussed in line of Interpersonal Acceptance-Rejection Theory (IPARTTheory).

RELATIONAL SELF-REGULATION AND PERCEIVED CLOSENESS IN COHABITATING AND MARRIED COUPLES IN COLOMBIA

Karen Ripoll-Núñez  
Universidad de los Andes (Bogota, Colombia)

Relational self-regulation refers to behaviors and efforts that individuals make to improve their relationships (Halford et al., 2007). Previous research on couple relationships indicates that relational self-regulation is a significant predictor of relationship satisfaction and stability (Meyer et al., 2012; Wilson et al., 2005). Also, research on couples suggests that cohabitating couples are more likely to have less satisfaction and stability. However, little is known about the association between self-regulation and other indicators of relationship quality, such as perceived relationship closeness. Perceived closeness in an intimate relationship derives from activities that partners share in different areas: emotional, sexual, and intellectual (Schaefer & Olson, 1981). This research study focused on evaluating the association between self-regulation and perceived closeness in heterosexual married and cohabitating dyads. Research questions included: Do individuals in cohabitating and married couples differ in self-regulation and perceived closeness? Do individual and partner self-regulation account for men’s and women’s perception of closeness in both married and cohabitating couples? Participants were 60 couples (30 cohabitating).
COMPETENCIES AND EDUCATION FOR CLINICAL NEUROPSYCHOLOGISTS: EXPERIENCE OF THE EUROPEAN COUNTRIES

Laura Hokkanen  
University of Helsinki (Helsinki, Finland)

Gus Baker  
Liverpool University / Department of Neurosciences  
(Liverpool, United Kingdom)

Bengt Persson  
Linnaeus University (Växjö, Sweden)

Fernando Barbosa  
University of Porto (Porto, Portugal)

Marios Constantinou  
University of Nicosia (Nicosia, Cyprus)

Abstract body. The models of specialist education and training in Clinical Neuropsychology in the European countries are variable. The Standing Committee on Clinical Neuropsychology initiated a series of structured interviews to collect information on the required competencies of Clinical Neuropsychology. The aim of the symposium is to present the results acquired from these interviews. Guiding principles on how specialist education and training in Clinical Neuropsychology is recommended to be organized in Europe are also presented and discussed.

Press paragraph. The symposium on European competencies and education in Clinical Neuropsychology is organized by the EFPA Standing Committee (SC) on Clinical Neuropsychology, professor Laura Hokkanen (University of Helsinki, Finland) as the chair. Professor Gus Baker (University of Liverpool, UK) first discusses the implications of a competency framework with UK as an example. Bengt Persson (Linnaeus University, Sweden) and Fernando Barbosa (University of Porto, Portugal) then describe new results of a study conducted by the SC comparing core competencies in the areas of assessment, intervention and consultation, and additional competencies in areas such as research and teaching across countries in Europe. Finally, Laura Hokkanen analyses agreement on preliminary recommendations on the models of specialist education and training in Clinical Neuropsychology. The recommendations were based on a previous survey by the SC which examined the legal status and general structure of specialization training in Europe. Although the need of each competency in practicing Clinical Neuropsychology are evaluated similarly, many of the competencies that are considered very necessary are not required when entering the profession in most countries. A common model of specialization training in Clinical Neuropsychology targeting the necessary competencies would help harmonizing and leveraging the quality of the clinical practice in Europe.

General summary of the Symposium. Specialization and training in Clinical Neuropsychology in the European countries is variable. The Standing Committee on Clinical Neuropsychology, appointed by EFPA, has previously collected data on the educational routes to becoming a Clinical Neuropsychologist. Information on the content of the education or the requirements of the profession in Europe is lacking, however. Competency framework within Europe has been established for psychology on the basic level but not within Clinical Neuropsychology as a specialist field. The aims were to compare competency requirements between different countries within Europe and to take steps towards a harmonized specialization in Clinical Neuropsychology. Methods. A series of structured interviews were conducted. The interview was based on the framework of foundational, functional, and additional competencies applied in the United States. The
responders were asked to first indicate if each of the competencies are currently required when entering the profession of a Clinical Neuropsychologist in their country, and then to evaluate how important they are. Finally, recommendations regarding education and training of Clinical Neuropsychologists were reviewed. The responders were senior Clinical Neuropsychologists with a longstanding and detailed knowledge about the training procedures of Clinical Neuropsychologists in their country. Two experts from each country were interviewed.

Thus far, 20 countries are represented. The symposium will begin with a presentation on the importance of reviewing competencies, education, and training when developing a profession, using UK as a model. The foundational, functional and additional competencies in Clinical Neuropsychology will then be compared across Europe. The fourth presentation will describe the general agreement among the respondents on five recommended principles regarding specialization.

Finally, discussion will be open to all participants.

---

**CLINICAL NEUROPSYCHOLOGY: THE DEVELOPMENT OF A TRAINING AND A COMPETENCY FRAMEWORK**

Laura Hokkanen  
University of Helsinki (Helsinki, Finland)

Gus Baker  
Liverpool University / Department of Neurosciences (Liverpool, United Kingdom)

The profession of Clinical Neuropsychology involves the employment a scientific understanding of the relationship between brain and neuropsychological function within an applied clinical context. As a consequence, Clinical Neuropsychologists require not only generic clinical skills and knowledge of the broad range of mental health problems, but also a substantial degree of specialist knowledge in the neurosciences to support competent assessment of neurological patients. Treatment and rehabilitation approaches encompass a broad range of specialist emotional, behavioural and cognitive interventions not only for the client, but also for the client’s family and carers. As part of the development of the profession it has been necessary to continually review training and modelling of core competencies for clinical practice. In this presentation the presenter will draw upon the UK experience to highlight the challenges of an evolving profession and the provision of training that is fit for purpose. Information will be presented on identified core competencies and training routes for Clinical Neuropsychology in the UK drawn from published documents including British Psychological Society Division of Neuropsychology Competency framework 2012 and Training and response document 2014. Implications for the work of the European Standing Committee on Clinical Neuropsychology will be discussed.
EXPERT APPRAISALS FROM 20 EUROPEAN COUNTRIES: CORE COMPETENCIES NECESSARY FOR CLINICAL NEUROPSYCHOLOGY

Laura Hokkanen
University of Helsinki (Helsinki, Finland)

Bengt Persson
Linnaeus University (Växjö, Sweden)

Training in Clinical Neuropsychology vary considerably in Europe. Competency frameworks exist in individual countries such as UK and USA but common guidelines on the European level are lacking. In order to evaluate the entry-level expectations, the EFPA Standing Committee (SC) on Clinical Neuropsychology compared the professional core competencies across Europe. The SC conducted a series of structured expert interviews during 2018 with senior Clinical Neuropsychologists of 20 countries in Europe. The interviews comprised questions on how important 54 foundational and functional competencies were when entering the profession, and whether each of the competencies were currently required or not in the responders’ countries. Representatives of 16 to 20 countries responded, depending on the question. All agreed that a very important area is to have scientific knowledge of neuropsychology and its methods. The interviews show, however, that core competencies such as knowledge of key symptoms in illnesses, their incidences, and their effect on brain, patterns of impairment and their effect on function and behavior were required in only 60% or less of responders’ countries. Skills in analyzing referring questions, selecting instruments, gathering information, administration and scoring of tests and measures, interpretation of results and formulation of an integrated conceptualization were necessary in 70% of the responses. Skills in providing adequate feedback for specific audiences and recommendations were required in 60% of responders’ countries. Knowledge in the area of individual and cultural diversity was required in 60% of responses. Ethical, policy and legal standards, as well as professional identity and awareness of the role as neuropsychologist were required in 65% of the responders’ countries. The results will be discussed in the context of the fact that experts evaluate quite similarly the need of each competency in practicing Clinical Neuropsychology, but still many of the competencies considered necessary are not required when entering the profession in most countries. A common European specialization training in Clinical Neuropsychology targeting the necessary entry-level competencies would help harmonizing and leveraging the quality of Clinical Neuropsychological practice in Europe.
EXPERT APPRAISALS FROM 20 EUROPEAN COUNTRIES: THE RELEVANCE OF ADDITIONAL COMPETENCIES TO CLINICAL NEUROPSYCHOLOGY

Laura Hokkanen  
University of Helsinki (Helsinki, Finland)

Fernando Barbosa  
University of Porto (Porto, Portugal)

The practice of Clinical Neuropsychology requires a set of entry-level competencies. Besides foundational (common across multiple areas of practice) and functional competencies (relative to specific areas), additional competencies regarding research/evaluation, teaching/supervision, management/administration, and advocacy may also be required in different European countries, at various levels. Here we present the results on the relevance of such competencies to Clinical Neuropsychology as evaluated by experts of different European countries. A series of structured interviews were conducted during 2018 with senior Clinical Neuropsychologists of 20 countries. The interviews comprised questions on how important 28 additional competencies were when entering the profession, and whether each of the competencies were currently required or not in the responders’ countries. Representatives of 16 to 20 countries responded, depending on the question. Regarding the knowledge-based research/evaluation cluster, all competencies were considered “very necessary” by most respondents, and are required in most countries. Concerning the applied research/evaluation cluster, being able to perform research activities, communicate findings, and apply methods in evaluating effectiveness, was considered “very necessary”, although the last competency is not currently required in most countries. As to the teaching/supervision cluster, the competencies considered “very necessary” were (a) ethical issues and requirements relevant to teaching/supervision, (b) effective training in neuropsychological interviewing, test interpretation, case conceptualization, and development of recommendations, (c) effective training in treatment planning and provision of feedback, and (d) Sensitivity to individual and cultural differences. Despite their importance, these competencies are only required in a minority of countries. In relation to Management/administration and advocacy clusters, all competencies were considered “somewhat necessary”, and with the exception of the collaboration with psychologists and other professionals to advocate for neuropsychology, none of the other competences are required in most countries.

Although the experts evaluate quite similarly the need of each competency in practicing Clinical Neuropsychology, many of the competencies that are considered very necessary are not required when entering the profession in most countries. A common specialization training in Clinical Neuropsychology targeting the necessary entry-level competencies in the various European countries would help harmonizing and leveraging the quality of the clinical practice in Europe.
Towards a More Harmonized Specialist Education and Training in Europe: Recommendations in Clinical Neuropsychology

Laura Hokkanen
University of Helsinki (Helsinki, Finland)

The models and level of training in Clinical Neuropsychology in different countries in Europe is currently quite variable. In 2016-2017 The EFPA SC on Clinical Neuropsychology conducted a survey exploring the situation. Based on the results, elements were identified that could form the guiding principles for a more harmonized educational model. The aim of this study was to measure the level of agreement on these elements across Europe.

A structured interview was conducted in 2018 with experts in Clinical Neuropsychology of 20 European countries. The interview included five statements on specialist education and training in Clinical Neuropsychology. The responses were on a scale of agree fully / agree in part / do not agree. Representatives of 70% of the countries agreed fully with the statement The specialist education in Clinical Neuropsychology should be preceded by at least a five-year master's degree (or equivalent) in psychology and a minimum of one-year clinical practice. Representatives of 95% of the countries agreed fully with the statement The core elements of the specialist education should include theoretical study, practical training with supervision, and research experience.

Representatives of 80% of the countries agreed fully with the statement The theoretical studies, whether in the form of a program or a combination of separate courses, should be accredited by a national authority. Representatives of 95% of the countries agreed fully with the statement The length, depth, and breadth of the different elements within the specialist education must be sufficient to allow for the accumulation of advanced competencies necessary for a successful entry in the profession. Achieving these competencies typically requires several years of specialization in Clinical Neuropsychology. The EFPA EuroPsy Specialist certificate is currently available in psychotherapy and work & organizational psychology. Representatives of 80% of the countries stated that compared to the requirements of those two specialist areas, the requirements for Clinical Neuropsychologists should be similar. There was considerable agreement within the experts. Building on these guiding principles will help in defining recommendations on how specialization training in Clinical Neuropsychology could be developed in order to harmonize the field in the future.
PSYCHOLOGY OF SOCIAL TRUST

Irina Antonenko  
Russian State University named after A.N.Kosygina  
(Moscow, Russia)

Ken Rotenberg  
Keele University (Keele, United Kingdom)

Abstract body. Society functions as a multi-level system of trust–distrust. A level of trust in a society determines its effectiveness, but in modern society it decreases. Therefore, there is a social problem of trust, which is becoming increasingly acute. Psychology reveals a number of key aspects of this problem, first of all, examining the essence of trust, its psychological content, structure, functions in society and influence on other social spheres: economic, political, legal, educational, spiritual, etc. Trust is considered at various social levels: interpersonal, group, intergroup, organizational, within medium and large social groups, between these groups, in society as a whole, etc. At each of these levels, it has its own psychological characteristics, patterns and functions. Of particular importance are empirical studies of trust, which provide concrete material for solving the social problem of trust at a certain level. Some of these psychological aspects of the problem of trust in modern society will be considered at a symposium. Leading researchers in the field of social trust are planning to attend the symposium. The report of professor Ken J. Rotenberg, is devoted to the issue of teen trust in the police. A system of psychological factors interconnected with personal trust will be presented. The report of Professor Antonenko I.V presents the dynamic content of trust. Professor Pier Paolo Bellini in his report focuses on the phenomena of credibility and trust in educational relations.

General summary of the Symposium. Society functions as a multi-level system of trust–distrust. A level of trust in a society determines its effectiveness, but in modern society it decreases. Therefore, there is a social problem of trust, which is becoming increasingly acute. Psychology reveals a number of key aspects of this problem, first of all, examining the essence of trust, its psychological content, structure, functions in society and influence on other social spheres: economic, political, legal, educational, spiritual, etc. Trust is considered at various social levels: interpersonal, group, intergroup, organizational, within medium and large social groups, between these groups, in society as a whole, etc. At each of these levels, it has its own psychological characteristics, patterns and functions. Of particular importance are empirical studies of trust, which provide concrete material for solving the social problem of trust at a certain level. Some of these psychological aspects of the problem of trust in modern society will be considered at a symposium. Leading researchers in the field of social trust are planning to attend the symposium. The task is to consider external and internal factors of social
trust, its structure and its concrete manifestations in various spheres of social life: the importance of trust in building a positive identity, trust relationship personality, the dynamic content of trust, the impact of Institutions, trust as a precarious resource, adolescents’ trust in the police, trust and social networks, trust as a component of organizational social capital, reciprocal trust as a resource for the development of society, dynamics of trust, distrust and mistrust in international peacekeeping. Of interest are theoretical models of the studied aspects of trust and the results of specific empirical studies conducted in different countries, cultures and societies. Theoretical and empirical results will be presented in presentations. Presentations will include generalized research results, which will facilitate their perception and allow you to get acquainted with a large number of different studies. This will allow, from a more general perspective, to consider the problem of social trust and to put forward adequate and effective psychological recommendations that contribute to the development of the individual, the organization and society as a whole. This will be a significant contribution to the development of the psychology of trust.

ADOLESCENTS’ TRUST IN THE POLICE

Ken Rotenberg
Becci Leese
Pelin Togay
Yaser Hussain
Keele University (Keele, United Kingdom)

The acquisition of trust in the police during adolescence is essential to the development of law-abiding citizenship in contemporary society. Two studies were carried out to identify the social factors that affect adolescents’ trust in the police. In Study 1, 285 13 to 15-year-old year students from a secondary school in the UK were administered the Adolescents’ Trust Beliefs in Police (ATBP) scale and measures of: (a) generalized trust beliefs in others, (b) delinquency, (c) peer friendships, and (d) co-operation with the police. Some variables were assessed at two time points across a year period. It was found that the adolescents’ trust in the police was positively correlated with generalized trust beliefs in others and co-operation with police and was negatively correlated with delinquency (all ps < .05). Regression analyses showed that the adolescents’ co-operation with police longitudinally predicted the ATBP scale (β = .16, p = .017) indicating that that co-operation with police is a probable cause of their trust in the police. Also, the ATBP scores of pairs of good friends were appreciably correlated which confirmed the expectation that peer socialization contributed to adolescents’ trust in the police. In Study 2, 174 adolescents from a secondary school in an inner city of Birmingham UK, completed the ATBP scale and a standardized measure of reported parenting styles of their parents. It was found that the adolescents’ trust beliefs in the police were positively correlated with reports of their parents demonstrating an Authoritative Parenting Style (p < .05) which entailed setting standards and engaging in adolescent-parent communication. Across studies, it was found that the ATBP scale demonstrated validity by being composed of the expected three-factor structure (reliability, emotional trust and honesty) and acceptable reliability by attaining psychometric standards of internal consistency (Cronbach alphas > .80) and stability across a year period, r(211) = .48, p < .001. The research yielded support for the conclusion that adolescents’ behavioural dispositions towards the police, peer socialization, and parents’ parental styles, contributed to the adolescents’ trust beliefs in the police.
Trust is the most important characteristic of a person, a social group and society. The genesis of personal trust goes back to early childhood, but the development of trust occurs throughout a person's life. In the actual situation of social interaction, the level of trust shown by a person is due to a number of important factors. These are subjective, objective, environmental and situational factors of trust. Trust as a real phenomenon in its form of particular trust, is built each time afresh in relation to each new object, with consideration of the experience of the individual and his / her basic trust.

The purpose of the study was to identify differences in assessments of confidence in a person by his face with natural occlusion. The lower part of a person's face is considered to be very informative and therefore natural occlusion in the form of vegetation on the face covering the chin, facial contours, mouth can affect the credibility of the represented person. The hypothesis was tested that when a person perceives a communicating object with facial vegetation in the form of a beard and mustache and without it, the communicating subject assesses confidence in the portrait in different ways. The subjects were 50 respondents, 29 women and 31 men, aged 21 to 58 years. They were presented with photographs of characters with vegetation on and without vegetation on the face. They assessed the degree of their trust in the depicted individuals using the Specific Interpersonal Trust Scale (Johnson - George & Swap) trust test. It was translated, adapted and validated for the Russian-language natives by TP Skripkina, O. Golub. It is shown that a character without vegetation causes greater confidence than the same character with facial hair. These differences in the estimates of the level of confidence in characters with facial hair and without it is statistically significant: $T = 2.79977$ with $p = 0.006408$. To analyze the data, the Student's t-test was used (STATISTICA.10).
NEUROPSYCHOLOGICAL REHABILITATION (EDUCATION) IN EMOTIONAL AND PERSONALITY PATHOLOGY

Joaquim Quintino-Aires
Institute Vygotsky (Cascais, Portugal)

Abstract body. The prevalence of personality disorder is 34% in primary health care samples (Tyrer & Batem, 2004). Multivariate studies to test the hypothesis of an association between personality pathology and the intensity of the symptomatic pathology, quality of life and quality of the doctor-patient relationship, found a global prevalence of 52.7% personality disorders (Carraça, 2012). Despite these numbers there is no response for these patients. The psychotherapeutic proposals both cognitive-behavioral and psychoanalytic have failed. There is no associated genetic factor and the cause appears to be educational. Professionals with training in the Theory of Activity (Leont’ev, 1959, Gal’perin, 1959, Talizina, 1988) and in Neuropsychological Historical-Cultural Rehabilitation (Luria, 1948; Tsvetkova, 1970; Gudmann & Craine, 1978; Akhutina, 2004) present a different therapeutic proposal with encouraging results. In this symposium, professionals from four different institutions reveal their methodologies, work materials and results achieved with their patients.

Press paragraph. The symposium begins with a very brief diagnostic and epidemiological data of emotional and personality pathology. A brief contextualization of both Theory of Activity and Historical-Cultural Neuropsychological Rehabilitation is presented, and the possibility of its use as an intervention orientation with this pathologies. Joaquim Quintino-Aires presents the re-education neuropsychological work plan through a case of a 12 year old boy with. He was brought to appointment for problems of impulsivity, smoking habits, and sexual behaviour with peers at school. Yulia Soloviev shows how fundamental principles of activity theory and concept of orientation provide useful methodology for neuropsychological correction and development. For further discussion, there are three more cases of re-education neuropsychological work plan. Adriana Rua presents a case of 10 years old boy with anxiety and fears, unable sleep alone and take bath alone, and with low academic results. Patrícia Medeiros a case of a 11-year-old boy who threw chairs against the walls and other colleagues inside the classroom several different times. Tâmara Rodrigues a case of a 19-year-old boy with a history of school and social maladjustment, impulsivity, self-hetero-aggressiveness problems. All cases are documented with short videos and outcome of individual programs are integrated into a joint conclusion.

General summary of the Symposium. The prevalence of personality disorder is 34% in primary health care samples (Tyrer & Batem, 2004). Despite these numbers there is no response for these patients. The psychotherapeutic proposals both cognitive-behavioral and psychoanalytic have failed. There is no associated genetic factor and the cause appears to be educational. It is necessary to look for new intervention strategies. Neuropsychological education seems to be a possibility (Quintino-Aires, 2016). In this purpose, it is especially inspiring the contribution of the School of Moscow, founded by Vygotsky, Luria and Leont’ev. Notably is the Vygotsky’s theory (1931) of the origin and development of the Higher Mental Functions. Neuroscience brings new scientific information that also guides us in this route. An example is the poor communication between prefrontal and amygdala in anger-prone patients (K. Bertsch et al., 2018). Of course, such a proposal required a rethinking of classical neuropsychological rehabilitation methodologies. The pedagogical proposals in Vygotsky’s School were the support. Fundamental principles of activity theory...
The Dynamics of Verbal Thinking allows children to develop very important psychological processes such as intelligent perception, the active attention and deliberate activity. Since the desire or intention to conquer each of the psychological activities mentioned above, it is necessary to go a long distance for the millions of neurons, and language functions as a highway of fast and accurate flow because it does not allow mistakes along the way. When there is a weak structuring of the posterior divisions of the left frontal lobe, people's thoughts will not move and they usually abandon the task or do nothing more than reproduce some habitual verbal or behavioral stereotype. The expression of this syndrome is most evident in situations of higher emotional stress as a consequence of having an unresolved problem. As a consequence fear arises of the inability to solve the problem. The verbal regulation allows the formulation of the resolution. Without it the problem remains unresolved and with emotional stress increase. And for all this we understand that the Dynamics of Verbal Thinking Syndrome is not only of interest for clinical neuropsychology of the adult with brain injury, but also in developmental neuropsychology. We illustrate our work on neuropsychological re-education through a case with anxiety and fear. A 10 years old boy was brought to the appointment for problems of fear, unable to stay home alone, sleep alone and take bath alone with low academic results. After examination at psychological laboratory, carried out with the Voluntary Activity Study (L. Quintanar & Y. Solovieva, 2010) and the Rorschach Exner (2000), the plan of neuropsychological re-education was structured as proposed by T. Akhutina and Pylaeva N. (2004, 2012). We present the materials that mediate educational activity sessions and the results of the intervention.
NEUROPSYCHOLOGICAL RE-EDUCATION WITH A 12 YEAR OLD BOY DIAGNOSED WITH UNDERDEVELOPMENT OF ACTION CONTROL BY FRONTAL LOBE

Joaquim Quintino-Aires
Institute Vygotsky (Cascais, Portugal)

Neuropsychology began as a discipline that studied the relationship between brain and behavior. The professionals in this area applied their knowledge in adult clients with brain injuries. The need to work as well with children and adolescents would arise later, but one quickly realized that applying the knowledge to the developing ages could not be a simple process of transposition. The search for new understandings with the integration of new theoretical and clinical data, led to developmental neuropsychology. Particularly with the contribution of the Moscow School, founded by Vygotsky, Luria and Leont’ev, as well with contributions from leading scientists like Sechenov, Pavlov, Anokhin, Bernstheyin, among others, the neuropsychology of development proved to be more than just a discipline; probably without being this its original purpose, it provoked a major paradigmatic rupture in Psychological Science. The way we understand the complaints of our clients, how we accomplish our clinical practice, and even the social commitment of psychologists in promoting citizenship, are now completely different. We illustrate our work on neuropsychological re-education through a case of underdevelopment of Action Control by Frontal Lobe Syndrome. A 12 year old boy brought to the appointment for problems of impulsivity, inability to be in the classroom for 50 minutes, smoking habits, sexual behaviour with peers at school. He was followed in Child psychiatry in the last 5 years. He received the diagnosis of Psychotic affective disorder. At the time of first consultation he was medicated with DIPLEXIL ® 250 mg (Divalproex Sodium) and ZYPREXA® 5 mg (Olanzapine). Two years Psychoanalysis, without success. Two years of Cognitive-Behavioural therapy, also without success. We present the materials that mediate educational activity sessions and the results of the intervention controlled by Luria Neuropsychological Battery and the Rorschach-Exner.
The aspects of design and application of methods for correction and development is one of emergent problems in child neuropsychology. Very often, psychologists use only methods of direct tasks or mechanic exercises, which are not interesting for children. Unreflective movements, repetition of words, direct memorization of items and images are frequently used by specialists. Another common choice for correction and therapies is context facilitation and adaptation. Our presentation shows how important proposals of activity theory, including the concept of orientation and development, as opposite terms for repetition and facilitation, might be used during introduction of drawing tasks with children. Cases of normal preschool children and of children with developmental difficulties are presented in the study. Method for introduction of drawing with orientation was used in guided tasks. Normal children worked in groups, while children with difficulties were submitted of individual sessions. The presentation includes important procedures by stages used during the work with children. The program is based on the usage of the zone of proximate development and considers psychological structure of graphic activity. The program is divided into three stages: previous material actions of comparison and differentiation, introduction of drawing of objects based on analyses of shapes, drawing of objects with essential details. During the program, graphic representation of shapes is used with the help of constant external orientation. Examples of initial and final assessment with important changes in graphic activity of children are presented. In case of children with developmental difficulties, the method of drawing was used as a part of complex program for neuropsychological correction. Our experience pointed out positive possibilities of application of drawing tasks for children who are not ready for direct tasks with writing and reading. Fundamental principles of activity theory and concept of orientation provide useful methodology for neuropsychological correction and development.
NEUROPSYCHOLOGICAL RE-EDUCATION OF A 19 YEAR OLD MAN PRESENTING AN UNDERDEVELOPMENT OF ACTION CONTROL FUNCTIONS DUE TO FRONTAL LOBE SYNDROME

Joaquim Quintino-Aires  
Institute Vegotsky (Cascais, Portugal)

Tâmara Rodrigues  
Associação Portuguesa de Psicologia Relacional Histórica (Viseu, Portugal)

The idea of merging the work of psychotherapy and neuropsychology (Quintino-Aires, 2016) arose from two main factors: Vygotsky’s thesis on human development which requires a dialectic approach to society’s demands on each person; and the need to optimize the clinical efficacy of psychotherapy. Using Psychotherapy as a tool for personal development is no longer just focused on counselling. With the introduction of Neuropsychology, it became an opportunity to assess the zones of proximal development (Vygotsky, 1987) and intervene so as to develop fulfilled and productive brains, able to contribute towards the exercise of citizenship. The author presents a case study on the Underdevelopment of Action Control Functions due to Frontal Lobe Syndrome of a 19-year-old man presenting a history of poor academic outcomes and aggressive behaviors. Up until the age of 14 he was seen at an Adolescent Mental Health Service and diagnosed with Antisocial Personality Disorder (F60.2, ICD-10). At around that time he was placed in a Mental Health Residential Care where he remained until the age of 17. His medication plan involved Abilify 10mg (mane), Risperidone 2.5 mg (TDS) and Proxen 300mg (BD).

Currently, he has monthly 75mg Risperidone depot injections. After assessment using Luria Neuropsychological Battery (1977) and Rorschach-Exner (2001), a treatment plan was developed based on the principles of neuropsychological rehabilitation as presented by Luria (1947) and Akhutina and Lylaeva (2004; 2012). The tools of (re)education used were described by Quintino-Aires (2016). The author presents videoclips of the neuropsychological intervention and its outcomes. Our aim was to analyze if integrating methodologies used in cases of brain injury rehabilitation could maximize the therapeutic gains of patients suffering with Personality Disorders. We believe that the changes are significant in an area where pharmacological treatment and traditional psychotherapeutic interventions seem to produce limited results.
Trust is the most important characteristic of a person, a social group and society. The genesis of personal trust goes back to early childhood, but the development of trust occurs throughout a person’s life. In the actual situation of social interaction, the level of trust shown by a person is due to a number of important factors. These are subjective, objective, environmental and situational factors of trust. Trust as a real phenomenon in its form of particular trust, is built each time afresh in relation to each new object, with consideration of the experience of the individual and his / her basic trust.

The purpose of the study was to identify differences in assessments of confidence in a person by his face with natural occlusion. The lower part of a person’s face is considered to be very informative and therefore natural occlusion in the form of vegetation on the face covering the chin, facial contours, mouth can affect the credibility of the represented person. The hypothesis was tested that when a person perceives a communicating object with facial vegetation in the form of a beard and mustache and without it, the communicating subject assesses confidence in the portrait in different ways. The subjects were 50 respondents, 29 women and 31 men, aged 21 to 58 years. They were presented with photographs of characters with vegetation on and without vegetation on the face. They assessed the degree of their trust in the depicted individuals using the Specific Interpersonal Trust Scale (Johnson - George & Swap) trust test. It was translated, adapted and validated for the Russian-language natives by TP Skripkina, O. Golub. It is shown that a character without vegetation causes greater confidence than the same character with facial hair. These differences in the estimates of the level of confidence in characters with facial hair and without it is statistically significant: T = 2.79977 with p = 0.006408. To analyze the data, the Student's t-test was used (STATISTICA.10).
Clinical neuropsychology of development is a recent area of intervention, with very positive results when applied to clinical cases traditionally with few effective responses. Particularly conduct disorders. Emotional control of the impulses is an essential component in these pathologies, and the poor communication between prefrontal and amygdala anger-prone patients is known (K. Bertsch et al., 2018). The quality of these connections has a marked plasticity throughout life, and the process of myelination is quite dependent on experience (M. Nickel and Ch. Gu, 2018). Vygotsky's theory (1930) on the formation of functional systems in neuropsychology, gains support in the results of neuroscience research. We show our work with an 11 year old boy diagnosed with mixed disorder of conduct and emotions, a group of disorders characterized by the combination of persistently aggressive, dissocial or defiant behavior with overt and marked symptoms of depression, anxiety or other emotional upsets. Followed in consultation with children's psychiatry for three years, was brought to the Institute by appointment of the special education teacher, after police intervention at the school following another episode in which he threw chairs against the walls and other colleagues inside the classroom. He was given DIPLEXIL ® 250 mg (Divalproex Sodium). We explained the psychological assessment at the beginning and at the end of the intervention, as well as the neuropsychological reeducation methodology. Today, this young man is 13 years old, is well integrated into the public school, with academic success and good behavior, and child psychiatry has suspended the medication, which allows us to conclude about the effectiveness of neuropsychological reeducation in this case of disorder of conduct and emotions.
CULTURAL-ACTIVITY APPROACH AND TRANSFORMATION OF SCHOOL CURRICULUM: ADVANCES AND PERSPECTIVES

Anastasia Sidneva  
Lomonosov Moscow State University (Moscow, Russia)

Elena Polotskaia  
Université du Québec en Outaouais (Gatineau, Canada)

Iya Rekhtman  
Introchemist Association (Morrisville, USA)

Elena Vysotskaya  
Psychological Institute of Russian Academy of Education (Moscow, Russia)

Svetlana Khrebtova  
Moscow Pedagogical State University (Moscow, Russia)

Abstract body. This symposium will be devoted to the theme of bridging between theory and practice. Specifically, we focus on guidance and support provided by educational psychologists to construct school curriculum that promotes effective learning and enhances students’ cognitive development through Developmental Instruction. We build on Cultural-Historical Activity Theory (CHAT) that stems from the educational theory of Vygotsky, Galperin, Davydov, and their colleagues. Following the principles of CHAT, transformation of school curriculum is mandatory to the introduction of Developmental Instruction. Two important entry points for such transformation will be discussed to address: how to identify the proper action that stands behind the concept in the human culture, and how to introduce this function of a concept to students. We will present some findings in subject domains such as mathematics, science, chemistry, and the teaching of the Elkonin-Davydov theory in higher education.

Press paragraph. This symposium is organized by an international group of researchers interested in the theory of Developmental Instruction and curriculum design in different domain-specific areas (mathematics, chemistry, science, and other subjects). We propose five communications under the umbrella of CHAT. Anastasia Sidneva, from Russia, will introduce the symposium and present the subject — problems and development in the area of transformation of school curriculum from the point of view of CHAT. Elena Polotskaia, from Quebec, Canada, will present results from and reflections on an adaptation of Davydov’s ideas in Quebec elementary school math curriculum regarding multiplicative thinking. Iya Rekhtman, from North Carolina, USA, will introduce the 7th grade chemistry curriculum integrating Galperin’s idea of third type of orientation basis. Elena Vysotskaya, from Russia, will share teaching and learning of ratio-based concepts from the point of view of CHAT. Maria Yanishevskaya, from Russia, will introduce the 5th grade science curriculum and results of its implementation in Russian schools.

General summary of the Symposium. The Cultural-Historical Activity Approach in educational psychology founded by L.S.Vygotsky and his scientific school (A.N. Leontyev, P.Ya. Galperin, V.V. Davydov, etc.). The CHAT plays an important role in modern educational practice allowing for the transformation of students’ learning experience into a meaningful one. To attain this goal, the main factor is students’ goal-oriented activity, which should be carefully organized by the teacher. Thus, teachers are important agents in this transformation as they design and choose appropriate actions, provide students with the rationale of their learning activities, and organize the step-by-step CHAT learning process. These features distinguish the CHAT approach from others. The teaching of a child can be organized in various ways that, according to Galperin, exploit the first, second, or
third type of orientation basis of action (OBA). The first type means that an OBA offered is not complete, so students have to look for missing features by themselves. When teachers use the second or third types of OBA they not only present OBA to students, but also encourage them to use it. Galperin’s notion of the third type of OBA was developed further by Davydov and his colleagues, who emphasize transformation of the school curriculum as a main factor of Developmental Instruction. Two important points of such a transformation will be discussed during the Symposium. First of all — how to find the proper action that stands behind the concept in the human culture? And the second one — how a concept’s primary function can be presented to students? We will discuss how an educational psychologist can make a contribution to the transformation of the school curriculum. All presenters will talk about their findings in their respective areas of mathematics, science, chemistry, and the teaching of the Elkonin-Davydov approach at the tertiary level.

--

MULTIPLICATIVE RELATIONSHIP UNDER SCRUTINY: EXAMINING A GRADE 3 MATH LESSON THROUGH TWO THEORETICAL LENSES

Elena Polotskaia
Quebec University (Quebec, Canada)

Sidneva Anastasia
Lomonosov Moscow State University (Moscow, Russia)

Activity Theory and its application to teaching mathematics at school have gained momentum in recent years in Canada. We are particularly interested in Davydov’s theory of learning activity, focusing on learning as a goal. One should distinguish between a student’s activity where the possibility for learning is covert and one where a student is actively looking to construct new knowledge. The former is generally practiced by Quebec teachers; the latter is our goal as researchers and agents of change. We draw on Davydov’s relational understanding of number concept and the theory of stage-by-stage action formation (Galperin, 2002), which distinguishes between three types of orientation basis allowing for potentially different knowledge formations.

According to Galperin, only the third type ensures the development of a stable and reliable knowledge in its highest mental form. We designed and tested several classroom lessons to support students’ development of relational understanding of number. One of these lessons focuses on the relations between lengths of Cuisenaire rods and a strip of paper. The lesson was video recorded and analyzed using the two theoretical lenses. Objective: We aim to deepen our understanding of student-teacher-mathematics interaction in light of Davydov’s and Galperin’s theories. The lesson analyzed does not present all characteristics of learning activity in Davydov’s terms. We identified the third type of orientation basis within teacher-student interactions, namely students orally deducing rod-rod multiplicative relationships based on rod-strip relationships and formulating a general rule of such relationships. At some point, students fail to connect the new knowledge to a previous one. This particular aspect is not addressed in either theories. The use of two theories analyzing the same concrete learning process substantially helps to deepen our understanding of teacher-student-mathematics interplay and raises a new question: What is the role of previous knowledge within the two theories? References: Davydov, V. V. (2008). Problems of developmental instruction: a theoretical and experimental psychological study. Hauppauge, NY: Nova Science Publishers. Galperin, P. (2002). Lectures on psychology. (A. Podolsky, Ed.). Moscow.
PROMOTING STUDENTS’ TYPE OF LEARNING BY CHANGING TEACHING CONTENT (NATURAL SCIENCES DOMAIN)

Anastasia Sidneva
Lomonosov Moscow State University (Moscow, Russia)

Iya Rekhtman
Introchemist Association (Morrisville, USA)

Elena Vysotskaya
Psychological Institute of Russian Academy of Education (Moscow, Russia)

Svetlana Khrebtova
Moscow Pedagogical State University (Moscow, Russia)

The third type of learning formulated by Galperin is considered to be the highest level, but it is a challenge to design such learning from scratch. With this ultimate goal in mind, we have tried to improve teaching and learning in the domain of natural sciences, in particular, in chemistry. We assume that the most important concepts are those that are considered basic knowledge, and that these should be understood by students at the first (motivation) stage, according to P. Galperin. This preliminary work helps students to learn the ways of communication in the subject — it provides students with a primary form of analysis («method of analysis») in Galperin’s terms and with the most abstract form of the concept in Davydov’s terms. These principles dictate that students learn the important concepts and corresponding models through a meaningful activity that substantiates each basic concept. Our next assumption is that the most effective activity to present a concept and its model to the students is one with strong cultural references: something people did in the past to satisfy their needs as humans. In the case of chemistry, it is preparation of needed substances from available ones. Primary models to succeed here are the basic particle model and the element cycle model. Upon these ideas we designed a teaching strategy for chemistry domain (Grades 6 to 9) within the educational design research framework, and 20 years of research, testing, and refinement have proven its efficiency and effectiveness. Students build the models step by step from the very start (abstract model) to much more detailed ones that correspond to the regular standards. This gradual development is possible as students’ activity develops. Our experience shows that teaching content matters. It shapes and determines students’ understanding, attitude, engagement, motivation, and, in turn, their willingness to learn further.
TEACHING AND LEARNING RATIO-BASED CONCEPTS: ACTIVITY THEORY APPROACH

Anastasia Sidneva  
Lomonosov Moscow State University (Moscow, Russia)

Elena Vysotskaya  
Maria Yanishevskaya  
Psychological Institute of Russian Academy of Education (Moscow, Russia)

Ratio-based concepts such as velocity, density, pressure, and power are vital for learning mathematics and natural sciences. To master these concepts, students have to operate ratios easily and confidently. Most common mistakes are made when students consider changes of only one parameter in a ratio. These mistakes are often attributed to lack of logical multiplication between the ages of 6 and 10 years. Thus, ratio-concepts are considered to be age-dependent and are taught to 12-year olds and up. We study the psychological aspects of the acquisition of ratio-concepts. Our research focuses mostly on early stages: what actions should students learn and what tools and instruments should be provided to mediate these actions? We assume that goal-oriented cooperation among students is a proper psychological basis to build a ratio-concept. The main features of the learning environment are: (1) pairs of students control an intensive property (density or concentration) — each member can change only one parameter of the ratio; (2) to make the changes tangible for students, we start from a material form of action — hands-on experiments or computer simulations; (3) to make the activity meaningful for students, we design activities with strong cultural references — we reconstruct the concept of density through buoyancy problems and concentrations through paint-mixing. The hypothesis has been tested for a decade within the educational design research framework. More than 10 classes (over 250 students of Grades 2 to 6, 8-13 year-olds) took part in our research project. We have observed the interiorization of the actions taught: from external coordination performed by two students to the internal individual concept of ratio. Post-tests results and consequential progress of our students in learning physics and chemistry show significant benefits of the suggested introductory curriculum. Thus, the concept of “age boundaries” can be replaced by understanding of the psychological nature of ratio-based concepts as we suggest that learning these concepts demands special features of a learning environment more than a minimum age.
INTRODUCTION TO NATURAL SCIENCES THROUGH TESTING TECHNOLOGIES: “NARTURE” FOR 5-GRADE

Middle school students gradually lose their interest in learning in general and in learning natural sciences in particular. It seems that school subjects (Chemistry, Physics, etc.) answer questions that students do not ask, so students are not willing to learn these answers. We refer to the Developmental Instruction (Elkonin & Davydov) to devise an introductory course to address this issue and to scaffold students’ interest to learn natural sciences. To foster students’ high-order (theoretical) thinking, we introduce concepts that are not ready-made. Students should retrieve them as a reflection of their own meaningful and goal-oriented activity. This activity is designed to reconstruct the origin of the concept and refers to the history of human culture. We have devised “NartURE” for 5-graders to help them develop theoretical thinking and have a smooth transition to natural science courses afterwards. The key idea of our course is to allow students feel the culture flow and development of science. This can be done through reconstruction of technologies that helped people to survive and transform nature materials into artifacts. During a learning cycle students: (1) read a text that poses a problem and describes desired results (what features needed) and corresponding technologies as a way to achieve them; (2) test the described technologies in the classroom (bread-making, weaving, etc.); and (3) build up a model that helps to predict the results and control technological processes. Main models used throughout the course comprise a technological flow chart (from raw materials to final products) and the basic particle model. The first helps students to track the sequence of operations needed to get a product. The second scaffolds students’ understanding of how visible changes emerge from invisible ones. We have taught “NartURE” to over 320 5-graders (12 classes during 6 years), constantly revising, refining, and upgrading learning materials. Post-tests results show that students keep up with the curriculum — thus, it is feasible. Moreover, our students tend to participate in science competitions at school and regional levels and often choose advanced science courses as they progress through schooling.
Abstract body. Human Rights are a widely acknowledge standard for the evaluation of political conduct and practice. In psychology, the debate about Human Rights is still limited. The symposium highlights the role Human Rights should and could play also in psychology, both within psychology and its organisations as well as when psychologists are confronted with cases of Human rights violations. Press paragraph Human Rights are an important norm for living together. Adherence to Human Rights can help to improve relations between national states, but also between groups and individuals. Psychologists know a lot about the conditions that lead to Human Rights violations, the misuse of Human Rights to legitimate injustice, consequences of Human Rights violations as well as how to support victims of Human Rights violations. The symposium aims at making this connection vivid for psychologists and for society.

General summary of the Symposium. The symposium will highlight the connectedness of Human Rights and psychology. It will contribute to a better understanding and promotion of this connection both within society as well as within psychology as a professional discipline.

Press paragraph. Decolonizing Psychology: A Human Rights Issue, EFPA Board Human Rights and Psychology. In this symposium, colleagues from different parts of the globe will present different perspectives on the theme of a decolonial, multi-indigenous and inclusive psychology from a human rights perspective. Ava Thompson, PhD & Milagros Mendez Castillo, PhD: Psychology Education and Training in the Caribbean. A Perspective on Decolonization and Promoting Human Rights; Rolando Díaz –Loving, PhD: Synthesizing universal and idiosyncratic paradigms; Waikaremoana Waitoki, PhD & Simon Bennett, PhD: Indigenous psychological knowledge: Protecting culture and humanity; Polli Hagenaars, MSc: Inclusive Psychology, essential to Human Rights; Human Rights, essential for an Inclusive Psychology.

General summary of the Symposium. The theoretical framework for decolonizing knowledge production, dissemination and application has grown substantially across disciplines in the last 50 years but the explicit call for a “decolonial psychology” is a relatively recent development. This symposium integrates seminal work from psychologists as well as from other disciplines, including Thomas Teo’s (2005) classic publication, The Critique of Psychology: From Kant to Postcolonial Theory, as well as Teo’s (2018) more recent publication, Outline of Theoretical Psychology, Critical Investigations; other critical scholarship includes among others, Glenn Adams et al. (2015), Decolonizing Psychological Science, Introduction to the Special Thematic Section of the Journal of Social and Political Psychology. In this symposium, the presenters explore two major questions: 1. To what extent are historical unequal social-economic relations and colonialism reflected in contemporary methodology, epistemology and applied profession of psychology? 2. How can psychologists integrate the human rights approach with a decolonizing framework and contribute to the development of an inclusive, global discipline that serves all of humanity?
INTEGRATING PSYCHOLOGY, ETHICS AND HUMAN RIGHTS IN A GLOBALIZING WORLD: ISSUES, CHALLENGES AND RECOMMENDATIONS

Ulrich Wagner
Philipps-University (Marburg, Germany)

Janel Gauthier
Laval University (Quebec, Canada)

The discipline of psychology has a long and rich history of investigating how humans related to and treat each other. Much of the related theory emerged and matured in the latter half of the 20th century, which coincides with the emergence and proliferation of human rights as an international discourse following the adoption of the Universal Declaration of Human Rights by the UN in 1948 and the development of the very first ethics codes for psychologists. Nevertheless, psychology and human rights have developed mostly in isolation. This is also true of psychological ethics and human rights. Only recently have psychologists begun to explicitly explore psychology’s responsibilities to society regarding the promotion and protection of human rights, and to discuss how best to connect and integrate psychology, ethics and human rights to build a better world for all persons and peoples. The purpose of this presentation is two-fold: (a) to address the question of whether psychology’s responsibilities include actively promoting and protecting human rights and, if so, what this means for psychology and for psychologists who live in an ever increasingly globalizing world; and (b) to examine how psychological ethics can support human rights in psychology and help further the promotion of human rights for the benefit of humanity. The presentation will open with a brief history of the origins, development, and contemporary meaning of psychological ethics and human rights. Then, using the Universal Declaration of Ethical Principles for Psychologists (2008) and the Universal Declaration of Human Rights (UN, 1948) as the primary references, the ways in which psychological ethics and human rights complement and differ from each other will be examined. After considering the issues about connecting ethics and human rights in psychology, recommendations will be made about how they can join forces to achieve enlightened globalization.
EXCLUSION OF REFUGEES — A VICIOUS CIRCLE OF HUMAN RIGHTS VIOLATIONS AND DEVALUATING THE VICTIMS

Ulrich Wagner
Philipps-University (Marburg, Germany)

Human Rights are supposed to be valid for all people. The same holds true for the idea of equality and equal access to resources. Violations of these principles are omnipresent, in these days visible, e.g., in the rejection of refugees in different parts of the world. A relevant practical and scientific question is, how all of us, as observers of Human Rights violations, handle such contradictions between widely accepted ethical standards and everyday political conduct? An important precondition for bearing such contradictions is to split the world up into “us” and “them”. Being ascribed to an outgroup ostensibly justifies to be devaluated and to be treated unjustly in getting access to resources — a process often (miss-)used in political discourse and backed up by the well-known social-psychological process of ingroup-outgroup differentiation. Psychologists know how individuals respond to enduring injustice: They tend to devaluate the victims and declare ethical standards not relevant for outgroup members. In this way both, the political debate as well as psychological mechanisms, contribute to a vicious circle in which injustice and devaluation go hand in hand. The paper discusses political and psychological means to overcome such perpetuations and step-up against injustice and derogation.

PROMOTING HUMAN RIGHTS THROUGH GOOD PSYCHOLOGICAL SCIENCE: PREVENTION RESEARCH AS A CASE EXAMPLE

Ulrich Wagner
Philipps-University (Marburg, Germany)

Abigail H Gewirtz
University of Minnesota (Minnesota, USA)

Psychological scientists may de-emphasize a focus on human rights in favour of good science. However, this presentation takes the perspective that good psychological science advances human rights in important and tangible ways. Prevention research — i.e. research focused on the development, testing, and widespread implementation of evidence-based programs to prevent psychological disorders — provides one such example. The presentation reviews the prevention research field, its contributions within psychology and its explicit and implicit focus on human rights. A case example is provided of prevention research with families affected by traumatic stressors such as war, and other types of violence.
RIGHTING OUR OWN WRONGS: ACCOUNTABILITY AND ACTIONS FOR PSYCHOLOGISTS

Ulrich Wagner  
Philipps-University (Marburg, Germany)  
Jeanne Le Blanc  
(Vancouver, Canada)

As psychologists considering human rights, we tend to highlight concerns about actions made by those outside of our own profession. However, leadership and peers within psychology are not immune from making choices which may purposely or inadvertently negatively impact the human rights of others. It is on these occasions in which individual psychologists can choose to remain silent or to speak out against injustice. This presentation will highlight the importance and process of speaking out as an individual, and also techniques for organizing a multi-faceted response to human rights challenges within our own profession.

PSYCHOLOGY AND THE GLOBAL HUMAN RIGHTS AGENDA ON SEXUAL ORIENTATION AND GENDER IDENTITY

Ulrich Wagner  
Philipps-University (Marburg, Germany)  
Sharon Horne  
University of Massechusetts (Boston, USA)  
Eric Manalastas  
University of Sheffield (Sheffield, United Kingdom)

Sexual orientation and gender identity (SOGI) concerns are among the most recent additions to the global discourse on human rights. Although Article 2 of the 1948 Universal Declaration of Human Rights (UDHR) proclaimed that all humans are entitled to the same equal rights regardless of “race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status,” the inclusion of sexual orientation and gender identity (SOGI) as protected statuses only began to emerge in the mid-1990s and remains a dynamic, ongoing human rights project. In this presentation, we describe psychological science’s contributions to the global rights agenda on sexual orientation and gender identity through historical documents, position papers, and other official policy. First, we trace the historical stance taken in psychology and other related disciplines on same-sex sexualities and on gender diversity, and how this positioning shaped how psychologists addressed (or in some cases failed to address) gender and sexual minority rights concerns. Second, we examine how global rights entities such as the United Nations Commission on Human Rights have engaged sexual orientation and gender identity. Third, we consider a growing tension in the area of human rights and SOGI concerns – the mobilization of human rights language in the resistance to equality for LGBT+ people. We analyze how psychology, as an academic discipline, as a profession, and as an organized network of professional associations have contributed to and can help further advance the human rights agenda for lesbian, gay, bisexual, transgender, and other gender and sexual minority (LGBT+) people, despite ongoing challenges in many parts of the world. We will provide an opportunity for discussion on human rights related to SOGI concerns based on the points from our presentation.
SOCIAL AND EMOTIONAL SKILLS IN THE EDUCATIONAL CONTEXT: DEVELOPMENT AND ASSESSMENT

Tatjana Kanonire
Alena Kulikova
Ekaterina Orel
National Research University Higher School of Economics (Moscow, Russia)

Abstract body. This symposium aims to present various aspects of social and emotional skills development and assessment in the educational context. These skills drive numerous measures of social outcome including health and well-being, and there are roles for policy-makers, teachers and parents to play in improving the learning environment. During the symposium prof. Sergienko and her colleagues will present the first results of the program of social and emotional development in schools, including the study of its effectiveness. Dr Javier Suarez-Alvarez will discuss the evidence-based lessons to foster socioemotional learning. Dr Miloš Kankaraš will present the large-scale cross-cultural study of social and emotional skills which is currently been running in 11 countries, including Russia. Alena Kulikova will present the results of the longitudinal study which aims to relate social and emotional skills to the various aspects of the students’ behaviour.

Press paragraph. Children need to develop a balanced set of cognitive, social and emotional capabilities, such as perseverance, sociability and self-confidence, to face the challenges of the 21st century. These skills nowadays are a part of the curriculum in many national educational systems. The symposium “Social and emotional skills in the educational context: development and assessment” will discuss a large area of social and emotional development and assessment in educational context. Speakers from academic institutions and the Organization for Economic Co-operation and Development (OECD) will discuss these issues, focusing on scientific and policy outcomes and the increasing role of social and emotional skills in the modern education and society. The symposium would contribute to the knowledge about “what works” to enhance social and emotional learning, the efforts made to foster it, and the actions taken to measure these skills and identify promising avenues for effective social and emotional development.

General summary of the Symposium. A large body of literature finds that social and emotional skills (SES) such as perseverance, sociability and self-confidence drive numerous measures of outcomes including health and well-being. SES are malleable, and there are roles for policy-makers, teachers and parents to play in improving the learning environment. Key objectives of this symposium are to reveal the best practices in the field of development and assessment of the SES. In the development section prof. Sergienko and colleagues will present the Russian programme of social and emotional development for children from 4 to 17 y.o. which is currently being run in Russian schools. Dr Javier Suarez-Alvarez will describe a wide range of social and emotional learning programmes to illustrate the variety of strategies in fostering the development of SES with a strong focus on what has proven to work well, what are the main challenges, and what are the lessons learnt. Dr Miloš Kankaraš in the assessment section will present the first results of the large-scale cross-cultural pilot study of SES in schools which has been running across 11 countries (including Russia) in 2018. He will describe the measurement properties of 19 SES scales, will present how student’s SES differ across various socio-demographic groups, and between the two cohorts (10 and 15 years old), and will examine relationships between SES and various environmental factors that might influence their development. And finally, Alena Kulikova and colleagues will discuss the relationships between inattention and hyperactivity at the beginning of the primary school and the level of SES at the end
The increasing number of studies and programs on the social and emotional skills (SES) development in schools shows their importance for the students’ wellbeing and future outcomes (see, for example, Poropat, 2009). The purpose of this study is to explore the relationships between students’ behavioral problems such as inattention and hyperactivity at the beginning of the primary school and the level of SES (task achievement, cooperation and emotional control) at the end of the primary school. The unique longitudinal data were collected for 1164 students (50% girls) in 2015 when they were in 1st grade of school, in 2017 — the 3rd grade and in 2018 — the 4th grade, the end of primary school, in Moscow, Russia. Behavioral questionnaire was developed as an ADHD check-list for the teachers. SES were measured using self-reports from students, the questionnaire was developed as a monitoring instrument for schools to assess SES (Orel, Kulikova, 2018). The results show the negative correlation between inattention and all SES. Though the associations between hyperactivity and SES are very low or even insignificant (for example, for emotional control). This is unexpected result and possible explanations will be presented as well as more detailed picture of the connection between behavioral indicators and social and emotional skills.
In this work we will present initial results of a pilot study in which we were assessing 19 social and emotional skills of 10- and 15-year-old students. The pilot study is conducted in 11 cities and countries around the world as a preparation for the main study that will be conducted in October and November 2019 in all 11 participants. There were 500 students per cohort per city/country, thus around 11000 students in both cohorts across all participating cities and countries. Students’s social and emotional skills are assessed through three different sources: using students’ own self-reports on their typical behaviours, thoughts and feelings, then their parent’s reports, and reports of a teacher that knew these students best. Apart from the assessment of students social and emotional skills, the study collected a range of contextual information about home, school and peer environments in which students live through comprehensive set of questionnaires administered to students themselves, their parents, teachers and school principals. We present four set of results. We first describe item and scale-level descriptive statistics and measurement properties of 19 scales from three different informants. Then we present how students’s social and emotional skills differ across various socio-demographic groups, and between the two cohorts. We then examine relationships between social and emotional skills and various factors in their family, peer and school environment that might influence their development. Some of these factors are quality and quantity of their relationships with parents, teachers or classmates, teacher pedagogies, school assessment practices, etc. Finally, we examine the associations of students social and emotional skills with a wide set of life outcomes, such as educational achievement, social connectedness, health, personal well-being. We conclude the work with discussion of presented results, their congruence with previous empirical findings and their relevance and possible implications for a range of policy issues.
RUSSIAN PROGRAM OF SOCIAL-EMOTIONAL DEVELOPMENT FOR CHILDREN 4-17 YEARS

Tatjana Kanonire  
National Research University Higher School of Economics (Moscow, Russia)

Elena Sergienko  
Evgenia Lebedeva  
Anna Ulanova  
Institute of Psychology Russian Academy of Sciences (Moscow, Russia)

Around the world, social-emotional learning programs are widespread and implemented in education. They are aimed at developing the non-cognitive skills of children who have a universal impact on various aspects of mental development and achievement. In the Russian education at the present time, the programs of social-emotional learning have not received their development and implementation in the educational process. The features of our program are that it is an integration of the model of emotional intelligence and the Theory of Mind as abilities to understand the social world, and includes the best achievements of Russian science in developmental psychology. Sections of the program cover the main social and emotional abilities of children and adolescents, whose development constitutes social competence and improvement of relations among peers and family. The program consists of 5 sections: 1. “The perception and understanding of emotions” aimed at recognition and understanding of emotions; 2. “Understanding Mental States” aimed at developing abilities to understand hidden mental states and use them to predict other people’s own behavior; 3. “Understanding False Belief” developing the perception false belief; 4. “Understanding the Moral Aspects of Behavior,” aimed at prosocial behavior and understanding of moral and ethical norms and rules; 5. “Social interaction” developing social and communication skills, social competence. The number of classes in each section varies depending on the age of the children. Approbation of programs for children of preschool and primary school showed that from 74 to 100% of children demonstrate positive dynamics in social and emotional skills based on the results of a survey of teachers and parents, as well as testing (compared to the experimental and control groups). Comparison with the control group and taking into account age-related changes showed an improvement in social and emotional skills. The first experience of testing the program demonstrates its effectiveness and the possibility of introducing it into the educational process, contributes to the child’s self-development and changes in the educational environment.
PROMISING INTERVENTION PRACTICES IN FOSTERING SOCIAL AND EMOTIONAL SKILLS IN STUDENTS

Tatjana Kanonire  
National Research University Higher School of Economics (Moscow, Russia)

Javier Suarez-Alvarez  
Directorate for Education and Skills, OECD (Paris, France)

The development of social and emotional skills together with well-being have gathered significant support worldwide in the last years. Despite the increasing empirical evidence on the factors associated with the development of social and emotional skills, there is still limited knowledge of how to apply this evidence. The educational context and the degree of involvement of various local, regional, and national actors might affect the nature of these intervention programmes and their characteristics. It is common to find specific programmes in the existing literature, originally created with an end date, while others are intended to be administered on a regular basis, although oftentimes there is no long-term evidence yet due to the relative novelty of these interventions. The different nature of these interventions can lead to many types of programmes and outcomes. The aim of this work is to collect evidence-based lessons to foster socioemotional learning as case studies. We collected information around intervention programmes but also on policy and practice like pedagogies, learning environments, and the work organisations in the school. We will describe a wide range of different intervention programmes as a first attempt to illustrate the variety of strategies in fostering the development of social and emotional skills. The evidence presented will have a strong focus on multiple actors and educational levels on what has proven to work well, what are the main challenges, and what are the lessons learnt. We will conclude discussing how the information collected can serve as the groundwork for the future analysis of policy interventions and nurture the discussion on how to assist researchers, educators, and policymakers in fostering social and emotional skills in students.
THE COGNITIVE NEUROSCIENCE OF SPATIAL ORIENTING

Joseph MacInnes  
National Research University Higher School of Economics (Moscow, Russia)

Raymond Klein  
Dalhousie University (Halifax, Canada)

Alexia Bourgeois  
University of Geneva (Geneva, Switzerland)

James Bisley  
University of California Los Angeles (Los Angeles, USA)

Abstract body. The symposium “The Cognitive Neuroscience of Spatial Orienting” will cover interdisciplinary approaches to the question of spatial orienting with a nod towards seminal work on the orienting reflex by Russia’s Evgeny Sokolov. Orienting to a location in space allows priority processing of information at that location, and is one method by which humans may select specific information from our surroundings. The speakers of this symposium will present their latest work on spatial orienting using a broad selection of methodologies in cognitive neuroscience. These will include behavioural experiments, computational models, cognitive neuropsychology, neuroimaging, TMS and animal neurophysiology.

Press paragraph. Human cognition can be imagined as the system by which we process information from the world around us. By that approach, spatial orienting is one mechanism by which humans may select information for priority processing. Although William James (1890) described passive and active attention and Evgeny Sokolov (1960) discussed an orienting reflex, our current understanding owes much to the development of a model task for exploring spatial attention by Posner (1980). Cognitive neuroscience has offered a diversity of approaches to studying this mechanism including behavioural experiments, computational models, cognitive neuropsychology, neuroimaging, TMS and animal neurophysiology. This symposium will approach a common topic from a diversity of current methods from computational and cognitive neuroscience to discuss whether converging evidence has led to a common understanding in spatial orienting.

General summary of the Symposium. This symposium intends to establish common theoretical ground on spatial orienting through a diversity of methods. We will discuss questions such as whether existing dichotomies of attention (endogenous/exogenous) are correct or useful, the degree to which ‘reflexive’ attentional capture can still be considered automatic, and the role of the oculomotor system in various attentional results. Joseph MacInnes will introduce the symposium and discuss these questions from the perspective of computational modelling. He will contrast two models of orienting — drift diffusion and deep learning neural networks — with an emphasis on what each adds to our understanding of the underlying cognitive and neural mechanisms of spatial attention. The discovery of an inhibitory aftermath of orienting that some have identified as “habituation of the orienting reflex” will be described by Klein. From a variety of behavioral and EEG evidence Klein will assert that there are two different forms of inhibitory aftereffect, an input form that operates on a salience map and an output form that operates on a priority map. Bisley will present cutting edge work in which monkeys were trained to perform a visual foraging task while the activity of single neurons in two visuo-motor regions was recorded. Bisley’s work suggests that the lateral intraparietal cortex functions as a priority map where the output form of inhibition is represented and that some neurons in the frontal eye fields might be the source of this inhibition. Bourgeois will describe a series of experiments in which stimuli that
become associated with reward are shown to have a special significance for attentional mechanisms even when they are no longer relevant. Her participants include normal individuals and patients suffering from unilateral neglect. Ray Klein will finish as the symposium discussant to give an overview of just how far we have come in recent years, and suggest some of the key remaining problems.

DIFFUSION AND SALIENCE MODELS OF ORIENTING: COMPARISONS, CONTRASTS AND COMBINATIONS

Joseph Macinnes
National Research University Higher School of Economics (Moscow, Russia)

Computational models of attention allow us to instantiate theories in ways that can be directly tested by experiment data. Salience and diffusion models use very different approaches, but they have each made significant contributions to our understanding of attention and orienting. Salience models predict shifts of overt attention based on bottom up features of visual input, and have been implemented with feature integration (Judd et al, 2009) and deep convolutional networks (Kümmerer et al, 2017). Diffusion models, meanwhile, mimic the neural accumulation of evidence toward a perceptual decision, and their strength lies in how the models parameters inform us of underlying cognitive mechanisms (MacInnes, 2017). I will give two recent examples of how these models generate distributions of reaction times and error estimates for covert and overt shifts of attention. A new temporal onset diffusion model will then be used to demonstrate how the timing (early/late) or impact (bias/drift rate) can be used to distinguish various theories of cued facilitation. This model is a full simulation of human participants in a classic attention experiment, and begins with the same visual input and display changes over time. The model builds a salience map based on low level image features and uses peak salience and salience changes over time to inform accumulation in the drift diffusion. We compare multiple versions of the model against 20 participants in a standard cuing paradigm with forced choice discrimination responses to determine when and how responses are impacted by a non-informative exogenous cue. While reaction time distributions fit multiple theories of attention, patterns of errors and anticipations suggest that the cue increases the rate of information accrual at the validly cued location.
DISTINGUISHING INHIBITORY AFTEREFFECTS OF ORIENTING WITH BEHAVIORAL AND NEUROSCIENTIFIC METHODS

Joseph Macinnes  
National Research University Higher School of Economics (Moscow, Russia)  
Raymond Klein  
Dalhousie University (Halifax, Canada)

Since its independent discovery by Posner and Berlucchi in the early 1980s an inhibitory aftermath of orienting has fascinated scholars, at least in part because of the proposal that by fostering novelty seeking it might function as a foraging facilitator. Yet, there were early hints that this phenomenon, called “inhibition of return,” might have multiple natures. After reviewing this early evidence, I will describe recent research from my laboratory using behavioral and electroencephalographic methods that point to at least two inhibitory aftereffects of orienting. One of these operates early in processing to reduce input strength in a salience map while the other operates later in processing to bias output options in a priority map. Our studies also demonstrate that the key to which of these forms of inhibition would be elicited depends on the activation state of the reflexive oculomotor system: The input form is elicited when this system is suppressed; otherwise the output form is elicited. Both forms can facilitate foraging by encouraging orienting to novel locations.

INHIBITORY TAGGING IN CORTICAL PRIORITY MAPS AND A TAGGING SIGNAL IN THE FRONTAL EYE FIELDS

Joseph Macinnes  
National University Higher School of Economics  
Researcher (Moscow, Russia)  
James Bisley  
Koorosh Mirpour  
University of California Los Angeles (Los Angeles, USA)

When searching a visual scene for a target, we tend not to look at items or locations we have looked at before. It is thought that this behavior is driven by an inhibitory tagging mechanism, often called inhibition of return, which inhibits responses on priority maps to the relevant items. The aim of this set of studies was to see whether neurons in cortical priority maps show such inhibitory tagging and to identify the possible source of this inhibition. We recorded from more than 200 neurons in the lateral intraparietal area (LIP) and frontal eye field (FEF) of 4 animals performing a visual foraging task, in which they had to find a reward linked to one of five identical targets (Ts) among five distractors. Neurons in LIP and most neurons in FEF had properties consistent with the representation of priority: responses to potential targets were greater than responses to distractors and responses to Ts that had been fixated earlier in the trial were reduced. Thus, neurons in both cortical areas showed a neural instantiation of inhibitory tagging. In addition, we identified a subset of neurons in FEF with activity that was significantly greater to a previously fixated T in their receptive field than to an unseen T. These neurons displayed a number of additional response features that were unlike the remaining FEF population: the activity was not suppressed during maintained fixation, was updated via a remapping mechanism and was minimally affected by saccade direction. These differences suggest that these neurons may be a functionally unique subset of FEF neurons. We propose that these neurons track items that have been looked at within the trial and that this tagging signal is propagated by remapping. Together, our results show that neurons in LIP and most neurons in FEF behave as predicted by priority map models. In addition, we found a novel subset of neurons in FEF that may be the source of the inhibitory tagging signal seen in both areas.
Recent studies suggest that motivational stimuli such as rewards could be a powerful determinant of attentional selection, both in healthy subjects and in brain-damaged patients suffering from neglect (Bourgeois, Chelazzi, & Vuilleumier, 2016 for a review). However, the exact mechanisms underlying this processing in the human brain are still poorly known. We developed experiments based on a visual search task in order to better understand how value-based attentional priority could modulate spatial orienting, and where within the cognitive system the signal providing attentional priority is generated. Our results in healthy subjects demonstrated that visual stimuli previously associated with a high monetary reward received higher attentional priority in a subsequent visual search task (Bourgeois, Neveu, Bayle, & Vuilleumier, 2017). Interestingly, we replicated these results in naturalistic and ecological conditions (Bourgeois, Badier, Baron, Carruzzo, Vuilleumier, in press). Using a 3D CAVE immersive platform for Virtual Reality, we demonstrated that reward-associated locations produce automatic biases in eye-movements, favoring search in the side of space where previous targets where highly rewarded relative to the less rewarded side. Value-driven attentional capture was also observed in brain-damaged patients suffering from neglect (Bourgeois, Saj, & Vuilleumier, 2018). The learned reward value of distractors interfered with spatial reorienting toward the left (neglected) side of neglect patients, presumably by competing with top-down mechanisms controlling exogenous spatial attention. Thus, attentional selection might be counteracted by reward information, independently of conscious control. The anatomical analysis of lesions in neglect patients indicated that the attentional capture, induced by previously rewarded stimuli presented as distractors in a subsequent phase, involved mainly the right angular gyrus. Reward signals may thus bias neural activity within key nodes of attentional network, through a common priority map integrating several different top-down influences. All together, these results offer interesting perspectives to explicitly link attentional orienting and motivational signals within current models of attention. They also open new perspectives that may usefully be exploited for neurological rehabilitation strategies in patients suffering from attentional disorders such as neglect patients.
SOCIAL CAPITAL IN THE CONDITIONS OF DIGITAL TRANSFORMATION AND ETHNIC DIVERSITY OF RUSSIAN SOCIETY

Alexander Tatarko
National Research University Higher School of Economics (Moscow, Russia)

Timofey Nestik
Maria Gagarina
Institute of psychology, Russian Academy of Sciences (Moscow, Russia)

Dmitriii Dubrov
Olga Abramova
National University Higher School of Economics Researcher (Moscow, Russia)

Abstract body. The present symposium (heads: A. Tatarko & T. Nestik) will focus on the different aspects of social capital in the conditions of digital transformation and taking into account intercultural relations in Russia. Social capital is one of the most important catalysts for the progress. Social capital affects the performance of individuals, groups and the whole society. In addition, it contributes to the economic development of the society, as well as to the health and well-being of members of the society. In this regard, it is important for us to understand both the psychological mechanisms of the influence of social capital on our behavior and the impact of changes in society on social capital. Digitalization of Russia and active migration can be considered as phenomena that strongly affect the life of our society and, accordingly, social capital. During the presentations at our Symposium, we are planning to discuss the mentioned above issues. Papers to be presented during the Symposium: 1. A. Tatarko, K. Choi, J. Berry “Social capital, Acculturation attitudes, and Sociocultural adaptation of Migrants from Central Asia and South Korea” 2. T. Nestik “Social Trust and Attitudes toward the introduction of artificial intelligence into everyday life”. 3. D. Dubrov “Generalized Trust as a Factor of Positive Attitude of Muscovites towards Cultural Diversity”. 4. M. Gagarina, T. Nestik, T. Drobysheva “Social and psychological Factors determining youth’s attitudes to cryptocurrency”. 5. O. Abramova, A. Tatarko Organizational culture and proactive behavior: on the example of educational organization”

General summary of the Symposium. Social capital is one of the most important catalysts for the progress (Putnam, 2001; Fukuyama, 2002). In this regard, it is important for us to understand both the psychological mechanisms of the influence of social capital on our behavior and the impact of changes in society on social capital. At this stage of the digitalization of society, the Internet is increasingly affecting the lives of people. Currently the Internet penetration rate in Russia is over 70% among the population over 16 years old. Among the younger generation, the percentage of Internet users reached the limit a few years ago, so now the audience growth is mainly due to older people (GfK study, 2017). Thus, digitalization actually covers almost the entire Russian society. And it is very important to
keep in mind that now the Internet is becoming not just a new way of interaction, but also a unique institution of socialization with great potential, but at the same time with significant risks (Naseri, 2017). According to UN estimates for 2017, the Russian Federation is the world’s third-leading country in terms of the number of immigrants (11+ million), after the US and Germany. Between 2003 and 2007, Russia experienced steady economic growth, which brought an increased inflow of cheap labor from Central Asian countries. In terms of the immigrants’ countries of origin, the states of the former Soviet Union account for most of the inflow (in 2009, their overall share was as high as 74%), with the relative contribution of Central Asian countries continuously on the rise (Vishnevskiy, 2011). This diversity brings about problems of intercultural relations, mutual acculturation and adaptation among different types of migrants, ethnocultural groups and the larger society. Digitalization of Russian society and active migration can be considered as phenomena that strongly affect the life of our society and, accordingly, social capital. On our Symposium, we are planning to discuss the mentioned above issues.
This study examines the relationship of social capital with the acculturation attitudes and sociocultural adaptation of migrants. We have built a model that relates two types of social capital among migrants (bridging and bonding social capital) with their acculturation attitudes and their sociocultural adaptation. The sample included 122 migrants from Central Asian republics of the former USSR (Uzbekistan, Tajikistan, Turkmenistan, Kyrgyzstan, and Kazakhstan, the so called "near abroad") and 136 migrants from South Korea (the so called "far abroad"). As found in the review of the literature, the social capital of migrants is associated with their adaptation. At the same time, their adaptation is associated with the acculturation attitudes of migrants, which are also related to their bridging and bonding social capital. Accordingly, this gives rise to the first question of the study: Which is primary: the acculturation attitudes of migrants or their social capital? To answer this question, we compared two alternative structural models. The second question is to what extent the structural model of relationships between social capital, acculturation attitudes, and sociocultural adaptation is similar for migrants from the near and far abroad, who have different levels of knowledge of the culture in their host country (that is, their 'cultural distance')? The questionnaire included scales for assessing: acculturation attitudes; individual social capital (bridging and bonding); the sociocultural adaptation of migrants. Using structural equation modelling, we built an invariant structural model. These models indicate that the acculturation attitudes are dependent on the social capital of migrants, rather than the other way around. We found that bridging social capital turned out to be more important for sociocultural adaptation. It can be related to sociocultural adaptation both directly (in migrants from the far abroad) and indirectly through the integration attitude (in migrants from the near abroad). The migrants from the near and far abroad have different relationships of their bridging social capital and bonding social capital with their acculturation attitudes. We identify the similarities and differences in the relationship of social capital with acculturation attitudes and the sociocultural adaptation demonstrated by these two groups of migrants.
SOCIAL TRUST AND ATTITUDES TOWARD THE INTRODUCTION OF ARTIFICIAL INTELLIGENCE INTO EVERYDAY LIFE

Alexander Tatarko  
National Research University Higher School of Economics (Moscow, Russia)

T. A. Nestik  
Institute of psychology, Russian Academy of Sciences (Moscow, Russia)

The review of contemporary research on the attitudes toward artificial intelligence (AI) is given, antecedents of human confidence in AI and robots are analyzed. The results of a series of empirical studies (N = 526, N = 129, N = 293) are presented, that were devoted to the socio-psychological predictors of Russian adults' attitudes toward the introduction of AI systems into everyday life. Different psychological types of AI technologies (“cyborgization technologies” and "smart city technologies”) are identified, which are influenced by different psychological factors. It is shown that the perceived threats of AI are associated not so much with the reliability and predictability of the technology as with its use by the state and other people. At the same time, fears that artificial intelligence will get out of control and subjugate people are more typical for those who are ready to use AI technologies, believes in its rapid development and benefit to society. It is shown that the estimation of the technologies of specialized AI and their possible influence on society directly depends on the person’s level of social trust. It was found that the willingness to interact with the general AI as a partner that has consciousness and emotions requires a combination of techno-optimism with social optimism, with confidence in social institutions and other people. Support for the using of AI to improve the effectiveness of social institutions was not associated with prosocial and collectivist attitudes, but with an emphasis on personal success and a low value of safety. Perspectives of further research are proposed.
SOCIAL AND PSYCHOLOGICAL FACTORS DETERMINING YOUTH’S ATTITUDES TO CRYPTOCURRENCY

Alexander Tatarko  
National Research University Higher School of Economics (Moscow, Russia)

Maria Gagarina  
Timofey Nestik  
Tatyana Drobysheva  
Russian Academy of Sciences (Moscow, Russia)

The relevance of the study is explained by the fact that socio-psychological determinants of attitudes toward cryptocurrencies are not revealed. The objectives of the study were to verify “Attitudes toward cryptocurrencies questionnaire” and identify factors of attitudes toward Bitcoin. Bitcoin was chosen because of relative reliability and predictability compared to other cryptocurrencies (Ammous, 2018). Sample: 262 participants; aged 17 to 33; males 45%. The choice of respondents was based on research by Bohr et al., (2014). Methods: associations, “Value Scale”, “The Moral Foundations Questionnaire” by J. Haidt; Money Beliefs and Behaviors Scale by A. Furnham; The Baseline Confidence Scale of L. Haff and L. Kelly. Confirmatory factor analysis proved three-factor structure of the questionnaire. A nuclear-peripheral structure of social representations about Bitcoin was formed on the basis of P. Vergès analysis of associations. A linear regression analysis showed that beliefs in the potential of cryptocurrency as a payment instrument (R = 0.611; R² = 0.373; F = 21.629 with p <0.001) is directly related to people-centered care, value of freedom and inversely related to sanctity; associated positively with confidence in the financial system and negatively in the government. Age and gender are also matter. Worries about the introduction of cryptocurrency are directly related to (R = 0.567; R² = 0.321; F = 14.972 with p <0.001) a negative attitude to money, the value of self-confidence, age, confidence in financial system and government and negatively related to trust in people and money anxiety. Willingness to use cryptocurrency in perspective directly depends on (R = 0.507; R² = 0.257; F = 17.676 with p <0.001) trust in money power, orientation towards independence in actions, age, gender and is indirectly depends on trust in the government. The data states that the intention to use cryptocurrency is directly related to the desire for financial autonomy and distrust to social institutions.
GENERALIZED TRUST AS A FACTOR OF POSITIVE ATTITUDE OF MUSCOVITES TOWARDS CULTURAL DIVERSITY

Alexander Tatarko  
National Research University Higher School of Economics (Moscow, Russia)

The report is devoted to the study of the role of generalized trust for intercultural relations in Moscow. An empirical study (N=219) showed that the length of residence in Moscow is negatively associated with a positive attitude towards ethnic diversity. However, the generalized trust neutralizes this association, making it insignificant. That means that in case of high level of generalized trust, the attitude towards cultural diversity does not depend on the length of residence in Moscow. Thus, generalized trust is an individual characteristic of a person, which, interacting with his/her experience, is able to neutralize the negative consequences of negative experience and increase the positive attitude of Muscovites towards cultural diversity. The obtained results can be explained by the fact that trust makes the boundaries between different cultural groups living in the same multicultural environment (Moscow) more pervious. This is based on the principle of social de-categorization, which implies the perception of other individuals just as individuals, regardless of their belonging to any group. That is, if an individual trusts other people, it does not matter to him/her what category other individuals belong to.

ORGANIZATIONAL CULTURE AND PROACTIVE BEHAVIOR: ON THE EXAMPLE OF EDUCATIONAL ORGANIZATION

Alexander Tatarko  
Olga Abramova  
National Research University Higher School of Economics (Moscow, Russia)

Proactive behavior in recent years has received a new wave of close attention in research and is regarded as an important component of a successful life strategy in an organization. Students’ proactivity is a predictor of their success in the future, therefore conditions in educational institutions that increase their proactivity is an important task of education. In our study, using different faculties of Higher School of Economics, we looked at three types of organizational culture: bureaucratic, supportive, and innovative, and determined through which mediators organizational culture affects perceived proactive personal behavior and proactive behavior at the group level. The study involved 120 HSE students. Data was collected online. We assumed that important mediators of the relationship between organizational culture and students’ proactivity are perceived autonomy, trust in the organization, satisfaction with university studies, and innovation self-efficacy. The analysis of the proposed mediation model confirmed the hypotheses about the positive mediation connection between the supportive and innovative culture and perceived proactivity at the individual and group level through autonomy, trust, satisfaction, and innovation self-efficacy. A negative impact was revealed between the bureaucratic organizational culture and the pro-activity of students through the same mediators. Thus, this study added an understanding of what tools needed to stimulate the most effective behavior of students for their further success — proactive behavior. Creating an innovative and supportive organization culture with a high level of autonomy in decision making, high levels of trust, job satisfaction, and innovation self-efficacy leads students to choose a proactive pattern of behavior in learning activities. And the elements of bureaucracy and hierarchy in the organizational culture lower the personality’s proactivity and affect negatively proactive behavior in the group.
HEALTH PSYCHOLOGY AND PSYCHOTHERAPY

Abstract body. Health Psychology and Psychotherapy as practical areas both aim to improve an individual’s well-being and mental health. The variety of the professional tasks for psychologists and psychotherapists includes: helping a person in going through crises, changing beliefs, compulsions, thoughts, emotions, problem or risk behavior and overcoming problems in desired ways. Health Psychology as scientific and evidence-based discipline could bring into Psychotherapy the knowledge about effective psychological technologies and instruments. At the same time Psychotherapy as a discipline based on close emotional relationships between therapist and client could emphasize the importance of promoting non-hierarchical approaches in dealing with individual and public health problems.

Press paragraph. Health Psychology is one of the most intensively growing area of psychology as a science and practice in the world. Psychotherapy as a medical and psychological practice plays important role in dealing with a wide spectrum of psychological conditions and behavioral disorders which influence significantly on human’s health and wellbeing. There are serious scientific and applied challenges existed in area of Health Psychology and Psychotherapy which require a lot of attention and the ways of solution at the national and international levels. The presentations at the symposium will be focused on the modern theoretical and practical approaches in dealing with urgent psychological issues in professional practice and society including the promotion of non-hierarchical strategies in overcoming individual and public health problems.

General summary of the Symposium. The presenters of the symposium – experienced experts in research and practice working in Health Psychology and Psychotherapy will share their thoughts and data on the important questions related to individual and public health. Dr. Shaboltas from St.Petersburg State University will provide a brief overview of the almost 15 years experience of developing and evaluating HIV prevention intervention programs in St.Petersburg for different target populations which were based on Psychological Conception proposed by author in order to incorporate subject-sublect and ecological approaches in cognitive behavioral technologies. Prof. Michail Reshetnikov will provide the overview of traditional views on the relationship between mental activity and the brain activity and present the hypothesis of brain as the biological interface, which was suggested by him in 2008. He will summarize the approaches to research of the psyche in the areas of physiology, psychology, psychotherapy and psychiatry sed, and will analyze their implications to therapy of patients with mental disorders. Dr. Alexandre Nepomiacht will share his more than 30 years experience in psychoanalytial practice and teaching of psychoanalysis in Russia. Particularly, the issues of conducting personal analysis with russian patients and it’s specific in comparison with french patients such as specifics of supervision, russian spiritual tradition and attitudes towards sexs and money
will be presented. Prof. Tkhostov, the Chair of the Neuropsychology and Clinical Psychology Division from Moscow State University will present the critical analysis on the current situation in psychotherapy practice in Russia focusing on the challenges in professional education and regulation and the potential ways of the resolution. Prof. Kholmogorova will present the data on the prevalence of symptoms of depression and anxiety among Russian students. The factors of these symptoms are considered. The crisis in the education system is analyzed on the basis of international data on the mental health of students in different countries. Targets of psychological assistance and psychotherapy are formulated. Prof. Natalya Sirota and Prof. Vladimir Yaltonsky will emphasize the importance of developing and implementing psychological interventions in fighting with the different types of addiction as inadequate recurring patterns in behavior using psychoactive substances, overeating and other types of behavior (gambling, gaming, Internet). Applying cognitive behavioral approach the authors will share their long term experience of developing prevention programs based on positive features, abilities of children, youth to expansion positive potential of growth, that allows to develop resistance to adversity. The programs of prevention of dependence and HIV infection were developed and introduced in Russia under the direction of authors within this approach.
PSYCHOLOGICAL CONCEPTION OF EFFECTIVE HIV PREVENTION INTERVENTION

Alla Shaboltsa
Saint-Petersburg State University (Saint-Petersburg, Russia)

HIV epidemic in Russia remains as a serious public health problem for more than 20 years. Despite the successes of antiretroviral therapy in HIV treatment the prevalence and incidence rates in general populations increase due to high levels of risk behaviors, especially in youth and adolescence. The objective of the presented work was to develop and to verify in a course of the longitudinal cohort studies the Psychological Conception and HIV prevention psychological technologies based on subject-subject and ecological approaches. The behavioral interventions developed for the main target groups — injection drug users, youth and adult populations were focused on three levels of HIV prevention — individual, group and community. The major research interests were focused on the effectiveness of the proposed HIV prevention interventions, specifically on the risk behaviors associated with HIV transmission and the dynamic of these behaviors in the participants of experimental and control groups. Since 2002-2015 several behavioral interventions based on Psychological Conception which used the cognitive behavioral technologies and the strategy of active prevention intervention were developed and evaluated in a course of international longitudinal studies in St.Petersburg, Russia in different populations using subjective (psychological) and objective (biological) markers. The results demonstrated the effectiveness of developed behavioral HIV prevention technologies in all target groups and provided the empirical verification of the proposed Conception in changing HIV risk behaviors. The level of effectiveness associated significantly with the individualized approach and close personal relationships between specialists and participants in conducting HIV prevention efforts which led to the considering effective HIV prevention rather as the process of subject-to-subject relationships. The presentation will include the description and specific results of evaluation and implementation in real practice of social and medical services developed and tested HIV prevention programs such as brief individual counselling, individualized case management, group trainings and community programs.
NON-MATERIAL THEORY OF THE PSYCHE: HISTORICAL PREREQUISITES, ARGUMENTATION AND PRACTICAL IMPLICATIONS

Michail Reshetnikov
The East-European Psychoanalytic Institute (Saint-Petersburg, Russia)

In this paper, traditional views on the relationship between mental activity and the brain activity are reviewed, and the hypothesis of brain as the biological interface, which was suggested by the author in 2008, is developed. Approaches to research of the psyche in the areas of physiology, psychology, psychotherapy and psychiatry are summarised, and their implications to therapy of patients with mental disorders are analysed. Two models of mental disorders are suggested, which are based on clearer differentiation of organic (the brain-related) pathology and mental disorders as such, which result from informational non-material influence on the psyche as the informational system rather than on the brain. Difference between nervous and psychic functioning of the organism and the personality is outlined; mental activity is viewed as an acquired programmed function, which is formed in a social informational environment. The question of aim of psychopharmacological influence is raised, as well as a number of other questions, which do not have unambiguous answers. The author substantiates the theory of the brain as the biological interface and outlines its historical prerequisites in the literature.
The report provides data on the prevalence of symptoms of depression and anxiety among Russian adolescents and students collected during a population-based study in various educational institutions of Moscow using the Children's Depression Scale (CDI). More than 1,000 adolescents 11–16 years old from gymnasiums, secondary schools, orphanages, and shelters in Moscow and the Moscow Region took part in the study. The high-risk group with pronounced symptoms of depression was the largest among gymnasium students (about 25%), in second place were children from orphanages (about 20%), and the risk group among children from secondary schools was about 10%. The research data of university students also indicate the severity of emotional distress in the sample studied. High rates of social anxiety had 20%, 35%—show symptoms of depression in self-reporting, and 18% report symptoms of moderate and severe depression. These studies indicate a fairly high risk of suicidal risk: 28% of students report the presence of suicidal thoughts in their self-reports, 4% report that they are ready to commit suicide. Students who have had suicidal attempts in the past and who practice self-harming behavior constitute 6% of the sample and are characterized by high rates of social anxiety. Based on the multifactor psychosocial model of affective spectrum disorders, the macrosocial, familial, personality and interpersonal factors of symptoms of depression and anxiety are considered. As an important macrosocial factor, the crisis in the education system is analyzed on the basis of international data on the mental health of students in different countries.

Another important factor contributing to the growth of social anxiety among the younger generation in the modern information society is the imbalance of direct communication off-line and virtual communication on-line. The data obtained with the support of the Russian Science Foundation convincingly showed that adolescents and young people who prefer on-line communication are distinguished by higher rates of social anxiety and lower levels of mentalization and empathy. Targets of psychological assistance and psychotherapy are formulated. The report substantiates the need for epidemiological research in Russia and stresses the need to organize effective mental health services for the younger generation.
The relevance of the problem of addictions as inadequate recurring patterns in behavior using psychoactive substances, overeating and other types of behavior (gambling, gaming, Internet) continues to increase in the 21 century, and the structure of addictions is drastically changing. The emergence of new psychoactive substances has expanded the range of chemical dependence significantly. Rapidly spreading such behavioral disorders as problematic behavior and gambling addiction, video games, socially acceptable technological dependencies and eating disorders. The commonality of etiology, pathogenesis and multiplicity of specific manifestations contribute to frequent combination of two and more chemical, eating, behavioral addictions in one person, formation of comorbidity of addictions. Relapse rates increase, effectiveness of treatment and rehabilitation of co-occurrence addictions significantly decrease by complicated comorbidity due to inclusion of mental (depression, schizophrenia) and somatic disorders (HIV infection). The objectives of the years of research are: 1) the development of theoretical approach for addictions treatment based on integration of the Transtheoretical Model of Intentional Behavior Change (TTM) J.Prochaska, C. Dicllente, motivational interviewing (MI) W.Miller, cognitive-behavioral psychotherapy (CBT) K.M.Carroll; 2) the development of universal programs of prevention for children, youth and young people, based on the idea of positive development of young people R.F.Catalano approach. TTM allows to personalize stages of changes, formulate objectives of therapy for each stage. Theoretical analysis of leading systems in psychotherapy afforded to emphasize the most effective experiential and behavioral processes of changes, increased self-esteem, self and environment re-evaluation etc. MI allows to engage a patient in the process of treatment, hold him in it. CBT is aimed to correction of distorted thinking, building skills of coping with addictions (coping with craving, affective disorders, problem solving and etc.). Applying the prevention approach of positive evolution of youngsters is aimed to develop positive features, abilities of children, youth to expansion positive potential of growth, that allows to develop resistance to adversity. The programs of prevention of dependence and HIV infection were developed and introduced in Russia under the direction of authors within this approach: for children 7-9 years — “Ship”, 12-13 — “Alive water”, 15-17 — “Fulcrum”, 14-17 — “Rook.”
IDENTITY AS A MENTAL HEALTH RESOURCE

At any given moment, an integrated identity of a person ensures his or her flexibility and efficiency when the person copes with life challenges. Identity generation takes place when the person implements his/her own life scenario with an aim to achieve his/her own goals and meet his/her own needs. The identity relies on values subjectively perceived as significant, a nature of which is bygone instead of known. The dissociated identity appears in case of a lack of psychological resources and under the influence of extremely stressful factors. An objective of psychological counselling is to preserve the customer’s identity or develop a new identity if circumstances have changed.

CHARCOT, HYPNOSIS AND FREUD — THE BEGINNING OF PSYCHOANALYSIS

On the way to new discoveries in psychology Z.Freud about 10 years did hypnosis. Trying to understand the hypnotic phenomena, he opened a new page in the history of psychology based on the experience of famous scientists and doctors. In 1885 Z.Freud went to study to Salpetrier (Paris) to the great French neurologist, the founder of clinical neurology Jean-Martin Charcot. Research of J. Charcot in medicine – neurology and psychiatry, had a strong impact on Z.Freud and in Salpetriere he began his research on hysteria. The author explains in the report the main facts that were at the beginning of psychoanalysis.

DEVIATIONS OF BEHAVIOR IN ADOLESCENTS AND DEPRIVATION EXPERIENCE

The results of the study of behavioral deviations in adolescents-students of social protection institutions are presented. In the context of the analysis of tolerant / intolerant behavior, knowledge of the nature of the traumatic events experienced in conditions of deprivation of experience, the vulnerable positions of the child’s psyche, which under conditions of chronic stress and adverse external influences can become prerequisites for the emergence of socio-psychological maladjustment, becomes very important. It is concluded that it is necessary to create a differentiated program of psychosomatherapeutic assistance to this contingent, taking into account membership in a group – orphans / social orphans and adolescents living in families.
PSYCHOTHERAPY OF CANCER PATIENTS

Natalia Rusina
Yaroslavl State Medical University (Yaroslavl, Russia)

The following results were obtained in our studies of cancer patients: 1. Self-attitude and life orientations are important components in the structure of patients’ personality. In the structure of self-relation there is a high positive correlation of internal conflict and self-blame. 2. Received 3 factors in the psychological portrait of the sick: containing emotions and gain control, a high degree of self-esteem, and incongruence of life expectations of the individual. 3. Adaptive resources of patients are depleted and provided with a high degree of restraint of emotions and self-control. 4. Deterrence of emotions is the basis of ineffective strategies of behavior, manifested in a shortage of coping resources, in the predominance of mechanisms of psychological protection of a protective type, in a conflict self-attitude. This situation leads to the implementation of mechanisms of autoagression, realized by the tumor somatic process. 5. Psychotherapeutic targets of cancer patients — “physical stiffness”, “suppressed negative emotions”, attitude, “incongruence of meanings”. Almost all patients have anxiety, masked depression, hidden aggression. Task: to help the patient cope with these conditions. The psychological mood to fight the disease or to give up life is important. The choice of psychotherapy depends on the stage of development of the disease; on the reaction to the disease. If the patient is in denial, understand how it helps him cope with the situation. If the patient is anxious, apply hypnotic, relaxation, meditative techniques. In a situation of aggression to determine the source to which it is directed. If anger is outside, help respond to emotions; if it is autoagression, put the patient’s experience in a long time perspective by connecting existential orientation. At the stage of depression to help release not experienced grief, unspoken resentment, unreacted emotions, work with guilt. Family problems: find the causes of disharmony coming from the ancestral family. Patients are infantile and tied to one object (work, person). Limit interaction with him aggravate contribute to the symptom. For patients relevant issues of meaning of life, guilt, anxiety, death, loneliness. Working with these categories is effective in the paradigm of existential therapy.

THE ROLE OF METAPHORS IN THE REPRESENTATIONS ABOUT HEALTH

Alexander Tkhostov
Lomonosov Moscow State University (Moscow, Russia)

A.S. Neliubina
(Moscow, Russia)

THE ROLE OF METAPHORS IN THE REPRESENTATIONS ABOUT HEALTH

In the case of illness or change of habitual state of health, a person employs the cognitive model of health in order to understand what is wrong with him or her (a part of the cognitive model of the world). In the cognitive theory by G. Lakoff (1980), that model of the world is structured mainly by means of metaphors and connected with language and cultural references. Let us mark possible classes of metaphors that describe health. Orientation-spatial metaphors which attach a spatial orientation to the concept, link life and health to the upper and rise (“at the peak of one’s own opportunities”), and decease and death — to the bottom (“fall off the flu”; “undermined health”). Ontological metaphors: metaphors of the essence are born out of the experience of handling material objects (including body). For instance, “he has a low emotional intelligence”. This also includes the metaphors of "machine" (“they’ve blown my mind”) and "a fragile object" (“his world has cracked”).
DECOLONIZING PSYCHOLOGY: A HUMAN RIGHTS ISSUE

Polli Hagenaars
European Federation of Psychologists’ Associations
(Amsterdam, Netherlands)

Diaz-Loving Rolando
National Autonomous University of Mexico (Mexico City, Mexico)

Waikaremoana Waitoki
Massey University (Wellington, New Zealand)

Milagros Mendez Castillo
University of Puerto Rico (Puerto Rico, USA)

Thompson Ava
University of The Bahamas (Nassau, The Bahamas)

Abstract body. The inherent, equal and inalienable worth of ALL human beings, forms the founding principle of the United Nations Universal Declaration of Human Rights (UDHR, 1948). This symposium will discuss the importance of a decolonial perspective on developing an inclusive and global psychology from a human rights perspective. The presenters reflect on the principle of the equal worth of all human beings as reflected in methodology, epistemology, applied practices, ethics and teaching of mainstream psychology. They will also focus on the ways psychology is seen and applied in different situations around the globe, with the intention to give all human beings the place, the respect and the treatment to which they are entitled.

Press paragraph. Decolonizing Psychology: A Human Rights Issue, EFPA Board Human Rights and Psychology. In this symposium, colleagues from different parts of the globe will present different perspectives on the theme of a decolonal, multi-indigenous and inclusive psychology from a human rights perspective. Ava Thompson, PhD & Milagros Mendez Castillo, PhD: Psychology Education and Training in the Caribbean: A Perspective on Decolonization and Promoting Human Rights; Rolando Díaz –Loving, PhD: Synthesizing universal and idiosyncratic paradigms; Waikaremoana Waitoki, PhD & Simon Bennett, PhD: Indigenous psychological knowledge: Protecting culture and humanity; Polli Hagenaars, MSc: Inclusive Psychology, essential to Human Rights; Human Rights, essential for an Inclusive Psychology.

General summary of the Symposium. The theoretical framework for decolonizing knowledge production, dissemination and application has grown substantially across disciplines in the last 50 years but the explicit call for a “decolonial psychology” is a relatively recent development. This symposium integrates seminal work from psychologists as well as from other disciplines, including Thomas Teo’s (2005) classic publication, The Critique of Psychology: From Kant to Postcolonial Theory, as well as Teo’s (2018) more recent publication, Outline of Theoretical Psychology, Critical Investigations; other critical scholarship includes among others, Glenn Adams et al. (2015), Decolonizing Psychological Science, Introduction to the Special Thematic Section of the Journal of Social and Political Psychology. In this symposium, the presenters explore two major questions: 1. To what extent are historical unequal social-economic relations and colonialism reflected in contemporary methodology, epistemology and applied profession of psychology? 2. How can psychologists integrate the human rights approach with a decolonizing framework and contribute to the development of an inclusive, global discipline that serves all of humanity?
INCLUSIVE PSYCHOLOGY, ESSENTIAL FOR HUMAN RIGHTS; HUMAN RIGHTS, ESSENTIAL FOR AN INCLUSIVE PSYCHOLOGY

Polli Hagenaars
European Federation of Psychologists’ Associations
(Amsterdam, Netherlands)

The inherent, equal and inalienable worth of ALL human beings, forms the founding principle of the United Nations Universal Declaration of Human Rights (UDHR, 1948). This presentation will discuss the influence of socio-economic relationships on psychology and the realization of the principle of equal worth of all human beings as reflected in methods, epistemology and research of mainstream psychology. A human rights based-and-oriented psychology is an inclusive psychology; psychologists can and should contribute to the well-being of people and peoples by the unlearning of exclusion. This is not always straightforward, as will be illustrated with reference to the story of the first African-European psychologist Anton Wilhelm Amo (1703-1759). What happened to him is considered by some authors as an act of colonialism or as we would say now as a violation of the rights of the child; by other authors it is framed as a sign of Enlightenment.

PSYCHOLOGY EDUCATION AND TRAINING IN THE CARIBBEAN: A PERSPECTIVE ON DECOLONIZATION AND PROMOTING HUMAN RIGHTS

Milagros Mendez Castillo
University of Puerto Rico (Puerto Rico, USA)

Thompson Ava
University of The Bahamas (Nassau, The Bahamas)

In the past decade, decolonization has become increasingly visible in the lexicon as psychologists strive to develop an inclusive, global discipline that represents and serves all of humanity. While limited attention has been given to Psychology Education and Training (PET) in this emerging field, we assert that PET should be placed at the centre of the discourse and strategic imperatives for decolonizing psychology. We also assert that the human rights perspective is of paramount importance for the construction of a culturally-relevant psychology, which by its very nature requires a decolonizing focus.

Drawing on select international human rights instruments and historical and contemporary developments in and from the Caribbean, we first demonstrate this intersectionality between human rights and psychology education and follow with an overview of regional efforts. In addition to emphasizing the commitment to the development of a pan-regional PET infrastructure that aims to eliminate the artificial boundaries created by colonizers, we also highlight curricular developments. These developments seek to democratize epistemology by privileging the realities of humanity traditionally invisible in psychological science (i.e., those from the Majority World), interrogating historical narratives of the discipline, and examining critical issues that reflect the socio-political and power dynamics in the field. Finally, we discuss some present challenges/lessons learned and implications for a human rights perspective in actualizing the vision of a global psychology that promotes human development in the 21st century and beyond.
SYNTHESIZING UNIVERSAL AND IDIOSYNCRATIC PARADIGMS

Diaz-Loving Rolando
National Autonomous University of Mexico (Mexico City, Mexico)

Early in psychological thought, Wundt (1916) vigorously pioneered both behavioural and cultural psychology. In retrospect, his principal objective of integrating them into an objective, generalizable, yet culturally sensitive science is a work in progress. One possible inroad to the controversy over universal or idiosyncratic characteristics is to solve it empirically. The answer lies in conducting internally valid research on specific themes in a variety of ecosystems and culturally diverse settings. Specifically, dealing with personality, we will present Mexican ethnopsychological research on the universal aspects of masculinity-femininity, locus of control and self concept, together with the idiosyncratic manifestations they present in Mexican populations.

STRENGTHENING CAREER GUIDANCE AND COUNSELING TO PROMOTE ACCESS TO DECENT WORK

Jérôme Rossier
University of Lausanne (Lausanne, Switzerland)

Gabriela Aisenson
University of Buenos Aires (Buenos Aires, Argentina)

Louise Michelle Vital
Lesley University (Boston, USA)

Jacobus G. Maree
University of Pretoria (Pretoria, South Africa)

Christian Heslon
Université Catholique de l’Ouest (Angers, France)

Abstract body. The Unitwin international network Life designing interventions (counseling, guidance, education) for decent work and sustainable development (www.unil.ch/unitwin) aims as contributing to promote access to decent work and lives by facilitating the access to appropriate counseling and career interventions adopting a holistic and integrative approach. This symposium will present how such type of interventions, in different contexts (Western countries but also Argentina, Burkina Faso, Haiti, Madagascar, or South Africa), with different types of clients, can indeed contribute promoting sustainable live and career development. For example, career guidance can contribute to facilitate the management of career transition. Career guidance and counseling for vulnerable, underserved, or disadvantaged people is crucial to promote access to a decent work for all and at all ages. All interventions of this symposium illustrate the importance of strengthening career guidance and counseling to promote access to decent work and thus decent lives.

Press paragraph. The Unitwin international network Life designing interventions (counseling, guidance, education) for decent work and sustainable development (www.unil.ch/unitwin) aims as contributing to promote access to decent work and lives by facilitating the access to appropriate counseling and career interventions adopting a holistic and integrative approach. This symposium will present how such type of interventions, in different contexts (Western countries but also Argentina, Burkina Faso, Haiti, Madagascar, or South Africa), with different types of clients, can contribute promoting sustainable live and career development. A first contribution will analyze the transition from tertiary education to work Haiti. A second contribution will present
how career interventions may promote sustainable career construction and development in Argentina. The third contribution will focus on career interventions in a seriously disadvantaged context in South Africa. A fourth presentation will illustrate that access to decent work can be a challenge all over the world and at all ages. The last presentation will analyze the perceptions, antecedents and outcomes of and decent work in the formal and informal sector in Burkina Faso. All these presentations will illustrate the importance of, among others, strengthening career guidance and counseling to promote access to decent work and thus decent lives.

General summary of the Symposium. Higher education experiences and career expectations of emerging adults: A focus on university students and graduates in Haiti Louise Michelle Vital, Assistant professor, Graduate School of Arts & Social Sciences, Lesley University, Boston, USA

The purpose of this paper is to examine the higher education experiences and career expectations of emerging adults. Data for the study was collected in 2013 from a higher education centered NGO in Haiti. The paper offers insights from students, alumni, and staff who named several factors that contributed to higher education and career challenges and discussed strategies to support the success of emerging adults in the country. A major factor was the HigherEdOrg (pseudonym) responding to university access and persistence in Haiti. Current literature on higher education in Haiti and labor market reports have also been reviewed. Concerns and suggestions related to wellness, identity, and success of Haiti’s emerging adults as they navigate a university to work/career path will be discussed from the country’s socioeconomic and cultural contexts. The paper has wider implications for discussion on mapping effective support for emerging adults in struggling economies in a global context.

Challenges of 21st Century Argentina’s Guidance Counseling: Interventions that promote sustainable development and the construction of a global human society through decent work activities Gabriela Aisenson, Full professor, Faculty of Psychology, University of Buenos Aires, Buenos Aires, Argentina

This presentation continues with the debate we have been holding from the UNITWIN NETWORK regarding "life-long in guidance and Counseling: How can life designed interventions contribute to the achieving sustainable life paths and to create decent work for all? In a social context as complex as the current Argentina scenario, having high poverty rates, higher levels of school dropout rates and unemployment rates increasing on daily basis, it is necessary to build a local conceptualization of the construct "decent work" allowing us to problematize the universal character of the notion and recognize the specific meanings in our particular context. In this way, to incorporate the concept within the framework of intervention orientation is the basis of a strategy designed to make visible themes that broaden the available resources of people to understand working worlds, aiming to achieve a sustainable development of the individual in the society. Group-based career construction counselling with unemployed women in a seriously disadvantaged rural context Jacobus G. Maree, Full professor, Educational Psychology, University of Pretoria, Pretoria, South Africa

The purpose of this study was to investigate the effect of integrative qualitative-quantitative career and self-construction counselling to promote the adaptability and career decision-making of women with unemployment in seriously disadvantaged, deep rural area. A mixed methods, non-experimental group design was used to gather data. While the Maree Career Matrix and the Career Interest Profile were used to gather data, the Career Adapt-Abilities Scale as well as the Career Decision-making Difficulties Questionnaire were used to evaluate the effect of the intervention. Participants demonstrated improved scores in subfields such as Lack of Information about the Decision-Making Process and Lack of Information about Ways of Obtaining Information. Moreover, their overall Career adaptability showed marked improvement. The intervention highlighted the challenging position and unique needs of unemployed woman in deep rural areas. Participants benefitted from the group career and self-construction counselling in the manner implemented during the current research. However, adaptation of the intervention to meet the idiosyncratic needs of participants is needed. Decent work and ages of adult life Christian Heslon, Senior lecturer, Institut de
Decent work is crucial for an individual's life development and well-being. However, what defines decent work may vary from one context to the next. For this reason, this study aimed to describe how decent work is defined by people working in the formal and informal sectors in Burkina Faso. Fifty participants were interviewed about their ideas of what constitutes decent work and more than 500 participants completed a survey about their unemployment history, work volition, decent work, and satisfaction and meaning at work. For most interviewees, decent work was defined as work that allows living, but also has dignity, and allows access to some social recognition. Decent work should provide a socially recognized social identity. Quantitative analyses showed that unemployment history, demographic variables (age, income, social class), have an impact on work volition and decent work, that in turn impacts well-being at work. These results illustrate the importance of considering macro- and micro-level determinant of well-being at work.
HIGHER EDUCATION EXPERIENCES AND CAREER EXPECTATIONS OF EMERGING ADULTS: A FOCUS ON UNIVERSITY STUDENTS AND GRADUATES IN HAITI

Louise Michelle Vital
Graduate School of Arts & Social Sciences, Lesley University (Boston, USA)

The purpose of this paper is to examine the higher education experiences and career expectations of emerging adults. Data for the study was collected in 2013 from a higher education centered NGO in Haiti. The paper offers insights from students, alumni, and staff who named several factors that contributed to higher education and career challenges and discussed strategies to support the success of emerging adults in the country. A major factor was the HigherEdOrg (pseudonym) responding to university access and persistence in Haiti. Current literature on higher education in Haiti and labor market reports have also been reviewed. Concerns and suggestions related to wellness, identity, and success of Haiti’s emerging adults as they navigate a university to work/career path will be discussed from the country’s socio-economic and cultural contexts. The paper has wider implications for discussion on mapping effective support for emerging adults in struggling economies in a global context.

CHALLENGES OF 21ST CENTURY ARGENTINA’S GUIDANCE COUNSELING: INTERVENTIONS THAT PROMOTE SUSTAINABLE DEVELOPMENT AND THE CONSTRUCTION OF A GLOBAL HUMAN SOCIETY THROUGH DECENT WORK ACTIVITIES

Gabriela Aisenson
University of Buenos Aires (Buenos Aires, Argentina)

This presentation continues with the debate we have been holding from the UNITWIN NETWORK regarding "life-long in guidance and Counselling: How can life designed interventions contribute to the achieving sustainable life paths and to create decent work for all? In a social context as complex as the current Argentina scenario, having high poverty rates, higher levels of school dropout rates and unemployment rates increasing on daily basis, it is necessary to build a local conceptualization of the construct "decent work" allowing us to problematize the universal character of the notion and recognize the specific meanings in our particular context. In this way, to incorporate the concept within the framework of intervention orientation is the basis of a strategy designed to make visible themes that broaden the available resources of people to understand working worlds, aiming to achieve a sustainable development of the individual in the society.
GROUP-BASED CAREER CONSTRUCTION COUNSELLING WITH UNEMPLOYED WOMEN IN A SERIOUSLY DISADVANTAGED RURAL CONTEXT

Jacobus G. Maree
University of Pretoria (Pretoria, South Africa)

The purpose of this study was to investigate the effect of integrative qualitative-quantitative career and self-construction counselling to promote the adaptability and career decision-making of women with unemployment in seriously disadvantaged, deep rural area. A mixed methods, non-experimental group design was used to gather data. While the Maree Career Matrix and the Career Interest Profile were used to gather data, the Career Adapt-Abilities Scale as well as the Career Decision-making Difficulties Questionnaire were used to evaluate the effect of the intervention. Participants demonstrated improved scores in subfields such as Lack of Information about the Decision-Making Process and Lack of Information about Ways of Obtaining Information. Moreover, their overall Career adaptability showed marked improvement. The intervention highlighted the challenging position and unique needs of unemployed woman in deep rural areas. Participants benefitted from the group career and self-construction counselling in the manner implemented during the current research. However, adaptation of the intervention to meet the idiosyncratic needs of participants is needed. Institut de Psychologie et de Sciences Sociales Appliquées, Université Catholique de l’Ouest Senior lecturer. Decent work is also a question of age around the world. In poor countries, the point is to avoid work of children and young people, and offer a longer life, which means reduce part of work into total awake life. In developed countries, the challenges are quite different: a better lifelong distribution of work, education and respites times. What might be the contribution of lifelong psychology to those two types of issues? This presentation will describe the lessons of two different action-researches, the first one in Madagascar with young students, the second one in France with senior workers.
MULTIDISCIPLINARY STUDIES OF READING IN TYPICALLY-DEVELOPING AND CLINICAL POPULATIONS

Aleksandr Kornev
Galperina Elizaveta
Natalia Shemyakina
Saint-Petersburg State Pediatric Medical University (Saint-Petersburg, Russia)

Jenifer Juranek
University of Texas (Houston, USA)

Abstract body. The proposed symposium is devoted to an evaluation of reading behavior, reading cognitive and neurological mechanisms, and reading development from different perspectives. An eye-tracking study of typically-developing and dyslexic children (gaze movements registration during narrative and expository texts reading) revealed that dyslexics tended to employ less mature and qualitatively distinct strategies for text processing than typically-developing peers (Kornev, Oganov). An MRI morphometric study of children with good and poor progress in the reading skills acquisition evidenced that cortical thickness and white matter tract volume are linearly related to performance measures of reading fluency in school-age children (Juranec). An EEG study in age-related features of ERPs in word and sentence processing revealed that brain mechanisms of the given process are still not mature in 9-11-year children and continue developing until adolescence (Galperina). Morphometric MRI study of adult good and poor comprehenders of written texts highlighted distinctions and ambiguous data about thickness measures of cortical matter.

Press paragraph. Reading skills are represented by multiple constituents and, thus, require a multidisciplinary scientific approach. The proposed symposium meets this requirement. Dr. Alexander Kornev MD, the head of the Lab for Neurocognitive Scientific and Applied Studies at the St.Petersburg State Pediatric Medical University, will present, with co-authors, an eye-tracking study which revealed new data about the text processing strategy used by children during natural text reading. In this study, eye gaze movements in narrative and expository texts reading were analyzed in typically-developing and dyslexic children. The findings evidenced that the

the senior researcher from the given Lab, will present, with co-authors, results of an EEG study on brain mechanisms involved in word and sentence processing during reading in typically-developing children and teenagers.

Ph.D. Natalia Shemyakina, the senior researcher representing the given Lab, will introduce, with co-authors, an MRI study which revealed significant quantitative and qualitative distinctions of brain structure between good and poor comprehenders (young adult). Dr. Ph.D. Jenifer Juranek, the Director of Brain Research Analysis in Neurodevelopment at the Children’s Learning Institute at the University of Texas Health Science Center at Houston will present, with co-authors, a multimodal MRI investigation of children (good responders vs. non-responders to an intensive reading intervention); in the current study, positive linear relations between reading measures and tract volume and cortical thickness was found.

General summary of the Symposium. The proposed symposium is devoted to an evaluation of reading behavior, reading cognitive and neurological mechanisms, and reading development from different perspectives. The first question is how the text reading, as the goal-directed behavior, is organized in dyslexic children vs. typically-developing peers. To answer this question, an eye-tracking study was carried on by A. Kornev and S. Oganov. They will introduce new data about the text processing strategy used by children during natural text reading. In this study, eye gaze movements in narrative and expository texts reading were analyzed in typically-developing and dyslexic children. The findings evidenced that the
DO DYSLEXICS STRUGGLE WITH ONLY THE DECODING PROBLEM WHEN READING? AN EYE-TRACKING STUDY OF A NATURAL TEXT READING IN TYPICALLY-DEVELOPING AND DYSLEXIC CHILDREN

Aleksandr Kornev
Sergei Oganov
Saint-Petersburg State Pediatric Medical University (Saint-Petersburg, Russia)

Introduction. In a vast number of dyslexia studies, a decoding incapability has been discussed as the core deficit in reading. Text comprehension weakness in dyslexics (DY) usually is treated as a consequence of their decoding limitations. The current study aimed to analyze the text processing strategy in DYs by means of the gaze movements registration during reading. Methods. The participants of our study were divided into two groups: the younger one included twenty-seven 9-11-year-old typically-developing (TD) and sixteen DY children (Grade 3); the older one consisted of sixteen 12-14-year-old TDs and ten DYs (Grade 6). All the participants had normal nonverbal intelligence; inclusion criteria for dyslexics was ≥1.5 standard deviation below the mean reading score according to the standard assessment SARS (Kornev, Ishimova, 2010). During individual sessions, two scientific expository and two fiction narrative texts were presented for a self-paced reading on a computer screen, followed by answering comprehension questions, and the eye gaze movements were registered by the eye tracker SMI RED500.

Measures analyzed included: the mean fixation duration; the mean number of fixations per word; the mean number of progressive and regressive saccades per word; and the mean amplitude of progressive and regressive saccades. Results. The between-group distinction in the text comprehension was significant only in Grade 3. The ANOVA revealed a significant between-group difference in a gaze movements patterns both in Grade 3 and 6. The linear correlation between the mean fixation duration and the mean amplitude of progressive saccades significantly differentiated the TDs and DYs (r=-0.72; P<0.000 in the TDs and r=0.71; P<0.000 in the DYs). The regression curves slope was dramatically distinct within the groups. Discussion. The modern approaches to text comprehension recognize the text processing as a cognitively and strategically complex activity (Muijselaar et al., 2017). Our data evidenced that the DYs tended to employ less mature and qualitatively distinct strategies for text processing in comparison to the TD peers.
EEG CORRELATES OF WRITTEN WORDS AND SENTENCES PROCESSING IN READING: ERP STUDY ON 9-13 YEARS OLD CHILDREN

Natalia Shemyakina
Olga Kruchinina
Aleksandr Kornev
Zhanna Nagornova
Galperina Elizaveta
Saint-Petersburg State Pediatric Medical University
(Saint-Petersburg, Russia)

Introduction: At the end of primary school, decoding skills are already mastered, while sentence and text processing skills are still developing during secondary school. Brain base for reading text processing has a multilevel organization. Hence, the current study aims to evaluate the age-related features of ERPs in word and sentence processing. Methods: Twenty-three typically-developing children (9-10 y.o.) and twenty adolescents (12-13 y.o.) were EEG registered according to two task modes. In mode 1, reading and categorizing semantically correct vs. violated sentences were presented in two steps, containing a contextual part of a sentence and a keyword presentation. In mode 2, two different words were presented sequentially and followed by a new vs. previously presented word. Results: A comparison between the semantically correct vs. violated sentences within the groups revealed a difference in N400 (396-450, Cz) component in children and in P600 (626-700 ms, Fz) component in adolescents. In both groups, correct sentences correlated with the higher amplitude of ERPs. In the correct sentences processing, N400 had a higher amplitude in children than in adolescents (396-450 ms, Fz, Cz). In the semantically violated sentences processing, N400 difference was revealed in Fz, C4 in 500-552 ms. In both new and repeated words tasks, children had a higher amplitude of N400 in Fz, F3, and C3. The study revealed age differences in neurobiological correlates of both word and sentence reading processes. In both groups, semantically correct sentences processing correlated with the higher amplitude of ERPs, in contrary to semantically violated ones. Thus, the correct sentences processing presumably was more resource-demanding. Differentiation between the correct vs. violated sentences was opposite between the groups: it manifested in N400 wave in children and in P600 one in adolescents. Conclusions: The results highlighted a process of mastering comprehension skills that occurred to be incomplete and still developing in adolescence. RFBR grants No18-013-01082, 17-06-00542.
FUTURE RESPONDERS VS NON-RESPONDERS TO AN INTENSIVE READING INTERVENTION: RELATIONS OF FLUENCY AND PASSAGE COMPREHENSION WITH BRAIN ORGANIZATION AND CONNECTIVITY

Irina Ovchinnikova
Pat W. Taylor
Jack M. Fletcher
University of Houston (Houston, USA)
Jessica A. Church
University of Texas (Austin, USA)
Juranec Jenifer
University of Texas (Houston, USA)

Multiple modalities were integrated to investigate structural features of brain organization and connectivity 1) relative to measures of reading skill; 2) between future responders vs non-responders to an intensive reading intervention. Diffusion tensor tractography was used to reconstruct white matter tracts relevant to the reading network in our study sample of 131 children. Tract volume was evaluated in relation to reading scores. Additionally, we evaluated cortical thickness values in future responders vs non-responders. DTI: We observed a significant positive linear relation between reading measures and tract volume (LH:p=0.024; RH:p=0.012). Cortical thickness: Higher scores were significantly associated with thicker cortex in regions of the reading network. Additionally, baseline cortical thickness predicted future responders. Cortical thickness and tract volume were linearly related to reading scores in school-aged children. Responders exhibited greater cortical thickness in regions important for attention, executive function, and expressive language.
NEUROANATOMICAL CORRELATES OF PROFICIENCY IN TEXT PROCESSING: A MORPHOMETRIC STUDY OF GOOD AND POOR COMPREHENDERS OF WRITTEN TEXT

Zhanna Nagornova
Vadim Novikov
Aleksandr Pozdnyakov
Aleksandr Kornev
Shemyakina Natalia
Saint-Petersburg State Pediatric Medical University
(Saint-Petersburg, Russia)

Neural networks for text processing are widespread and involve zones of frontal, temporal, and parietal cortex. However, we still need clear data on the interaction between a comprehension competence in reading and anatomical particularities of the given areas. The current morphometric study focuses on neural differences between two groups of typically-developing young adults (18-20 y.o.), i.e. good and poor comprehenders of a written text. First, 136 young adults were assessed by the Test of written text comprehension; according to the results, 12 subjects (2 males and 10 females) were scored 0-15 percentiles and identified as poor comprehenders; while 15 subjects (4 males, 11 females) were scored 85-100 percentiles and identified as good comprehenders. These subjects composed two experimental groups. In all the participants, nonverbal intelligence, working memory, and reasoning skills (the Analogical reasoning test) were assessed. The mean scores for the psychological assessment were, consequently, 124±13, 6.7±2, and 16±3 for the good comprehenders and 105±7, 4.5±1, and 9±3 for the poor comprehenders. In all the participants, MRI scans were collected. The whole brain volumetry, cortical thickness analysis, and voxel-based morphometry were carried on. In the good comprehenders, we observed the greater indexes of the gray matter relative volume bilaterally in the BA6, in the rostral middle frontal areas, right superior frontal and left caudal middle frontal, lateral orbitofrontal, inferior temporal, and left paracentral areas. The thickness of the right pars orbitalis was greater in the poor comprehenders; while the thickness of the right rostral anterior cingulate cortex was greater in the good comprehenders. The results revealed neuroanatomical differences between the good and the poor comprehenders in the language related networks, decision making, and conflict monitoring.
PSYCHOLOGY OF AGING AND LONGEVITY

Liubov Akopian
Samara State University of Social Sciences and Education (Samara, Russia)

Christian Heslon
Western Catholic University (Angers, France)

Alena Garber
Rehabilitation Clinic "Reinhardshöhe" (Hessen, Germany)

Abstract body. The attention of the psychological scientific community is drawn to human longevity and an increase in the proportion of older people in the world. C. Heslon considers general psychological problems of aging and longevity. In the semantic sphere of persons of late age, the topic of transvital meaning is highlighted — L. Akopyan. The development and evaluation of a stress management program for the elderly is theoretically justified and put into practice by K. Reschke. The potential of virtual reality methods for assessing and enhancing functional autonomy in Alzheimer’s patients is discussed in P. Allain. The use of the concept of salutogenesis by A. Antonovsky in psychotherapeutic work with elderly oncological patients is described in A. Garber. The value-semantic factors of professional teacher longevity are considered in the project by N. Zotova. Spirituality and its fundamental role in old age is considered in the work of O. Kovshova.

Press paragraph. The problem of aging of the planet’s population is of increasing interest in various scientific fields, including psychology. Important problems in this area are: life meaningful orientations and the acquisition of new meanings of life at a later age; the role of spirituality in old age; psychological factors of professional longevity; self-regulation and self-organization, as well as coping with stress in old age; features of psychotherapeutic work of elderly people with cancer and Alzheimer’s disease, allowing them to make their lives more meaningful and positive. The scientific theme of the symposium “The Psychology of Aging and Longevity” makes it possible to practically realize the possibilities of professional, psychological, psychophysiological and psychotherapeutic ensuring human longevity. The well-known experts in this field take part in the symposium “Psychology of aging and longevity”: L. Akopian (Russia); Alena Garber (Germany); Konrad Reschke & Franziska Stoeb (Germany); Christian Heslon (France); Philippe Allain (France); N. Zotova, S. Peredelskaya, M. Tikhomirov (Russia); O. Kovshova (Russia), Berezena T., Chumakova Y.

General summary of the Symposium. Increasing a person’s longevity throughout the world is not only a social, but also a psychological problem. The most important tasks of development in old age, researchers include the task of accepting and understanding the past life and old age as a stage in the life path. The problem of prosperous aging and longevity is considered from a psychological position in the work of C. Elon. The transvital sense in the system of semantic formations of the personality of a late age is characterized by the search for new meanings that motivate social or other activity at the final stage of life — L. Akopian. The development of a stress management program for the elderly at the retirement stage is theoretically justified and put into practice by K. Reschke&F. Stoeb, A. Garber, A. Militarieva & G. Sarbasova. P. Allain in an experimental study proves the usefulness of virtual environments for assessing and rehabilitating the daily life of older people with Alzheimer’s disease. The use of the concept of salutogenesis by A. Antonovsky in psychotherapeutic work with elderly oncological patients contributes to resistance to stress (A. Garber, K. Reschke, S. Berdibayeva). In the work of O. Kovshova, the concept of spirituality is analyzed, focusing on the fact that in old age the fundamental role of spirituality is a regulator of human behavior and activity, and its relationships with other people. The results of the study of N.
Zotova, S. Peredelskaya, M. Tikhomirov suggest that in the post-pension period teachers in the educational institutions remain to work with a high level of meaningfulness of life, job satisfaction, and an active lifestyle. There are individual and personality prerequisites for the occurrence of cardiovascular diseases, depending on the professional type of a person — Berezina T., Chumakova Y.

DEVELOPMENT AND EVALUATION OF A STRESS MANAGEMENT PROGRAM FOR ELDERLY PEOPLE

Konrad Reschke
University of Leipzig (Leipzig, Germany)

Alena Garber
Rehabilitation Clinic "Reinhardshöhe"(Hessen, Germany)

Anar Bikadamova
Gulsat Sarbassova
Sandugash Duanayeva
Al-Farabi Kazakh National University (Almaty, Kazakhstan)

The goal was the development and evaluation of a stress management program for elderly people (age 60 – 80). Stress can begin in transition phase of retirement. Psychosocial Stress depends on balance between resources and stressors and in relation to conservation of resources (Hobfoll) and proactive coping resources (Greenglas). For elderly people no specialized stress intervention programs exist. Thatsway we modified the stress-management program "Mastering stress optimistically" for elderly people according to the stressors in the retirement phase of life. Methods: The program includes 10 sessions (8 fixed, 3 free electable). Content of exercises: systematic stress checkup, emotion regulation, relaxation, future orientation, communication, coping with death and dying, goal setting. The study was an intervention trial with prae-post-follow up design (formative & effect evaluation). Measures/ tests were: Leipzig short questionnaire^ chronic stress (LKCS), Measurement of change questionnaire of behavior and experiencing (VEV), Screening scale of chronic stress (SCSS), Satisfaction with Life Scale (SWLS), Life Orientation Test (LOT), Self efficacy scale (SWE), a sense of coherence scale (SOC-L9). The participants were n= 15 retired persons (age 66 to 77, M̅ = 71, .93 SD = 3.22). Data were analyzed by t-test and power analysis. Findings: The formative evaluation showed positive results by expert ratings and ratings of the participants for each element of training. In all dimensions the new developed training program reached high values mean = 1.7 on a five point likert evaluation scale from (1 very good – 5 very bad). 10 persons reported significant positive changes in VEV. Main positive effect sizes were found in the evaluation of effects in the sense of coherence and life satisfaction measure. Discussion: The program "Optimistic Coping the retired state" was highly accepted by the participants and evaluated positive in dimensions of evaluation. It showed a clear structure and usability, and acceptance for training-parts. Results of intercultural comparisons with Kazakhstan people will be reported.
THE POTENTIAL OF VIRTUAL REALITY TECHNIQUES TO ASSESS AND ENHANCE FUNCTIONAL AUTONOMY IN PATIENTS WITH ALZHEIMER’S DISEASE

Philippe Allain
University of Angers (Angers, France)

Alzheimer’s disease causes impairments affecting autonomy in activities of daily living. Transdisciplinary research in neuropsychology and virtual reality has fostered the development of ecologically valid virtual tools for the assessment and rehabilitation of these activities, using simulations of real life activities.

Few studies have examined the benefits of this approach in patients with Alzheimer’s disease. In this communication we will present the work of our lab in this field. We will first focus on the assessment results obtained from a group of patients with Alzheimer’s disease on a task designed to assess their ability to prepare a virtual cup of coffee, using a virtual coffee machine implemented in a virtual kitchen. We will then focus on the training results obtained for another group of patients with Alzheimer’s disease on a system designed to increase their autonomy in cooking activities using interventions based on errorless learning, vanishing-cue, and virtual reality techniques. We will demonstrate that our work provide support for the utility of virtual environments for the assessment and rehabilitation of everyday life activities in Alzheimer’s disease.
APPLICATION OF A. ANTONOVSKY’S CONCEPT OF SALUTOGENESIS TO PSYCHOTHERAPEUTIC WORK WITH ELDERLY ONCOLOGICAL PATIENTS

Alena Garber
Rehabilitation Clinic Reinhardshöhe, Bad Wildungen (Hessen, Germany)

The objective of the study is application of a resource-oriented psychotherapeutic approach to elderly cancer patients. Its theoretical framework constitutes Aaron Antonovsky’s concept of salutogenesis. Research questions are focused on cases when people successfully overcome stressful situations, even if these cases are contrary to the general trend, and on finding factors contributing to stress resistance. Such analysis allows to consider illness and health on a single continuum and helps to proceed from dealing with a particular disease to searching for factors by which a person, regardless of where on the continuum he/she is located, can move to the health pole. The concept of salutogenesis was used at the rehabilitation stage of cancer disease. The experimental group of the study involved 70 cancer patients aged from 68 to 75 years (44 women). To 40 of them model of salutogenesis was offered in the form of weights. Patients filled the scales twice: first, independently, and then with the help of a therapist. With 30 other patients, group counseling was conducted on the topic “Protection factors or due to what factors a person is able to stay healthy” without providing individual counseling. 50 patients compiled a control sample. Leipzig Test for Chronic Stress (K. Reschke, G. Schröder), a questionnaire for assessing the quality of life and content analysis of weights answers reflecting A. Antonovskiy’s salutogenesis model were used. At a statistically significant level was shown a decrease in the general level of stress, an increase in the assessment of the quality of life, an increase in reflexive abilities in finding one’s internal resources, an increased understanding of the physical and psychological conditions/factors contributing to health in patients for whom individual counseling was carried out. Patients who participated in the group counseling increased their understanding of physical and psychological conditions/factors contributing to health. Patients of the control group demonstrated no significant changes. The study supports application of the A. Antonovskiy’s model to psychotherapeutic work with elderly oncological patients at the rehabilitation stage of disease. The next step is investigation of possibilities of this model with elderly population in general.
The problem of rendering psychological help for teachers is relevant to modern educational practice in Russia. It is not only about prevention of negative phenomena (for example, burn-out), but also about preservation of teachers installation on professional longevity. The project participants were school and preschool teachers of Volgograd region (n=247) aged 22-65. We explored individual psychological characteristics, which could determine a specialist's desire to prolong his professional life. The results of the research claim that in educational institutions work conscious teachers of post-retirement period, who are satisfied with labour and have active life position. Moreover we have established that material motive does not play a significant role in deciding to continue working till retirement age. This is confirmed by the data of R. Engelhard: material values are important for respondents with 16-30 years’ experience, meanwhile 31-35-year-old teachers focus on the values of individualization. The analysis of the received data shows that crisis trends like concern about material problems, reduction of self-confidence, expressed tendency of passive life position, increased burn-out symptoms, are typical for teachers with 16-30 years’ experience.

This prepares the ground for attitude towards the retirement age as a desirable period of rest, given the cumulative nature burn-out. Consequently, the aspiration to professional teachers’ longevity can be considered to a greater extent as a result of value-semantic mechanisms human work: professional activity is full of new meanings, it is connected with the nearest future. Undoubtedly the social environment plays a big role, first of all — the organizational culture of the educational institution, stimulating a teacher to constant professional growth against the background of beneficial psycho-emotional climate with colleagues. Thus, we have found that the proximity of the value orientations of school teachers positively correlates with the degree of satisfaction with labour. Continuation of our research is connected with revealing of psychological criteria and conditions for professional longevity on the basis of analysis of value-semantic mechanisms regulating reliability and efficiency of teachers’ work at the completion career stage.

The reported study was funded by RFBR according to the research project № 18-013-00712.
Life experience accumulated over many years allows an elderly person to navigate in the surrounding social space, but at the same time, the same life experience can become “difficult doorstep to step over” at the intersection of change, when meanings, values, needs and attitudes are changing. The presence and “work” of consciousness presupposes an understanding of life, corresponding to the social situation and individual possibilities, also in old age. The transvital sense in the system of semantic formations of the personality of the late age is characterized by the search for new meanings that motivates post-professional, social or other activity at the final stage of life, as well as the realization of post-life continuation through descendants or personal achievements: leave behind a memory in deeds, ideas, in created material and intangible values, etc. At a later age, a person searches and acquires a transvital sense only when he has a semantic life context. Not every person of a late age certainly thinks about the transvital sense, but the context of approaching the final stage, explicitly or indirectly, prepares the formulation of this question and the need to solve it in one way or another, in one form or another. As a rule, a certain “trigger mechanism” is needed, which actualizes the search for transvital meaning (“what remains after me”, “what else can you manage to do”, “what can I leave behind, what memory, trace”, etc.). For people of late age it is especially important to understand what they have achieved in their entire life span (a question turned to the past), what they have now (now) and what will happen after they leave, what and how “I will exist” (a question addressed to the future), which is, in our opinion, the task of searching for transvital meaning.
ACUTALIZATION OF SPIRITUAL RESOURCES OF PERSONALITY IN PSYCHOTHERAPY

Liubov Akopian
Samara State University of Social Sciences and Education (Samara, Russia)

Olga Kovshova
Valentina Kalashnikova
Tatiana Kireeva
Samara State Medical University (Samara, Russia)

Depressed states are common in old and old age, although they do not belong to the "typical" companions of old age. From a cognitive-behavioral point of view, dysfunctional thoughts of anxious and depressed patients can be singled out, which appear to be inevitable companions of "specific senile reality". In the minds of these thoughts are fixed due to the frequent negative ideas about the future, fears, difficulties of perceiving positive events. Help with depressive conditions in elderly patients includes preventive and therapeutic measures that require an integrated approach involving not only doctors, but also psychologists and psychotherapists. At the same time, from the standpoint of improving the mental state, both medicinal treatment and psychotherapy with elements of psychological correction are equally important. Psychological assistance of this kind is aimed at transforming suffering into the possibility of intra-personal growth — in kindness, beauty, forgiveness, wisdom, love. In old age, the regulator of the behavior and activity of a person, his relationship with other people is the development and the fundamental role of spirituality. When analyzing spirituality, attention is focused on the value, moral aspect of a self-actualizing person. Proper understanding of the suffering suffered brings a person to new levels, both of self-knowledge, and the meaning of what is happening in the world and Higher. The principal difference between "benign" spirituality consists in its reliance on traditionalism, using the sociological term, or "collegiality," borrowing a theological term. Orthodox-oriented psychotherapy is designed to interpret the situation of the suffering of an elderly person, based on the cumulative experience of overcoming such by mankind in its doctrinal traditions.
THE INFLUENCE OF A PERSONALITY TYPE ON THE PROGRESSION OF CARDIOVASCULAR DISEASES IN THE OLDER AGE

Tatiana Berezina
Moscow State University of Psychology and Education (Moscow, Russia)

Yelizaveta Chumakova
State Budgetary Institution of Healthcare City Polyclinic № 9 of the Moscow City Health Department (Moscow, Russia)

The personality characteristics affecting the development of cardiovascular diseases at the retirement age (496 people) have been studied; It is shown that bad habits and aggressiveness have an effect on diseases. It is noted that the professional activities performed earlier, influence as an additional factor. We studied the individual and personality characteristics that affect the development of cardiovascular diseases in different types of elderly people.

Method: The analysis of medical documents, expert assessment, questioning the life course and self-assessment of the personality traits. Independent variable — the level of cardiovascular disease; additional variables: gender, age and professional types according to J.Holland. Dependent variables: features of self-esteem of the personality and the life path. Data processing method ANOVA analysis of variance. Empirical base: pensioners attached to the City polyclinic of Moscow — 496 people. Results: the risk of developing cardiovascular diseases among pensioners increase: bad habits (alcoholism (F=12,65, p=0,00), tobacco smoking (F=5,81, p=0,003), overeating (F=4,19, p=0,01)), aggressiveness (F=3,14, p=0,05) and professional activities in the field of "Man — Technique" (F=3,44, p=0,05); reduce: the presence of the subject hobbies (F=3,10, p =0,05) and optimism (F=3,23, p=0,05). The types distinguished by sex and age didn’t have a significant additional effect on the severity of the disease. Only professional types additionally influence on the connection between personal characteristics and cardiovascular diseases. Among the realistic-type pensioners (workers and technical specialties) the risk of cardiovascular diseases was further enhanced by sociability (F=3,93, p=0,05), activeness and commitment, career growth (F=3,14, p =0,05) and reduced by the availability of subject hobbies (F=4,36, p=0,01). Pensioners of the social type (professions in the service sector) further reduced the risk by having sports hobbies (F=5,44, p=0,005), while pensioners of the conventional type (office workers) reduced by professional activity and career growth, and increased by the tendency to overeating (F=3,10, p=0,05) and by sports hobbies (F=4,03, p=0,01).

Conclusion: along with the general, there are individual and personality prerequisites for the occurrence of cardiovascular diseases, depending on the professional type of a person. To clarify these results, the additional research is needed.

Abstract body. In the Russian philosophy I'I'enkov (I'I'enkov, 1974) opposed two logics — dialectical and formal. The distinctive feature of formal logic was the manipulation of mental forms that were abstracted from the content, and by dialectical logic the logic of the unfolding content was understood. In Western psychology, the analysis of the processes of dialectical thinking was greatly influenced by the works of J.Piaget. J.Piaget considered the formation of intelligence as the formation of formal-logical structures (Piaget, 1969). Problems of dialectical thinking were considered in the context of the formation of formal intelligence (Riegel 1973). The study of dialectical thinking, based on the understanding of dialectical logic as a special kind of formal logic started in the 1980s (Veraksa, 1981, 1983). One of the tasks that was solved in the course of these studies was to show the presence of formal dialectical operations that are different from the operations of formal logic.

Press paragraph. In the Russian philosophy I'I'enkov (I'I'enkov, 1974) opposed two logics — dialectical and formal. The distinctive feature of formal logic was the manipulation of mental forms that were abstracted from the content, and by dialectical logic the logic of the unfolding content was understood. A meaningful understanding of dialectical logic formed the basis for the developmental learning (Davydov, 1986). In connection with the separation of formal-logical and dialectical approaches, the problem of dialectical thinking understanding was presented. Various authors in most cases understood dialectical thinking through meaningful understanding of dialectical logic (Andreev, 1985; Kedrov, 1962; Stolyarov, 1975).

At the same time, the question of purely dialectical forms that were devoid of their content was also posed. In Western psychology, the analysis of the processes of dialectical thinking was greatly influenced by the works of J.Piaget. J.Piaget considered the formation of intelligence as the formation of formal-logical structures (Piaget, 1969). In this process, he singled out the dialectical moments and spoke about special structural dialectic transformations (Piaget, 1982). Thanks to his research, questions of dialectical thinking began to be considered in the context of the formation of formal intelligence (Riegel 1973). The study of dialectical thinking, based on the understanding of dialectical logic as a special kind of formal logic started in the 1980s (Veraksa, 1981, 1983). One of the tasks that was solved in the course of these studies was to show the presence of formal dialectical operations that are different from the operations of formal logic. Those operations constitute a logical structure that can be described in the language of discrete mathematics (Veraksa, Zadadaev 2012). Dialectical thinking in this case appears as operating with opposites revealed by the subject in the course of analyzing the initial situation (Veraksa, 2006). On its basis, a structural-dialectical method of analysis has been developed and described, which allows exploring possible options for the conversion of various contents. This method is productive and is used in the creative work of many scientists and inventors.
General summary of the Symposium. In the Russian philosophy Il’enkov (Il’enkov, 1974) opposed two logics — dialectical and formal. The distinctive feature of formal logic was the manipulation of mental forms that were abstracted from the content, and by dialectical logic the logic of the unfolding content was understood. A meaningful understanding of dialectical logic formed the basis for the developmental learning (Davydov, 1986). RETHINKING AND INTEGRATING PARADIGMS FOR STUDYING THE ROLE OF DIALECTICAL THINKING IN ADULT DEVELOPMENT

Nikolay Veraksa
Russian Academy of Education (Moscow, Russia)

Michael Besseches
Suffolk University (Boston, USA)

Over the past five decades, the role of dialectical thinking in adult development has been a topic of increasing focus. Looking through the recent past and into the future, we see 1) dynamics of change operating increasingly rapidly at many levels 2) increasingly frequent encounters among contradictory perspectives and contradictory socio-cultural-political, technological and environmental forces, and 3) increasing challenges of claims to “universally certain knowledge,” thus expanding the realm of “uncertainty.” These trends suggest that the importance of dialectical thinking to adult development will only increase in the future. Two paradigms for understanding dialectical thinking became differentiated as further studies were conducted. One was based on the interpretation of dialectical logic as a process of developing thought content (Davydov, 1972; Il’enkov, 1974) and another on the interpretation of dialectical logic as a system of special operations and thought forms (Veraksa, 2006; Zadadayev, 2012; Shiyan, 1995). Both approaches led to productive research histories. The first paradigm formed the basis for the development of developmental learning (Davydov, 1986; Elkonin, 1994). The second was successfully applied in the education of children and adults (Veraksa, 2000, Shiyan, 2005). Most research outside Russia on dialectical thinking as a phenomenon of adult development can be considered broadly “neo-Piagetian” in that it starts from an apparent limitation of Piaget’s stage theory. Formal operational thinking was equated with “mature thought” (Inhelder and Piaget, 1958); Yet Piaget’s own theory of the process of individual development relied on a dialectical model. In his later work Piaget began to address this limitation of his stage theory by studying processes that continue to stimulate cognitive development after the stage of formal operations is reached. Klaus Riegel (1973), in his proposal of dialectical operations, took the tack of challenging Piagetian stages by claiming that they “describe(s) thought in its alienation from its creative, dialectic basis”. In contrast, Basseches (1984) made an explicit philosophical and psychological case for understanding dialectical thinking as a post-formal-operational level of cognitive organization.
THE APPLICATION OF “METATHINKING” TO ANALYSE AND INFORM CONTEMPORARY DISCOURSE ON “DIGITAL TRANSFORMATION”

Nikolay Veraksa
Russian Academy of Education (Moscow, Russia)

Nick Shannon
(London, United Kingdom)

Bruno Frischherz
Lucerne University of Applied Sciences and Arts (Lucerne, Switzerland)

The subject of “Digital Transformation” is a prominent and recurrent theme in contemporary discourse about the challenges facing organisations worldwide. The topic appears regularly in the articles produced by the top business schools and business consultancies and is debated in major global conferences such as the World Economic Forum. Estimates of the failure rate for digital transformation projects run as high as 84% (https://www.forbes.com/sites/brucerogers/2016/01/07/why-84-of-companies-fail-at-digital-transformation/#6a7720de397b). How organisational leaders think about carrying out digital transformation is therefore worthy of research.

Purpose: We analyse current discourse on Digital Transformation using an approach we describe as “Metathinking”. Metathinking examines the content of discourse with reference to Ken Wilber’s Integral Model (AQAL) and the form of such of discourse with reference to our model of 4 dialectical thinking modes (adapted from a framework established by Basseches (1984) and Laske (2006)). We aim to show that such discourse typically misses perspectives and ways of thinking about the subject that limit the success of digital transformation projects. We take a cross section of articles on the subject of Digital Transformation, a panel discussion involving the CEOs of 5 multi-national organisations, and an interview with an ex-CIO and specialist consultant on Digital Transformation and analyse each to show the content of thinking and thinking processes involved. We demonstrate the method of analysis and show how we obtain results. We show that discourse and debate on the subject of Digital Transformation is frequently too narrowly focused on specific areas and that thinking that is applied is typically deficient in terms of the dialectic thinking modes that are applied. We conclude that a more holistic approach both in terms of the content and form of thinking about the subject would increase the likelihood of successful digital transformation. We offer three different forms in which we can present our work.

1. A formal presentation. 2. A presentation with exercises for participants to participate in the analysis. 3. A workshop in which participants experience our methods and debate the results.
**DEVELOPMENT OF PROFESSIONAL THINKING OF STUDENTS OF TEACHING PROFESSIONS BY MEANS OF POSITIONAL TRAINING SYSTEM**

Nikolay Veraksa  
*Russian Academy of Education (Moscow, Russia)*

Igor Shiyan  
*Moscow City University (Moscow, Russia)*

One of the main goals of professional training is preparing professionals, whose competencies could meet the challenges of the practice. Positional training (Veraksa 1994) technique was designed as a method for development of professional thinking as well as the ability to analyze complex scientific content. In the process of specifically organized training an acquisition of a system of means takes place, the means that allow understanding the structure of content area that is being studied. Structural dialectical approach (Veraksa 1991) represents the methodological base for positional training which sets as a goal the development of dialectical thinking (as a system of special mental actions) making possible the analysis of phenomena of development through distinguishing the relations of opposition within the content. In particular, the foundation of dialectical methodology is formed by the idea of a science as of a developing subject. Therefore dialectical thinking is required in order both to understand content area and master the ability to act productively within scientific space.

Dialectical thinking is defined as an ability to create new and solve problems emerging in the changing world. The following stages of students’ professional development were named in accordance with the technique main provisions: 1. Organization of joint-divided activity (introduction to the potential of application of individual means for the analysis of subject content on the external level), 2. Acquisition of a system of means with their transferring to the internal level (activity obtains personalized character), 3. Analysis of educational systems, and 4. Design of educational systems. We designed and held a research for the potential of positional training as a mean of development of students’ dialectical thinking and their acquisition of specific mental means for analysis and handling of scientific content. We used the performance of three 1st year groups from the Institute for Teaching and Psychology of Moscow City University in the framework of “General Psychology” course as research material.
THE RELATIONSHIP BETWEEN DIALECTICAL THINKING AND THE ABILITY TO RESOLVE CONFLICTING SITUATIONS IN CHILDREN OF DIFFERENT AGE

Nikolay Veraksa  
*Russian Academy of Education (Moscow, Russia)*

Anastasiya Belolutskaya  
*Moscow City University (Moscow, Russia)*

At the beginning of the 21st century the ability to resolve conflicting situations productively is becoming one of the most demanded both in the labor market and in modern social life. The ability to find solutions in problem-contradictory situations covers a number of fundamental mental properties, the key of which is the so-called “creative” thinking. In the scientific psychological literature there are more than a dozen terms to define this phenomena. It should be noted that many foreign and domestic researchers recognize that the “dialectical” way of thinking may be considered as a factor contributing to a high capacity for intellectual creativity. The key foreign researchers of dialectical thinking are: K. Riegel, M. Besseches, O. Laske, O. Robinson, and others. In Russia, a structural-dialectical approach is being developed, where the formation of dialectical thinking is considered as a separate line of cognitive development, originating in preschool age. The hypothesis of the study is that dialectical thinking is significantly positively associated with the ability to resolve problematic situations productively by children of different ages. Sample: the schoolchildren of the first grade (School No. 514, 69 respondents) and high school students (school No. 1448; 80 respondents) Methods: methods of diagnosing dialectical thinking “What can be at the same time?” (N.Veraksa), “Unusual tree” (N.Veraksa); method of diagnosing the ability to resolve problem situations “Heroes in the city” (A.Belolutskaya) Results: Significantly positive correlation coefficients were obtained. In the case of primary school students, \( r = 0.42 \) for \( n = 69 \) (\( P < 0.01 \)); in the case of high school students, \( r = 0.39 \) with \( n = 80 \) (\( P < 0.01 \)). Thus, the hypothesis about the connection of dialectic thinking and the ability of productive resolution of problem situations by children of different ages was confirmed. The findings suggest that it is necessary to develop educational programs for the development of dialectical thinking for children of different ages.
DIALECTIC STRUCTURES AS A RESOURCE OF COGNITIVE AND EMOTIONAL DEVELOPMENT AT DIFFERENT AGES

Tatiana Chernokova
Northern (Arctic) Federal University named after M.V. Lomonosov (Severodvinsk, Russia)

Nina Bagdasarova
American University of Central Asia (Bishkek, Kyrgyzstan)

Tatyana Artemyeva
Institute of Psychology and Education Kazan Federal University (Kazan, Russia)

Abstract body. Dialectical thinking is understood as a special cognitive structure that allows operating with opposites, detecting the structure of opposites in reality and solving problems containing contradictory situations. The symposium will discuss the relationship of dialectical thinking with other aspects of cognitive development in children of preschool age, the relationship of dialectical thinking with solving emotional contradictions, methods of amplifying dialectical thinking in preschool children and adults.

Press paragraph. Olga Shiyan presents the results of a formative experiment on the amplification of dialectical thinking in younger preschoolers. The report of Angela Brandão is dedicated to the project of researching the possibilities of developing dialectical thinking in people over 55 years old. Chernokova Tatiana explores the place of dialectic structures in the general cognitive development of children of preschool age. Artemyeva Tatyana describes the results of the study of dialectic structures as cognitive mechanisms of humor. Nina Bagdasarova considers dialectical thinking as a tool for solving emotional contradictory situations.

General summary of the Symposium. The theoretical basis of research is the idea of dialectical thinking as a special cognitive structure based on dialectical logic. Participants in the symposium are based on different models of dialectical thinking. The first model goes back to the works of Riegel and Basseches and considers dialectical thinking as a post-formal stage of cognitive development. The second model was proposed by N. Veraksa and considers dialectical thinking as an independent, independent from the formal-logical line of cognitive development, manifested in children of preschool age. Both models are united by the idea of dialectical thinking as a mechanism for understanding systemic processes of development and a mechanism for transformation. Also in both models, dialectical actions are considered as units of dialectical thinking. O. Shiyan showed that a specially organized educational program stimulates the development of dialectical thinking in children 3-5 years old. Angela Brandão proposes a cognitive stimulation program aimed at developing dialectical thinking in people over 55 years old. The aims of this study are not only to characterize a population of older adults without significant cognitive deficits, but also to use the measures to assess the effect of the program. T. Artemyeva will present the results of a study of children's understanding of humor and the creation of humorous stories and the role of dialectical thinking in this process. Tatiana Chernokova will present a correlational study of the relationship between formal logical thinking, dialectical thinking and metacognition in preschool age. Nina Bagdasarova will analyze the dialectical mechanisms in the emotional development of a person, the role of dialectical structures in solving emotional conflicts.
POSSIBILITIES OF AMPLIFICATION OF DIALECTIC THINKING IN 3-5 YEARS OLD CHILDREN

Olga Shiyan
Moscow City University (Moscow, Russia)

Dialectical thinking is a cognitive structure that allows one to efficiently operate with opposites (Basseches, 1984, N.Veraksa, 2005). In accordance with the framework proposed by N.Veraksa (N.Veraksa, 2005) dialectical thinking is the separate line in cognitive development and develops in preschool age in parallel with the development of formal logic. In previous studies (Shiyan O.A., 2017) the possibility of amplifying dialectical thinking in children of 5-7 years has been proven. The key question of this study is: what are the possibilities of amplifying dialectic thinking in children of preschool age (3-5 years old) as part of a specially designed educational program. We analysed the dialectical transformation and sensitivity to opposites in children 3-5 years old. The study involved preschoolers control group: 34 children in the control group and 46 children in experimental group. In the experimental group, we analyzed the developmental processes with children, taught them to discover the relationship of opposites in the outside world.. The formative experiment went on for 6 months. We obtained the following results after the completion of the formative study. In the development of the dialectical transformation significant differences were found in the experimental group (t-criterion 4.6), but no significant differences were found in the control group. In the development of the sensitivity to contradictions significant differences were found in the experimental group in children 3–4 years old (t-criterion 3.3), but no significant differences were found in the experimental group in children 4–5 years old, as well as in the control group. However, in the experimental group in children 4–5 years old, a greater number of responses holding two pairs of opposites were found. Thus, the possibility of amplifying the dialectical transformation and sensitivity to contradictions in younger preschoolers was proved. In the future, it is important to analyze how different acts of dialectical thinking are related in children of preschool age: transformation, mediation, etc.
In the field of adult development, there are several conceptual frameworks that describe different ways of conceptualizing developmental issues in adults. One is the analysis of different forms of organization of thought. This framework allows us to describe the developmental movements of individuals as, through series of steps, new more complex and adaptive organizations of thought emerge that hierarchically integrate earlier organizations of thought, transforming the ways individuals understand the world. Dialectical thinking (Basseches, 1984) is a proposed organization of thought based on use of a model of dialectic, defined as "developmental transformation (movement through forms) that occurs via constitutive and interactive relationships."(p.22).

Using this model of dialectic allows adults to analyze interacting open self-transforming systems, both including organizations of ideas of facts within which the concepts of truth and falsity are meaningful but which are susceptible to contradiction and change that may arise as people, communities and cultures interact. Dialectical thinking has been gaining increasing importance in understanding the development of capacities to deal with incongruities and change in adulthood. Previous studies have demonstrated an effect of dialectical thinking in various cognitive domains as well as personality traits related to the self. However, despite the growing interest in the study of dialectical thinking, the knowledge of the brain regions involved in this type of thinking still remains largely unexplored. Based on the foregoing, we intend to design a study of how a program of cognitive stimulation influences the development of dialectical thinking in adults aged 55 years and older. This cognitive stimulation program includes challenges and/or stories that portray contradictory information that could stimulate the development of dialectical thinking. This study will use three types of measures, before and after the cognitive stimulation program — a measure that analyzes forms of thought used, a measure of personality, and a psychophysiological measure using functional magnetic resonance imaging (fMRI). The aims of this study are not only to characterize a population of older adults without significant cognitive deficits, but also to use the measures to assess the effect of the program.
DIALECTIC TRANSFORMATIONS IN THE HUMOR OF CHILDREN

Tatyiana Artemyeva
Institute of Psychology and Education Kazan Federal University (Kazan, Russia)

Humor is a complex phenomenon that includes many psychological functions: cognitive processes, emotions, and communication, which manifest themselves in various social and cultural contexts. Comic texts are intellectual tasks of a special kind. The function of the comic component is not only entertainment and the creation of a favorable emotional background, but also the creation of a kind of an obstacle that violates the logic of the task. The content analysis of funny stories composed by preschool age children allowed us to highlight the actions involved in the creation of comic content and develop a methodology “Funny stories” for diagnosing humor in children. We carried out an empirical study using this technique and the “Dialectic Actions” technique (Shiyan I.B.) and revealed the interrelations between the action of transformation and closure (r = .46); alternative change (r = .39) (p = 0.01), however, no relationship was found between the indicator according to the “Coloured Raven Progressive Matrices” method and the actions involved in creating humor. Was used to study dialectical actions (Bayanova L.F.); “Dialectical stories” (Shiyan I.B.); sensitivity to contradictions was studied using the scale of coping with humor and the subtest “Sequential pictures” by D. Wexler. Correlational research has confirmed our assumption that the actions of dialectical thinking are involved in the understanding of comic, contradictory situations. We found significant direct correlations (p = 0.01) between humor and the dialectic action of association (r = .82), the dialectical action of the content seriation (r = .70), and the dialectical action of the alternative (r = .53). The carried out studies indicate the involvement of the dialectical thinking actions in the understanding of the comic text contradictions. The importance of the study lies in the fact that by offering children different versions of conflicting tasks, it is possible to develop children’s curiosity, the desire to solve mental tasks that require the reflection of complex hidden links and relations between objects, to teach how to find creative solutions.
METACOGNITION IN THE STRUCTURE OF INTELLIGENCE OF PRESCHOOL AGE CHILDREN

Tatiana Chernokova
Northern (Arctic) Federal University named after M.V. Lomonosov (Severodvinsk, Russia)

The problem of the structure of intelligence is of great theoretical and practical importance. Its solution determines the strategy of diagnostic methods application and conditions for the development of intelligence. We propose to include three types of abilities in the structure of intelligence: 1) cognitive abilities that provide the mastering and application of knowledge; 2) creative abilities that ensure the transformation of mastered knowledge; 3) metacognitive abilities that provide self-regulation of the cognitive process (gnostic goal-setting; analysis of conditions for activity; programming of cognitive actions; self-control). The psychological literature presents inconsistent data on the correlation between these components of intelligence. Our research belongs to the structural-dialectical approach (N.E. Veraksa). We suggest that creative and metacognitive abilities can be formal and dialectical in their focus. This becomes evident already in preschool age. The purpose of research is to discover the correlation between metacognitive, cognitive and creative abilities. To study cognitive abilities of preschool age children, we used the Wechsler method tests designed to diagnose formal thinking. To study creative abilities, we used the method of N.E. Veraksa "What could be at the same time?" designed to diagnose dialectical thinking of children. To study metacognitive abilities, we used the method presenting a problematic situation: the child had to set a cognitive goal, establish conditions for its achievement, make a plan of actions and monitor the results. The Pearson criterion was used to identify the correlation of studied parameters. 42 children 5-6 years of age were examined. The results indicate the ambiguity of relations between cognitive, metacognitive and creative abilities. No children with a balanced profile of studied abilities were identified in the experimental group. Notable correlations within metacognitive abilities were found: r=0.50; 0.60; 0.57, p=0.01. This confirms that metacognitive abilities represent a single system. Correlations between indicators of the formal logical thinking and metacognition (analysis of conditions for activity; programming of actions; self-control) are moderate (r=0.43; 0.33; 0.37). Correlations between indicators of dialectical thinking and cognitive and metacognitive abilities are negative. The absence of close correlations can be explained by the fact that initially diffuse systems become more differentiated in the senior preschool age.
This is one of the oldest and still very important tasks of methodology of Psychology to find out bridges between different concepts and approaches that still seem incompatible after more than a hundred years of development of psychological thought. It was in early 1930s when Vygotsky wrote about crisis in Psychology showing that it is very difficult (if not completely impossible) to compare Psychoanalysis and Behaviorism and both of them with Gestalt psychology. Since that time the boundaries between some approaches may look wider though some of new ideas might provide one with some insights of certain similarities between different scopes of psychological studies. It is very well known that soviet tradition of psychological theories is much more successful in the field of cognitive and educational studies than in the part concerning emotions and issues of personal distress and therapeutic methods. Moreover it is important to show the common concepts between pure cognitive approach based on activity theory which is structural dialectical approach in psychology (Veraksa et al, 2013) and Freudian Psychoanalysis rooted and oriented mostly in psychotherapeutic practice. It is Freud himself who started considering Unconscious as a highly organized part of human psyche and described similar structures within "dream work" (in "Interpretation of Dreams") and jokes (in "Jokes and Their Relation to Unconscious"). According to Veraksa and his followers the activity during this process contains mental acts that transform oppositions in different ways (ibid, pp.66-67). The results of these transformations are usually new types of understanding or vision of situation or definite task. The descriptions of some of these mental acts are very similar to acts of Unconscious during dream work or joking provided by Freud. The act of “dialectical integration” repeats a structure of Freudian “concentration” and “dialectical transaction” repeats in a way classical “projection”. From this comparison following hypothesis arises: emotional contradictions might be solved by structural mechanisms that are identical to the cognitive activity of dialectical thinking. The presentation is aimed at analysis of dialectical thinking as a part of common unconscious structures.
INTERACTION BETWEEN A SIGNIFICANT ADULT AND A TODDLER: EVALUATION AND PSYCHOTHERAPY, CROSS-CULTURAL ASPECT

Irina Galasyuk
Tatiana Shinina
Moscow State University of Psychology & Education (MSUPE) (Moscow, Russia)

Sergey Kiselev
Ural Federal University (Yekaterinburg, Russia)

Olga Mitina
Lomonosov Moscow State University (Moscow, Russia)

Anna Varga
National Research University Higher School of Economics (Moscow, Russia)

Abstract body. Observing mother-child interaction made it possible for scientists to define a significant feature of parent behavior related to the dynamics of frequency and intensity of reactions of the significant adult to a child’s signals, called ‘parent responsiveness’. Contemporary research has evidenced that the responsiveness influences neurocognitive functions including speech and regulative functions. Dynamical features of behavior in the dyad during interaction are very significant. A non-linear dynamic model evaluates the responsiveness of the significant adult in the course of interaction with a toddler. The discussion of the longitudinal research provides an opportunity to define the microdynamics of the responsiveness of the significant adult during the growth of the child. The study of the interaction in the ‘significant adult — child’ dyad brings about the interest towards a comparison of behavioral manifestations of the adult in respect of the child in various cultures.

Press paragraph. The Symposium focuses on the discussion of psychological features of the interaction in the ‘significant adult — toddler’ dyad as a determining factor of a child’s development at early stages of ontogenesis. The Symposium includes five oral presentations by the leading scientists from Russian and Vietnamese universities. 1) Non-linear dynamic model of evaluation of responsiveness of the significant adult in the course of interaction with a toddler Galasyuk Irina (Moscow State University of Psychology and Education) and Mitina Olga (Lomonosov Moscow State University) 2) Cross-Cultural Specifics of Interaction Between a Significant Adult and a Child in Russia and Vietnam Anna Shvedovskaya, Irina Galasyuk, Tatiana Shinina (Moscow State University of Psychology and Education) and Nguyen Thi Hang, Nguyen Tuyet Lan (National Pedagogical College of Nha Trang, Vietnam) 3) Longitudinal study of toddlers: parental responsiveness and developmental crises of a child Kiselev Sergey, Lavrova Maria, Suleymanova Ekaterina (Ural Federal University, Laboratory for Brain and Neurocognitive Development) 4) Diagnosis and correction of interaction in the “foster parent — child” dyad using video surveillance Anna Varga, Oksana Pasecnik, (Higher School of Economics) 5) Markers of child communication signals: behavioral aspect Shinina Tatiana (Moscow State University of Psychology and Education) and Mitina Olga (Lomonosov Moscow State University).

General summary of the Symposium. Introduction In early childhood, a child’s brain is especially responsive to any and all external factors. The influence of a significant adult is the primary external factor modulating the neuron network of the brain and laying down cognitive, emotional, and social patterns. The significant adult’s ability to flexibly react to the child’s mental evolution determined by its growth and crisis stages of development may contribute to the child’s cognitive and socioemotional development. Cultural specifics of the manifestation of the significant adult’s responsiveness to the child’s...
communicative signals are a matter of interest. Objective Researching the influence of a significant adult’s responsiveness on a toddler’s neurocognitive and socioemotional development with respect to cultural specifics of the behavior of the significant adult. Research Questions 1) The system of indicators of the significant adult’s behavior enabling the evaluation of the interaction dynamics. 2) Markers of the toddler’s communication signals during interaction with the significant adult and an object. 3) Defining the mechanisms of the influence of interaction with the significant adult on neurocognitive and socioemotional development of the child in various cultural contexts. 4) Comprehensive study of parent responsiveness and early development of the child using instrumental and behavioral experimental paradigms. 5) Diagnostics of parent-child interaction in substituting families using video surveillance before and after the intervention. The symposium is a platform for the discussion of factors determining neurocognitive, socioemotional and communicational development of toddlers. Participants will discuss models of interaction between the toddler and the significant adult with regard to the specifics of social environment, indicators of the child’s neurocognitive and socioemotional development, and behavioral patterns of the child and the adult during their interaction.
DEVELOPING AND APPROBATION SYSTEM OF INDICATORS FOR EVALUATION THE SIGNIFICANT ADULTS’ RESPONSIVENESS TO TODDLER’S COMMUNICATION SIGNALS

Irina Galasyuk
Moscow State University of Psychology & Education (MSUPE) (Moscow, Russia)

Olga Mitina
Lomonosov Moscow State University (Moscow, Russia)

In early childhood, child’s brain is most sensitive to any external factor. The influence of the significant adult is the primary external factor modulating the neuron network of the brain and laying down cognitive, emotional and social patterns (Bowlby in Callaghan & Tottenham, 2016). In the cultural-historical and activity paradigm, the interaction between significant adults and the modes of intellectual activity, guided by adults, determine the zone of proximal development of a child (Vygotsky, 2002; Elkonin, 1995). According to contemporary studies, the quality of communication signals by the significant adult affects the development of child’s emotional phenotype that can last throughout one’s lifetime (Casey, 2017; Gee, 2016; Gee et al, 2014; Tottenham, 2015; Gabar-Durnam et al, 2016). Hence we suggest there is a need to assess qualitative features of the interaction process and to standardize the behavioral indicators of the significant adult during communication with a child. Our theoretical analysis yielded indicators of responsive behavior of the significant adult that we tested in a research using video recordings (Galasyuk, Shinina, 2017, 2019).

Aim. The research aimed to develop and approbation system of indicators for evaluation the significant adults’ responsiveness to toddler’s communication signals during spontaneous play time. 55 families raising children under 3 years old took part in the research.

Methods. Responsiveness of the significant adult was assessed by the Evaluation of Child-Parent Interaction (ECPI) method. The data from the analysis of video recordings were processed by Observer XT-14 software enabling dynamic visualization of behavioral characteristics of respondents.

Results. Principal component method helps to extract 4 factors for indicators of parental responsiveness. 1st factor (Teaching): the parent is focused on the education of the child, takes a directive position. 2nd factor (Ignoring): the parent does not respond to the needs of the child. The emotional background of communication is mostly negative. 3rd factor (Engaging): the parent responds to the needs of the child in a timely and adequate manner, reflects on the emotions of the child and expresses them verbally. 4th factor (Sensitive): the parent demonstrates nonverbally positive emotions, positively comments on the actions of the child without criticizing him, sincerely praises the child.

Conclusion. The research resulted in a system of indicators for the significant adult’s behavior, allowing us to evaluate the interaction dynamics and define the character of relation between significant adult’s and child’s behaviors during the play.
PARENTAL RESPONSIVENESS DURING THE CRISES OF THE INFANT’S FIRST YEAR

Irina Galasyuk  
Moscow State University of Psychology & Education (MSUPE) (Moscow, Russia)

Maria Lavrova  
Ekaterina Suleymanova  
Ural Federal University (Yekaterinburg, Russia)

The parents’ ability to respond flexibly to child’s mental changes which associated with age development and crisis stages of development can contribute to the cognitive, social and emotional development of the child. The aim of the research was to describe the parent’s behavior and the child’s cognitive and socio-emotional development in a case study. 2 cases included in the longitudinal project of the Laboratory for Brain and Neurocognitive Development. The Evaluation Child-Parent Interaction method was used for the analysis of parent responsiveness (Parent Responsiveness Indicator Protocol). Bayley Scales of Infant Development Third Edition, Bayley-III was used to assess cognitive, communicative, social-emotional development and adaptive behavior. The parents signed an ethical agreement, which included the point about presentation of the results for discussion in the scientific community. In cases were described the mothers and premature infants interactions at 12 months-age (adjusted age) according components: affective, physical, cognitive, effective. As a result of data processing 2 schemes of parental responsiveness were presented. And it included qualitative and quantitative characteristics. Accordingly, the children’ indicators of cognitive, communicative, motor development were presented. As well as indicators of social and emotional development and adaptive skills of the child. Problems in parenting are associated with the child’s attempt to use new opportunities due to age-related new mental formations. The child tests new abilities and explores new possibilities of the situation, while parents often try to restore balance old proven methods and means. Thus, the question arises about the need for an adult to have knowledge about the nature of the changes occurring with the child, the skill of analyzing their behavior and appropriate actions. Limitations of the study is the consideration of a single case, but such an analysis of parent-child behavior can be used in practice to correct the behavior of the parent, and further accumulation of longitudinal research data will determine the mechanism of influence of parent-child interactions on cognitive and socio-emotional development.
The aim of the study was to understand the factors defining neurocognitive, socio-emotional and communicative development during early childhood, considering culture-specific contexts of development to use them in building diagnostic tools and intervention programs. The study evaluated the behavioral degree of responsiveness of the significant adult (RSA) to toddler communicative signals in a culture-specific context (of Russia and Vietnam). The study revealed the dynamics in the mutual development of socio-emotional and cognitive systems under the influence of RSA on communicative cues of the child.

Methods: 1) Evaluation of Child-Parent Interaction (ECPI) – diagnosis of parental responsiveness to communicative signals of toddlers in the process of spontaneous play using video surveillance; 2) Observer XT – video recording of respondents’ behavior: frequency and duration of RSA communicative signals; quantitative characteristics of each indicator of the RSA and the communicative signals of the child.

The longitudinal study of early child development using instrumental and behavioral experimental paradigms providing four metrics of child’s development and the RSA during the period from 10 to 36 months (at 10, 14, 24 and 36 months). It offers a unique opportunity to examine micro-dynamics of changes in the RSA and its role in early childhood development with regard to cultural specifics of adult behavior in Russia and Vietnam. Sample for the one-year research included a group of children from Russia (25 girls and 25 boys) and a group of children from Vietnam (25 girls and 25 boys).

The results of the study include building the model interaction in the ‘significant adult – child’ dyad, the system of behavioral indicators to evaluate this interaction and the typology of socio-cultural characteristics of adult behavior that affect the neurocognitive and socio-emotional development of the child.

This study gives better understanding of the nature of development of child’s mind and brain, and also brings new perspectives in designing methods of monitoring child’s risks of atypical development and providing timely intervention programs.
The number of adopted children being returned to state institutions by their foster parents is rising. Main causes include interactional difficulties between foster parents and adopted children. The decision to return an adopted child to the orphanage is traumatic for both sides. The child is experiencing the attachment trauma and foster parents have feelings of powerlessness and incompetence. The systemic work with foster families is required. Traditional evaluation methods (questionnaires and tests) fail to identify problem areas in parent-child interaction. One needs to develop a set of psychological tools to involve parents in evaluation, in discovering the reason for the difficulties in parent-child interaction and to participate in corrective activities.

Aim. To describe the entire cycle of psychological work through the example of one foster family, which includes a diagnosis of parent-child interaction using the video surveillance before and after the intervention. Socio-demographic characteristics of the client: Woman, 39, higher education, teacher, unmarried. She has a three-year-old foster child adopted one year ago. Client’s queries: The client cannot control her aggression towards the foster child, feels guilty for using physical punishment; complains about child’s disobedience and frequent hysteric.

Methods. Evaluation of Child-Parent Interaction (ECPI). Discussion of video materials with the foster parent according to Parent Council techniques. Parent-Child Interaction Training (PCIT) aimed at changing parent responsiveness to child’s communicative signals to correct undesirable behavior of the child.

The data from the analysis of video recordings were processed by The Observer XT software allowing to visualize the characteristics of interaction in the parent – foster child dyad in the dynamics of therapeutic process.

Results. 1) Reduced parent’s anxiety and distress levels and sense of guilt. 2) Building and strengthening emotional contact with the foster child. 3) The foster parent realizing her resources and growth points in interaction with the child.

Discussion. The research into foster parent – child interaction involves certain difficulties stemming from foster parents’ fear to appear incompetent and risk facing administrative implications. Using video recording of parent-child interaction and subsequent discussion of co-influence of behavioral patterns of both parties helps enhance the effectiveness of psychotherapeutic work to stabilize family system.
Rapid developments in modern society and the use of digital technologies in communication with children of toddler years demand scientific examination and the search for new ways of assessing parent-child interaction. Abroad, we observe a current surge in research activities focusing on studying the interaction by video recordings and observation scales. The NCAST (Nursing Child Assessment Satellite Training) evaluation of parent-child interaction studies the ability to produce clear and clean signals to adults (Thomas J.C., Letourneau N., Campbell T.S., Tomfohr-Madsen L., Giesbrecht G.F, 2017). The MACI (Manchester Assessment of Caregiver-Infant) scale notes child behavior by three variables: a child’s attentiveness to a parent, the child’s positive affect, and the child’s vivacity (Green J., Pickles A., Pasco G., Bedford R., Wan M.W., Elsabbagh M., Slonims V. et al., 2017). In Russia, the approach developed at the School of Ontogenesis of Communication by Maya I. Lisina (Lisina, 1986, 2009; Smirnova, Galiguzova, Ermolova, Meshcheryakova, 2002) ranks among the most advanced and sophisticated methods of standardized observation of adult-child interaction. To evaluate child’s communication signals during spontaneous playing with an adult, we designed observation indicators for coding behavior when watching video recordings.

Aim. Researching toddler communication signals during spontaneous playing to build a scale and define the dynamics of the intensity of the signal to the significant adult.

Methods. Toddler communication signals were assessed using the Evaluation of Child-Parent Interaction (ECPI) technique (Galasyuk, Shinina, 2017, 2018). The research spanned over 55 families with toddlers and included ethical conventions with parents. The data from the analysis of video recordings were processed with Observer XT-14 software. Age features enable us to define two main lines of toddler behavior aimed at communication with adults and at substantive activity. Toddler behavior was coded in two ways. First, for Child-Object Communication Signals, five indicators for the evaluation of a toddler’s independent investigative activity towards an object were suggested. Second, Child-Object-Adult Communication Signals were examined using five indicators for the evaluation of a child’s signals aimed at interaction with an adult. The research shows the effect of responsiveness of the significant adult on a child’s being independent and initiative, and on the intensity of the crisis of three years.

Results. The research resulted in the creation of a principal component method, which helps to define 3 factors for the child’s behavior: 1st factor is exploring objects; the 2nd factor is interacting with adults; and the 3rd factor is alienated from adults. It makes possible the evaluation of the intensity of toddlers’ signals and provides a model for the analysis of the dynamics of “toddler communicational behavior” in interaction with the significant adult.
INTERFACES BETWEEN NEUROCOGNITIVE SYSTEMS IN LANGUAGE ACQUISITION AND USE: MULTIMODAL STUDIES OF SPEECH AND LANGUAGE

Yury Shtyrov
Aarhus University (Aarhus, Denmark)

Olga Shcherbakova

Mikhail Pokhoday
National Research University Higher School of Economics (Moscow, Russia)

Abstract body. We present a symposium covering a broad range of psychological, psychophysiological and neurobiological investigations of speech and language function. It aims chiefly at addressing cross-modal and cross-domain interactions in the process of language use and acquisition. Combined, our speakers will: (1) discuss a range of psycholinguistic information processing types, most importantly lexicon, lexical semantics, syntax, language learning and cross-linguistic interactions in bilingualism, (2) showcase a range of research methods, including behavioural psycholinguistic measures, eye-tracking, electrophysiology (EEG, MEG, TMS, tDCS), and structural imaging (MRI/DKI), (3) explore psycholinguistic processes in different test languages, which will include at least English, Russian, Danish and Finnish. Together, the data presented speak to a high degree of interactivity in language acquisition and use between (a) different cognitive domains, (b) different modality-specific and domain-general systems, and (c) different languages of an individual, and make a strong case for a largely automatized character of these interactive processes.

Press paragraph. This is at international symposium with a diverse group of scientists working on language and cognition who will discuss a broad range of psychological, psychophysiological and neurobiological investigations of speech and language function. It aims chiefly at addressing cross-modal and cross-domain interactions in the process of language use and acquisition. Combined, our speakers will: (1) discuss a range of psycholinguistic information processing types, most importantly lexicon, lexical semantics, syntax, language learning and cross-linguistic interactions in bilingualism, (2) showcase a range of research methods, including behavioural psycholinguistic measures, eye-tracking, electrophysiology (EEG, MEG, TMS, tDCS), and structural imaging (MRI/DKI), (3) explore psycholinguistic processes in different test languages, which will include at least English, Russian, Danish and Finnish. Together, the data presented speak to a high degree of interactivity in language acquisition and use between (a) different cognitive domains, (b) different modality-specific and domain-general systems, and (c) different languages of an individual, and make a strong case for a largely automatized character of these interactive processes. Furthermore, they suggest novel strategies and techniques paving the way for improved interventions in language rehabilitation and novel practices in education and language training.

General summary of the Symposium. We present an international symposium covering a broad range of psychological, psychophysiological and neurobiological investigations of speech and language function. It aims chiefly at addressing cross-modal and cross-domain interactions in the process of language use and acquisition. Combined, our speakers will: (1) discuss a range
of psycholinguistic information processing types, most importantly lexicon, lexical semantics, syntax, language learning and cross-linguistic interactions in bilingualism, (2) showcase a range of research methods, including behavioural psycholinguistic measures, eye-tracking, electrophysiology (EEG, MEG, TMS, tDCS), and structural imaging (MRI/DKI), (3) explore psycholinguistic processes in different test languages, which will include at least English, Russian, Danish and Finnish. Together, the data presented speak to a high degree of interactivity in language acquisition and use between (a) different cognitive domains, (b) different modality-specific and domain-general systems, and (c) different languages of an individual, and make a strong case for a largely automatized character of these interactive processes. The symposium will feature 4 talks (submitted individually) by scientists from Aarhus University (Denmark), Northumbria University (United Kingdom), St. Petersburg State University (Russian Federation) and Higher School of Economics (Moscow, Russia): 1. Cross-linguistic interplay and bilingual advantage in late bilinguals Andriy Myachykov (Northumbria University, Newcastle- upon-Tyne, UK) and colleagues 2. Perceptual priming and syntactic choice in Russian language: multimodal eye-tracking study Mikhail Pokhoday (NRU Higher School of Economics, Moscow, Russia) and colleagues 3. Explicit and implicit acquisition of novel semantics: Evidence from EEG. Olga Shcherbakova (St. Petersburg State University, Russia) and colleagues 4. Formation of novel word representations in the brain tracked online using multi-modal neuroimaging Yury Shtyrov (Aarhus University, Denmark).
Humans can learn new language elements rapidly, an essential skill ensuring efficiency of our communication system. However, the neural bases of this important function are poorly understood. We review a body of our recent studies that addressed the brain mechanisms of online formation of representations for novel meaningless wordforms, new meaningful words as well as novel affixes. To register functional dynamics during the learning process, we used electro- and magnetoencephalography (EEG, MEG) to track memory circuit activation, manifest as enhanced brain responses to familiar morphemes. Furthermore, to tackle the causal role of the neurophysiological processes at hand, we used brain stimulation methods — transcranial magnetic and direct current stimulation techniques (TMS, tDCS) — to interfere with the cortical function during learning. Finally, we used novel structural MRI methods (diffusion kurtosis imaging, DKI) to query possible microstructural changes underpinning word acquisition. We find that frontotemporal neocortical circuits exhibit complex activation pattern changes in the process of acquiring novel representations. These chiefly become exhibited as a gradual increase in activation for novel representations. These effects are (1) largely independent of attention, reflecting automatised nature of initial word acquisition stages, (2) most efficient for native language, (3) present both immediately and after an overnight consolidation, (4) are found in acquisition of simple and complex words as well other morphemes, and (5) operate in both visual and auditory modalities. By using neurostimulation, we could show the role of modality-specific systems in the acquisition of semantics: e.g., stimulation of motor cortex using TMS affects learning of action-relation words. Modulating activity in the language network using tDCS has a non-specific facilitatory effect on learning, and may also specifically change the balance between the acquisition of concrete and abstract language. Finally, our microimaging experiments using DKI suggest rapid plastic changes taking place in the microstructure of a range of cortical areas within even a short (40 minutes) language learning session. To conclude, our brain is capable of a rapid formation of new cortical memory circuits online, as it gets exposed to novel linguistic patterns in the input. This becomes evident in functional and structural dynamics, and through causal relationships.
EXPLICIT AND IMPLICIT ACQUISITION OF NOVEL SEMANTICS: EVIDENCE FROM EEG

Olga Scherbakova

Margarita Filippova
Saint-Petersburg State University (Saint-Petersburg, Russia)
Evgeny Blagoveshchensky
National Research University Higher School of Economics (Moscow, Russia)

Two main learning strategies of word acquisition (implicitly (“fast mapping”, FM) or explicitly (explicit encoding, EE) supposedly differ in terms of their brain bases, but neural underpinnings of these learning types remain elusive (Greve et al. 2014; Merhav et al. 2015). We compared event-related potentials elicited in the brain of adults learning new wordforms in either FM or EE fashion, with the two tasks being matched for their cognitive load and the manner of presentation. We designed an experimental paradigm that combined images of familiar and novel objects with auditorily presented questions. Under the FM condition, the meaning of a new wordform could be inferred from the context. Under the EE condition, the novel image and the wordform corresponded explicitly with the task to learn this correspondence. All wordforms were balanced for linguistic features and counterbalanced across conditions. Ten novel words were presented in each condition to 12 healthy right-handed Russian-speaking volunteers; as a control condition, familiar words and images were used. All conditions were pseudo-randomised in a single sequence. ERPs elicited by passive listening of wordforms were recorded before and after the training session and then compared. Behavioral results showed no significant differences between successful learning of new wordforms in both FM and EE conditions. Auditory ERPs peaked at ~170, 250 and 520 ms indicating clear learning effects (ERPs elicited by familiar and novel wordforms diverged before training but became highly similar following the learning session). The topography of ERPs effects differed significantly between the FM and EE conditions in the early negativity at ~170 ms. For wordforms presented under EE condition, this topography displayed right-lateralised changes; for those presented in the FM condition, learning-related dynamics was distributed more centrally/left-lateralised. Analysis of cortical activity sources using LORETA suggested that the learning dynamics was underpinned by differentially lateralised activity in anterior temporal lobes of the two hemispheres as well as parietal and frontal areas. The results support the existence of two different neural learning mechanisms for word acquisition and suggest their differential distribution across the cerebral hemispheres. Supported by the grant of the Government of Russian Federation № 14.W03.31.0010.
Perceptual priming and syntactic choice in Russian language: Multimodal eye-tracking study

Mikhail Pokhoday
Andriy Myachykov
National Research University Higher School of Economics (Moscow, Russia)

Yury Shtyrov
Aarhus University (Aarhus, Denmark)

Perception provides an input of information about the event, attention foregrounds relevant/important information for the conceptual analysis, and subsequent language production mechanisms collaborate to generate speech (Levelt, 1989). A part of this complex process is the necessity to select between simultaneously available syntactic alternatives. Existing evidence suggests that the system responsible for assigning the grammatical roles is sensitive to the distribution of the speaker’s attention within the described scene (Myachykov, Pokhoday, Tomlin, 2018, for a recent review). This indicates a regular interplay between attention and syntactic choice, they also exclusively used variants of the visual cueing paradigm (Posner, 1980). As a result, the reported link between attention and syntactic choice cannot be generalised beyond the visual modality. A more ecologically valid proposal needs to take into account a multi-modal nature of attention. Participants (N=72 native Russian speakers (40 Females, M age: 23.1, SD=2.83)) described transitive events (Pokhoday et al 2018) following either (1) auditory, (2) motor or (3) visual lateral cues to (1) the agent or (2) the patient. Eye-movements and verbal responses were recorded. A within subjects, within-items design was used with Event Orientation and Cue Location manipulated on 2 levels (2x2).

Dependent variable — the proportion of cued referents assignment to the most prominent position in the sentence. Eye movements were recorded with EyeLink 1000+. Analysis — General Estimating Equations (GEE) Binomial Logit Model (SPSS 24). Experiment 1 a main effect of visual cue location: X²(1) = 4.15, p=.042. A main effect of event orientation: X²(1) = 3.91, p=.048. No interaction. Experiment 2 no effect of auditory cue. A main effect of event orientation: X²(1) = 5.23, p=.022. Experiment 3 Main effect of Cue Location: X²(1) = 4.04, p=.04. No effect of Event Orientation: X²(1) = 0.1, p=.99. No interaction. Overall these results as well as our English language experiments suggest an existence of a hierarchy in effects of modality of primes on syntactic choice with an interesting addition that Russian speakers tend to be more affected by event orientation than their English-speaking counterparts.
CROSS-LINGUISTIC INTERPLAY AND BILINGUAL ADVANTAGE IN LATE BILINGUALS

Andriy Myachykov
Northumbria University (Newcastle-upon-Tyne, United Kingdom)

Nikolay Novitskiy
The Chinese University of Hong-Kong (Hong-Kong, China)

Anna Petrova
Yury Shtyrov
National Research University Higher School of Economics (Moscow, Russia)

The mechanisms underlying second language learning remain at the center of research in psychology, linguistics, and neuroscience. On one hand, research continues to illuminate the interplay between the linguistic codes co-existing in a bilingual mind. On the other hand, research has indicated that speaking more than one language leads to potential advantages related to cognitive control, memory, and healthy ageing. However, while a vast majority of bilingual speakers acquire their L2 knowledge later in life, existing research often focuses on studying early/balanced bilinguals. In this presentation, we will discuss our recent behavioural and neurophysiological data, which offer new evidence about the cross-linguistic interplay and cognitive control in late/unbalanced bilinguals. First, we will present the results of an EEG study showing phonological and semantic interplay between L1 and L2 lexicons: By using a masked priming paradigm with L1 (Russian) priming words and L2 (English) targets we demonstrated a joint phonological and semantic overlap between L1 and L2 lexicons manifested as a modulation of the N400 amplitude as a function of L2 proficiency. Second, we will present the data from a behavioural study using Attention Network Task (ANT), which reveals an overall better conflict resolution with the increase in L2 competence further confirming a regular correspondence between late bilingualism and improvements in cognitive control. Third, we will present results from a preliminary small-scale MRI study, which documents a cortical volume increase in the left hemisphere's language-related areas of L2-learners: By using Voxel-based morphometry (VBM), we registered brain matter increase in two cortical clusters in the left hemisphere (the inferior frontal (BA11) and fusiform (BA20) gyri) suggesting that second language learning may be associated with increased cortical plasticity in the areas associated with cognitive control (orbitofrontal) and visual word form processing (left fusiform gyrus).
PROBLEMS AND METHODS OF PSYCHOPHYSICS

Irina Skotnikova
Institute of Psychology Russian Academy of Sciences
(Moscow, Russia)

Alexey Gusev
Lomonosov Moscow State University (Moscow, Russia)

Abstract body. The symposium includes presentations on 4 main topics. a) Perception of complicated “real life objects” (Zhegallo) and significance of an observer’s own variables in sensory performance: distribution of attention during circular rotations of 3D objects (Losik et al.), personality factors in decision optimality criterion choices in psychophysical tasks (Golubinov), development of subject-oriented psychophysics of sensory tasks (Skotnikova, Gusev, Emelianova, Volkova). b) Clinical studies: perception restoration after brain damage (Elliott), time perception in autism disorders (Sysoeva), contrast sensitivity in schizophrenia (Shoshina), visual discrimination under dental stress (Zabrodina). c) Mathematical modeling and multiple objects perception: Bayesian model of decision making and confidence in sensory tasks (Shendyapin), perception of single and multiple contour orientations (Sawada), theory of stimulus bisection turning in the frame of Inner Psychophysics (Lubashevsky). d) Developmental and Animal Psychophysics: discrimination thresholds and habituation in newborn infants and fetuses (Tristao), fish’s differential chemo sensitivity (Selivanova), body perception in different animal species (Khvatov), reptiles’ visual discrimination (Zhelankin).

Press paragraph. 1. Elliott Mark – Ireland’s psychophysicist and clinical psychologist, studies visual perceptual functions and their cortical (EEG) and neural mechanisms after brain damage, in schizophrenia, autism disorders and psychosis. 2. Losik George – Belarusian psychophysicist and psycho physiologist, develops his teacher’s Professor E.N. Sokolov’s vector theory of visual perception and subjective spaces, works in the fields of informatics and artificial intelligence as well. 3. Sawada Tadamasa – Japanese psychophysicist and mathematical psychologist, studies decision making, visual perception, in particular of multiple objects, now works at the National Research University “Higher School of Economics”, School of Psychology. 4. Skotnikova Irina, Gusev Alexey – Russian psychologists, at present leaders of a theoretical approach in psychophysics which helps to extend its borders and move from psychophysics of “pure sensations” in “an ideal observer” to psychophysics of a real observer’s performance in sensory tasks. 5. Tristao Rosana – head of a unique Brasilian school of experimental psychophysical investigations in newborn infants and fetuses, studies early mechanisms in sensation and perception, discrimination thresholds and habituation for nociceptive and auditory complex stimuli.

General summary of the Symposium. Psychophysical studies submitted describe sensory and perceptive phenomena investigations and quantitative estimations using the most precise objective experimental and mathematical modeling methods. They realize classical psychophysical paradigms as well as extended approaches which provide with more close relations to the real life than traditional “pure” laboratory studies. a) 6 works reflect increase of psychophysical investigations of perception of complicated “real life objects” (Zhegallo) and “an observer’s own variables” in sensory and perceptive performance: attention (Losik et al.), volitional dispositions (Emelianova), individual peculiarities: personality traits (Golubinov) and cognitive styles (Volkova). A generalized approach is suggested which unites such studies: subject-oriented psychophysics of sensory tasks (Skotnikova, Gusev). b) 4 applied works have been made in clinics and also introduce psychophysical studies into the real life: perception restoration after brain damage (Elliott), atypical time perception in children with
autism spectrum disorders (Sysoeva), contrast sensitivity in schizophrenia as an indicator of functional state of mango cellular visual system which provides with a psychical state prognosis (Shoshina), an individual degree of stress-resistance (examined in dental patients) as manifested in visual discrimination indices dynamics (Zabrodina, Sorokin). c) 3 works elucidate mathematical modeling and: moving to multidimensional and multiple objects perception (Shendyapin, Skotnikova; Sawada), Inner Psychophysics ideas based on the Teghtsoonian’s hypotheses (Lubashevsky, Namae). d) 4 Developmental and Animal Psychophysical studies describe: discrimination thresholds and habituation in newborn infants and fetuses (Tristao), fish’s differential chemosensitivity (Selivanova), body perception in some animal species (Khvatov, Kharitonov), individual reptiles’ decision-making patterns in visual discrimination (Skotnikova, Zhelankin).

DEVELOPMENT OF SUBJECT-ORIENTED PSYCHOPHYSICS OF SENSORY TASKS

Irina Skotnikova  
Institute of Psychology Russian Academy of Sciences  
(Moscow, Russia)

Alexey Gusev  
Lomonosov Moscow State University (Moscow, Russia)

Most psychophysical studies realize the traditional “object-oriented” paradigm: they examine sensory performance in dependence on external factors. As well, a tendency increases to analyze effects of observer’s own variables on psychophysical indices obtained (Wackermann, 2014 and references there in). Subject-oriented psychophysics of sensory tasks (Bardin, 1988; Skotnikova, 1991, 2016; Gusev, 2002, 2013) considers these different research directions in the frame of an integrative approach, added to the traditional paradigm: investigation of participant’s own individual activity as sensory tasks solving. This activity hierarchical structure includes: a task as it is accepted by an observer, his (her) inter individual peculiarities (cognitive styles, extroversion — introversion, neurotism — emotional stability), intra individual inner states and reflections (activation, effort, confidence — unconfidence), strategies used which are determined by the task and individual features. We found that these factors influence performance in various signal detection and discrimination tasks. The approach mentioned is developing as follows. Mathematical model of decision making is suggested which establishes that observer’s confidence depends on a sensory task as his (her) goal given in certain circumstances, and on an individual degree of caution (Shendyapin, Skotnikova, 2015). The approach is continued regarding animals’ behavior. In visual discrimination task reptiles’ reflection/impulsivity has been revealed to be an internal mechanism of decision making, as well as their activity: frequent turnings to a way in a labyrinth to be chosen (Skotnikova, Zhelankin, 2018). It corresponds to models of decision making in humans: a certain alternative is chosen in favor of which more evidences have been accumulated. Effects of EEG-activation were found on a successfulness of sensory tasks performance. Resources associated with participant’s personality features (extroversion, neuroticism, anxiety, achievement motivation) were found to be determinants of a possibility to attract additional activation for coping with situations of sensory ambiguity (Gusev, 2004, 2016). A significance was revealed: regarding motivational and volitional dispositions for effective strategies selection in loudness discrimination (Emelianova, Gusev, 2016), individual peculiarities for probability prognosis strategies in auditory signal detection (Gusev, Utochkin, 2006) and cognitive styles as inter individual determinants of accuracy and speed of performing in visual/auditory signal detection/discrimination tasks (Volkova, Gusev, 2018). Fulfilled according the State Assignment.
CAN WE USE TIME TO HEAL MINDS AND BRAINS?

Elliott Mark A.
School of Psychology, National University of Ireland (Galway, Ireland)

Because information processing depends upon the integrity of the brain as a dynamic system, time may be considered an integral part of information processing. In over 20 years of research into the importance of ‘specific timing’ for successful information processing, I have made two important findings: first: when perception is impaired due to focalized brain damage, some perceptual function may be restored by using repeating stimulus presentation at very specific presentation frequencies. This appears to encourage a form of short-term brain plasticity, which I interpret as the brain developing a compensatory dynamic system. This is described in detail in Seifert et al., (2010), while Elliott et al., (2015), developing upon this earlier work, show that stimuli flickered at particular frequencies in the blind field of patients with cortical blindness, can restore visual function in previously blind areas of the visual field. The second set of findings lead to the prospect that forms of therapy exploiting stimulus timing may restore more complex psychological functions. Giersch et al., (2009) and Schmidt et al., (2011), using a paradigm developed by Elliott et al., (2007) have shown that patients with schizophrenia, or who have recently experienced their first psychotic episode, experience a psychological moment that is roughly double the duration of the moment in healthy controls (Elliott & Giersch, 2016) for review. Assuming attentional systems to be relatively unaffected, the environmental event structure experienced by these patients would have become quite unnatural as compared to previous experience, leading to the possibility that this new and unnatural way in which the world appears to be operating will feed back and exacerbate their psychopathology. I will steer discussion towards some possible, and simple means to restore close to normal psychological timing, with the expectation that if successful, this would reduce symptoms in complex disorders such as schizophrenia (see also, Elliott & du Bois, 2017).
Comparing Human Performance Measured Using Different Psychophysical Methods and Tasks

Sawada Tadamasa
National Research University Higher School of Economics (Moscow, Russia)

Human performance of detection and discrimination tasks in behavioral experiments is traditionally characterized with some descriptive variable such as a threshold or d-prime. In conventional psychophysical methods, the stimuli used in the experiment are points in a one-dimensional space and the responses to these stimuli are represented as a function along the stimulus dimension. The function of the responses is characterized by a few parameters some of which are used as descriptive variables of the human's performance. In this presentation, I describe how the psychophysical method can be generalized to stimuli represented as points in a multi-dimensional perceptual space and how the results of this generalized method should be interpreted. Here, I discuss the perception of the orientation of a single contour and the perception of a configuration formed by multiple contours (e.g. parallel or perpendicular configurations, Koshmanova & Sawada, 2019). This generalization method is based on the assumption that the contours forming the configurations are perceived individually from one another and that the configurations are perceived as linear combinations of the contours. The perceived orientations of the individual contours are represented as the individual dimensions of a multi-dimensional perceptual space. A function representing the responses to the configuration can be characterized by the orientation threshold to each contour. This assumption allows me to compare the perception of some configuration with the perception of another configuration quantitatively.
DISTRIBUTION OF HUMAN ATTENTION DURING A CIRCULAR ROTATION OF A 3D OBJECT

Losik George
Igor Boyko
United Institute of Informatics Problems of National Academy of Sciences of Belarus (Minsk, Belarus)

Identify the difference between the psychological mechanism of distribution of human attention during a circular rotation of a 3D object and the mechanism of saccadic eye jumps during a planar perception of the 2D video scene. Hypothesis. When you scan the appearance of a 3D object, saccades and fixations of attention stops are originated during the object's rotation. "Downloading" of the object's parameters into the image is performed in fixed interesting places on the object's surface and is not performed in uninteresting sections of the "walk-through courtyards" route. In places of interest attention is delayed, the trajectory makes a maneuver. On the sections of the "walk-through courtyards" the parameters of the object do not enter the image. The special computer system used. The subject saw a 3D object on the display. He could rotate it with the mouse. The trajectory of the perception was recorded in computer. It registered the process of attention distribution. The research showed that circular perception routes are remembered in the brain as neural topological route figures. They repeat the topology of the external circular perception routes by the subject of this object and are memorized in three-dimensional space of neurons anatomically dispersed in the brain. In this case, the sequence of steps of movement along a route is not remembered, but only the topology of the route is recorded. On the sections of the routes in their individual places are formed anchor points. On the section from one reference point to the next, during the perception, the movement of the same command neuron (E.N. Sokolov). How many types of command neurons are formed subjects, respectively, so many types of various maneuvers a subject can make on the route. A subject cannot build a maneuver under control of several command neurons simultaneously during a circular perception of an object. Recent studies of the human visual cortex using microscale functionally magnetic core tomography have shown that storing video frames in neural structures is also possible by topological principle.
One big challenge for the psychophysics area is to understand the early origin of complex stimuli perception as music and nociception. Music perception on foetuses has been described in habituation, categorical perception, sound preferences and recall tests. Nociception has been described in habituation tests in convenience studies of infants’ response to painful procedures. I’ll present two sets of data using habituation paradigm comparing complex information processing by foetuses, premature and term newborns by physiological and behavioural response. the first study investigated the temporal dimension of rhythm and source of music in foetuses of 41 pregnant women (mean 34.7±2.4 gestational weeks) evaluating: heart rate (HR) and movement and body organization observed during ultrasound exams in response to folkloric lullaby sung by: 1. adult male voice in slow pace (Adagio); 2. adult male voice at fast pace (Allegro); and 3. mothers’ voice in slow pace (Adagio). The second study investigated 13 dyads mothers-newborns, premature and term (38.2±2.2 gestational weeks), and their reaction to four repetitive nociceptive stimuli through COMFORT behavior pain scale, HR and including salivary cortisol levels testing maternal-infant stress effect. In the first study the dimensions movement and body organization were sensitive to the change between the first and last two stages indicating perception of sound source. “Movement” was sensitive when changed between the first and second stage. HR varied significantly between paces and decreased to baseline to maternal song. In the second study, the data revealed a varied pattern of behavioural response and 46.2% infants habituated to nociceptive stimulation, 38.5% showed sensitization and 7.2% didn’t change across trials. Cortisol and HR reaction to nociceptive stimuli decreased along trials, though maternal stress predicted infant baseline and shaped post heel lance cortisol and behavioural profile (R=.69, p=.010). Foetuses showed discrimination to music paces and habituation to maternal voice. Prematures modulated their response to painful procedures in the first day of life, but it seems to suffer the effect of maternal stress level. We conclude that foetuses both in and out womb as at term infants were able to show behavioural and physiological habituation response to complex stimuli.
**RESEARCH AND IMPACT: THE PSYCHOLOGY OF HEALTH AND HEALTHCARE**

---

**Abstract body.** Psychology can contribute to the Sustainable Development Goals (SDGs) of the United Nations. Efforts to reach SDGs, need to take account the psychology of patients, the public and those working within the health and social care systems. Patients and the public do not always behave in a health protective fashion and health care workers do not always adhere to best practice. Psychological studies help to explain the cognitive, emotional, interpersonal, social and cultural factors that shape behaviours. Crucially, understanding these determinants of practice can also lead to improvements in behaviour. The balance between practice and research in health psychology varies between countries, and even between universities within a country. The pressures for health psychologists to produce robust research to answer scientifically driven questions can oppose the drive for practice improvements. This symposium will present research into health worker behaviour, discussing the balance between research and practice.

**Press paragraph.** In order to realise the UN’s ambitious Sustainable Development Goals (SDG), we need to understand and act on the psychology of patients, the public and those working in health and social care systems. This symposium presents four projects in which psychologists are working in low- or middle-income country settings to evaluate, drive and understand behaviour change for health improvement. The health issues covered are self-harm, hand-washing in young children, infection prevention and control practices in healthcare workers and patient safety behaviours in anaesthetic practitioners. The speakers and audience will discuss the benefits and challenges of working cross-culturally, in low-resource settings and in partnerships with organisations whose role it is to improve health outcomes. The speakers are Dr Jo Hart, a Reader in Health Professional Education and Health Psychologist from University of Manchester, UK; Dr Jason Bantjes, Senior Lecturer from Stellenbosch University, South Africa; Dr Jennifer Inauen, Assistant Professor of Health Psychology, University of Bern, Switzerland, Dr Lucie Byrne-Davis, Senior Lecturer and Health Psychologist, University of Manchester, Switzerland, and discussant, Professor Daryl O’Connor, Professor of Psychology, University of Leeds, UK.

**General summary of the Symposium.** There are a number of theoretical frameworks for the study of human behaviour and some of these have been applied to the study of patients, public and health worker behaviours. These studies have used qualitative, quantitative and mixed methodologies and vary in whether they take a co-development / participatory research approach or not. This symposium will explore 1) how health psychology can and is having impact on the study and practice of behaviour change for improved health; 2) the benefits and challenges of psychologists working across geographical boundaries; 3) the balance between research and practice in working in health psychology. We will present four studies of health behaviours, in four distinct clinical areas: health workers and emergency treatment of self-harm, hand-washing in young children, health workers’ infection prevention and control behaviours in
suspected viral haemorrhagic fever and the behaviours of anaesthesia providers. This work was conducted by and with people in high, middle and low-income countries: Zimbabwe, South Africa, Sierra Leone, Tanzania, Bangladesh and Nepal. The studies will introduce a range of methods: qualitative, quantitative and mixed and a range of analytic techniques: inductive thematic analysis, mediation analysis and framework analysis. The discussant will lead the presenters and audience in a discussion of the key questions about how to maximise the impact of psychology in these contexts, whilst maintaining the balance between research and practice, and the ethics of inter-country projects.
EXPLORING THE IMPLEMENTATION OF SAFE ANAESTHESIA PRACTICES IN TANZANIA, ZIMBABWE, NEPAL AND BANGLADESH USING A BEHAVIOURAL FRAMEWORK

The Safer Anaesthesia from Education (SAFE) project is an initiative of the Association of Anaesthetists of Great Britain and Ireland with the World Federation of Societies of Anaesthesiologists, supporting anaesthesia providers to deliver competent anaesthesia. Funded by Laerdal Foundation, a 3-day obstetric SAFE training intervention was delivered in Tanzania, Nepal, Bangladesh and Zimbabwe, by anaesthesia providers from across the world. Health psychologists partnered with the SAFE team, and explored the behaviours, behavioural determinants and behaviour change techniques related to competent anaesthesia practice. 361 participants (30% doctors, 70% allied health professionals) received the SAFE intervention in Tanzania (n=135), Bangladesh (n=115), Zimbabwe (n=56) or Nepal (n=54). Courses in Tanzania were observed and coded for behaviours targeted and behaviour change techniques (BCT) used (according to the BCT Taxonomy v1). Participants were assessed on day one, after day three and at 6-month follow up, on knowledge and skills, self-reported expectation of performing key behaviours and other psychological determinants of key behaviours. A convenience sample of participants were interviewed and observed in practice at follow up. More than 200 behaviours were targeted in the intervention and 36 behaviour change techniques observed, from a variety of domains of techniques, targeting capability, opportunity and motivation. Collaborators specified 20 core behaviours. Knowledge and skills rose from pre to post course and remained high at follow-up. Self-reported behavioural expectations were high pre-course (median expectation of above 50% for all behaviours) and were significantly higher post-course for 5 of the 20 behaviours. Participants reported many barriers and facilitators of practice change, including capability, opportunity and motivation. The SAFE intervention improved knowledge, skills, and some determinants of behaviour change pre to post course, with maintenance at 6-month follow up. Behavioural input enabled specification and measurement of behaviours and behavioural determinants, observations of BCTs and exploration of barriers and facilitators to implementation and feedback to the trainers to focus the course.
WHAT THE EXPERIENCE OF PROVIDING EMERGENCY CARE FOR SELF-HARM PATIENTS TELLS US ABOUT SUICIDE PREVENTION IN SOUTH AFRICA

The practices and actions of health care workers play an important role in improving patient outcomes. Yet health care workers do not always behave rationally or adhere to best practice, particularly when working in contexts which are emotionally provocative, such as caring for self-harm patients. The aim of this qualitative study was to document the experiences of health professionals tasked with providing emergency medical and psychiatric care to self-harm patients in the emergency room (ER) of a South African hospital. An inductive data driven process was employed to identify factors which may hamper adherence to best practice guidelines in suicide prevention. Data were collected via semi-structured interviews with 29 medical staff, and analysed using thematic analysis. Participants described their work as challenging and anxiety provoking. Factors identified as contributing to these challenges include: resource constraints; lack of access to community-based psychosocial care; perception that suicide risk and intent cannot be assessed accurately; belief that self-harm patients do not provide reliable accounts of themselves; and a perception that medical professionals are legally responsible for preventing suicide. Participants employ a number of strategies to contain their anxiety, including: avoiding asking patients about current suicidal intention; rigidly over-relying on protocols and psychometric instruments; and shifting responsibility for patient care to psychiatry. Participants perceptions and the strategies they employ to contain their anxiety seem to work against adherence to evidence-based best practice guidelines and the provision of integrated, collaborative and person-centred care for self-harm patients.
UNDERSTANDING HEALTH CARE WORKERS’ EXPERIENCES OF AN EBOLA OUTBREAK AND ATTITUDES TO INFECTION PREVENTION CONTROL IN SIERRA LEONE

The Ebola outbreak in West Africa 2014-2016 was an unprecedented public health challenge. Many patients and healthcare workers contracted the highly infectious disease. Fragile health systems contributed to the scale of the epidemic and lack of adequate training in infection prevention control (IPC) was a key issue. In the Tonkilili district, 14,124 cases were reported and 3,590 lives lost. A team from the UK (Plymouth University) developed distributed simulation for immersive training using tablet devices; which was delivered to healthcare workers in the Tonkilili District in 2016. Following this training, we wanted to understand more about the healthcare workers’ experiences of the outbreak and their attitudes towards infection prevention control. We conducted 7 focus groups with 31 healthcare professionals in the Tonkilili district, about 6 months after training. The interviews were semi-structured, mixture of English, Krio and translated in situ. We carried out inductive thematic analysis and deductive framework analysis (based on the COM-B system, Michie et al 2013). There were four inductive themes: 1) Knowledge is power — and we have knowledge; 2) Mortal men are hard to control — but strong clinical leaders can influence whole communities, 3) Agonising decisions — Ebola risk wanes and other priorities threaten IPC, 4) Now Ebola is over — the challenge of maintaining behaviours in resource-poor healthcare system. The framework analysis shows four distinct phases of the outbreak with differing levels of capability, opportunity and motivation at each: a. the outbreak begins — confusion; b. uncontrolled spread — mistrust and anger c. epidemic controlled — behaviour changes and d. post-outbreak phase — resilience or complacency? Health care workers were confident of their ability to resist a further outbreak because of the knowledge and skills they now have. They described complex decision making in prioritising preventive behaviours — balancing cultural and social acceptability with perceived risk of disease. Changes in capability, opportunity and motivation over the timeline of the outbreak can enhance understanding of the experience and potentially contribute to future interventions.
REFINING HEALTH BEHAVIOR CHANGE INTERVENTIONS BY IDENTIFYING ACTIVE INGREDIENTS: A CLUSTER-RANDOMIZED CONTROLLED HAND WASHING TRIAL IN RURAL ZIMBABWE

Lucie Byrne-Davis  
University of Manchester (Manchester, United Kingdom)

Eawag (Zurich, Switzerland)

Diarrheal disease is a major cause of mortality in young children globally. Consistent hand washing with soap can reduce the risk of diarrhea, but changing hand-washing behavior is difficult. Systematic behavior change approaches promise to enhance hand washing with soap effectively, and allow refining behavior change interventions by identifying their active ingredients. We demonstrate this at the example of a behavior change intervention to promote hand washing with soap based on the RANAS approach (risk, attitudes, norms, ability, and self-regulation). Sixteen wards of Masvingo province in Zimbabwe were randomly allocated to the RANAS-based intervention or a wait-list control group. Hand washing at baseline and follow-up was observed for 224 randomly selected caregivers of young children. They additionally participated in quantitative face-to-face interviews assessing the social-cognitive factors of the RANAS model. Intervention effects on observed hand washing with soap were analyzed using generalized estimating equations accounting for the nested structure of the data. Mediation analyses were conducted to identify the social-cognitive mechanisms and active ingredients of the intervention. At baseline, hand washing with soap was <3% on average, and did not differ between groups (p=0.526). At follow-up, intervention participants’ odds to wash hands with soap were 6.6 higher than controls (B=1.88, SE=0.32, p<.001). Mediation analyses revealed that the intervention enhanced several of the targeted social-cognitive factors; return, descriptive and injunctive norms, action knowledge, action self-efficacy, maintenance self-efficacy, action planning, and remembering. The intervention effect was mediated through increased remembering. This study supports the efficacy of a systematic, theory-based approach to behavior change to promote hand washing with soap. The analyses of the mechanisms revealed important insights into the active ingredients of the intervention, which will facilitate its refinement.
ENHANCING RESILIENCE IN CHILDREN AND ADOLESCENTS: FOCUSING BASIC NEEDS AND RESOURCES FOR PREVENTION AND INTERVENTION.

EFPA-EVENT

Christoph Steinebach
ZHAW Zurich University of Applied Sciences (Zurich, Germany)

Aleksander Veraksa
Lomonosov Moscow State University (Moscow, Russia)

Abstract body. Given the tremendous challenges of increasing numbers of behavioral and mental disorders in children and youth and its associated costs and psychosocial problems for the society, it is crucial to investigate possible prevention and intervention programs which help to reduce problematic development and vulnerability to mental and behavioral problems at an early stage of life. The current symposium aims at evaluating possible strategies and effects of educational and psychological programs in Europe. Research on positive attitudes and emotions line out favorable effects of interventions which aim to enhance e.g. empathy and well-being. In addition, evaluations of interventions targeting pro-social behavior show sustainable effects on self-efficacy and resilience.

Press paragraph. It is becoming increasingly accepted that considering individual needs, strengths and resources must reorient the deficit-focused approach of prevention and interventions. Research on positive attitudes and emotions suggest that mindfulness-based interventions enhance positive qualities such as empathy and well-being. In addition, evaluations of interventions targeting pro-social behavior show sustainable effects on self-efficacy and resilience. The symposium addresses the following problems and questions: (1) What are important determinants of positive interventions? (2) What is the role of optimistic thinking in depression prevention and how it could be taught? (3) Is it more important to teach children how to explain negative life events or positive events? The presenters and their topics: (1) Christoph Steinebach (Organizer and presenter), Alvaro Langer, Volker Schulte & Larisa Zotova: Mindful peers: Mindfulness- based and peer-related interventions in positive environments. (2) Marcel Schär & Imke Knafla: Positive Body Image: An Important Factor of Wellbeing in Adolescence. (3) Daria A. Bukhalenkova: Features of self-determination and notions of success in adolescence. (4) Tamara O. Gordeeva & Oleg A. Sychev: Linking Optimistic Thinking to Well-Being and Academic Achievement: Explaining Positive Events Matter Most. (5) Agnes von Wyl & Filomena Sabatella: “Inclusive”: Group counseling for emerging adults in transition. Discussant: Aleksander Veraksa.

General summary of the Symposium. In our symposium we discuss different core variables for sustainable prevention and intervention to enhance resilience and optimistic thinking in childhood and youth. Accordingly, the different presentations focus on mindfulness-based and peer-related interventions in positive environments, on positive body image, features of self-determination, optimistic thinking and social inclusion. With this features for possible interventions to enhance resilience and well-being in childhood and youth are lined out.
MINDFUL PEERS: MINDFULNESS-BASED AND PEER-RELATED INTERVENTIONS IN POSITIVE ENVIRONMENTS

How do we promote the willingness of children and adolescents to participate actively, constructively and sustainably in a mental health program? Children and young people are most likely to get involved in projects that address their basic needs. According to the self-determination theory of Ryan and Deci (2000), belonging, autonomy and competence experience are basic human needs. The Circle of Courage (about Brendtro & Larson, 2006) adds a fourth to these three basic needs: generosity. As research shows, increasing generosity leads to an increase in self-efficacy and resilience (Steinebach et al., 2018). It is often complained that their peers are more of a burden than support and assistance in coping with the tasks ahead. Mindfulness based and/or peer-related interventions want to use the strengths of children and adolescents. The willingness to help is addressed and through promoting mindfulness and compassion the experience of being able to help others, self-image and self-esteem are positively developed and stabilized. Generosity or helpfulness are seen as strengths of character that help to accomplish developmental tasks and promote happiness and well-being. In various surveys (adults, N=236) and evaluations (adolescents, N=483) we investigated the role of mindfulness and peer support in the development of resilience. According to the bio-psycho-social model, different levels were taken into account: in addition to the individual level, also the level of the school class and the school as an organization.

Questions about mindful leadership in schools were also addressed. The results confirm the conditional model and refer to the complex relationships between individual change, the different aspects of social relations in school classes and a comprehensive development of school culture. They also point to the importance of leadership in schools that promotes and exemplifies a culture of mindfulness and mutual support.
The aim of the present study was to investigate positive body image during adolescence. Even though the focus of the research in the past 15 years was the body image of girls, recent findings show that also boys have more and more trouble to establish a positive body image. We conducted two studies: The first with 371 and the second with 652 Swiss girls and boys at age between 13-16 years. The data were analysed thematically (e.g. body image, motivation, social background, basic need, psychological wellbeing). The results showed that the boys have in general a more positive body image as the girls. But we find also some other interesting gender differences. For example, in the first study we found that 60% of the girls would like to be thinner and were at least once on a diet. The boys are mostly satisfied with her weight, but a big amount of the boys would like to have more muscles (77%), but only 54% do something to reach that (going to the gym,...). Further thematic analysis revealed that the adolescents with a positive body image were more critical against current ideals, describing them as unnatural and unrealistic. Girls and boys with a low positive body image at the other side, believe that a better/nicer body would lead to more friends, success and to a happier life. Furthermore, a positive body image correlate with a higher psychological well-being. These results may be helpful to adapt preventions programs to strength the positive body image for girls and boys.
FEATURES OF SELF-DETERMINATION AND NOTIONS OF SUCCESS IN ADOLESCENCE

Daria A. Bukhalenkova
Lomonosov Moscow State University (Moscow, Russia)

The purpose of this study was to analyze the connection between teenager notions of success and the specific features of their self-determination, which is expressed in self-esteem, the feeling of their life meaningfulness and future time perspective. The study involved 500 teenagers aged 15-17 years (M = 16.1), who are 10th and 11th grade students at Moscow’s secondary schools and gymnasiums (41.8% are boys). Modern adolescents are more likely to find successful people mostly from their surroundings (relatives and teachers) or well-known figures in the spheres of business and media. We found three different models of the teen's notions of success («social recognition and achievement”, «self-development and self-actualization” and « the implementation of external social demands») and their connection with teen’s self-confident, esteem of successfulness and feeling of their life control and meaningfulness. Teachers can correct teenagers self-esteem and help them in building their future life plans by discussing the success.
Abstract: Linking Optimistic Thinking to Well-Being and Academic Achievement: Explaining Positive Events Matter Most

Tamara Gordeeva
Lomonosov Moscow State University (Moscow, Russia)

Oleg Sychev
Shukshin Altai State Humanities Pedagogical University (Biysk, Russia)

From the beginning, the research on optimistic thinking and, in particular, optimistic attributional style has focused primarily on the relations of attributional style for negative events with depression (Peterson et al., 1985; Sweeney et al., 1986; Hu et al., 2015). Less research has focused on the relationship between optimistic attributional style and well-being, as well as attributional style and academic achievement. Also, the extant research has concentrated on optimism following negative events rather than optimism following positive events, and has yielded rather mixed results (Houston, 2006; Gordeeva & Osin, 2011). Via both a meta-analysis and two new studies, we examined the relationship between optimistic attributional style for positive and negative events, academic performance, and well-being in different categories of students. In the meta-analysis, focused on optimistic thinking and academic achievement, dispositions to make optimistic attributions (stable and global) were more strongly related to academic achievement (d = 0.21, k = 30, N = 6351) than dispositions to make optimistic attributions (unstable and local) regarding negative events (d = 0.11, k = 66, N = 11023). Academic level (primary school, secondary school, university students) moderated the associations, with the effect of positive thinking on academic achievement was more pronounced for children and adolescents. Two new studies with primary and secondary schoolchildren were designed to address remaining questions. In both studies the results of structural equation modeling indicated a positive relationship between optimistic attributional style for positive events in achievement situations and academic performance (GPA), including boosted achievement and well-being over time. It is concluded that optimism in the explanation of positive events is an important psychological variable that has been undeservedly forgotten. Practical interventions for the development of optimistic thinking that promote resilience, well-being, and academic achievement in children and adolescents will be discussed.
“INCLUSIVE”: GROUP COUNSELING FOR EMERGING ADULTS IN TRANSITION

Christoph Steinebach
Agnes von Wyl
Filomena Sabatella
ZHAW Zurich University of Applied Sciences (Zurich, Germany)

In Switzerland, nearly one out of six persons (16%) has no occupational solution after completing compulsory education. Various transitional options and interim solutions are nowadays available to the young people who are in transition and seeking an apprenticeship. A lot of them suffer from mental disorders (Sabatella & von Wyl, 2014). Usually, the transition options focus on academics and social deficits without offering psychotherapeutic services. However, early intervention is important, as studies have shown that the course of a mental disorder can be positively influenced if the disorder is treated early and immediately (Stein et al., 2003). To enable an early intervention in a non-clinical setting, we started a group psychotherapy program in a transitional option for unemployed people in the agglomeration of Zurich. To underline the low-threshold character we call it group counseling instead of group psychotherapy. Over the next 1 ½ year 60 young people will participate in the program and thus in the intervention. The group size for the group counseling is limited to 8 participants. The program consists of three elements. Based on the concept of Positive Peer Culture (PPC) the focus is set on building resources like self-efficacy, self-worth, and social competence. In addition, the program includes an element of psychoeducation to sensitize and raise awareness on mental disorders. The third element entails mindfulness and relaxation exercises. Using selected indicators, resulting changes will be measured at three measurement time points (entering the program, leaving the program, 6 months after leaving the program). We will present first results of the outcome of those participants who finished the program. Discussion and recommendations will focus on implications for early intervention in emerging adulthood. The research project is funded by the Foundation Gebert Rüf under its BREF program.
Abstract body. This symposium will cover four contributions on Lesbian, Gay, Bisexual, Transgender, and Intersex (LGBTI) concerns focusing on the marginalization of sexual and gender minorities through anti-LGBTI policies and services, as well as the impact of victimization and hate crimes on the development of trauma and mental health risks among LGBTI people. Presentations from Russia, Canada, Cameroon and South Africa highlight the impact of anti-LGBT legislation, including non-affirming mental health care professionals, pervasive stigma and bias directed toward LGBT people as well as violence and hate crimes, limitations on the creation of families, and lack of attention to the safety and well-being of LGBT people in society.

Press paragraph. This symposium will cover four contributions on Lesbian, Gay, Bisexual, Transgender, and Intersex (LGBTI) concerns focusing on the marginalization of sexual and gender minorities through anti-LGBTI policies and services, as well as the impact of victimization and hate crimes on the development of trauma and mental health risks among LGBTI people. Chair: Sharon G. Horne, Ph.D., USA First Presentation: Maria Sabunaeva, PhD in Psychology, Head of Psychological Service, Russian LGBT Network, LGBT group "Coming out", Russia Olga Razmakhova, Director, “Psychology for Human Rights” Movement, Russia Second Presentation: Joseph Roy Gillis, Ph.D., Department of Applied Psychology & Human Development, University of Toronto, Toronto, Canada & Sarah E. Wootten, Ph.D., Department of Applied Psychology & Human Development, University of Toronto, Toronto, Canada Third Presentation: Joachim NTETMEN, Director of Programs, Alternatives-Cameroon Fourth Presentation: Nam: Juan A Nel DLitt et Phil, University of South Africa, Gauteng, South Africa & Hanlie van Wyk, University of South Africa, Gauteng, South Africa/Habits at Work, Chicago, Illinois, United States Discussant: Polli Hagenaars, European Board of Human Rights & Psychology

General summary of the Symposium. This symposium will cover four contributions on Lesbian, Gay, Bisexual, Transgender, and Intersex (LGBTI) concerns focusing on the marginalization of sexual and gender minorities through anti-LGBTI policies and services, as well as the impact of victimization and hate crimes on the development of trauma and mental health risks among LGBTI people. The first presentation documents the challenges faced by Russian LGBT people due to the impact of anti-LGBT legislation, including non-affirming mental health care professionals, pervasive stigma and bias directed toward LGBT people as well as violence, and lack of attention to the safety and well-being of LGBT people in society. The second presentation explores the experience of anti-LGBT trauma and discrimination among 168 LGBT individuals in Canada and the U.S., finding that problem-focused coping, lower overall distress and emotional support were significant
partial mediators between the salience of an anti-LGBT event and well-being. The third presentation explores the psychosocial context for LGBT people in Cameroon who desire to become parents in a country where same-sex behavior is criminalized. In this study, desire to become parents was investigated in relationship to social and political barriers among a sample of 13 gay men and 9 lesbian women. Finally, the fourth presentation focuses on the patterns of crimes and other incidents, collectively referred to as 'hate incidents' in South Africa targeting sexually and gender diverse people. They describe the impact of these incidents on psychological health and the role the Psychological Society of South Africa has applied the science and practice of Psychology towards shaping public discourse and policy nationally and regionally to address hate crimes. The symposium will end with a dialogue on these themes in three different regions of the world.

Chair: Sharon G. Horne, Ph.D. Counseling Psychology University of Massachusetts Boston Wheatley Hall 2-162 100 Morrissey Blvd Boston, MA, 02125 Sharon.Horne@umb.edu 617 287-7495 This is our abstract, it’s number is 943 on the ECP online platform: Problematic Issues of Providing Psychological Help to LGBT People in Russia Maria Sabunaeva, PhD in Psychology, Head of Psychological Service, Russian LGBT Network, LGBT group “Coming out”, Russia Olga Razmakhova, Director, “Psychology for Human Rights” Movement, Russia Socio-political situation in Russia has a great influence on mental state of LGBT people. Statistical data shows (n=120) a high level of fear among LGBT people towards turning to psychological and psychotherapeutic help by specialists outside LGBT organizations due to the risk of facing homophobia, biphobia and transphobia. The law prohibiting the “advocacy of non-traditional sexual relationships”, as well as information concerning prosecution and murders of homosexuals in Chechnya and refusal of initiation of critical cases against hate crimes, — all these issues have a tremendous effect on LGBT people (which is confirmed by high levels of anxiety, depressive states, suicidal behaviors: St.-Petersburg, Moscow n=80; other Russian regions n=40; Spielberger-Khanin Anxiety Scale, Beck Anxiety Inventory, Beck Depression Inventory). The most significant factors which were distinguished by complex research (statistical data is going to be presented within the project proposal): 1. Homophobia and transphobia of specialists, psychologists who are not qualified to work with LGBT clients. It can be a conscious personal attitude of specialists or can be caused by lack of information. The students are often forbidden to conduct research on sexual orientation and gender identity. Clients who have encountered discrimination by specialists don’t have a practical possibility to file a complaint towards these psychologists. One of the problems in Russia is the absence of laws which would ensure ethical aspects of psychological help. 2. Insecurity and exposure of organizations and groups of specialists who provide educational services in the sphere of working with LGBT people. In 2018 in Moscow the 5th Annual Family Conference LGBT “Family and Partnership Values. Ethics and Politics” had to be cancelled due to incoming threats and refusal of the venue owners to host the event. In 2017 two participants of that conference were attacked after leaving the building. 3. Difficulties and lack of possibilities to include LGBT-related topics into official public educational programs. Impossibility and difficulties of defending theses and high-quality scientific papers on LGBT topics in psychology. As a result, secondary traumatization of LGBT clients by specialists occurs, which we consider to be a crucial yet invisible problem of professional community. Title: Correlates of Well-Being Following Anti-LGBT Trauma or Discrimination Authors: (1) Joseph Roy Gillis, Ph.D., Department of Applied Psychology & Human Development, University of Toronto, Toronto, Canada (2) Sarah E. Wootten, Ph.D., Department of Applied Psychology & Human Development, University of Toronto, Toronto, Canada Background: Lesbian, gay, bisexual, and transgender (LGBT) individuals continue to experience anti-LGBT trauma and discrimination. However, relatively little is known about the well-being of these individuals despite experiencing anti-LGBT events. Using multiple regression and mediation analyses, this study assessed the correlates and mediators of the following positive psychology character strengths, including coping styles, authenticity of LGBT identity, level of belonging to the LGBT
community, perceived levels of available emotional social support, the degree of centrality of an anti-LGBT event to identity, and disclosure and concealment of sexual orientation or gender identity to determine levels of overall well-being.

Methods: This study measured the severity of the anti-LGBT event and overall distress. Participants, recruited online in both Canada and the United States, included 168 LGBT-identified individuals who reported having experienced anti-LGBT trauma or discrimination based on their sexual orientation and/or gender identity. Findings: Problem-focused coping and emotional support were positive correlates of well-being. Avoidant coping, distress, and centrality were negative correlates of well-being. Further, higher levels of problem-focused coping, lower levels of overall distress, and higher levels of perceived availability of emotional support were all found to be significant partial mediators of the relationship between the centrality of the anti-LGBT event to identity and overall well-being.

Discussion: These findings suggest that by helping individuals (1) gain a greater sense of control over their lives, (2) reconceptualise the anti-LGBT event as less central to their narrative, and (3) create meaning, that mental health providers may help to increase overall well-being of LGBT individuals following anti-LGBT events.

Joachim NTETMEN, Director of Programs, Alternatives-Cameroon 2178 Boulevard de la Liberté +237 699943595 Abstract: Child Wish: Finding out how to help LGBTI people in Cameroun having children As an organization defending LGBTI rights in Cameroun where same-sex behavior is criminalized, Alternatives-Cameroun have launched since 2016 a program designed to analyze and fulfill the needs of LGBTI who want to have children. The first step was a community-based study conducted in 2017 which shows that more than 80% of LGBTI want to have children and out of them, more than 80% want to have them through sexual intercourse with opposite sex. This implies and other step in the program: analyzing how they would choose their mate to have children and under which conditions would they accept to have children with the chosen mate. Methods We conducted an interview using a form where we filled information related to criteria given by participants in order to have children. We collected 22 interviews from 13 gay men and 9 lesbians. Findings Gay men would want to have children with ladies who are: preferably bisexual, beautiful, clean, full of integrity, respectful and financially stable. Lesbians on their side, would want to have children with a man who I physically attractive, tall, older, financially able and ready to care for children, and yet not involved enough in the relationship with children to claim the children as theirs. This is to make sure children would belong to them ladies. Conclusion: The process of having children in such a homophobic context is still complex and risky. There are still no facility to help those gay and lesbians having children. They would need psychosocial help and technical assistance. That is the next step we are looking for. By the way, we would try to help them find, contact and negotiate with, their ideal mate in order to have children. Nothing is sure if the "requesters" would find in the community someone who accept their conditions. Recent developments suggest that, instead of abating, negative attitudes in some African countries, in fact, may be intensifying. A great deal of evidence points to this stigmatisation leading to deep-seated and widespread prejudice, discrimination and anti-homosexual harassment and violence,
both state-sanctioned and extrajudicial. In stark contrast to the rest of Africa, South Africa has a progressive constitutional and legal framework for the protection of the rights of minorities. Regardless of these legal protections, South Africa is observing on-going patterns of crimes and other incidents, collectively referred to as ‘hate incidents’ — specifically targeting people on the basis of, among others, their sexual orientation and gender identity. Such incidents (i.e., hate crimes, hate speech and intentional unfair discrimination) undermine social cohesion on a societal and community level and have been shown to have an especially traumatic impact on victims. Considering the indisputable linkages between human rights, and health and well-being, Psychology — in serving humanity, has a greater role to play in moving (South) African societies to where they ought to or could be. In so-doing, Psychology not only has the power, but also the responsibility to actively challenge prevailing conditions of injustice and inequality. This includes counteracting systems of exclusion and violent othering, shaped by a colonial and apartheid past, on the basis of, among others, sexuality and gender, race, and socio-economic status. This presentation will outline how the Psychological Society of South Africa (a.k.a. ‘PsySSA’) as a Learned Society, has applied the science and practice of Psychology in a variety of ways towards shaping public discourse and policy nationally and regionally to address hate crimes, in general, and the violent othering of those whose sexualities and/or genders challenge heteronormative and patriarchal power arrangements. The presentation concludes by proposing a collaborative and transnational approach to further strengthen and contribute to the safety and wellbeing of sexually and gender diverse populations globally.
Socio-political situation in Russia has a great influence on mental state of LGBT people. Statistical data shows (n=120) a high level of fear among LGBT people towards turning to psychological and psychotherapeutic help by specialists outside LGBT organizations due to the risk of facing homophobia, biphobia and transphobia. The law prohibiting the "advocacy of non-traditional sexual relationships", as well as information concerning prosecution and murders of homosexuals in Chechnya and refusal of initiation of critical cases against hate crimes, — all these issues have a tremendous effect on LGBT people (which is confirmed by high levels of anxiety, depressive states, suicidal behaviors: St.-Petersburg, Moscow n=80; other Russian regions n=40; Spielberger-Khanin Anxiety Scale, Beck Anxiety Inventory, Beck Depression Inventory). The most significant factors which were distinguished by complex research (statistical data is going to be presented within the project proposal): 1. Homophobia and transphobia of specialists, psychologists who are not qualified to work with LGBT clients. It can be a conscious personal attitude of specialists or can be caused by lack of information. The students are often forbidden to conduct research on sexual orientation and gender identity. Clients who have encountered discrimination by specialists don’t have a practical possibility to file a complaint towards these psychologists. One of the problems in Russia is the absence of laws which would ensure ethical aspects of psychological help. 2. Insecurity and exposure of organizations and groups of specialists who provide educational services in the sphere of working with LGBT people. In 2018 in Moscow the 5th Annual Family Conference LGBT "Family and Partnership Values. Ethics and Politics" had to be cancelled due to incoming threats and refusal of the venue owners to host the event. In 2017 two participants of that conference were attacked after leaving the building. 3. Difficulties and lack of possibilities to include LGBT-related topics into official public educational programs. Impossibility and difficulties of defending theses and high-quality scientific papers on LGBT topics in psychology. As a result, secondary traumatization of LGBT clients by specialists occurs, which we consider to be a crucial yet invisible problem of professional community.
CORRELATES OF WELL-BEING FOLLOWING ANTI-LGBT TRAUMA OR DISCRIMINATION

Joseph Gillis
Sarah Wootten
University of Toronto (Toronto, Canada)

Lesbian, gay, bisexual, and transgender (LGBT) individuals continue to experience anti-LGBT trauma and discrimination. However, relatively little is known about the well-being of these individuals despite experiencing anti-LGBT events. Using multiple regression and mediation analyses, this study assessed the correlates and mediators of the following positive psychology character strengths, including coping styles, authenticity of LGBT identity, level of belonging to the LGBT community, perceived levels of available emotional social support, the degree of centrality of an anti-LGBT event to identity, and disclosure and concealment of sexual orientation or gender identity to determine levels of overall well-being. This study measured the severity of the anti-LGBT event and overall distress. Participants, recruited online in both Canada and the United States, included 168 LGBT-identified individuals who reported having experienced anti-LGBT trauma or discrimination based on their sexual orientation and/or gender identity. Problem-focused coping and emotional support were positive correlates of well-being. Avoidant coping, distress, and centrality were negative correlates of well-being. Further, higher levels of problem-focused coping, lower levels of overall distress, and higher levels of perceived availability of emotional support were all found to be significant partial mediators of the relationship between the centrality of the anti-LGBT event to identity and overall well-being. These findings suggest that by helping individuals (1) gain a greater sense of control over their lives, (2) reconceptualise the anti-LGBT event as less central to their narrative, and (3) create meaning, that mental health providers may help to increase overall well-being of LGBT individuals following anti-LGBT events.
CHILD WISH: FINDING OUT HOW TO HELP LGBTI PEOPLE IN CAMEROON HAVING CHILDREN

Juan Nel
Hanlie van Wyk
University of South Africa (Gauteng, South Africa)

As an organization defending LGBTI rights in Cameroon where same-sex behavior is criminalized, Alternatives-Cameroun have launched since 2016 a program designed to analyze and fulfill the needs of LGBTI who want to have children. The first step was a community-based study conducted in 2017 which shows that more than 80% of LGBTI want to have children and out of them, more than 80% want to have them through sexual intercourse with opposite sex. This implies and other step in the program: analyzing how they would choose their mate to have children and under which conditions would they accept to have children with the chosen mate. Methods We conducted an interview using a form where we filled information related to criteria given by participants in order to have children. We collected 22 interviews from 13 gay men and 9 lesbians. Findings Gay men would want to have children with ladies who are: preferably bisexual, beautiful, clean, full of integrity, respectful and financially stable. Lesbians on their side, would want to have children with a man who is physically attractive, tall, older, financially able and ready to care for children, and yet not involved enough in the relationship with children to claim the children as theirs. This is to make sure children would belong to them ladies. Conclusion The process of having children in such a homophobic context is still complex and risky. There are still no facility to help those gay and lesbians having children. They would need psychosocial help and technical.
DEINSTITUTIONALIZATION AND COMMUNITY INTEGRATION OF PERSONS WITH MENTAL HEALTH PROBLEMS

José Ornelas  
APPsyCIV/ISPA – Instituto Universitário (Lisboa, Portugal)

Abstract body. The deinstitutionalization and community integration of persons with mental health problems remains a contemporary challenge due to the persistence of large-scale psychiatric institutions. In many countries social movements and mental health policies advocate for change in mental health resulting in the effective closure of psychiatric hospitals. As a result the priority of mental health services required a shift with a two-fold focus: a) the development of prevention programs to respond to persistence of mental health problems and the development and continuing improvement of research and action focused on prevention, and b) the need for community initiatives fostering integration of people with mental health problems through socialization and culture development, and concrete access to community resources of housing employment and education. Research focused on both prevention aims and integration focus provide a new range of perspectives and challenges for prevention and community integration in mental health (José Ornelas — Convenor).

Press paragraph. The deinstitutionalization and community integration of persons with mental health problems remains a contemporary challenge due to the persistence of large-scale psychiatric institutions. In many countries there were social movements and mental health policies advocating for change in mental health procedures and practices that resulted in the effective closure of psychiatric hospitals, issue presented by José Ornelas (PT), and the development of prevention programs to respond to persistence of mental health problems and the development and continuing improvement of research and action focused on prevention, issue presented by Berndt Roehrle (GER). Simultaneously, there is the absolute requirement for community initiatives to facilitate the integration of people who have experiences of mental health problems emerged through socialization efforts related with culture, here presented by Bruna Zani and Antonella Guarino (IT), but also the development of programs focused on housing employment and education, presented by Maria Vargas-Moniz (PT). Research focused on both prevention aims and integration focus provide a new range of perspectives and challenges for prevention and community integration in mental health (José Ornelas — Convenor).

General summary of the Symposium. Recently the Lancet Commission has argued that "Despite substantial research advances showing what can be done to prevent and treat mental disorders and to promote mental health, translation into real world effects has been painfully slow" (www.thelancet.com Vol 392 October 27, 2018). The deinstitutionalization and community integration of persons with mental health problems remains a contemporary challenge due to the persistence of psychiatric institutions in many countries. Nevertheless, many evidence-based practices aimed to change the actual situation continue to be realised, due to social movements and mental health policies that advocate for a shift to more prevention and mental health promotion. The aims of this symposium are therefore a. to discuss some theoretical perspectives on prevention of mental health problems, based on ecological systemic approach of community psychology, and b. to present community initiatives oriented to the social integration of persons with mental problems. Questions raised regard the effectiveness of such initiatives and the impact of some innovative prevention programs on wellbeing of persons with mental problems. Data provided by the four presentations will offer evidence of the importance, efficacy and effectiveness of different preventive mental health strategies (abstract 4, Roehrle, DE),
suggesting that interventions on addressing housing, working and education needs (abstract 1, Ornelas, PT), facing the homelessness (abstract 3, Vargas-Moniz, PT) or using theatre experiences (abstract 2, Zani & Guarino, IT) have the potential to enhance personal empowerment and capabilities of vulnerable people and can provide concrete supports to their community integration and social inclusion.

HOUSING, EMPLOYMENT AND EDUCATION AS FACILITATORS OF DEINSTITUTIONALIZATION AND COMMUNITY INTEGRATION

José Ornelas
APPsyC1/ ISPA — Instituto Universitário (Lisboa, Portugal)

Despite the ample research about supported housing, employment and education in the mental health field as means toward the completion of the deinstitutionalization processes, the access and maintenance of people with psychiatric disabilities to housing solutions, employment and education achievements are still moderate and need to be expanded. Aims: In this presentation it is examined how access to permanent and individualized housing competitive employment option and regular educational resources contribute to a positive impact on personal empowerment among people with psychiatric disabilities who participate in community based mental health organizations. The participants filled out the Portuguese version of the empowerment scale and hierarchical regression analysis was used to study if participants’ housing, employment or educational status were predictors of personal empowerment. The conducted analyses demonstrated that housing, employment and education are related with higher scores of empowerment, and that the empowerment dimension of power-based interpersonal relationships was significantly associated with being at work.

Our results suggest that addressing consumers’ housing, working and education needs through supported services has the potential to enhance consumers’ personal empowerment and improve community life.
The approach of community development is a people-centred approach, which aims at identifying participatory solutions to community problems based on local knowledge and priorities (WHO, 2004). Factors related to mental illness in the literature include, among others, low self-esteem, learned helplessness, social isolation and unemployment (WHO, 1990). Mental health programs that promote a collaborative approach and partnership between community services and organisations contribute to the construction of healthy environments for mental health patients. Previous studies (Secker et al., 2007, Hacking et al. 2008) showed that interventions using theatre, music or dancing play an empowering role for vulnerable people and persons with mental disease. To analyse and evaluate the roles, meanings, and functions of theatre companies composed by actors who are also users of mental health services. The main aim was to find indicators of the effectiveness of the theatre experience on wellbeing of the companies’ members. Method. We collected 62 narrative interviews, focusing on the life histories of the companies’ members. Participants were selected from three companies (part of the regional project Theatre and Mental Health in Emilia-Romagna Region, Italy), according to their role: 33 are actors-patients, 13 theatrical workers and 16 health workers. A thematic content analysis was made on the total corpus of interviews (Braun & Clarke, 2006). Four indicators of change were found: a) a shift from extrinsic to intrinsic motivation, both in actors and workers; b) a change in identity (from feeling patient to person to actor); c) an increase in the dimensions of psychological empowerment (more control, critical awareness and participation); d) an increase in sense of community (higher level of sense of belonging, shared emotional connection, influence and fulfilment of needs). Theatrical companies can be considered as integrated organisations able to promote empowering processes in actors and workers. The contribution of these experiences on the reduction of social stigma towards mental illness will be discussed.
CAPABILITIES APPROACH AND COMMUNITY INTEGRATION OF HOMELESSNESS PEOPLE WITH MENTAL ILLNESS: RESULTS OF THE HORIZON 2020 PROJECT HOME_EU: REVERSING HOMELESSNESS IN EUROPE

José Ornelas
Maria Vargas Moniz
APPsyC! ISPA – Instituto Universitário (Lisboa, Portugal)

The Housing First is an evidence-based practice that more effectively reverses homelessness and promotes recovery than traditional homelessness services. The European Commission recently endorsed the implementation of ‘housing-led’ strategies like Housing First at national, regional and local levels (European Commission, 2013). In this population there is a significant incidence of people with mental illness or severe addictions of alcohol and drugs. In Europe, there is an increasing number of programs that have reconfigured their services toward Housing First or implemented new Housing First services, but that number is increasing. The “Homelessness as Unfairness” (Home_EU) is a multi-country, longitudinal project funded by Horizon2020, the European Commission’s largest research and innovation program. The Home_EU goal is to use evidence-based research to influence homeless policies and practice, through a capabilities and ecological approach to understanding how European citizens, policymakers, and stakeholders respond to and address homelessness as an extreme form of social inequality and injustice. We aim to map the readiness of eight European countries: France, Ireland, Italy, the Netherlands, Poland, Portugal, Spain and Sweden, to mainstream the Housing First approach. Methods: Partners have been compiling qualitative and quantitative data on social policies on homelessness, citizens’ attitudes to homelessness, and service providers’ and service users’ experiences of homelessness. The overall results focus on 1) a citizens’ survey on attitudes toward homelessness and willingness to pay for homeless services; 2) the aggregated data (Quant/Qual) of the study of service users’ experiences; and 3) the Qual/Quant study of service providers’ experiences, and 4) the ways in which we will use our findings to influence European homeless policies. It is discussed how these data are useful for the in-depth understanding of the perspective of the stakeholders and the relevance of the completion of an overarching system to respond to a severe social problem providing the concrete supports to community integration and social inclusion.
PREVENTION IN MENTAL HEALTH

José Ornelas
APPsyC/ ISPA — Instituto Universitário (Lisboa, Portugal)

Bernd Roehrle
University of Marburg Emeritus (Marburg, Germany)

The growing number of mental health problems cannot only be handled by better curative treatment. A shift to more prevention and mental health promotion is necessary. This presentation is focused on the efficacy and effectiveness of different preventive mental health strategies.

Method: A meta-meta-analysis of the prevention of mental disorders. Numerous reviews reporting on the moderate efficacy of strategies to prevent mental disorders are methodological inconclusive. More convincing is the following meta-meta-analysis based on a random effect model that reports a moderate effect size. This effect is based on numerous meta-analyses grounded on a heterogeneous database. Differences in results stem from different approaches, such as competence or disorder orientation, specific life events focus, and setting specific forms. Selective or indicated prevention programs did not differ significantly from each other. Effects for pathogenic or salutogenic characteristics did not differ significantly.

Prevention programs for adults were more successful compared to those for children and adolescence or mixed population. A meta-regression analysis indicated that disorder- and proportion-oriented interventions negatively predict effects, thus contrasting results for the adult population. These results are discussed with respect to potential strategies for the evaluation of the prevention of mental disorders. Results of well-controlled prevention studies are far from a real success. Rather, the question arises as to whether and how these results can be implemented in practice and sustainably cultivated with widespread impact. The results of such efforts are promising. However, the number of prevention studies reporting results on implementation, dissemination and sustainability efforts is still comparatively low.
INTEGRATIVE APPROACH TO THE STUDY OF NEUROCOGNITIVE FUNCTIONS IN THE CLINIC OF NEUROPSYCHIATRIC DISEASES

Elena Isaeva
Pavlov First Saint-Petersburg State Medical University (Saint-Petersburg, Russia)

Abstract body. The integrative approach is the most promising in terms of addressing the issue of the nature of neurocognitive impairment in neuropsychiatric pathology. The symposium is aimed at combining the efforts of specialists in various fields, working on solving fundamental and applied problems in the study of mental functions in health and pathology. The symposium discusses the possibility of considering impairments of integrative processes as a convenient cognitive model for studying combined forms of mental disorders. Reports will be presented reflecting different approaches to information processing and demonstrated that both ascending and descending processes are involved in perception. In particular, about the features of gnosis, praxis and speech in children with adaptive and non-adaptive behaviors, disorders at early levels of perception and cognitive functioning in schizophrenia, characteristics of the structure of cognitive functions in normal and pathological aging on the MCI model, the initial form of Alzheimer’s disease, depression.

Press paragraph. The symposium is aimed at combining the efforts of specialists in various fields working within the framework of an integrative approach to solving fundamental and applied problems in the field of studying cognitive functions in health and pathology. Badalov A. A., Psychiatrist; Senior lecturer, Department of Medical Psychology, Psychiatry and psychotherapy; Kyrgyz-Russian Slavic University, Bishkek, Kyrgyz Republic. With the report about neurophysiological features of integrative process as a promising model for the study of the phenomenon of progeneration. Matanova V., Full professor, PhD, DSc, Sofia University, Institute of Mental Health and Development, Sofia, Bulgaria. With the report about inhibitory control and external behavior in childhood. Isaeva E.R., Professor, PhD, Head of department of general and clinical psychology, Pavlov First Saint Petersburg State Medical University, Saint Petersburg, Russia. With the report about impairments at early levels of perception and cognitive functioning in schizophrenia. Shoshina I.I., PhD, Chief researcher, Laboratory of Physiology of Vision, Pavlov Institute of Physiology, Saint Petersburg, Russia. With the report about the features of perception and cognitive functions in schizophrenia with drug resistance. Roshchina I.F. – PhD, Leading Researcher, Geriatric Psychiatry Department, Mental Health Research Center (MHRC), Moscow, Russia. With the report about the characteristics of the structure of cognitive functions in normal and pathological aging.

General summary of the Symposium. The problem of cognitive impairment is currently one of the most relevant and significant in clinical (medical) psychology. The integrative approach is the most promising in terms of addressing the issue of the nature of neurocognitive impairment in neuropsychiatric pathology. Psychologists often distinguish between top-down and bottom-up approaches to information-processing. In top-down approaches, knowledge or expectations are used to guide processing. Bottom-up approaches, however, are more like the structuralism approach, piecing together data until a bigger picture is arrived at. One of the strongest advocates of a bottom-up approach was J.J. Gibson (1904-1980), who articulated a theory of direct perception. This stated that the real world provided sufficient contextual information for our visual systems to directly perceive what was there, unmediated by the influence of higher cognitive processes. At the symposium will present reports demonstrating that perception provides both ascending and
descending processes that determine cognitive functioning.

Neurophysiological features of integrative process as a promising model for the study of the phenomenon of progeneration Using the example of the «integrative process», the author's conceptual framework, the application of the theory of evolutionary diatronics that originated in the framework of classical evolutionary doctrine of monogenesis to the modern realities of the development of the theory of genius is considered. With the help of cross-correlation analysis of electroencephalography — neurophysiological method of research, the hypothesis of unifying the three main «circles» of mental pathology in the composition of the psychic education under consideration is substantiated. The possibility of considering the integrative process as a convenient cognitive model for studying combined forms of mental disorders is discussed. Inhibitory control and external behavior in childhood The aim of the present study is to examine the relationship between inhibitory control functioning and externalized behavior. This kind of behavioral manifestation can occur at both behavioral and cognitive levels. Behavioral studies typically involve inhibition, motor responses and impulse control as primary aim for construct correlation research. On the other hand, cognitive studies focus on mental processing of attention and memory. Children's externalized behavior is being increasingly viewed as a public health problem. The construct itself is referred as a combination of behavioral patterns manifested in children's behavior and reflecting the surrounding environment in adaptive or maladaptive ways. The study examined two groups of children. All participants attended elementary school with Bulgarian as primary language. The methods used are inhibitory control checklist rated by parents and general neuropsychological assessment.

Impairments at early levels of perception and cognitive functions in schizophrenia Idea of the study: impairments at early levels of perception were associated with integration process, memory and attention dysfunctions. The functional state of magnocellular and parvocellular visual systems, features of their interaction and cognitive functions were analyzed in patients with different stages of the disease. The obtained data were considered as the evidence of the mismatch in the functioning of magnocellular and parvocellular systems in schizophrenia with features of working memory and attention. The activity of the magnocellular system is associated with the feature of working memory and the properties of attention. The hyperactivation of the magnocellular system is accompanied by a disruption of the selectivity of attention. The sensitivity of the magnocellular neural system and cognitive impairments in schizophrenia with drug resistance The study was to examine the functional state of magnocellular and parvocellular visual pathways, features of their interaction, cognition functions in healthy subjects and in patients with drug resistance schizophrenia. The research hypothesis — patients with drug resistance are characterized an increase in the sensitivity of the magnocellular neural system that related on cognitive function. The volume of short-term memory, insufficiency of cognitive control and visual motor coordination are correlated in direct correlation with the contrast susceptibility in range of low spatial frequencies (magnocellular system). Sustainability of memorizing and attention are connected with the parvocellular system, while the ability to switch is inversely proportional to the activity of the magnocellular system. Patients with the therapeutic resistance demonstrated hyperactivity of the magnocellular system and related features of memory and attention. Tactile sphere in the structure of cognitive functions in normal and pathological aging Studies show the possibility of using tactile function as a support in the correction and rehabilitation during aging. A block diagram of the tactile sphere, reflecting the level structure, intra- and intermodal communications, multiplicity of components of tactile sphere, has been developed. It gives the possibility of a complex structural and functional analysis of the components of the tactile sphere in norm and in clinical models. Preliminary results show that the tactile sphere in MCI syndrome, the initial form of Alzheimer's disease remains relatively intact and can be used as a resource for rehabilitation work. In the initial forms of Alzheimer's disease, there is
a marked dissociation between relatively intact levels (perceptual and semantic) with a significant violation of the sensory level. With normal aging, a reorganization of the hierarchy of levels of organization of the tactile sphere is observed: the capabilities of the sensory level are reduced, while the semantic level remains fairly intact.

**INHIBITORY CONTROL AND EXTERNAL BEHAVIOR IN CHILDHOOD**

Elena Isaeva  
Pavlov First Saint-Petersburg State Medical University (Saint-Petersburg, Russia)

Vanya Matanova  
Sofia University, Institute of Mental Health and Development (Sofia, Bulgaria)

Martin Kolev  
Institute of Mental Health and Development (Sofia, Bulgaria)

Zlatomira Kostova

The aim of the present study is to examine the relationship between inhibitory control functioning and externalized behavior. This kind of behavioral manifestation can occur at both behavioral and cognitive levels. Behavioral studies typically involve inhibition, motor responses and impulse control as primary aims for construct correlation research. On the other hand, cognitive studies focus on mental processing of attention and memory. Children’s externalized behavior is being increasingly viewed as a public health problem. The construct itself is referred as a combination of behavioral patterns manifested in children’s behavior and reflecting the surrounding environment in adaptive or maladaptive ways. The study examined two groups of children. All participants attended elementary school with Bulgarian as primary language. First group — experimental — consisted of 35 children with externalized maladaptive behavior rated from elementary school teachers and parents via inhibitory control checklist. Second group — control one — consisting of 35 children at the same age as the experimental group, showed no significant signs of externalized maladaptive behavior. The neuropsychological assessment applied again with both groups included mainly gnosis and praxis functioning as well as language development. Experimental group results show significant correlation between the level of inhibitory control and some attention qualities such as concentration and dividedness. Other significant correlations are showed between inhibitory control and level of language development. These findings can be utilized as ground for planning therapeutic programs aimed primarily at cognitive and language functioning. Findings demonstrate how primary school children with externalized maladaptive behavioral patterns show impairment in inhibitory control functioning irrespective of cognition and neuropsychological deficits.
IMPAIRMENTS AT EARLY LEVELS OF PERCEPTION AND COGNITIVE FUNCTIONING IN SCHIZOPHRENIA

Elena Isaeva  
Pavlov First Saint-Petersburg State Medical University (Saint-Petersburg, Russia)

I. Shoshina  
I.P. Pavlov Institute of Physiology, RAS (Saint Petersburg, Russia)

Yu. Mukhitova  
Yu. Simon  
I. Tregubenko  
Pavlov First Saint-Petersburg State Medical University (Saint-Petersburg, Russia)

The visual system plays an important role in building an internal picture of the external world that determines the behavior and adaptability that are impaired in schizophrenia. Idea of the study: impairments at early levels of perception were associated with integration process, memory and attention dysfunctions. The functional state of magnocellular and parvocellular visual systems, features of their interaction and cognitive functions were analyzed in patients with different stages of the disease. The magnocellular and parvocellular neural systems are different sensitive to spatial frequency. The magnocellular system is most sensitive to low spatial frequencies, parvocellular system — to high spatial frequencies. 30 people with the first psychotic episode and 30 people with chronic schizophrenia were examined. Methods were used: figures of Poppelreuter, TMT, 10 words test, visual contrastometry. We used the Gabor gratings with spatial frequencies of 0.4, 3.0 and 10.0 cycles/degree. U-test and Pearson’s correlation coefficient were used for statistical analysis. Patients with first-episode demonstrated increased contrast sensitivity in range of low spatial frequency and decreased contrast sensitivity in medium and high spatial frequencies. Patients with first-episode had higher result in words memorization growth rate, switching of attention, speed informational processing than in chronic patients. However, patients with the first psychotic episode coped worse with the selection of figures from the background. The obtained data were considered to be the evidence of the mismatch in the functioning of magnocellular and parvocellular systems in schizophrenia. The results of the correlation analysis revealed a direct relationship between the contrast sensitivity in the low spatial frequency range (magnocellular system) and the growth rate of words memorization. Regarding attention, a correlation has been established between contrast sensitivity in the low spatial frequency range (magnocellular system) and the ability to selection a figure from the background. Contrast sensitivity in the high spatial frequency range (parvocellular system) had an inverse correlation with the number of unrecognized figures. The activity of the magnocellular system is associated with the feature of working memory and the properties of attention. The hyperactivation of the magnocellular system is accompanied by a disruption of the selectivity of attention.
NEUROPHISIOLOGICAL FEATURES OF INTEGRATIVE PROCESS AS A PROMISING MODEL FOR THE STUDY OF THE PHENOMENON OF PROGENERATION

Andrey Badalov
Kyrgyz-Russian Slavic University (Bishkek, Kyrgyzstan)

Svetlana Brovkina
Kyrgyz State Medical Academy named after I. K. Ahunbaev (Bishkek, Kyrgyzstan)

Evgeniy Sumanov
Medical Center of Neurophysiological and Vascular Research (Kaliningrad, Russia)

Annotation. Using the example of the «integrative process» the author's conceptual framework, the application of the theory of evolutionary diatropics that originated in the framework of classical evolutionary doctrine of monogenesis to the modern realities of the development of the theory of genius is considered. With the help of cross-correlation analysis of electroencephalography — neurophysiological method of research, the hypothesis of uniting the three main "circles" of mental pathology in the composition of the psychic education under consideration is substantiated. The possibility of considering the identity integration disorder as a convenient cognitive model for studying combined forms of mental disorders is discussed. Relevance. «Integrative process» is a specific mixed form of psychopathological diathesis, characterized by the presence in the personality structure of a combination of symptoms of the three main circles of mental disorders: schizophrenic, epileptic, affective. A similar combination had previously been considered in psychiatry from the perspective of the theory of degeneration and progeneration, a two-pole spectrum, where, on the one hand, there is a highly intelligent creative individual, and on the other, is procedural mental pathology. Purpose of the study. Considering the peculiarities of the neurophysiological indices of the brain of persons with «integrative process» as consolidating with respect to the main forms of mental disorders, to substantiate the possibility of studying this phenomenon as a diatropic model of mental pathology. Materials and methods. 2732 respondents were examined, 1224 of which were patients, 1508 students. A total of 76 people were selected with «integrative process». For neurophysiological examination, cross-correlation analysis of electroencephalography respondents was used.
THE SENSITIVITY OF THE MAGNOCELLULAR NEURAL SYSTEM AND COGNITIVE IMPAIRMENTS IN SCHIZOPHRENIA WITH DRUG RESISTANCE

D. Lubomirskaya
Herzen State Pedagogical University (Saint-Petersburg, Russia)

It has repeatedly been shown the discrepancy between the work of the magnocellular and parvocellular system and cognitive impairment in schizophrenia. The aim of the study was to study the functional state of the magnocellular and parvocellular visual pathways, the features of their interaction, cognitive functions in healthy people and in patients with drug-resistant schizophrenia. The hypothesis of the study — patients with drug resistance are characterized by increased sensitivity of the magnocellular nervous system, that related on cognitive function. The magnocellular system is more sensitive to low spatial frequencies and is involved in processing information about the global organization of the stimulus. The parvocellular system is more sensitive to high spatial frequencies and is responsible for describing the fine details of the object. For contrast sensitivity, a threshold was measured with Gabor elements with spatial frequencies of 0.4, 3.6, and 17.8 cycles/degree. Neuropsychological research was carried out using the test methods of the verbal association, the complex figure, the test of auditory memory, the test of attention. Patients participating in our study were 20 peoples with therapeutic resistance paranoid schizophrenia. The volume of short-term memory, lack of cognitive control and visual-motor coordination are in direct correlation with contrast susceptibility in the range of low spatial frequencies (magnocellular system). The stability of remembering and attention is associated with the vapor-cellular system, and the ability to switch is inversely proportional to the activity of the magnocellular system. Hyperactivation of the magnocellular system, which is responsible for peripheral vision and distribution of attention, is accompanied by a violation of the selectivity of attention. An inverse correlation with contrast sensitivity at low spatial frequencies indicates that the higher the activity of the magnocellular system, the more pronounced are impairments of cognitive control and selectivity of attention.

Patients with therapeutic resistance demonstrated hyperactivity of the magnocellular system and associated features of memory and attention. The change in information filtering at early levels of perception correlates with cognitive impairment.
TACTILE SPHERE IN THE STRUCTURE OF COGNITIVE FUNCTIONS IN NORMAL AND PATHOLOGICAL AGING

N. Korsakova
Lomonosov Moscow State University (Moscow, Russia)

It is known that the tactile modality plays an important role in human activity. It is formed in early ontogenesis and has a systemic importance in the formation and development of the psyche, less subject to age-related changes. With aging, the tactile analyzer can perform a compensatory function.

Studies show the possibility of using tactile function as a support in the correction and rehabilitation during aging. A block diagram of the tactile sphere, reflecting the level structure, intra- and intermodal communications, multiplicity of components of tactile sphere, has been developed. It gives the possibility of a complex structural and functional analysis of the components of the tactile sphere in norm and in clinical models. The study of the characteristics of the tactile sphere in the structure of cognitive functions in normal and pathological aging (MCI syndrome, the initial form of Alzheimer’s disease, depression) based on ideas about the three levels of organization of the tactile modality: sensory, perceptual and semantic. Materials and methods. 10 patients with the initial stage of Alzheimer's disease and 14 healthy elderly study participants were examined. A complex neuropsychological examination by the method of syndromic analysis of A. R. Luria with a quantitative assessment of the state of higher mental functions, a comprehensive study of the tactile sphere, the Montreal cognitive assessment scale (MoCA) was used. Preliminary results show that the tactile sphere during pathological aging (MCI syndrome, the initial form of Alzheimer’s disease) remains relatively intact and can be used as a resource for rehabilitation work. In the initial forms of Alzheimer’s disease, there is a marked dissociation between relatively intact levels (perceptual and semantic) with a significant violation of the solution of tactile tasks at the sensory level. With normal aging, a reorganization of the hierarchy of levels of organization of the tactile sphere is observed: the capabilities of the sensory level are reduced, while the semantic level remains fairly intact. The identified most intact components of the tactile sphere can be used as a resource for remedial and rehabilitation programs in the work of a clinical psychologist in gerontopsychiatry.
ATHLETES’ WELLBEING: HOLISTIC APPROACH IN SPORT PSYCHOLOGY RESEARCH AND PRACTICE

Snezana Stoljarova
Kristel Kiens
Tallinn University (Tallinn, Estonia)
Konstantin Bochaver
Lydia Dovzhik
Moscow Institute of Psychoanalysis (Moscow, Russia)

Abstract body. Having departed from traditional focus on athletic performance, modern sport psychology suggests a holistic approach, where athletes’ wellbeing and athletic career development are no less important than performance. Combining both research and practical experience in the field of sport psychology, symposium authors will present important theoretical conceptualizations, research questions, empirical data and practical implications of the holistic approach to athletes’ wellbeing in sport psychology. Stemming from the holistic lifespan perspective on athletic careers, the topics of career trajectories will be discussed though analysis of world champions’ experiences. Further, dual career challenges and requirements will be discussed in light of transitions from junior to senior athletic levels among student-athletes in Estonia. Wellbeing will be analyzed also in terms of risks and resources during rehabilitation of injured athletes who are motivated to return to the sport. Finally, the phenomenon of mindfulness and its role in psychological wellbeing of athletes will be presented.

Press paragraph. Researchers and practitioners from Estonia and Russia consider and discuss the notion of wellbeing as the significant predictor of optimal performance, positive athletic career development and generally satisfying experiences of an athlete. Starting off the topic, Konstantin Bochaver’s talk ‘Pathway of successful athlete: in pursuit of wellbeing’ presents his case-study with the sample of famous Russian athletes, describing their life events and trajectories from birth to medals of the World Championships. Continuing with the holistic narrative of athletic careers, Kristel Kiens’ presentation ‘Dual career support in sport: Taking a holistic approach to youth development’ will give the insight into her PhD project that investigates the competencies needed for maintaining a dual career as well as the role of the environment that should be taken into account when supporting athletes’ holistic development. Narrowing more specifically on such critical events as injuries in athletic careers, Lydia Dovzhik describes known risks and mental resources of successful rehabilitation and recovery in her presentation ‘Wellbeing and successful recovery of injured athletes’. Finally, focusing specifically on daily wellbeing maintenance and support techniques, Snezana Stoljarova presents talk on ‘Mindfulness-based approaches to athletes’ wellbeing’, which stemming from applied experience describes implications and considerations of using mindfulness with athletes.

General summary of the Symposium. Traditionally sport psychology has focused on performance enhancement, implementing the Big4 strategies of goal setting, imagery, relaxation and self-talk. However, one of the major recent trends in the applied field shifted the focus from solely athletic performance enhancement to the holistic lifespan perspective (Alfermann & Stambulova, 2007; Stambulova, Alfermann, Statler, & Côté, 2009). As sport psychologists’ perspective shifted from performance support to a larger notion of athletic career support, and the range of transitions studied spread to different stages throughout the athletic career, it became also important to consider that transition experiences relate to developmental challenges in other domains of the athlete’s life. These conceptual changes lead to a more ‘holistic’ approach, which
understands transitions though “life-span perspective which spans the athletic and post-athletic career and which includes transitions occurring in the athletic career as well as those occurring in other domains of athletes’ lives” (Wylleman et al., 2004; p. 7). Current symposium aims to adopt this holistic perspective and investigate the questions of athletic career development and athletes’ wellbeing from different perspectives. Taking a resumptive look at the career trajectories of three top level athletes, Konstantin Bochaver will share his research conclusions on important factors throughout the development of athletic careers, as well the notable shift that athletes are experiencing when transitioning to senior levels of sport. Continuing on the topic of career transitions, Kristel Kiens will give insight into the dual-career environments and its implications, specifically for the transition from junior to senior level of sports. Focusing on one of the most critical events in athletic careers, Lydia Dovzhik will share her applied expertise and her research results on the topic of athletic injuries and athletes’ wellbeing, as an indicator of successful rehabilitation. Finally, coming to the microlevel of athletes’ personal mental skills and resources, Snezana Stoljarova will share up to date research developments and her practical experiences of introducing mindfulness-based interventions for enhancing and supporting athletes’ wellbeing.
**DUAL CAREER SUPPORT IN SPORT: TAKING A HOLISTIC APPROACH TO YOUTH DEVELOPMENT**

Snezana Stoljarova  
Kristel Kiens  
*Tallinn University (Tallinn, Estonia)*

Athletes go through many transitions during their careers of which transition from junior to senior level has been considered as one of the most difficult (Stambulova, 2009), which has led to a lot of youth athletes dropping out (Lindner & Johns, 2004; Vanden Auweele, De Martelaer, Rzewnicki, De Knop & Wylleman, 2004). The athletic career model states that successful transition during the athletic career occurs when an athlete copes effectively due to a good fit between the transition demands and athlete’s resources and strategies, which can be divided between internal (e.g. motivation, mental skills, health condition, etc.) and external resources (e.g. social and financial support) (Stambulova’s 2003, 2009). Based on previous research, student athletes, who are usually going through that transition, face many challenges, which increases the need for a holistic skillset development (e.g. O’Neill, Allen, & Calder, 2013, Stambulova & Ryba, 2013, Wylleman & Reints, 2010). Bronfenbrenner’s bio-ecological theory of human development stresses that human development is affected by the complex interrelationship between process, person, context and time, which all need to be considered for optimal growth (Bronfenbrenner, 2005).

Therefore, an ecological-holistic approach in supporting dual career athletes should be adopted. To contribute into supporting optimal dual career development, a PhD project is in process in a sport gymnasium in Estonia. The project would gain a thorough insight into the environment and it’s success factors based on Dual-career development environment and Environment Success Factors working models (Henriksen et al. In process), analyze dual career pathways and describe a dual competencies development programme with an analysis of it’s effectiveness. It would be conducted as a nested single case study (Thomas, 2011, p. 95). Data would be gathered through qualitative (i.e. interviews, observations, document analysis, reflections, intervention programme description and analysis) as well as quantitative methods (i.e. survey). The results would provide valuable information on dual career development on multiple levels and more broadly on how to support youth athletes holistic development. During the symposia, the researcher-practitioner would be sharing the progress and applied experiences gained so far when working in the dual career development environment.
PATHWAY OF SUCCESSFUL ATHLETE: IN PURSUIT OF WELLBEING

Snezana Stoljarova
Tallinn University (Tallinn, Estonia)

Konstantin Bochaver
Lydia Dovzhik
Moscow Institute of Psychoanalysis (Moscow, Russia)

The main purpose of the study is to identify a possible model of the champion’s pathway, as well as the main components of psychological wellbeing. Design and sample of the study: case-study of the pathway of three athletes of the highest level (3 men, 25-29 years old, belong to the same culture and perform in the same sport). The main method is structured interview (Kvale, 1983), 35 questions in 4 blocks. Methodologically, the study is based on the works of T. Orlik (Orlick, 2015), as well as the principles of working with qualitative methods in the field of sports (Leavy, 2014; Tenenbaum, Driscoll, 2005; Biddle, Markland et al., 2001).

Results: In the study we identified a trend. Firstly, favorable “microenvironment” of sport clubs or schools seems to play important role in the childhood. Regular training at the beginning of the trajectory almost guarantee the first success, and then sport victories take place as a powerful emotional reinforcement. In adolescence a young athlete faces difficulties, and we see the role of the environment in supporting motivation. After transition to the senior level of sports, the role of the environment is weakened, and the athlete takes central responsibility for managing one’s athletic career. The environment doesn’t influence his/her decisions but remains an important resource throughout training and competitive activities. This balance between environmental impact and individual choice is important for understanding the mental wellbeing of professional athletes. Discussion: we examined the life trajectories of successful athletes and determined the central factors underlying a successful and consistent athletic career. The beginning of athletic career may depend heavily of external factors, but in the future, the internal locus of control increases, and athletes’ own responsibility for both achievements and mistakes prevails. In essence, along the transitions in athletic careers, athletes move further away from environmental impact, and towards increased personal responsibility for their health, development directions, priorities. Although having different experiences, in the course of a successful interaction with the environment all respondents have found resources for growth and ways to overcome motivational and other crises.

SUPPORTED BY GRANT OF THE PRESIDENT OF THE RUSSIAN FEDERATION (PROJECT MK-2938.2019.6)
WELLBEING AND SUCCESSFUL RECOVERY OF INJURED ATHLETES

Snezana Stoljarova
Tallinn University (Tallinn, Estonia)

Konstantin Bochaver
Lydia Dovzhik
Moscow Institute of Psychoanalysis (Moscow, Russia)

Sport injury is a special life event, which may involuntary determine future of athletic career. Sport injuries are characterized as highly intense experiences that combine pain, emotional stress and long-lasting significant consequences. Relevant to the topic, the level of wellbeing can be seen as an indicator of successful recovery after injury. Thus, the study of personal predictors of successful recovery from injury is of exceptional interest (F.J. H Lu, Y.Hsu, 2013; Arvinen-Barrow, M., Walker, N., 2013). Methods and sample: the empirical base of research was 283 respondents (M age = 20 years) of various sports.

Questionnaires assessed the skills and strategies of coping (CSI, ACSI-28), emotional state (PANAS), wellbeing (WEMWBS), the level of resilience (Hardiness Survey). Statistical processing was performed using the method of Bayesian regression-factor analysis. Results: 1) There were obtained data of personal predictors of recovery from injury, which include problem solving, coping with adversity, coachability, confidence and achievement motivation, as well as a general scale of coping skills. Interestingly, such coping skills as concentration, goal setting and mental preparation showed negative correlations to positive affect after injury. 2) Coping with sport injury relates to athletes’ age: injured adult athletes demonstrate a higher level of negative affect after injury than adolescents, while their level of subjective wellbeing upon recovery is also higher. 3) There was found out the dependence between time and coping: the more time has passed since the moment of injury, the lower the indicators of coping: injuries, like other stresses represent situations that mobilize and improve the coping skills of athletes immediately at the time of its coping, but subsequently drain their resources. 4) Analysis of the data allowed us to identify 6 types of athlete's coping strategies, taking into account the specifics of their experience of sports injury and response to it: «Victims»; «Unstable»; «Hope of Sport»; «Unbroken»; «Experienced veterans»; «Sustainable». Conclusions. The prosaicness of sports injury in sports career determines the need to investigate personal predictors of successful coping with sports injuries, aimed at increasing the level of subjective wellbeing. **Abstract body.** Science, and not just psychology, is undergoing a renaissance. It is an exciting time for our discipline, and it is great that psychology has been leading the way. This symposium will debate and discuss how psychological science can be improved in Europe (and beyond). The context is prompted by Nosek et al’s (2015) Science paper and the recent findings from the large scale Many Labs 2 project that only 14 of 28 classic and contemporary studies replicated and failures to replicate were not attributed to sample diversity (Klein et al., 2018). However, in contrast, a promising new paper has been published showing that 9 key findings from cognitive psychology have passed a stringent test of replicability (Zwaan et al., 2018). Taken together, these findings have substantial implications for how we do psychological research and how we publish our research as well for how scientific methods are taught to future generations.

**Press paragraph.** Science, and not just psychology, is undergoing a renaissance. It is an exciting time for our discipline, and it is great that psychology has been leading the way. This symposium will debate and discuss how psychological science can be improved in Europe (and beyond). The context is prompted by Nosek et al’s (2015) Science paper that showed that less than 40% of psychology studies were replicated in a large scale multi-lab collaboration and the recent findings from the large scale Many Labs 2 project that only 14 of 28 classic and contemporary studies replicated and failures to replicate were not attributed to sample diversity (Klein et al., 2018). However, in contrast, a promising new paper has been published showing that 9 key findings from cognitive psychology have passed a stringent test of replicability (Zwaan et al., 2018). Taken together, these findings have substantial implications for how we do psychological research and how we publish our research as well for how scientific methods are taught to future generations. Perspectives from Germany, Italy and the United Kingdom will be provided. Our speakers will discuss potential solutions such as pre-registration, registered reports (Daryl O’Connor), data sharing recommendations (Andrea Abele-Brehm), implications for publishing and open peer review (Rebecca Harkin) as well as discussion of the implications for teaching and training across Europe (Remo Job). In addition, we will hear that open science can provide opportunities for research to have greater reach and impact on policy development (Lisa Morrison-Coulthard). The symposium will be followed by a question and answer session.

**General summary of the Symposium.** Science, and not just psychology, is undergoing a renaissance. It is an exciting time for our discipline, and it is great that psychology has been leading the way. This EFPA Board of Scientific Affairs symposium will debate and discuss how psychological science can be improved in Europe (and beyond). Background: The context is provided by Nosek et al’s (2015) Science paper that showed that less than 40% of psychology studies were replicated in a large scale multi-lab collaboration and the recent findings from the large scale Many Labs 2 project that only 14 of 28 classic and contemporary studies replicated and failures to replicate were not attributed to sample diversity (Klein et al., 2018). However, in contrast, a promising new paper has been published showing that 9 key findings from cognitive psychology have passed a stringent test of replicability (Zwaan et al., 2018).
2018). Taken together, these findings have substantial implications for how we do psychological research and how we publish our research as well for how scientific methods are taught to future generations. Issues arising from the ‘replication crisis’ in relation to study programs have been widely discussed in Europe. In order to address the issues raised psychology in Europe needs to consider: (1) the relationship between research and teaching, (2) the development of open science competences as a core concern in higher education, (3) the relationship between education and training ethics especially in research processes, and (4) the implications for publishing, peer review, preregistration and statistical training and new methods. In this symposium perspectives from Germany, Italy and the United Kingdom and elsewhere in Europe will be provided. Our speakers will discuss potential solutions such as pre-registration, registered reports and recent developments made by the British Psychological Society (Daryl O’Connor, University of Leeds, UK), an overview of latest developments relating the German data sharing recommendations will be provided (Andrea Abele-Brehm, Universität Erlangen-Nürnberg, Germany) as well as discussion of the implications for teaching and training across Europe (Remo Job, University of Trento, Italy). In addition Rebecca Harkin (John Wiley & Sons, UK) will provide an overview of the five key areas of open research: open access, open data, open practices, open collaboration and open recognition, before focusing specifically on the creation and implementation of data sharing and open/transparent peer review practices in our journal portfolio, and the impact of this for researchers. Finally, we will hear that open science can provide opportunities for research to have greater reach and impact on policy development (Lisa Morrison-Coulthard, British Psychological Society, UK). The symposium will be followed by a question and answer session.
COMMUNITY PSYCHOLOGY: INTERVENTIONS AND SOCIAL CHANGE

Maria Vargas-Moniz  
ECPA/ APPsyCl/ ISPA — Intituto Universitário (Lisboa, Portugal)

Abstract body. This symposium addresses the multi-purpose interventions inspired by Community Psychology principles, practices and applications, with the common aim of providing opportunities and introduce socially transformative processes aimed to change persistently damaging experiences of different social groups.

Assessing the interventions with victims/survivors of intimate partner violence is a contemporary social challenge that requires a wide attention and a centrality of the socio-political debate and the formative approaches indicate the relevance required to the change procedures and practices (Albanesi, Cabua). Resilience studies are pertinent due to the social interventions within community (Procentese). Finally the civic engagement in school settings and academic achievement with an European approach (Guarino, Cicognani, Mazzoni) and a local focus (Vargas-Moniz, Ornelas) are contributions of Community Psychology for social inclusion and development.

General summary of the Symposium. Empowerment is one of the key concepts of Community Psychology theory and intervention. It describes both a process and an outcome, and it is often indicated as the aim of many community interventions, contributing to community health and wellbeing. Even if some scholars complain about the lack of clear conceptual definition (empowerment as a buzzword), it is recognized as a strengths-based approach that recognizes, respects, and promotes capacities of marginalized and vulnerable community. Brodsky and Cattaneo (2013) argue that, differently from other process (i.e. resilience) empowerment involves not only building personal resources and taking action but also drawing on community resources and promoting social change. The papers presented in the Symposium are focussed on demonstrating different methodological strategies for the advancement, advocacy and support to socially sustainable change through community psychology intervention. The proposal are focused on formative models of intervention, resilience promotion, civic engagement of youth and school achievement, all exemplifying how individual and community resources can be mobilized in different ecological systems, and the challenges that all these forms of intervention have to address. The selected thematic domains are associated with the intervention with Intimate Partner Violence victims/survivors, with community resilience focused on the outcomes of social
conflicts/tensions, youth participatory action-research in school, and a community-based ecological intervention to promote school achievement. A feature of Community Psychology that is common to all the presentations is that they correspond to an effort to bridge science into community practice and social intervention. Community Psychologists strongly advocate that research with social impact is the key for the development of Psychological Interventions.
A COMMUNITY PSYCHOLOGY MODEL TO ASSESS THE INTERVENTION WITH VICTIMS OF INTIMATE PARTNER VIOLENCE

Maria Vargas-Moniz  
ECPA/ APPsyC/ ISPA — Instituto Universitário (Lisboa, Portugal)

According to the WHO multi-country study on women’s health and domestic violence against women (2005) intimate partner violence is one of the most common forms of violence against women. The same survey revealed that a range comprised between 4–49% women reported having experienced severe physical violence by a partner ever having experienced physical violence by a partner, while 20–75% reported experiencing one emotionally abusive act, or more, from a partner in their lifetime. The consequences of IPV can be dramatic and programs to help survivors have been established in many countries. Cattaneo and Goodman (2015) have defined a community psychology model that offers specific pathways for evaluating program and practice in terms of their influence on empowerment of women victims of Intimate Partner Violence. Empowerment is recognized as one of the aim of intervention with victims of Intimate Partner Violence. In this contribution, following a request of a Support Centre for Women located in Forlì that asked for a formative evaluation of their activity with victims of IPV, we have applied their model to understand their program and practices’s strengths and weaknesses. Method: To this aim we collected 10 semi-structured interviews with women survivors of IPV and 10 interviews from professionals working in coalitions in charge of IPV intervention in the municipality of Forli (including professional working in local health service, social services, police forces, emergency rooms). Thematic content analysis was performed on the data collected. Preliminary analysis showed that the Support Centre for Women facilitates empowerment process providing access to material resources that are needed by women in order to achieve economic independence.

Another key factor in the empowerment process of survivors is the recognition of their skills and capacities, including resilience. The analysis however revealed that the capacity of the Support Centre to engage women in self determined network-oriented practice (that is reengaging and get support from people in their community) is underdeveloped. Implications of the results will be discussed.
RESILIENT INTERVENTIONS FOR SOCIAL EMERGENCIES. COLLABORATING AND RESPONSIBILITY ACTION IN LOCAL COMMUNITIES

Maria Vargas-Moniz
ECPA/APPsyCi/ISPA — Instituto Universitário (Lisboa, Portugal)

The emergence of increasingly complex forms of social interventions within community settings is a challenge for social and community psychologists. These characteristics of the modern social communities bring conflictual relationships, strong inequalities, social disagreements, distrust and indifference towards the others and an affective disinvestment towards the community, with violent actions and oppression as consequences. The present contribution deepens the methodologies aimed to develop a resilient intervention within the local communities. To develop resilient interventions, the first aspect to be taken into account refers to the risk factors about the adverse events, like the macro-dimensions — social, economic-environmental, natural and technological— affecting the communities and the collective management of the intermediate structures present on site. A second aspect refers to the factors that can protect the communities as alternative resources that are by far adaptive for a specific critical event and referred to historical, structural and macro-social dimensions. The co-management of these factors represents the basis for creating resilient interventions aimed to foster responsible styles of togetherness and to allow recovering symbolic and physical spaces where meaningful relationships can be established and managed and social engagement can be fostered. Moreover, promoting and enhancing daily life and individual and collective well-being in extreme situations can foster in turn the emergence of resilient factors to face ongoing events, encouraging the social development and helping in the social identity reconstruction of the whole community. In urban areas within our territory, quality of life and social health were promoted moving from collaborative actions, through the activation interinstitutional and community resources. The theoretical, pragmatical and political aspects will be discussed.
PROMOTING CITIZENSHIP EDUCATION THROUGH A YOUTH PARTICIPATORY ACTION-RESEARCH IN SCHOOL

Citizenship education is crucial to processes of civic regeneration (Davies, 2014) which offer means for connecting young people to the political system, helping them to make sense of a complex political world, and thereby strengthening democracy (Kisby & Sloam, 2014). Youth participatory Action Research (YPAR) promotes youth contribution and voice by stimulating the creation of sustained relationships with at least one committed adult, who provides skill-building opportunities, facilitates critical dialogue, awareness and acts to enhance the young person active engagement with the community (Ozer et al., 2010).

Aims The main aim of this study, which is part of the H2020 CATCH-EyoU project, is to describe and evaluate the effectiveness of a school-based YPAR intervention, conducted in five EU countries, in promoting youth social and political interest (at national and EU level), sense of political efficacy and active engagement. Participants to the intervention (IG) conducted in Italy included N = 45 high school students attending a Lycee in Parma (North Italy)(M age =15.76 years, females= 53.3%); . A mixed-method evaluation was used, including a questionnaire submitted at three time-points to the IG and a control group (CG; N = 44, M age 15.73 years, females = 56.8%), focus groups with the intervention group and interviews to teachers involved. Increasing level of political interest and sense of political efficacy, positive attitudes towards Europe, political participation were found in IG compared to CG. School climate, quality of participation and peer norms influence improved in IG. In line with quantitative results, thematic analysis showed that political awareness, critical thinking and transversal competencies were improved in students involved in the intervention. These competencies were also confirmed by teachers. Promoting citizenship education is a challenge for school and communities, but it is fundamental in order to strengthen democracy in society. Inclusive and participatory methods that involve students and teachers in reflecting and proposing actions are effective in constructing a virtuous circle around civic and political participation.
The PIC (Partnership for Community Intervention) Project is framed upon an ecological approach applied to educational achievement in contexts with persistent and prevailing academic failure, absence and drop-out. To present the results of a community-based dynamics of School- Family and Community intervention, often affirmed as a basic principle for school and community development, but with a demonstration of the complexities and the dynamics required to implement this multi-dimensional approach to academic performance and success. Method: Based on a multi-level model of community intervention and development, where Educational Achievement transformed into a community mission, grounded in the local Municipality, and combining micro and macro level variables. Through the promotion of a coherent, progressive and consistent engagement dynamics supported on community and action research methods and techniques, the project was implemented from May 2016 to July 2017, and the major overall outcome was the reduction of the academic retention in 41%. The results are a myriad of QUAL/QUANT outputs on the civic and professional engagement of the multi-sectorial professionals, civic leaders, the students and their families; the role of the teachers, and the school directors and their concrete actions, entailed in connection with the community representants. The Regional Welfare Services, had a particular role in the supports provided to the families and the students.
DEVELOPING CAREER COUNSELING SKILLS IN MULTICULTURAL SOCIETIES: REFLECTIONS AND SUGGESTIONS FROM CMINAR ERASMUS+ PROJECT

Lea Ferrari
University of Padova (Padova, Italy)

Abstract body. In this symposium the results of the CMinaR Erasmus+ project 2017-2019 will be presented. This project aimed to provide pilot courses in higher education and further training in public employment services to strengthen vocational and career counsellors in coping with new challenges that arise from a growing refugee population and consequently challenging settings. Based on a review of the literature and a need analysis recently conducted in Germany, Italy, Sweden, Turkey, and UK (CMinaR report 2017) researchers will present the issues addressed in a newly developed higher education course within the CMinaR Erasmus+ project together with results emerged from its first implementations in the diverse countries. A framework and a set of core themes are then proposed for developing knowledge and confidence of professionals, dealing with multicultural career counseling and vocational guidance.

Press paragraph. This symposium aims to discuss the results of the CMinaR Erasmus+ project 2017-2019 with the following four presentations: Career counselling in multicultural societies: the importance of reflexivity in practice Anne Chant and Claire Nix, Canterbury Christ Church University, UK The role of language and learning dimensions in career counselling with newly arrived migrants Åsa Sundelin and Fredrik Hertzberg; Stockholm University, Department of Education, Sweden Migration Complexity Salim Atay and Neşe Gülmez, Istanbul Technical University, Istanbul, Turkey Beyond supportive measures: Life Design and Career counseling skills in multicultural societies Teresa Maria Sgaramella and Lea Ferrari, University of Padova, Italy Discussant: Paola Magnano, University of Enna, Italy

General summary of the Symposium. Career counselling in multicultural societies: the importance of reflexivity in practice Anne Chant and Claire Nix Critical reflection is something that usually takes place after you have done some work that you reflect on afterwards and thus having that in the later course we changed to have that topic right after the introduction. As we are all predetermined by a specific culture we have been raised in, by a specific socialisation in our professional sphere and by the public and political discourse on common topics especially in questions of migration, refugees and integration of new immigrants, we are now addressing the impact of all of this on our thinking, working, teaching and learning before we start with concrete content issues. We need a critically reflected perspective on all that follows in the course of teaching and learning. The aim of the activity developed was to engage in critical reflexion of participants’ future practice with refugees and develop this skill. Twenty four master students from 23 to 30 y.o. were included in the course organized in 6 modules of 3 two-hours sessions each. Three sessions were devoted to critical reflection. A range of reflexive techniques were proposed to engage participants in their own reflections on their thoughts, concerns, assumptions and perspectives of working with asylum seekers and refugees. Lectures, paired and small group work and whole group discussion were then proposed to participants. A semi-structured interview were used to analyse changes in knowledge and attitudes of participants together with their satisfaction for the activity carried out. Besides learning outcomes determined in each module, the presentation will specifically describe the development in the ability to explore a range of approaches to enable reflexive practice, evaluate their own multicultural competences, engage in a critical reflexive exercise to clarify and agree to
further developments. Participants understand the particular importance of critical reflection when working in CGC for refugees, know central concepts of critical reflection and are able to work with appropriate reflexive instruments. The role of language and learning dimensions in career counselling with newly arrived migrants Åsa Sundelin and Fredrik Hertzberg Language is a topic widely perceived and discussed when dealing with questions of migration and the integration of newly arrived immigrants (Sheikhi, 2013; Sundelin, 2015). And, yes, skills in the language of the receiving country is a base for the effectivity of all further steps on refugees’ ways to their integration into society and into the labour market. But language also is the main instrument in counselling settings themselves (Sundelin, 2017). A starting point for the module is Kolbs theory about experimental learning which suggests that learning activities should give the participants an embodied learning experience where thoughts, emotions and actions are involved (Granberg & Ohlsson, 2014). The aim of the module is to develop the course participants understanding of language as a meaning making resource for career mobility and in career guidance and counselling (CGC) with migrants/refugees, and the participants’ ability to manage language asymmetries and intercultural communication in CGC. Twenty seven participants are included in the course. The majority of the participants are professional career counsellors working in school settings, counselling projects in municipalities, employment offices among all. The majority has a university degree from the career counselling program (undergraduate exam). The course takes place at two occasions: 2.5 days + 2.5 days. The course departs from and is organized in 6 modules. One module, three sessions, are devoted to language and intercultural communication. The module employs a mixture of different learning activities: lectures, group work, reflections (individually and group) and practical exercises. A semistructured interview is used to analyse changes in knowledge and attitudes of participants together with their satisfaction for the activity carried out. Besides learning outcomes determined in each session of the module, the presentation will specifically describe what training and resources are used to develop participants ability to use counselling methods that manage language asymmetries and support migrant clients’ participation in CGC and, design CGC activities that support migrant clients learning about career issues. Migration Complexity Salim Atay and Neşe Gülmez Refugees are coming from different cultures and sets of experiences; as a result, they perceive things differently. With counsellors who can apply their own understanding of culture and effective intercultural communication the counselling sessions will be much more effective. This presentation focuses on the fourth module of the six developed into the CMINAR Erasmus+ project. The three sessions focus on cultural differences and cultural adaptation. Special attention is also devoted to gender and religion. The purpose of this module is to make career counsellors ready for the cultural differences, which can increase effective counselling, and to provide a tool that can be used as a source when the cultural differences have a role in labor market orientation. Participants that attended all the 18 sessions of the training programs included higher education students in career counselling and practitioners. Lectures, group work, individually and group reflections and practical exercises are included in the teaching strategies. In discussing the results of the piloting special attention will be devoted to the fourth module. Results show gaining insight about cultural awareness and adaptation help career counsellors understand some challenges refugees and immigrants may encounter in employment. Thus, they can be aware of and ready for the role of cultural differences on labor market integration. Beyond supportive measures: Life Design and Career counseling skills in multicultural societies Teresa Maria Sgaramella and Lea Ferrari Life Design is meant as a lifelong self-construction process that aims to promote skills and competences in life planning (Vanhalakka-Ruoho, 2010). This approach provides the opportunity to design a satisfying work life which can be redesigned as needs, interests and life experiences change (Peavy in Campbell & Ungar, 2004); to design a work life in terms of future opportunities, which are determined by the accumulation of knowledge, skills, experience (Schreuder & Coetzee, 2006). Recent developments underline the potential
benefits for individuals with vulnerabilities and/or complex personal stories who more frequently may lack personal resources and skills needed in order to access relevant community resources that would facilitate social and work inclusion (Ferrari, Sgaramella, & Soresi, 2015). The aim of the activity proposed is to develop counsellors’ knowledge about strengths of refugees, threats to labour market inclusion, and provide them strategies to support their participation in the work contexts (Setlhare-Meltor, & Wood, 2016). Twenty-four master students whose age ranged from 23 to 35 y.o. have been involved in the activity with an educational background in psychology. Participants are engaged in 18 two-hours sessions three sessions where a series of lectures, videos, group work, practical examples, text analysis, and exercises where proposed on courage and future time perspective. A semistructured interview is used to analyze changes in knowledge and attitudes of participants together with their satisfaction for the activity carried out. Besides changes in each module proposed, a qualitative analysis highlights (a) development of knowledge on the meaning of the Life Design constructs and on qualitative measures; (b) the increase in the ability to support a client in a career counselling session in developing a positive mind-set from real situations, as well as future goals and the analysis of barriers and supports. Training master students on work inclusion, threats to work inclusion and strategies to develop language, attitudes and goals in counselling with refugees and migrants increases their confidence, competence and sense of efficacy in their actions.
CAREER COUNSELLING IN MULTICULTURAL SOCIETIES: THE IMPORTANCE OF REFLEXIVITY IN PRACTICE

Lea Ferrari
University of Padova (Padova, Italy)

Anne Chant
Claire Nix
Canterbury Christ Church University (Canterbury, United Kingdom)

Critical reflection is something that usually takes place after you have done some work that you reflect on afterwards and thus having that in the later course we changed to have that topic right after the introduction. As we are all predetermined by a specific culture we have been raised in, by a specific socialisation in our professional sphere and by the public and political discourse on common topics especially in questions of migration, refugees and integration of new immigrants, we are now addressing the impact of all of this on our thinking, working, teaching and learning before we start with concrete content issues. We need a critically reflected perspective on all that follows in the course of teaching and learning. The aim of the activity developed was to engage in critical reflexion of participants’ future practice with refugees and develop this skill. Twenty four master students from 23 to 30 y.o. were included in the course organized in 6 modules of 3 two-hours sessions each. Three sessions were devoted to critical reflection. A range of reflexive techniques were proposed to engage participants in their own reflections on their thoughts, concerns, assumptions and perspectives of working with asylum seekers and refugees. Lectures, paired and small group work and whole group discussion were then proposed to participants. A semistructured interview were used to analyse changes in knowledge and attitudes of participants together with their satisfaction for the activity carried out. Besides learning outcomes determined in each module, the presentation will specifically describe the development in the ability to explore a range of approaches to enable reflexive practice, evaluate their own multicultural competences, engage in a critical reflexive exercise to clarify and agree to further developments. Participants understand the particular importance of critical reflection when working in CGC for refugees, know central concepts of critical reflection and are able to work with appropriate reflexive instruments.
THE ROLE OF LANGUAGE AND LEARNING DIMENSIONS IN CAREER COUNSELLING WITH NEWLY ARRIVED MIGRANTS

Lea Ferrari
University of Padova (Padova, Italy)

Åsa Sundelin
Fredrik Hertzberg
Stockholm University (Stockholm, Sweden)

Language is a topic widely perceived and discussed when dealing with questions of migration and the integration of newly arrived immigrants (Sheikhi, 2013; Sundelin, 2015). And, yes, skills in the language of the receiving country is a base for the effectivity of all further steps on refugees’ ways to their integration into society and into the labour market. But language also is the main instrument in counselling settings themselves (Sundelin, 2017). A starting point for the module is Kolbs theory about experimental learning which suggests that learning activities should give the participants an embodied learning experience where thoughts, emotions and actions are involved (Granberg & Ohlsson, 2014). The aim of the module is to develop the course participants understanding of language as a meaning making resource for career mobility and in career guidance and counselling (CGC) with migrants/refugees, and the participants’ ability to manage language asymmetries and intercultural communication in CGC. Twenty seven participants are included in the course. The majority of the participants are professional career counsellors working in school settings, counselling projects in municipalities, employment offices among all. The majority has a university degree from the career counselling program (undergraduate exam). The course takes place at two occasions: 2,5 days + 2,5 days. The course departs from and is organized in 6 modules. One module, three sessions, are devoted to language and intercultural communication.

The module employs a mixture of different learning activities: lectures, group work, reflections (individually and group) and practical exercises. A semistructured interview is used to analyse changes in knowledge and attitudes of participants together with their satisfaction for the activity carried out. Besides learning outcomes determined in each session of the module, the presentation will specifically describe what training and resources are used to develop participants ability to use counselling methods that manage language asymmetries and support migrant clients’ participation in CGC and, design CGC activities that support migrant clients learning about career issues.
Refugees are coming from different cultures and sets of experiences; as a result, they perceive things differently. With counsellors who can apply their own understanding of culture and effective intercultural communication the counselling sessions will be much more effective. This presentation focuses on the fourth module of the six developed into the CMinaR Erasmus+ project. The three sessions focus on cultural differences and cultural adaptation. Special attention is also devoted to gender and religion. The purpose of this module is to make career counsellors ready for the cultural differences, which can increase effective counselling, and to provide a tool that can be used as a source when the cultural differences have a role in labor market orientation.

Participants that attended all the 18 sessions of the training programs included higher education students in career counselling and practitioners. Lectures, group work, individually and group reflections and practical exercises are included in the teaching strategies. In discussing the results of the piloting special attention will be devoted to the fourth module. Results show gaining insight about cultural awareness and adaptation help career counsellors understand some challenges refugees and immigrants may encounter in employment. Thus, they can be aware of and ready for the role of cultural differences on labor market integration.
Beyond Supportive Measures: Life Design and Career Counseling Skills in Multicultural Societies

Lea Ferrari
Teresa Maria Sgaramella
University of Padova (Padova, Italy)

Life Design is meant as a lifelong self-construction process that aims to promote skills and competences in life planning (Vanhalakka-Ruoho, 2010). This approach provides the opportunity to design a satisfying work life which can be redesigned as needs, interests and life experiences change (Peavy in Campbell & Ungar, 2004); to design a work life in terms of future opportunities, which are determined by the accumulation of knowledge, skills, experience (Schreuder & Coetzee, 2006). Recent developments underline the potential benefits for individuals with vulnerabilities and/or complex personal stories who more frequently may lack personal resources and skills needed in order to access relevant community resources that would facilitate social and work inclusion (Ferrari, Sgaramella, & Soresi, 2015). Abstract body. The neurotechnogy represent a new class of intelligent technologies that provide the building of self-learning artificial intelligence systems. In the coming years, they will ensure the rapid development. The crucial area is behaving in uncertainty condition. The aim of the work is the humans in work in uncertainty and spatial mazes: developmental and clinical issues? The symposium will include main problems of theoretical and practical experience of vision in uncertainty. This symposium will have at least a visual-spatial aspect. Visual-spatial investigations of incomplete images perception under uncertainty; human and animal water maze and all Virtual Reality (VR) and 3-D work likewise but in different ways. Research focuses on the design and evaluation of mobile and ubiquitous technologies for interactivity learning. The attention will be done to the behavioral neuropsychology of control of mental disorders following behavioral therapy. The current growth of neurotechnologies is to provide a further transition from traditional means of electronic computing to xeromorphic associative systems that work with semantics and are capable of independent, purposeful behavior, adaptive to the changing environment in accordance with these changes. The key direction of the neurotechnologies development is the development of artificial intelligence systems, which understand the semantics of the surrounding scenes and the purposeful activity of these systems on the bases of human behaving in the maze.

General summary of the Symposium. The abstracts of the talks during the symposium "VISUAL UNCERTAINTY, SCENE RECOGNITION AND SPATIAL BEHAVIOR" 1. CONSCIOUS AND UNCONSCIOUS COMPONENTS OF INCOMPLETE FIGURE PERCEPTION N.Foreman, Yu.Shelepin, I.P.Pavlov Institute of Physiology Russian Academy of Sciences, St-Petersburg, Russia Middlesex University, London, UK The Gollin test was originally introduced by Eugene Gollin in the 1960s. It involved the presentation of line drawings that included more and more contour information (5%, 20%, 30% and so on), until the figure (elephant, umbrella) was successfully recognized by the participant. In the original version, cards were used but in a computerized version (Foreman and Hemmings 1987) pixel blocks accumulated on a screen so that the exact percentage of figure required for identification could be ascertained. In a personal communication to one of the present authors (NF) Eugene Gollin said that he had originally envisaged it (the card version) as a developmental test, and indeed data gathered using the computerized version showed that on first presentation, less and less contour was required for identification over the period 18 to 60 months of age. Learning is rapid and the percentage required drops substantially over 3-5 presentations. Recent forms of the test involve presentation of colored or 3-D images. In 1997-2010 we argued that rather than figural “completion”, the test reflects the brain’s potential to calculate the statistics of the signal and mask (occlusion) even though the mask is unconscious as it is in the traditional version of the Gollin test. The masking idea allows the measurement of the statistics of the texture, conscious and unconscious, including the prevailing levels of internal noise in the visual system and as such it can be used potentially to diagnose forms of visual agnosia. The Gollin test can arguably be employed more widely to examine the effects of brain damage on visual form recognition. To examine this possibility further we have developed versions of the Gollin test using DOG and Gabor wavelet transformations (Chikhman et al., 2006). Foreman N, Hemmings R. The Gollin incomplete figures test: a flexible, computerized version. Perception. 1987;16(4):543-8 Chikhman V., Shelepin Y., Foreman N., Merkuljev A., ProninS. Incomplete figure perception and invisible masking // Perception. 2006. Vol. 35. No. 11. P. 1441-1457. 2. THE SEEING OF COMPLEX SCENE DURING SACCADES Barabanschikov V.A., Zherdev I.Y. vladimir.barabanschikov@gmail.com, Institute of Experimental Psychology, Moscow State University of Psychology and Education, Moscow, Russia We studied the patterns of perception of complex ecologically and/or socially significant objects during rapid eye movements. We hypothesized that during a saccade the effect of “saccadic suppression” takes place. The experiments were conducted on a hardware and software complex based on the iViewXTM Hi-Speed 1250 video eye tracker (SMI,Germany). The participants were shown a colour face image (3.7°×6°) expressing one of the basic emotions, while performing a targeted saccade. Face image duration was 7–14ms; average duration of 10° saccades: 41±9ms; average speed: 224±36°/s. The saccades were initiated by a neutral stimulus, which disappeared immediately after the start of eye movements. The test objects were presented pseudo-randomly along the main horizontal line of the field of view, to the right and to the left of the central fixation point (0°,±5°,±10°). Results. The average probability of accurate identification of facial expressions during saccades for all stimulus situations is above chance (0.61). Expressions of happiness (0.81), fear (0.71) and disgust (0.62) are recognized most accurately. The result of the evaluation depends on the alternative choice. Poorly recognized expressions, as well as a neutral state, are better recognised in intermediate positions (±5°); the frequency of well-recognized expressions is distributed evenly across all egocentric positions; emotion of sadness is reliably recognized only in the centre
The evaluation of the visual direction of the face is different from the actual. Discussion. The results confirm the possibility of an adequate perception of complex objects when performing rapid eye movements. The recognition accuracy is several times higher than the frequency of detection of point light flashes or than the recognition of simple objects during saccades, but 15-20% lower than the recognition of basic emotions in normal conditions. The results allow to conclude that the perception of facial expressions can begin not only during a stable fixation, but also at the peak of the saccade speed (about 400°/s), both in the centre and on the periphery of the visual field. The idea of “saccadic suppression” as a possible mechanism regulating the perception of ecologically valid objects seems controversial. Supported by Russian Science Foundation, project №18-18-00350 3. ENHANCING MOTOR LEARNING: A BRAIN-COMPUTER INTERFACE FOR MOTOR ERROR DETECTION, CORRECTION AND MEMORY CONSOLIDATION Miriam Reiner Technion — Israel Institute of Technology Three components are embedded in relearning of motor skills: error detection and omission of motor errors from the motor pattern, repetitive training, and consolidation of the corrected motor execution. Here we suggest a model that consists of two brain-computer-interfaces processes, and a simple repetitive motor task in between. The outcome is a paradigm that includes a identification of EEG error signals that predict an upcoming or performed error. Once the signal comes up, an external robotic arm is employed to correct the motion. This is repetitive until full correct motion is achieved, and no EEG markers for error detection occur. The second stage is an independent free repetition of the motor act that validates the free ability to perform an act. Once the motor motion is finalized and found correct, a process of consolidation using neurofeedback for motor sequence consolidation is employed. In earlier work it has been shown that error potentials are associated with errors, but did not address the type of error. Recently it has been shown, that EEG signals are uniquely associated with error characteristics, suggesting a potential BCI system for error-tailored correction, rather than generic BCI. Thus the first stage of error detection provides also a BCI loop for motor correction that fits the characteristics of the error, rather than a generic correction, one-fits-all, further suggesting a new paradigm of error correction BCI. This new paradigm targets personalized profile of error detection and correction. The third component relates to neurofeedback theta applied after motor learning. Results showed a significant effect of enhanced motor memory performance in the experimental group compared to the control groups. This paper describes a preliminary paradigm of motor rehabilitation: BCI error detection and enhanced motion accuracy, training and BCI for consolidation of the corrected motion.

4. OPTIMISING THE DESIGN OF TEXT USING SIMPLE ALGORITHMS Arnold Wilkins University of Essex, Colchester, UK Simple algorithms that assess the spatial periodicity of text can predict both the comfort and the speed with which text can be read. Ratings of discomfort from a wide variety of images are predictable from the extent to which the images are “un-natural”, as assessed by fitting a 1/f cone to the two-dimensional Fourier transform. The size of the residuals in such a fit predicts discomfort from text, as reflected in the choices people make when adjusting i-Books. Reading speed can be predicted from the first peak in the horizontal autocorrelation of text. The higher the peak, the lower the reading speed because more time is required to re-align the eyes following a saccade. There are large differences between fonts as regards predictions of comfort and speed. Text for children is inappropriately designed: it gets too small too early in life, compromising reading speed and comprehension. In addition, appropriately selecting the background colour of text can sometimes facilitate reading. The reasons may be related to cortical hyper excitability and a consequent susceptibility to the spatial periodicity of text.

5. NEUROTECHNOLOGIES: COGNITIVE BEHAVIOURAL THERAPY AND VIRTUAL ENVIRONMENTS Liliya Korallo, Svetlana Muravjova, Olga Schemeleva, Evgenii Shelepini Middlesex University, London, UK ; I.P.Pavlov Institute of Physiology Russian Academy of Sciences , St-Petersburg, Russia lkorallo@yahoo.co.uk The aim of this study was...
to evaluate the effectiveness of the application of neurotechnology with an interactive virtual environment for the correction of cognitive impairment in patients with schizophrenia and depression. We created a neurotechnology using virtual reality for the rehabilitation of patients with neurocognitive disorders. The virtual environment used at the second stage of the analysis represented a video of natural scenes that simulated a bike ride through the landscape with a varying relief completely synchronized with the movement of the patients. The observer’s task included a thorough review of both spatial images (magno-system) and separate objects (parvo-system) presented on the panoramic monitor, but also the fulfillment of the cognitive task. For example, focusing on individual video elements in order to search and account objects with certain characteristics set at the beginning of the session. The effectiveness of the methodology was assessed using the electrophysiological (cognitive visual evoked potentials).

Comparative analysis of evoked potentials amplitude during the perception of images, which filtered via digital filtration for selective effect on the magno- (low frequency) and parvo- (high frequency) — channels of the visual system, was used. It was shown that in patients with schizophrenia and depression, exhibited a decrease in the amplitude of the components to stimuli filtered at high spatial frequencies and reduced contrast sensitivity at high spatial frequencies. The difference between these pathologies is the different localization of disturbances. In schizophrenia — the localization of disturbances in the occipital, parietal, central, frontal areas and the right temporal region. In depression — the localization of disturbances in the central parietal, central and frontal areas.

According to the obtained data, activation of the parvo system was observed in patients of two pathologies after application to the visual system of interactive virtual environment. And also the improvement of the processes of concentration of attention, early sensory processing, working memory and in-depth analysis of information. Accordingly, this methodology using an interactive virtual environment can be effectively used in patients with neurocognitive disorders.

McCOLLOUGH EFFECT AS BALANCE BETWEEN PERCEPTUAL UNCERTAINTY AND COLOR CONSTANCY MECHANISMS Archil Kezeli, David Janelidze, Manana Khomeriki, Natela Lomashvili Laboratory of Vision Physiology, Ivane Beritashvili Center of Experimental Biomedicine, Tbilisi, Georgia akezeli@gmail.com Our early investigations show that McCollough Effect (ME) elaboration causes shifts of spectral and pigment color discrimination thresholds as in normal, so in naturally and artificially color anomaly human subjects. So it was interesting to check if ME has any influence on color constant perception ability. For evaluating color constant perception rate there have been conventionally used the so-called Brunswick ratio, its modified version or the so-called constancy index. These approaches allow to indirectly measure the degree of constancy. For quantitative evaluation of constancy degree a diverse, relatively simple and closer to natural conditions method was used. This method, under conditions of alteration of illumination chromaticity in a given direction, allows determination of the parameters which can be used for assessing changes in functional state of color constancy mechanisms i.e. color constancy abilities. The data obtained in our experiments show that in the majority of individuals investigated (75%), following acquisition of the MCE, statistically reliable alteration of the "thresholds" of pigment color constant perception occurs. Present investigation once more indicates that ME generates significant shifts in functional state of color visual subsystem. These shifts according to our view are mainly realized by compensatory-correcting mechanisms, in particular, by color constancy mechanisms and data presented about alterations of the pigment color constant perception "thresholds", due to elaboration of ME also speak in favor of this theory.

VISUAL UNCERTAINTY, AMIGDALA AND CONTROL OF BEHAVIOR Panakhova E.N., Hashimova U.N., Babayev Kh.,F. Institute of Physiology of National Academy of Azerbaycan, Baku Our electrophysiological results indicate the direct pathways from basolateral amygdala to the Visual Cortex. The neurodegenerative process (Alzheimer’s disease-AD) includes amygdala and Visual Cortex. The vision under uncertainty in this patients demonstrate suppression evoked
potentials amplitude. Natural antioxidants such as saffron (Crocus Sativus) and curcuma (Curcuma Longa L) growing in Azerbaijan were used to control of AD patient behavior. The aim of our work was to study the saffron and turmeric in neurogenesis and the rehabilitation of AD. Experiments were provided on old white rats (n=75). The spatial memory in the Morris water maze under standard conditions were studied. After the contraction of the latent period of the search for the invisible platform, surgical olfactory bulbectomy was initiated, causing an experimental analogue of AD. 50 rats were per os administrated by saffron extract, 25 –by curcuma solution. The saffron for 21 days immediately prior to the bulbectomy led to a significant lengthening of the period before the manifestation of the primary signs of cognitive impairment. In bulbectomied animals that did not receive saffron, memory impairment occurred 3 months after surgery, while in those who received saffron before bulbectomy all cognitive functions were maintained for 5.5 months. Another group of animals receive curcuma 3 months after surgery – during this period prolonged deterioration of spatial memory was observed and the rats again, like naive animals, could not detect the platform for a long time (120-180 s). After 6 days of curcuma administration, the latent period in these animals was reduced to 4-6 seconds with the first immersion in the water maze. The crocin, in saffron, is a good antioxidant that can control behavior, prevent and treat the visual behavior under uncertainty and curcuminos (bimethoxycurcumin, disbimethoxycurcumin, and cyclocurcumin) have the ability to bind to beta-amyloid and thereby restore neurogenesis and neurotrophic factor expression. These work has financial support from Science Development Fund under the President of the Republic of Azerbaijan. Grant ELF-BGM-3-BRFTF-2 + / 2017-15 / 10/3-M-08. 8. COLORIZED GOLLIN INCOMPLETE FIGURES TEST.Yu.Shelepin, S.Pronin, N.Foreman*, K.Shelepin, L. Korallo*, E.Shelepin, I.P.Pavlov Institute of Physiology Russian Academy of Sciences, St-Petersburg, Russia.*Middlesex University, London, UK. Foreman N. and Hemmings R. (1987) developed a computerized version of the Gollin test formed from black and white images of incomplete contour figures, which provides a precise and versatile alternative to the original Gollin card version. This powerful test (S.Pronin version) has been widely used for a measuring of Gestalt perception, visual development, learning, memory, and signal to noise ratio investigations and as a clinical test to examine brain dysfunction at amnesic patients, brain injury. Usually Gollin test is not colored. Color version of has been recently proposed (S.Pronin and K.Shelepin et al., 2018). Famous Ishihara or Rabkin color tests paper cards, and Mollon, and Reffin computer-controlled color vision test (1989) consists of incomplete figures but with one level of completeness. Our New version of Color Gollin Test include colored digitized drawings of familiar objects were presented via computer, the percentage of the figure on the screen slowly increasing level of completeness from 0 to 100. Performance on the task improved markedly over three tests in all participants. Neurophysiological investigations of the mechanisms of incomplete contour figures recognition has been recently investigated (Shelepin et al., 2018). In our work we propose the Colorized Incomplete Figures Gollin Test, for experimental and clinical psychology. Our Test is a powerful instrument to measure perception of colored figures of different levels of figural completeness for Gestalt psychology. Foreman N, Hemmings R. The Gollin incomplete figures test: a flexible, computerized version. Perception. 1987;16(4):543-8. Shelepin K. Yu., Trufanov G. E., Fokin V. A., Vasilev P. P., and Sokolov A. Spiritual abilities as a resource of mental well-being. The symposium “Ability and Giftedness” provides a unique opportunity for scientists and all who are interested to discuss major themes and challenges of theoretical research as well as practical implementations.

Press paragraph. William Sulis, M.D. (psychiatry), Ph.D. (mathematics), Ph.D. (theoretical physics). He is a President of the Society for Chaos Theory in Psychology and Life Sciences. He is on the Editorial Board of the journal "Nonlinear Dynamics in Psychology and Life Sciences". His areas of expertise are collective intelligence, neurochemical systems regulating human behavior, mathematical methods and their use in psychology. Vladimir Shadrikov, Doctor of Sciences (Psychology). He is Academician of the Russian Academy of Education. He is on the
Editorial Board of the “Journal of the Higher School of Economics”, “Psychological Journal”, “Psychology issues”. His areas of expertise: psychology of activity and abilities, problems of education content, evolution of thought (cultural and historical aspect, ontology of thought, thought and cognition). Irina Trofimova, Ph.D. (Psychology). She developed a class of stochastic models called Ensembles with Variable Structures (EVS), the theory of diagonal evolution in complex systems studies, and the neurochemical model Functional Ensemble of Temperament (FET). Her activities were awarded by two grants from the NATO Scientific Committee, Russian Fund for Fundamental Research and Russian Humanitarian Science Fund. Elena Volkova, Chemistry (MD), Doctor of Sciences (Psychology). She is the author of the Di-theory of special abilities. Her areas of expertise are ability, giftedness, intelligence, creativity, mechanisms of development, Intelligent Systems and Technologies. Her activities were awarded by two grants from Russian Science Foundation. Philippe Oliviero, Social Sciences and Social Psychology. The focus of his actual researches concerns the Cognitive Modeling of levels (metacognition, cognition, incarnation) of subjectivation and intersubjectivation as a psychosocial and spiritual resource. Galina Ozhiganova, Philology (MD), PhD (Psychology). His areas of expertise are Psychology of spiritual capacities.

She was a vice-editor in chief of the Psychological Review — the Journal of Russian Psychological Society. She proposed a psychological model of spiritual capacities and new ways to study them. Her activities were awarded by two grants from Russian Science Foundation.

**General summary of the Symposium.** Main issues: D How to determine the ability and giftedness? D What are the changes in abilities during the age development? D What are the mechanisms that ensure the integration of abilities into giftedness? D What are the stages of development of giftedness? From the point of view of Chaos Theory, Prof. Sulis raises the question of what collective intelligence can teach us about intelligence. Based on empirical research, Prof. Shadrikov shows that giftedness appears as a metasystemic quality and it has, like abilities, three dimensions: the natural capability of the individual, the capability of the subject of activity, and the capability of the personality. Prof. Trofimova, addressing the issue of the natural foundations of giftedness, in the context of the Functional Ensemble of Temperament (FET) describes the roles of main neurotransmitter, hormones and neuropeptide systems in regulation of temperament traits and abilities. Dr. Volkova, based on the Di-theory of development, reveals the mechanisms and stages of chemical giftedness development. Dr. Oliviero & Dr. Ozhiganova consider spiritual capacities as a mental resource for the development of giftedness. Invited Speakers: 1. Dr. Vladimir Shadrikov. Academician of the Russian Academy of Education; Higher School of Economics, Research Professor at the Faculty of Social Sciences; Russia. 2. Prof. Irina Trofimova. A Senior Researcher and an Adjunct Professor in Department of Psychiatry and Behavioral Neurosciences, McMaster University, Canada. 3. Dr. Elena Volkova. The Head of the Laboratory of Psychology of Abilities and Mental Resources, IPRAS; Russia. 4. Prof. William Sulis. Director of the Collective Intelligence Laboratory, McMaster University, Canada. 5. Dr. Philippe Oliviero, Doctor in Social Sciences and Social Psychology at the University of Sorbonne, France: +33 6 64 00 56 70; oliviero.philippe@gmail.com 6. PhD. Galina Ozhiganova. A senior researcher in the Laboratory of Psychology of Abilities, IPRAS, Russia.
DIAGNOSTICS AND DEVELOPMENT OF CONCEPTUAL EXPERIENCE AS THE BASIS OF GENERAL AND SPECIAL GIFTEDNESS

Elena Volkova
Institute of Psychology, Russian Academy of Science (Moscow, Russia)

The main disadvantage of psychometric approach to the assessment and development of general and special giftedness is that it does not allow us to move from the level of split analysis to the understanding of the holistic nature of giftedness. We believe that DI-approach to the study of giftedness can be a worthy alternative to the psychometric one. The main issue of our research was to discover the ontological nature of concept “substance” which from inside determine the essence of giftedness in chemistry and explain to us the peculiarities of interaction between general and special abilities in the structure of individuality. Research design consisted of three series of studies (two formative and comparative experiments). The diagnostic complex included the assessment of concept “substance”, chemical abilities, intelligence, creativity, field dependence/independence, and temperament. The data obtained revealed: 1) concept formation leads to an increase in the speed, accuracy and easiness (in terms of decreasing of EEG power spectrum) of solving chemical problems; 2) purposeful concept formation leads to the development of intelligence; 3) the formation of the detailed level of the concept “substance” determines successfulness in real professional activity of chemists; 4) there are intellectual thresholds for success in chemistry: (a) IQ<110 (WISC) — intelligence determines success; (b) IQ>130 — chemical abilities define success; 5) the higher is the level of concept organization, the higher is the level of intelligence, creativity, field independence, and successfulness in real professional activity of chemists.
TOWARDS A TAXONOMY OF NEUROCHEMICALLY-BASED INDIVIDUAL DIFFERENCES IN GIFTEDNESS

Irina Trofimova  
McMaster University (Ontario, Canada)

When discussing neurophysiological systems underlying consistent individual differences, such as giftedness, abilities or temperament, a prominent focus on neuroanatomic systems regulating human behavior often overshadows the very important role of neurochemical systems, such as neurotransmitters, hormones, and neuropeptides. This presentation summarizes the contributions of neurotransmitter and neuropeptide systems regulating consistent aspects of behaviour that emerge as abilities and temperament traits. The review of main models of human taxonomy, including 30 main temperament and personality models shows a convergence of experimental research in psychophysiology, kinesiology and clinical neuropsychology and functional neurochemistry. This convergence leads to functional ecology perspective considering the development of the structure of adult temperament as a result of certain functional properties of the tasks and activities of adults. The roles of main neurotransmitter, hormones and neuropeptide systems in regulation of consistent (temperament) traits and abilities will be discussed in the context of the Functional Ensemble of Temperament (FET) framework.

WHAT DOES COLLECTIVE INTELLIGENCE TEACH US ABOUT INTELLIGENCE?

William Sulis  
McMaster University (Ontario, Canada)

Collective intelligence is ecologically salient, adaptive behavior, expressed by a collective of individual agents, in the absence of any central authority. It occurs in the presence of uncertainty and pluripotentiality and can reasonably be viewed as a form of decision making. Collective intelligence arises in an emergent manner from the interaction between the collective and its environment. It is intelligence without representation and without explicit goals. As such it is a form of non-rational decision making even though its outcomes are significant for the survival of the collective. Some collective intelligence systems can approximate rational decision strategies such as the weighted additive strategy. The archetypal naturally occurring example of a collective intelligence is the social insect colony. Collective intelligence approaches have been used in emergent computation architectures. This presentation will illustrate the range of decision making strategies that have been observed in natural collective intelligence systems using examples from social insects. Several formal approaches to modeling and explaining collective intelligence decision making, such as phase transitions, broken symmetries and transient induced global response synchronization will be discussed. Implications for computational architectures will also be explored.
ABILITIES FOR ENTITIES SUBJECTIVATION AND SPIRITUAL CAPACITIES AS A MENTAL RESOURCE

Philippe Oliviero
University of Paris Sorbonne (Paris, France)

Galina Ozhiganova
Institute of Psychology, Russian Academy of Sciences (Moscow, Russia)

Abilities and giftedness linked to the metacognition of the plurality of knowledge of the subjectivity help to develop mental and spiritual resources. Spirituality should be involved in the adaptation to the orientations and the variations of subjective and intersubjective life at all stages and in all practical components of human existence (education, cultural and professional activities, social relations, feeling of existence, health). Predisposition to the manifestation of spiritual capacities is inherent in all people. The basis of spiritual capacities is a moral-value component, associated with higher moral capacities of the people and their main life values and meanings. The instrumental component of spiritual capacities is represented by higher reflexive, self-regulatory, and other higher capacities. A specific component of spiritual capacities is the transcendent component related to the capacity for transcendence. Spiritual capacities are a powerful mental resource of personal development. The study was supported by RSF grant (project № 18-18-00386), Institute of Psychology RAS.

THE SYSTEMOGENESIS OF GIFTEDNESS

Vladimir Shadrikov
National Research University Higher School of Economics (Moscow, Russia)

In this paper the processes of systemogenesis of giftedness are being considered. The understanding of giftedness as an integral manifestation of abilities for the purposes of a specific/particular activity, acting as a systemic quality of the subject of activity, having an individual measure of expression/severity, developing in activity and manifested in the qualitative originality of its implementation, is substantiated. Based on empirical research conducted by the author there were reviewed and given the answers to the questions: How to understand the ability? What are the mechanisms to ensure the integration of abilities into giftedness? How does the value of each ability change in the processes of interaction with other abilities? What are the stages of formation of giftedness in activity? It is shown that giftedness, as well as abilities, has three dimensions: the natural giftedness of the individual, the giftedness of the subject of the activity and the giftedness of the personality. In noted dimensions the giftedness acts as metasystem quality.
SEXUALITY AND SOCIAL RELATIONSHIPS IN OBSESSIVE-COMPULSIVE SPECTRUM PHENOMENA

Andrea Pozza
Davide Dettore
Casale Silvia
University of Florence (Florence, Italy)

Abstract body. Modern conceptualizations grouped a family of conditions (body image/eating disorders, among others), called as Obsessive-Compulsive Spectrum, based on similarities with Obsessive-Compulsive Disorder (OCD), such as repetitive preoccupation, compulsive behaviours, key emotion (disgust). Sexuality encompasses all erotically significant aspects of social life (eg, attractiveness, relationships, identity) essential to self-value. Sexuality and social relationships are understudied in OCD spectrum research. With the 21st century changes in communication system, problematic social media use, sexuality and intimate relationships have become vulnerability/maintenance factors of OCD-like phenomena and a target of intervention. In the present symposium, Professor Casale discusses two experiments providing causal evidence about social media use, body image, and sexual attractiveness in undergraduates. Professor Dettore discusses the role of attachment styles in sexual response in OCD. Dr. Pozza focuses on personality traits in partner-/relationship-centered obsessive thinking in Lesbian-Gay-Bisexual people. Implications are addressed in terms of development mechanisms of OCD-like phenomena, psychotherapy and prevention.

General summary of the Symposium. Modern conceptualizations grouped a family of psychological conditions, called as Obsessive-Compulsive Spectrum phenomena, based on their similarities with Obsessive-Compulsive Disorder (OCD) in terms of repetitive thinking, preoccupation, doubting and/or compulsive behaviours (e.g., reassurance seeking/checking), as well as their key emotions (disgust, shame), illness course, and treatment response similar to OCD. OCD spectrum conditions include body image disorders, eating disorders, among others. Such similarities were supported by empirical research on community and clinical samples. Sexuality is a broad concept encompassing all erotically significant aspects of social life, including desires, attractiveness, practices, relationships, and identities. It has a key role in the development of the individual's self-value. Although the content of the obsessive...
preoccupations may vary across the conditions, being related to different domains (e.g., body image, physical health, intimate relationships). OCD spectrum conditions share a common vulnerability root, in which self-value is based on social life. Sexuality is understudied in OCD spectrum research. Along with the 21st century changes in the communication systems, problematic social media use, sexuality and intimate relationships have become vulnerability/maintenance factors of OCD-like phenomena and a target of the intervention. The current symposium focuses on sexuality and social relationships in OCD spectrum conditions. The presentation by Professor Casale discusses two experimental studies providing causal evidence about the association between social media use, body image investment, and perceived sexual attractiveness in large undergraduate samples. Professor Dèttore discusses a case-control study about the role of the attachment styles in excitation/inhibition sexual response in OCD. Dr. Pozza focuses on DSM-5 personality traits in partner- and relationship-centered obsessive thinking in Lesbian-Gay-Bisexual people. The authors focus on the implications of these findings in terms of development mechanisms of OCD-like phenomena, psychotherapy and prevention. Research gaps/directions are addressed about the role of sexuality/social relationships in OCD spectrum development, treatment, and prevention.
DSM-5 PERSONALITY TRAITS AND PARTNER- AND RELATIONSHIP-CENTERED OBSESSIVE THINKING IN LESBIAN-GAY-BISEXUAL SEXUAL ORIENTATION

Andrea Pozza
Davide Dèttore
University of Florence (Florence, Italy)

Guy Doron
Intersciplinary Center Herzliya (Herzliya, Israel)

Recent research has identified two new forms of Obsessive-Compulsive Disorder (OCD), Partner- and Relationship-centered OCD (ROCD) having a detrimental impact on the quality of intimate relationships. The first one includes preoccupation, checking, and reassurance seeking behaviors relating to one’s partner’s perceived flaws in domains of physical appearance, sociability, morality, emotional stability, intelligence, and competence. The second one includes obsessions, checking, and reassurance seeking behaviors centered on an individual’s feelings towards his/her partner and the “rightness” of their relationship. The role of personality traits in ROCD phenomena is understudied. The Lesbian-Gay-Bisexual (LGB) population was found to be a vulnerable subgroup with maladaptive personality traits as compared with heterosexual people. No research focused on ROCD thinking in this subgroup. The current study explored the role of DSM-5 personality trait domains in Partner- and Relationship-centered obsessive thinking in a LGB group, controlling for vulnerability/maintenance cognitive factors of obsessive thinking (i.e., obsessive beliefs). 95 individuals with LGB sexual orientation were recruited from the general population (mean age= 27.25, SD= 8.12, range= 18-57; 69.50% females). 62 (65.30%) were lesbian or gay and 33 (34.70%) bisexual. The Personality Inventory for DSM-5 Adult, the Obsessive Compulsive Inventory-Revised (OCI-R), the Obsessive Beliefs Questionnaire-46 (OBQ-46), the Partner-focused Obsessive Compulsive Inventory (PROCSI), and the Relationship-focused Obsessive Compulsive Inventory (ROCI) were administered. The participants were included if self-reporting an intimate relationship (mean relationship duration= 3.50 months, SD= 4.50). Higher scores on the OBQ-46 Responsibility for Omission ($\beta$= 0.30, $t=3.14$, $p<0.01$) and on the PID-5 Antagonism ($\beta= 0.27$, $t=2.85$, $p<0.01$) predicted higher scores on the PROCSI. Higher scores on the OBQ-46 Importance of Thoughts ($\beta= 0.30$, $t=2.97$, $p<0.01$) and on the PID-5 Psychoticism ($\beta= 0.21$, $t= 2.06$, $p<0.05$) predicted higher scores on the ROCI. Antagonism personality traits and Responsibility for Omission beliefs seem to be associated with partner-centered obsessive thinking. Metacognitions related to excessive importance of thoughts and Psychoticism personality traits seem to be specific to relationship-centered obsessive thinking. Such personality trait domains may be the focus of the intervention with ROCD thinking. Clinical implications are discussed. Future investigations using clinical samples are required.
ATTACHMENT STYLES AND SEXUAL RESPONSE IN OBSESSIVE-COMPULSIVE DISORDER: A MATCHED COMPARISON WITH HEALTHY CONTROLS

Andrea Pozza
Davide Dettore
University of Florence (Florence, Italy)

There is a lack of knowledge on the clinical predictors of impaired sexual response in OCD, including inhibition and excitation. Attachment style may be associated with impaired sexuality. The present study examined the role of the attachment styles in excitation/inhibition sexual response in patients with OCD, controlling for obsessive beliefs. 41 patients with OCD [mean age = 34.51, DS= 9.75; 15 females (36.60%)], were matched for sex and age with 41 participants drawn from the general population, who did not report clinically significant OCD. The Attachment Styles Questionnaire (ASQ), the Obsessive Beliefs Questionnaire-46 (OBQ-46) and the Sexual Inhibition and Sexual Excitation Scales (SIS-SES) were administered. Multiple linear regression analyses were performed by including the scores on the OCI-R and the ASQ as predictors and those on the SIS-SES as outcomes. As compared with controls, patients with OCD reported higher scores on the ASQ Need for Approval (Mann-Whitney U= 426, p<0.001) and ASQ Preoccupation with Relations (Mann Whitney U= 509.50, p<0.01) and lower on the SIS-SES Type 1 Inhibition scale (Mann Whitney U= 297.50, p<0.01) and SIS-SES Type 2 Inhibition (Mann-Whitney U= 626, p<0.05). No difference was found on the other ASQ scales and on the SIS-SES Excitation scale. In the group with OCD, higher scores on the ASQ Need for Approval predicted lower scores on SIS-SES Type 1 Inhibition (B= -0.04, p<0.01), suggesting that patients having an attachment style based on need for approval have stronger sexual inhibition related to fear of failure or not satisfying the partner’s expectations. Higher scores on the OCI-R Contamination/Washing scale predicted lower scores on the SIS-SES Type 2 Inhibition (B=-0.04, p<0.05), suggesting that those patients having less severe contamination/washing symptoms have stronger sexual inhibitions related to the physical context where the sexual activity may occur and to the potential psycho-social consequences of sex (transmission of diseases). This is the first study investigating the role of attachment in sexual response in OCD. Inhibition seems relevant to OCD. Attachment based on need for approval and contamination/washing symptoms are associated with inhibition and may be a target of the intervention.
DOES INSTAGRAM USE AFFECT BODY IMAGE INVESTMENT AND PERCEIVED SEXUAL ATTRACTIVENESS? PRELIMINARY EXPERIMENTAL RESULTS

Giulia Fioravanti
Casale Silvia
University of Florence (Florence, Italy)

Among social media, Instagram (Ig) is unique in that it is purely dedicated to the posting and sharing of photos and it allows users to manipulate their photographs in a more visually appealing manner. For this reason, Ig use has received attention from body image researchers since 2010. The current presentation aims to build upon previous studies on the effects of Ig use on body image by including a multidimensional view of body image and providing through two experimental designs evidence for causal interpretations about the association between social media use and body image. A pre- and post-test design was performed with 608 undergraduate students (72.7% F; mean age: 22±2.12) randomly assigned to view either a set of Ig fit inspiration images (experimental group) or a control set of travel images (control group). Results show that one-time exposure to fit inspiration images led to decreased sexual attractiveness [F(1, 606) = 5.79, p = .02, \eta^2_p = .01]. This effect was obtained only among females (t_{232} = 3.12, p=.002, d=.20). In the second study, 30 undergraduates (mean age: 23.40 ± 1.51; F = 50%) were asked to open an Ig account and exposed to 15 attractive same-sex images for a week. They were compared with a same-age non-exposed control group (n = 30; mean age: 22.67 ± 1.58; F = 50%). Results show that one-week exposure to attractive image on Ig increased self-evaluative salience of appearance among females (t = -2.507, p<.05); no significant differences were found between the experimental and the control group on body dissatisfaction after one-week exposure. Present findings build upon previous research by 1) highlighting the negative effects of viewing ideal images on specific body image dimensions among females and 2) extending previous results about media effects on physical attractiveness into a new media format (i.e. Ig).
POSITIVE SOCIALIZATION: PERSONAL FACTORS AND SOCIAL RISKS

Petrova Elena
Russian Social State University (Moscow, Russia)

Abstract body. The phenomenon of socialization continues to be one of the most popular ones with researchers studying psychology, sociology, pedagogics and political sciences. Socialization is seen as continuous interaction between an individual and the society. Young people represent the main strategic resource of the society’s reproduction and constitute a considerable innovative potential. The presented within symposium studies tend to provide complex interdisciplinary approach to the phenomenon of positive socialization, which allow for increasing potential of our society. In practical psychological work it is very important to emphasize the process of personal awareness of the deeper aspects of one’s inner world and one’s true, authentic nature, taking responsibility for one’s life, when the subject becomes its creator. Theoretical grounds and practical tools will be considered that allow individual to reach awareness of his/her own authenticity and positive socialization in society, contributing to increasing the quality of collective wellbeing.

Press paragraph. The absence of a socialisation standard defined as the result of successful socialisation which enables individuals and the society to recreate socialties, social relations and cultural values and ensure their further development. In the current environment of fast changes and social transformation shared ideals lose their universal nature and new behaviour models and styles emerge, so the socialisation standard is transformed. In the environment of changing society the relations between particular people and various social institutions, which are often in a crisis, get weaker; existing characteristics of social personality types become less definite. It is quite common that the functions and roles assigned to an individual and the ones they actually perform are not the same. This contradiction is harmful not only for young for young people, but all generations. The qualified speakers from the leading universities (state and private) of Russia, Brazil and Belorussia will present the outlined problem and possible solutions to prevent negative aspects that can trigger the development of digressing socialisation in the situation when the space for independent decision-making is expanding.

General summary of the Symposium. The development of today’s youth takes place in the turbulent social and economic environment. Delayed social maturity, social infantilism, learned helplessness, emotional numbness and detachment are the social phenomena that represent dysfunction of socialization of youth. Today we need new studies on the content of the positive and negative influence of the environment on the development of a personality and psychological mechanisms of positive socialization. The concept of positive socialization is a relatively new concept and it has not been fully defined. Traditionally the term socialization implies a double-sided process of assimilation of social experience of the society the particular person belongs to and active reproduction and buildup of social ties and relations system. Although the attitudes to this concept have changed as have the role and the status of a person in the life of a society.

Positive socialization can be considered as a bidirectional process and phenomenon—mastering prosocial behaviour, social roles, norms and cultural traditions and subjective mental wellbeing (Volkova et al, 2016). The symposium will consider the outcomes of different social, psychological counseling and educational project, which can be introduced as technologies of positive socialization. As well as recent research in these areas will be presented. In particular there will be discussed the issues of new approaches in career counseling for stimulating the process of positive socialization; the development of the entrepreneurial mindset and behavior as technology for achieving positive
socialization; socio-psychological parameters of a person’s safe prosocial behavior; discrepancies between the declared value system and its actualization in real behavior for young people actively involved in social networking; psychological well-being and authenticity as the basic parameters for an active subjective position of the socialising personality.

NATIONAL-CIVILIAN IDENTITY IN THE SOCIO-CULTURAL IDENTIFICATION OF YOUNG STUDENTS

Shmeleva Elena
Pavel Kislyakov
Russian State Social University (Moscow, Russia)

The issue of socio-cultural identification acquires a new interpretation today when the rapid social changes trigger changes in social relationships. The new epoch is characterized by such features as globalization, digitalization, inter-ethnic and inter-confessional conflicts, ambivalent concepts about passionarity and an explicit expression of uncertainty in understanding the goals and the trends of society development. The burning issue today is what are the conditions in which socio-cultural identification becomes a regulator of social stability and a means of forming a person’s resistance to socio-cultural threats? In this work we shall consider socio-psychological regularities of socio-cultural identification of young students in the context of national-civilian identity. In the first stage of the study, interviews were conducted with students (N=384). Analysis of the interviews revealed a list of socio-cultural needs of young students. The collected data formed the basis for a questionnaire, “Socio-cultural needs of youth”. In the second stage, 341 students were surveyed using questionnaire and testing (“Personal and social identity” by A.A. Urbanovich). The results of factor analysis made it possible to establish the fact that one of the main socio-cultural needs of the Russian youth is the national-civilian identity. In the third stage using the correlation analysis, we have carried out a research on the connection of socio-cultural needs with personal and social identity of the student youth. The needs for national-civilian identity are associated with a sense of patriotism, which maintains desire to develop one’s homeland, and bolster connections with it, which manifests itself in his professional activities. The socio-cultural needs for national-civilian identity are interconnected with identity in its professional role, identity of oneself as a subject of market relations, identity with the inner world, identity with health, identity with the social role in the family, identity with the social roles in society, identity with notions about the future of the self, and identity with social status in society. The formation of civilian attitudes and patriotism in youth and of the socio-cultural identity will resolve the creed crisis, and revive the respect for the state, society, family, and national cultural heritage. The study was supported by RFBR, project 18-413-370002.
ORTHO-SUBJECTIVE APPROACH IN CAREER COUNSELING FOR SOLVING THE PROBLEMS OF POSITIVE SOCIALIZATION

Elena Petrova
Vera Ptchelinova
Russian State Social University (Moscow, Russia)

Only harmonious personality can make in a natural way a true independent and conscious choice of a professional path. The experience of positive socialization within socially significant work activities provides a reliable support for this process. The purpose of the Ortho-Subjective Approach in career counseling is the holistic scientific examination of a person’s lifedesign in terms of interdependence of properpersonal and professional development. The client in the career development sessions is trained to introspect personal life experience in order to be able to identify and prevent negative trends. The sample of the experimental study is comprised of people, aged 14-58 (N=420), clients of the Center for Psychological Counseling (based in Moscow), which specializes in occupational and vocational guidance, providing means to individual in solving problems related to occupational choice and building professional path in general. The study design was based on the understanding of personality as a system of psychodynamic relations between the external world and internal reality, determined by eight group of factors: parental family, reference group, mentoring, natural aptitudes, abilities, level of aspirations, model of the world of professions (about fifty thousand descriptions), and awareness of connections between all these factors. The factor analysis revealed the role of each factor in the images of the real and ideal situation of personal and professional development. The results of acceptance of personal and vocational self-determination have demonstrated that 90% of the respondents accept short-term (32-36 hours) personal and vocational training, and only 10%, regardless of age, are ready to be seriously engaged in in-depth courses on increasing personal efficiency. Practical outcome of the experiment involve the possibility to develop special targeted training courses at the early stages of personal development and vocational guidance (beginning from high school), which should include self-knowledge and self-awareness courses as well as courses targeted to the development of the vocational and occupational identity, allowing for positive socialization of young people. Special emphasis within these programs should be made on developing self-orientation skills in vocational guidance.
DEVELOPMENT OF THE ENTREPRENEURIAL MINDSET AND BEHAVIOR BY THE MEANS OF AN ENTREPRENEURIAL EDUCATION

Patricia Wazlawick
Ricardo Schaefer
Faculdade Antonio Meneghetti (Recanto Maestro, Brazil)
Daria Sklemina
Russian Social State University (Moscow, Russia)

The interest in the entrepreneurial mindset has grown significantly over the last years, stimulating new studies. In the uncertain decision contexts of the modern society, we consider the development of the entrepreneurial mindset in young people to be one of the efficient strategies to increase their positive socialization in the future. The purpose of the presented study was to analyze the development of the entrepreneurial mindset in undergraduate students and professors of a private university in Brazil. Entrepreneurial mindset can be defined as cognitive adaptability (the ability to be dynamic, flexible, and self-regulating) in one’s cognitions given dynamic and uncertain task environments (Michael Haynie, et al, 2010). The first step, pilot research, identified the faculty members who, from the students’ point of view, develop unique activities in the classroom. There were selected and interviewed about the specifics of the education process the most frequently mentioned professors from each course. The content analysis was applied to process the data obtained. The second—quantitative—stage included interviewing students and professors (N= 439) using the following instruments: questionnaire of entrepreneurial behavioral characteristics (McClelland et. al., 1987), test ‘Forma Mentis’ (Mencarelli, 2014). Finally, the triangulation of the data was executed. The results’ analysis of both stages revealed the key characteristics of the entrepreneurial education, the specific roles and duties that students and professors assume and the new didactic pedagogical methodologies and practices aimed at the entrepreneurial formation, based on the recent developments in psychological science. There were identified and described the dimensions of the entrepreneurial mindset and the characteristics of the entrepreneurial mindset and behavior (related both to professors and students). As the study showed, the entrepreneurial education should not only be oriented to the transmission and acquisition of knowledge, but also aimed at treating entrepreneurship as a way of being, knowing and doing that is a new spectrum of competencies for young people entering the labor market, a re-connection of practical experience with the process of acquiring knowledge. This represents an emerging priority for the higher education systems in today’s world and a prerequisite for positive socialization of youth within society.
SOCIO-PSYCHOLOGICAL PARAMETERS OF A PERSON’S SAFE PROSOCIAL BEHAVIOR

Pavel Kislyakov
Russian Social State University (Moscow, Russia)

The social institutions face the problem of forming a safe prosocial behavior of young people oriented towards welfare of the society and fostering the abilities to withstand social risk factors. The aim of our research was to establish socio-psychological parameters of a person’s safe prosocial behavior under conditions of actualization of national interests and socio-cultural transformations of society. The theoretical and methodological basis of the study was the theory of social norms of prosocial behavior. The study covered young specialists and representatives of socionomic professions (psychologist, social worker, teacher, health professionals) (N=214). At the first stage, by using the focus-group method, a list was made of likely characteristics and motives (indicators) for a person’s safe prosocial behavior. At the second stage, by using a method of classifying by results of ranging the proposed qualities and motives, 30 (thirty) outstanding ones were singled out. In processing the empirical data a method was used elaborated by P. Vergers for analyzing the structure of social notions. The basic notions of a person’s safe prosocial behavior the following groups: 1) conformism, need for social approval, orientation toward values of collective wellbeing, etc.; 2) social responsibility, devotion to national and cultural traditions, political maturity and others; 3) communication skills, an ability to establish social contacts, orientation to development of social capital, a need for contact with other people, etc.; 4) resilience, psychological wellbeing, tolerance of uncertainty, adaptability; 5) moral stance, humanistic attitude to the world, position of non-violence, etc.; 6) mercy, spirituality, faith in God. The factor analysis made it possible to bring together socio-psychological parameters of a person’s safe prosocial behavior based on six components: social identity, social responsibility, social capital, psychological safety, religiousness. Thus, the formation of a person’s safe prosocial behavior must ensure integration of social competences and socially significant qualities and motives into a single system that determines a person’s readiness for performance of actions benefitting another person and the society in general in terms of its social safety. The study was supported by RFBR, project 18-313-20001.
CULTURAL-DIALOGIC METAPERSPECTIVE OF POSITIVE SOCIALISATION: THE ASPECT OF VALUES SIMULACRAZATION

Vladimir Yanchuk
Belarusian State University (Minsk, Belarus)

The problem of positive socialization and its mechanisms definition are analyzed from the position of authors cultural-dialogic interdeterminist metatheory of psychological knowledge integration (Yanchuk, 2018). Psychological phenomenology is considered as heterogeneous dynamic nonlinear systems approach position. The idea of four-dimensional continuity of psychological phenomenology is grounded, the system-forming universal basis of which is proposed culture, functioning as the acculturation process central mechanism, as well as the orientation and value-normative behavior regulator and orientation matrix of its interpretation, integration, coordination and sanctioning. As the system functioning central mechanism is proposed cultural-dialogic interdetermination, standing in the basis of the heteroqualitative natures, psychic spheres and behavior determinants dialogical interaction, providing integral functioning balance, through finding and developing mutually acceptable co-existence compromises and optimums. Attention is focused on transitions in the process of acculturation from one quality to another and the psychological conditions of its provision in the youth socialization process. By the introduced theoretical background where investigated the problem of youth value simulacrazation (separation sign from reference) (Baudrillard, 1981) from real life behavior.

Through combining quantitative (Schwartz Value Survey) and qualitative methods (narrative analysis) using parallel methodological triangulation on a sample of 650 young people actively involved in networking, Instagram explored the relationship between the declared value system and its actualization in real behavior. The age of respondents varied between 12 and 18 years with a mean age of 14.8 (SD = 1.64). The results of the study showed a clear disagreement of the declared value system and its actualization in real life situations in persons with high ego-involvement in networking. For the present studies, we used the Statistical Package for the Social Sciences (SPSS 23.0) and a p-value of .05 (two-sided) to detect significant effects. High ego-involvement in networking were negatively correlated, $r(171) = -0.22, p = .005$. This group of informants showed a pronounced tendency to avoid real interpersonal relationships, which are environmentally friendly indicators of the regulatory function of values. Moreover, this is in the presence of positive correlations with the results of passing test measurements — the structure of positive values were positively correlated, $r(171) = 0.36, p < .001$. 
PROGRAMS OF PROFESSIONAL RETRAINING IN PSYCHOLOGY AS A TOOL FOR ACHIEVING PERSONAL AND SOCIAL WELL-BEING

Tatiana Vereitinova
Victoria Dmitreiva
Aleksander Ostrovskiy
Russian Social State University (Moscow, Russia)

Just knowing about the outside world is not enough to make the right choice; one needs to get to know oneself, one’s abilities and possibilities. Therefore the process of socialisation requires an active subjective position of the socialising personality. Modern information age puts people in a position, which requires constant renewal and updating of the knowledge system, skills and previously acquired competence. This is confirmed by our studies conducted in Russia, the CIS, Europe and Latin America, which show that leaders-entrepreneurs uphold the values of development; their prevailing value orientations are those of “achievement”, “stimulation” and “self-sufficiency”. Over a half of the respondents named education and personal development among their principal investment directions. Based on more than 20-years experience of running professional retraining program in psychology for the international audience, it can be emphasized that a key success feature of such programs is integration of psychological knowledge with business, politics, economics and other areas. When assessing the results of the program we discovered a trend for real change in a number of personal characteristics of the students. Studies of the results of the on-going work have shown that the functional organization of the educational process leads to changes in life situation of the subject, increased level of psychological well-being, which is reflected in the positive dynamics in different spheres of human life and social wellbeing as a whole. Obtained education facilitates better self-understanding and self-acceptance, understanding of one’s own project, autonomy, presence of goals in life, positive relations with others, professional development and growth of competitive ability, as self-evaluation of the graduates has shown. These characteristics are crucial for the process of ‘life-long learning’ (continuous, voluntary search for new knowledge) in which a modern person is constantly involved. Thus, on the different cases it will be demonstrated that the psychological education is an opportunity for integral development of the personality, whereby it is possible to promote the development of the whole society.
POLITICS IN PUBLIC REPRESENTATIONS

Gordana Jovanovic  
University of Belgrade (Belgrade, Serbia)

Irina Samuilova  
Saint Petersburg State University (Saint-Petersburg, Russia)

Olga Mitina  
Victor Petrenko  
Lomonosov Moscow State University (Moscow, Russia)

Abstract body. The symposium reports on researches about different ways of public representations of political issues. Jovanovic analyses implicit political representations in the knowledge production in the research situation itself (political saturatedness of the choice of the subject matter, status of the subjects, methods used etc.). Deyneka deals with representations of foreign policy decisions in the minds of Russian citizens. One of the results showed a common factor reflecting citizen’s concerns about economic consequences of political decisions (Crimea, Syria). In their contribution on social representations of political leaders, Mitina, Petrenko and Papovyan report on two classes of phenomena shaping the perception of leaders among the youth — the images of the leaders and set of factors (morality, political adventurism, charisma and statism). Samuilova’s presentation deals with the representations of political leaders in public consciousness in different generations, showing a tendency to associate the mood in the country with characteristics and activities of leaders.

Press paragraph. The symposium reports on researches about different ways of public representations of political issues. Jovanovic analyses implicit political representations in the knowledge production in the research situation itself (political saturatedness of the choice of the subject matter, status of the subjects, methods used etc.). Deyneka deals with representations of foreign policy decisions in the minds of Russian citizens. One of the results showed a common factor reflecting citizen’s concerns about economic consequences of political decisions (Crimea, Syria). The representation of foreign policy decisions of politicians of other countries in the mind of Russian citizens also showed a common factor related to security in the broad sense of the term, including military security.

Domestic policy decisions were presented as specific and did not give a common factor. In their contribution on social representations of political leaders, Mitina, Petrenko and Papovyan report on two classes of phenomena shaping the perception of leaders among the youth — the images of the leaders and set of factors (morality, political adventurism, charisma and statism). Samuilova’s presentation deals with the representations of political leaders in public consciousness in different generations, showing a tendency to associate the mood in the country with characteristics and activities of leaders.

General summary of the Symposium. The symposium reports on researches about different ways of public representations of political issues. In a more general framework, Jovanovic analyses implicit political representations in the knowledge production in the research situation itself (political saturatedness of the choice of the subject matter, status of the subjects, methods used) and argues for their analysis as a way to contribute to a critical attitude toward science and politics. In her contribution, Deyneka deals with representations of foreign policy decisions in the minds of Russian citizens. After obtaining data about the most important political decisions in the last five years, Deyneka used modified semantic differential to assess the quality of those decisions. One of the results showed a common factor reflecting citizen’s concerns
about economic consequences of political decisions (Crimea, Syria). In their contribution on social representations of political leaders, Mitina, Petrenko and Papovyan report on two classes of phenomena shaping the perception of leaders among the youth — the images of the leaders and a set of factors including morality, political adventurism, charisma, and statism. By combining psycho-semantic methodology with multitrait- multimethod, the coauthors obtained deeper insights into implicit categories shaping the perception of political leaders. The presentation by Samuilova deals with the representations of political leaders in public consciousness in different generations, based on researches conducted since 2012. The representations are analysed in terms of the role and content of activities ascribed to political leaders (functional purpose of the leaders, tasks expected, desired results). Additionally to psychological characteristics expected from leaders by respondents it was shown that there is a tendency to associate the mood in the country with characteristics and activities of leaders, which supports a turn toward a personalized model of politics.
THE POLITICS OF PSYCHOLOGY

Gordana Jovanovic
University of Belgrade (Belgrade, Serbia)

The aim of this theoretical paper is to argue for the political relevance of psychology beyond its sub-discipline of political psychology. The theoretical framework is shaped by critical and interpretive psychologies which will direct the search for manifest and latent representations of the political issues in the research process itself. The method is a hermeneutic analysis oriented also toward understanding possible hidden meanings. The very choice of subject matter is politically relevant, as one can choose, ignore, reveal or cover phenomena of political importance. The fact that samples in most psychological research belong to a very specific population, but inferences are expressed as generalizations valid for humans in general, raises, beyond the statistical significance, a politically relevant question of representation — who and how can one represent the other, how one qualifies to represent others? In research design, in the position of research subjects, how they are named (subjects, clients or participants) and treated, social relations are inscribed saturated with political connotations — inequality, domination, power. The methods applied also have their politics (Steinmetz). Beyond its appearance as a human encounter, interviews can be a powerful tool to instantiate and reinforce dominance, as shown by Steinar Kvale. Interpretive frameworks are very saturated with cultural and political values. The best example is the widely used individualism-collectivism dichotomy. Interpretations which positively evaluate individualism and discredit collectivism, reproduce by scientific means the dominant Western political ideology of individualism. Thus, from the choice and definition of research problems up to interpretation of findings, knowledge production is determined by external, social, political processes, even if researchers are not willing to acknowledge it. Therefore, the quest to reflect on them and to assume a self-reflective attitude characterizes, for example, alternative qualitative methodology. In conclusion, it could be said that the very structure of the research situation provides arguments to support the claim that knowledge production in psychology as in science in general is inherently politically saturated. Whether this is acknowledged or not is also politically relevant, as it can foster or suppress critique of politics, and in that way contribute to the culture of critical dialogues.
REPRESENTATION OF FOREIGN POLICY DECISIONS IN THE MIND OF RUSSIAN CITIZENS

Olga Deyneka
Saint Petersburg State University (Saint-Petersburg, Russia)

The problem of assessing the quality of political decisions is acute in the modern world (George, 1997) and especially in foreign policy (Mintz et al., 2010; 2014). One of the key criteria for the quality of political and managerial decision-making is the degree of their support (Janis, 1972). Disapproval of political decisions leads to a loss of trust in the government and reduce the identifications of citizens with the state. The aim of the present study was to identify the specifics of the reflection of foreign policy decisions in the minds of Russian citizens. The study was conducted in two stages. At the preliminary stage, the author’s questionnaire and frequency analysis were used to identify the most significant political decisions over the past five years. At the stage of the main study, the modified semantic differential (MSD) was used to assess the quality of political decisions, which contained the criteria for evaluating political decisions as descriptors, and specific decisions as incentives. In addition the attitudes to the state and government, political values and personality profile (“Big five”) were measured. The frequency analysis of the political decisions selected by the respondents showed that the list of significant foreign policy decisions is more unified, and the list of domestic policy decisions shows a wide variety. The results of factor analysis of the MSD data clearly demonstrated not only the uniqueness of the representation of each evaluated foreign policy decision of Russian politicians, but also the presence of a common factor of their reflection in the mind. It embodied citizens’ concerns about the possible adverse economic consequences of resonant political decisions (the return of the Crimea, military assistance to Syria, the decision on counter-sanctions). The representation of foreign policy decisions of politicians of other countries in the mind of Russian citizens also showed a common factor related to security in the broad sense of the term, including military security. Domestic policy decisions were presented as specific and did not give a common factor. Correlations of representation of political decisions with political values of respondents, their civic attitudes and personal characteristics are revealed.
IDENTIFYING KEY FACTORS IN THE PERCEPTION OF POLITICAL LEADERS

Olga Mitina
Victor Petrenko
Marina Papovyan

Lomonosov Moscow State University (Moscow, Russia)

Our goal was to determine the composition of factors that underlie the perception of modern Russian political leaders among youth and therefore play a major role in shaping social representations. The present study was carried out within the theoretical and methodological framework of the psychosemantic approach, which seeks to reconstruct systems of meanings, both individual and collective, through the investigation of subconscious as well as explicit categories of perception. Previous research in psychosemantics had repeatedly demonstrated certain factors that can help explain the perception of various political phenomena. Given the fact that modern politics tends to be increasingly personalized, it seems vital to gain a realistic understanding of the key dimensions along which political leaders are perceived. In this study, conducted in late 2017 — early 2018, the data was collected from a sample of student participants (n=200) with the “Political Leader’s Image” psychosemantic inventory, which had proven to be an effective research tool in earlier studies of political perception. The exploratory factor analysis has revealed four major factors — morality, political adventurism, professional characteristics (charisma) and statism — that determine the way political leaders are perceived and evaluated. In order to gain a more refined understanding of the factors that affect the processes of perception, we implemented modeling in EQS program with the help of the multitrait-multimethod model (MTMM). We have demonstrated that two distinct sets of factors contribute to shaping the attitude to political leaders — the images of the leaders as well as the aforementioned four factors. As for the theoretical and practical value of the study, our findings have several important implications. Firstly, the results of the conducted analysis can improve our understanding of political processes by explaining the framework within which modern Russian political leaders are perceived by younger generation. Secondly, by combining the psychosemantic approach and the MTMM method we have attempted to expand the methodological toolkit of political psychology, demonstrating the possibility to analyze implicit categories of perception with sophisticated mathematical procedures. Finally, from a practical standpoint, the obtained results may prove useful in political image building, eventually helping to ensure more efficient political communication. Funded by grant RSF № 17-18-01610.
REPRESENTATION ABOUT POLITICAL LEADERSHIP IN THE PUBLIC CONSCIOUSNESS

Irina Samuilova
Saint-Petersburg State University (Saint-Petersburg, Russia)

In actual circumstances of development of society, the role and place of leaders involved in socio-political transformations is significantly increased. The study of the role and content of the activities of political leaders, as well as the representation of citizens about their characteristics, is of particular relevance and is becoming increasingly necessary in terms of understanding the potential of the country and the formulation of national priorities to overcome the consequences of the crisis. The presentation will reflect the results of many years of research (from 2012 to present) about the representation of the concepts of “political leadership” and “political leader” in the public consciousness of representatives of different generations. Empirical data refer to the functional purpose of political leaders, from the point of view of respondents, the range of tasks expected from the leaders of the citizens of the country, as well as to the desired results of political activity in modern conditions. Universal psychological characteristics that politicians of different levels should have are: responsibility, organization, purposefulness, sociability, balance, courage, etc. The respondents’ ideas about the characteristics, political views and results of the activities of political leaders are analyzed on the example of specific political figures of different periods of Russia's history (Stalin, Khrushchev, Brezhnev, Gorbachev, Yeltsin, Putin, etc.). Multiple correlations of the above-mentioned parameters of assessment of political leaders with the image of the country and the States that arise in response to political incentives are established. The more pronounced the characteristics of a political leader, the more positive the image of the country in the minds of its citizens. Respondents associate socio-political moods in the country and abroad with the activities and specific characteristics of political leaders.
Abstract body. The symposium attempts to broaden the perspective of life meaning research by addressing conceptual, theoretical, and methodological issues associated with meaning. The presentations focus on the history of the concept of meaning in Western culture and human sciences, individual differences in lay theories of meaning and in the salience of emotional, cognitive, and activity indicators of a meaningful life, as well as on new measurement tools and meaning-promoting interventions. Meaning was traditionally viewed as a universal process, but it appears as a heterogeneous phenomenon with important individual differences not only in terms of content, but also in terms of structure and functions, revealing a diversity of individual developmental patterns. The implications of these new perspectives and findings for the future studies of life meaning will be discussed.

Press paragraph. The question of the meaning of life is usually seen as a universal human problem. However, historically, it is a relatively recent phenomenon: in the West, it had been a problem for a narrow elite until the middle of the 20th century (Frank Martela). Meaning still remains a puzzle for personality scientists: it is revealed in emotional, cognitive, and volitional phenomena, but is not limited to any single class of those (Shulamith Kreitler, Dmitry Leontiev). Empirical studies reveal a corresponding variety of individual views, or lay theories of meaning: it can be understood by different individuals as a goal, as an idea, as an emotional experience, with some people even failing to find a clear understanding of meaning or viewing it as an abstract or absurd concept with no relation to real life. This diversity of views corresponds to differences at the level of psychological functioning and personality development (Evgeny Osin): it appears that meaning becomes salient when a person faces the challenge of finding their individual path in life (Polina Beloborodova). Future research on meaning could do well by acknowledging the diversity of individual developmental trajectories, reflecting various possibilities offered by culture.

General summary of the Symposium. Life meaning is usually seen as a universal human problem and as one of the basic human needs (V. Frankl). However, historically, it is a recent phenomenon, associated with modernity. Within cultural-historical activity theory, the conscious concept of meaning can be seen as a cultural tool that becomes essential at higher levels of personality development, when the issues of individual identity and self-determination with respect to the biological, social, and cultural contexts become salient. The symposium will focus on the issues of universality of meaning, individual differences in the content and the very concept of meaning, the diversity of modes of personality functioning connected with these differences, and on ways this diversity could inform future psychological research. Frank Martela will present the historical and cultural background of the problem of meaning and individual identity in Western societies, and discuss the implications for our views on individual development. Shulamith Kreitler will present a new instrument based on the assumption that there are many ways in which a person can find and experience meaningfulness in life and that these ways are grounded in different aspects of meaning (emotions, actions, possessions, cognitions or functions). Evgeny Osin will present empirical findings revealing a diversity of lay theories of meaning, showing that indifference to this concept and lack of awareness of the problem of meaning are associated with lower scores on a range of personality indicators of higher-level positive functioning. Finally, Polina Beloborodova will present the findings of a positive intervention study, which reveals that meaning may emerge as a result of searching for an individual calling. The presentations will be discussed by Dmitry Leontiev with references to existing theories and studies of meaning, aiming to elucidate the new perspectives in life meaning research.
IS A CRISIS OF MEANINGFULNESS A MODERN PHENOMENON? — A HISTORICAL ANALYSIS OF KEY TRANSITIONS IN THE WESTERN CULTURE

Martela Frank
Aalto University (Helsinki, Finland)

In studying various psychological phenomenon, psychology as a science tends to take a relatively ahistorical look at its subject, ignoring, for example, how differently individuality and selfhood has been constructed in various historical epochs (Baumeister, 1987). This is also true of research on meaning in life, which has proliferated in recent years (see Heintzelman & King, 2014; Martela & Steger, 2016). Following calls to develop a more historically grounded science of psychology (e.g. Cushman, 1990), the present article aims to examine the question how meaning of life has become a problem in Western countries during the last two centuries. The article is based on a historical analysis of various primary and secondary sources that have discussed the question of meaning of life in the 19th and 20th century. A particular emphasis is on the pioneers of meaningfulness, including Thomas Carlyle, Arthur Schopenhauer, Søren Kierkegaard, and Leo Tolstoy, and the cultural changes that led them to experience a crisis of meaningfulness in the 19th century. As a starting point, it is observed that the whole phrase meaning of life was only coined in 1834 by Thomas Carlyle (O’Brien, 2014), and it is shown how it was only the loss of the certainty of the religious framework that made it possible to experience what we tend to call an existential crisis or a crisis of meaningfulness (Hyman, 2010). A look at the biographies of the pioneers of meaningfulness reveals the religious struggles they all went through. General trends in religiousness in Western countries are examined and compared to other explanations to examine to what extent it is the central factor in leading to the crisis of meaningfulness becoming more prevalent. While in the 19th century lack of meaningfulness was a syndrome that only a very narrow elite was suffering from, the conditions that led to them losing a sense of meaningfulness nowadays characterize a significant part of the upper and middle classes of Western societies, thus potentially explaining why the question has become such an important topic in current times.
MEANINGFULNESS OF LIFE AND ITS CORRELATES

Kreitler Shulamith
Tel-Aviv University (Tel-Aviv, Israel)

The paper presents the meaning-based measure of the Meaningfulness of Life (MOL) which consists in applying the theory of meaning (Kreitler & Kreitler) to the issue of life’s meaningfulness. The MOL is based on the assumption that there are many ways in which a person can find and experience meaningfulness in life and that these ways are grounded in the different aspects of meaning, for example, emotions, actions, possessions, cognitions or functions. Accordingly, the MOL includes statements describing meaningfulness of life in terms of the 22 basic content categories of the system of meaning, e.g., to be active and be doing things, to experience many different emotions, to be aware of one’s development, to get evaluations from others. Subjects are requested to state on a 4-point scale the extent to which each of the items contributes to their sense of meaningfulness of life. One hypothesis underlying the MOL is that the items constituting one’s meaningfulness of life correspond to the meanings one habitually considers (i.e., one’s profile of meaning assessed by the Test of Meanings). Thus, if emotions are salient in one’s way of thinking and assigning meaning emotions would also be an important component of one’s meaningfulness of life; or, volunteering would be a potential action contributing to one’s meaningfulness of life if actions and consideration for others are salient components in one’s profile of meaning). The correlation between the scores in the MOL and in one’s profile of meaning were in the range of .63-.85 (p<.01) in different samples. The correlation was lower (r=.34) between the score of the MOL and the meanings used by subjects for expressing freely the meaning of life or of happiness. The scores of the MOL were correlated significantly (in the range of .50-.72, p<.01) with the total scores of quality of life in samples of healthy as well as cancer patients.
IS “MEANING” ALWAYS MEANINGFUL? : INDIVIDUAL DIFFERENCES IN LAY THEORIES OF MEANING

Evgeny Osin
Sofya Kuznetsova
Elena Voevodina
Anna Malyutina
National Research University Higher School of Economics (Moscow, Russia)

There is a wide range of theoretical conceptions of life meaning, emphasizing its cognitive, affective, or motivational aspects. But do everyday people have lay theories of meaning and if they do, how are those theories reflected in the scores of widely used meaning measures? The aim of this exploratory study was to find out the typical ways people understand the notion of meaning. Participants from Russian community and online samples (N=376, age 14 to 77, 69% female) were asked to rate 20 items reflecting different dimensions of life meaning: its ontological nature, conceivability, universality, necessity, determinism, the role of individual choice, reasons for questioning, and importance. They also completed measures on a range of psychological variables. Using hierarchical cluster analysis (Ward’s method) of individuals based on the meaning dimension items, we established 4 distinct implicit conceptions (lay theories) of life meaning. Respondents tend view meaning in the following ways: 1) as a goal or a direction in life (activity conception), 2) as an idea or an emotional experience (subjective conception), 3) as an illusion (conflicting conception), or 4) as an absurd question, unrelated to life. Respondents in the first two clusters devote their time to the question of meaning and report having a clear understanding of this concept. Cluster 3 respondents understand this notion to a lower extent, but evaluate their past efforts at finding meaning as not very successful. Finally, respondents in cluster 4 do not really understand what meaning is, as they either failed to find it or never searched for it. Significant differences across clusters in experienced meaning (MLQ, PIL), self-determination, self-control, and systemic reflection suggest that respondents in cluster 3 may lack personality resources to pursue life meaning, while those in cluster 4 may lack the motivation to search for it. People do indeed differ in their subjective positions toward the problem of life meaning: there are also those who see meaning as an illusion or dismiss it as a pointless question. These findings have implications for empirical studies of life meaning, which typically assume that this construct is universally applicable.
“I’M LOOKING FOR A CALLING, NOT JUST A JOB”: TESTING A CAREER CALLING DISCERNMENT INTERVENTION FOR COLLEGE STUDENTS

Beloborodova Polina
National Research University Higher School of Economics (Moscow, Russia)

In recent years researchers are increasingly interested in the concept of career calling. Stemming from religious background, this idea emerged into its modern understanding focused on self-actualization. Research shows that individuals who are living their calling benefit from higher levels of life and work satisfaction, life meaning, and engagement. Receiving guidance in the search for calling could be especially beneficial for college students as they undergo the process of identity formation. The goal of the present study is testing an intervention for the discernment of calling, as well as investigating the role of meaning in life and personal life position in this process. 2×2 quasi-experimental repeated measures research design was used to estimate the effect of an eight-week course aimed at guiding students in searching for their callings. The course included investigation of character strengths, values, and sources of positive emotions, followed by their integration into personal mission and pinpointing ways to implement it in real life (potential callings). Intervention group (n = 25) consisted of students who signed up for the course. Students in the control group (n = 63) volunteered to participate in the study to receive feedback on their replies to calling and life meaning questionnaires. Average intervention effect was measured with difference-in-differences estimation. The sense of having a calling and perceived actualization of calling significantly increased in the intervention group. Also, if measures of meaning in life and personal life position were included into the statistical model, intervention effect became insignificant, indicating that the increase of the sense of having and living a calling occurred due to the increase of meaningfulness and change of personal life position towards higher agency, awareness and authenticity. The results of the study can be used in a variety of contexts. The intervention may be included in the career orientation seminars in order to encourage students to think about their future work not only in terms of career perspectives and earnings, but also as a path to self-actualization and serving greater good. The research has been funded by the Russian Foundation for Basic Research, project 17-06-01009.
CONCEPTUALIZATIONS OF SUICIDAL BEHAVIOR

Ksenia Chistopolskaya  
Boris Polozhy  
Moscow Research Institute of Psychiatry (Moscow, Russia)

Jie Zhang  
Center for Suicide Prevention Research (Jinan, China)

David Klonsky  
University of British Columbia (Vancouver, Canada)

Kari Dyregrov  
Western Norway University of Applied Sciences (Bergen, Norway)

Abstract body. The symposium is dedicated to different conceptualizations of suicidal behavior. Prof. Polozhy (Russia) will present his upgrade of J. Mann’s model, based on his study. Prof. Zhang (China-USA) will show empirical evidence of the Strain Theory of Suicide. Prof. Klonsky (Canada) will talk on his 3 Step Theory and its future. Prof. Dyregrov (Norway) will argue for the necessity of the shift from the psychiatric model of suicidal processes to more broad person-centered perspective. Ksenia Chistopolskaya will be the convener.

Press paragraph. The symposium is dedicated to different conceptualizations of suicidal behavior. Prof. Polozhy (Russia) will present his upgrade of J. Mann’s model, based on his study. Prof. Zhang (China-USA) will show empirical evidence of the Strain Theory of Suicide. Prof. Klonsky (Canada) will talk on his 3 Step Theory and its future. Prof. Dyregrov (Norway) will argue for the necessity of the shift from the psychiatric model of suicidal processes to more broad person-centered perspective. Ksenia Chistopolskaya will be the convener. The symposium is best scheduled on the first day of the suicidology section, before or after the lectures of Fabrice Jollant and Rory O’Connor, before the Panel Discussions on Comprehensive Models of Suicidal Behavior and What Do We Need to Study?
A SHIFT AWAY FROM THE PSYCHIATRIC MODEL TOWARDS A BROADER UNDERSTANDING OF SUICIDAL PROCESSES — EXEMPLIFIED THROUGH A QUALITATIVE PSYCHOLOGICAL AUTOPSY RESEARCH DESIGN

Kari Dyregrov
Western Norway University of Applied Sciences (Bergen, Norway)

To understand the complexity behind suicidal behavior and completed suicide, we need to challenge the “truth” that 90% of those who kill themselves suffer from mental disorders (Hjelmeland et al., 2012). This may be a dangerous discourse leading to the notion that if there are no signs of mental illness, there is no danger of suicide afoot. Also, it may contributed to the current high emphasis on identification and treatment of mental disorders as the main suicide prevention effort. To study the suicidal processes and complexities behind a suicide, we need to incorporate a focus on contextual and relational factors inherent in suicidal processes. We need varied and complex research methods, and especially more qualitative research is needed. “Why suicide?”, a Qualitative Psychological Autopsy (PA) study will exemplify this. Method. The study aimed at answering the question why a person kills him/herself, through the exploration of the suicidal processes leading up to the individual suicide. The data consisted of 120 in-depth interviews with close family members and friends, and suicide notes, relating to 20 suicides. The deceased who aged 18-65 years and had no previous mental disorders were recruited through the chief municipal medical officers and GP’s. The PA-interviews took place 6-18 months post loss and consisted of a narrative- and a problem-focused section. Qualitative analysis followed the flexible guidelines of Interpretative Phenomenological Analysis (Smith et al., 2009). Results. The results showed that there is an extensive interplay between psychological characteristics, social context, and life events in the suicidal processes. Also, the results showed the importance of combining information from different persons who knew the deceased from different life spheres prior to death. Because non-clinical suicides are not preceded by identifiable symptoms of mental disorder, and many who take their life do not seek help prior to death, the present findings underscore that talk or actions indicating suicidality, as well as repetitious worrisome indirect appeals for emotional support, should be explored directly with the person. Conclusion. Guidelines to increase responsibility of carers’ and helpers’ of suicidal persons under conditions of despair and isolation may carry the potential to save lives.
THE THREE-STEP THEORY (3ST) OF SUICIDE: EVIDENCE, CHALLENGES, AND NEXT STEPS

David Klonsky  
University of British Columbia (Vancouver, Canada)

This presentation addresses a new theory of suicide rooted in the ‘ideation-to-action’ framework: the Three-Step Theory (3ST; Klonsky & May, 2015). Specifically, I will a) describe the theory and its rationale, b) review current evidence for the theory, c) discuss challenges for scientifically testing the theory, and d) suggest important future directions for the operationalization and evaluation of the theory’s core tenets and constructs. The 3ST has three primary tenets. First, suicidal desire results from the combination of pain (usually psychological pain) and hopelessness. Second, among those experiencing both pain and hopelessness, connectedness is a key protective factor against escalating ideation. Third, the theory views the progression from ideation to attempts as facilitated by dispositional, acquired, and practical contributors to the capacity to attempt suicide. Evidence supporting the theory’s tenets has come from large correlational studies in both the US (Klonsky & May, 2015) and UK (Dhinra et al., 2018), studies of motivations for suicide in numerous samples (May & Klonsky, 2013; May et al., 2016), research on the events, thoughts, and feelings that precede lethal and near-lethal suicide attempts (Wintersteen, 2014), and recent work on the capability for suicide (Klonsky, Qiu, & Saffer, 2017). I will review this work and also present findings from a new study of the 3ST in psychiatric inpatients. At the same time, several scientific challenges and next steps must be addressed if the 3ST is to be more fully validated and applied. These include the need to: (a) distinguish suicidal desire (relevant for Step 1) from the broader construct of suicidal ideation, which can include suicidal plans and perceptions of suicide capability (relevant for Step 3); (b) delineate and measure the construct of overwhelming pain, including its differentiation from other negative emotions; (c) develop a more comprehensive measure of dispositional, acquired, and practical contributors to the capacity to attempt suicide. Overall, the 3ST appears to provide a useful and accurate explanation for suicidal thoughts and behaviors that has promise for prevention and clinical applications. But there is more work to be done.
Suicide is a global public health problem, but very few theories have been developed for its etiology and effective prevention. Strain, resulting from conflicting and competing pressures in an individual’s life, is hypothesized to precede suicide. The Strain Theory of Suicide proposes four sources of strain leading to suicide: (1) value strain from differential values, (2) aspiration strain from the discrepancy between aspiration and reality, (3) deprivation strain from the relative deprivation including poverty, and (4) coping strain from deficient coping skills in the face of a crisis. The report presents a comprehensive and parsimonious theory explaining the socio-psychological mechanism of suicidal behavior.

Hypotheses: It is hypothesized that the higher the level of strains, the greater the risk of suicide. Social support, impulsivity, etc. can moderate the relationship between strain and suicidality. This presentation will illustrate a number of empirical studies that test the Strain Theory of Suicide with various samples. One of the studies is of a psychological autopsy design. Data for this study were from a large psychological autopsy study conducted in rural China, where 392 suicides and 416 community living controls were consecutively recruited. Two informants (a family member and a close friend) were interviewed for each suicide and each control. Major depression was assessed with HAM-D and the diagnosis of mental disorder was made with SCID. It was found that individuals having experienced failed aspiration were significantly more likely than those having not experienced a failed aspiration to be diagnosed with at least one disorder measured by the SCID and major depression measured by HAM-D, and to be a suicide victim, which is true of both suicides and controls.

This study supports the hypothesis that the discrepancies between an individual’s aspiration and the reality is likely to lead to mental disorder including major depression and suicidal behavior. Lowering a patient’s unrealistic aspiration can be part of the of psychological strains reduction strategies in cognitive therapies by clinicians’ and mental health professionals. Future research with rigorous quantitative data needs to be conducted to further test the STS on a more comprehensive level.
Suicide is one of the acute medical and social problems in Russia. In spite of the marked decline in suicide rates, the level of suicides in Russia is still high – 17-18 per 100,000. It demands the development of new, preferably differentiated approaches to prevention of suicide behavior. To date the most recognized theory of suicide in the world is the one of diathesis-stress (J.J. Mann et al., 1999), according to which suicidal behavior develops in the result of specific diathesis (disposition to suicidal behavior, or heightened vulnerability to factors, which lowers the threshold of its development) and the influence of stressors (triggers), which accelerate the forming of this behavior. The authors describe following factors of diathesis: family history, personal development, personal traits, psychiatric disorders, lack of social support, presence or absence of religious beliefs, substance abuse, somatic illnesses – a wide range of various factors. Despite indisputable strengths of this theory, the concept of diathesis is still rather vague. In particular several questions arise: Which of the listed factors are the basic? Is one factor enough, or a specific constellation is needed to develop suicidal behavior? Which constellation it will be? Are the factors of diathesis comparable in their impact? Seeking answers to these questions, we explored the factors of diathesis on the material of clinical psychological study of 257 people with non-fatal suicidal attempts, as well as psychological autopsy of 119 people, who died by suicide. The whole sample consisted of 376 people. The study allowed to form 3 groups of factors, which were found in suicidals more frequently. According to its significance they were designated as first-order determinants. They are: family history of suicidal behavior and / or psychiatric disorder (54.1% of all suicidals); personal traits, characteristic for people with suicidal behavior (87.4%) and presence of psychiatric disorders (predominantly depressive specter) (91.5%). Other factors of diathesis occurred significantly less often (p<0.05). The acquired results allow with high confidence to identify groups of heightened risk of suicidal behavior and develop differentiated programs of prevention.
Abstract body. The symposium aims to discuss cross-cultural differences in development of cognitive functions across lifespan. Cross-cultural differences in development of cognitive functions are studied on the basis of longitudinal studies (“Cross-cultural Longitudinal Analysis of Student Success”, CLASS, and National Survey of Health and Development, NSHD) and cross-sectional studies which were conducted in Russia, China, United Kingdom and Kyrgyzstan. The development of domain-general functions such as intelligence, working memory and processing speed and domain-specific functions such as spatial ability, symbolic and non-symbolic representations are considered. The symposium also addresses the role of depression for cognitive development in late adulthood.

Press paragraph. The symposium discusses the cross-cultural differences in developmental trajectories of domain-general and domain-specific cognitive functions. The Symposium is organized by two psychologists, known for their work on cognitive psychology and behavioural genetics (Y. Kovas, London and S. Malykh, Moscow). The first study, presented by M. Likhanov, explores the the factorial structure of spatial abilities in samples of Russian, Chinese and United Kingdom university students (Likhanov M., Ismatullina V., Fenin A., Wei W., Rimfeld K., Maslennikova E., Esipenko E., Sharafieva K., Feklicheva A., Chipeeva N., Budakova, A., Soldatova E., Malykh S., Kovas Y.). The second study, presented by Y. Kuzmina, explores cross-cultural differences in relations between non-symbolic and symbolic representations across elementary school years (Kuzmina Y., Tikhomirova T., Lysenkova I., Malykh S.). The third study, presented by I. Zakharov, focused on estimation of cross-cultural differences in cognitive and executive functions in Russian and Kyrgyz adolescents (Zakharov I., Voronin I., Ismatullina V.). The fourth study aims to investigate the effect of depressive symptoms in adolescence and adulthood on trajectories of cognitive function from middle to late adulthood (D. Gaysina, A. John, S.-N. James, J. Rusted, M. Richards). The fifth study, presented by I. Voronin, focuses on estimations of socioeconomic factors of individual differences in intelligence (Voronin I., Kovas Y., Malykh S.).

General summary of the Symposium. The symposium discusses the cross-cultural differences in cognitive functions and their developmental trajectories. Studies demonstrated that there existed significant cross-country differences in domain-general and domain-specific cognitive functions. These differences were salient for schoolchildren and for university students. Among domain-specific functions symbolic, non-symbolic magnitude representations and spatial ability were discussed. Studies shown that there existed cross-cultural differences in developmental trajectories of symbolic magnitude representation and in relations between non-symbolic and symbolic representations across elementary school years. Cross-country difference in accuracy of symbolic representation were partly explained by differences in fluid intelligence. Studies also shown that there existed significant between-country difference in factorial structure of spatial ability and in the level of spatial ability. Among domain-general cognitive functions, executive function, fluid intelligence and processing speed were considered. Studies shown that there were significant cross-countries differences in executive function, fluid intelligence and processing speed. The findings were discussed in the context of methodological limitations, as well as potential cultural and educational differences among countries.
Spatial abilities (SA) are a robust predictor of STEM success and other life outcomes. A recent study of United Kingdom adults has suggested that SA has a unifactorial structure (Rimfeld et al., 2017). It remains unknown whether the structure of spatial ability is the same across different cultures. This study explored the factorial structure of spatial abilities in samples of 921 Russian, 229 Chinese and 839 United Kingdom university students. The same gamified spatial abilities battery (King’s Challenge) as used in Rimfeld and colleagues (2017) was administered to all participants. The battery consists of 10 different domains of SA, including 2D and 3D visualization, mental rotation, spatial pattern assembly, spatial relations, spatial planning, mechanical reasoning, spatial orientation and spatial decision making speed and flexibility. The results of the factor analysis showed a somewhat different pattern for different samples. In the Russian sample, the Unifactorial structure, shown previously in the UK sample was replicated. A single factor explained 40% of the variance, similar to 42% explained in Rimfeld et al. (2017). In the Chinese sample two factors emerged: first factor explained 26% of the variance and the second factor, including only Mechanical reasoning and Cross-Sections tests, explained 14%. The results also showed that the Chinese sample significantly outperformed both Russian and the UK samples in 5 subtests (Cross sections, Pattern assembly, Mechanical reasoning, Paper folding and Shape rotation). Russian and UK students outperformed Chinese students in Elithorn mazes, 3D drawing and Perspective taking. In addition, Russian students outperformed the UK students in mechanical reasoning. The effects of all group comparisons were small. The findings are discussed in the context of methodological limitations, as well as potential cultural and educational differences among countries.
RELATIONS BETWEEN NON-SYMBOLIC AND SYMBOLIC MAGNITUDE REPRESENTATIONS IN ELEMENTARY SCHOOL IN RUSSIA AND KYRGYZSTAN

Yulia Kuzmina
Tatiana Tikhomirova
Psychological Institute of Russian Academy of Education (Moscow, Russia)

Irina Lysenkova
Kyrgyz-Russian Slavic University (Bishkek, Kyrgyzstan)

Sergey Malykh
Psychological Institute of Russian Academy of Education (Moscow, Russia)

Non-symbolic and symbolic magnitude representations are believed to predict later math achievement. However, little is known about how these two representations relate to each other longitudinally. The first aim of this study was to estimate longitudinal relations between symbolic and non-symbolic magnitude representations across elementary school years. The second aim was to estimate if these relations were independent from fluid intelligence. To fulfill these goals data from four-waves longitudinal study of schoolchildren in grades 1-4 from Russia and Kyrgyzstan (N=490, mean age was 7.65 years at Grade 1) were analyzed. We applied structural equation modelling and tested several competitive models. Results revealed that in early school age relations between symbolic and non-symbolic representations was explained by fluid intelligence whereas at the end of elementary school non-symbolic representation predicted subsequent symbolic representation independently from fluid intelligence. Study also demonstrated that there existed significant differences between Russian and Kyrgyz sample in non-symbolic and symbolic representations but these differences were salient in different grades.

Students from Russia demonstrated the higher accuracy in symbolic representations at the start of schooling but this difference reduced over time. Regarding non-symbolic magnitude representation, there were no cross-country differences at the start of schooling but these differences became significant later in favor of Russian schoolchildren. Russian children demonstrated higher progress in non-symbolic magnitude representation in elementary school comparing to Kyrgyz children. This difference was not explained by fluid intelligence.
CROSS-CULTURAL DIFFERENCES IN COGNITIVE FUNCTIONS AND GENERAL COGNITIVE ABILITIES IN RUSSIAN AND KYRGYZ ADOLESCENTS

Ilya Zakharov
Victoria Ismatullina
Ivan Voronin
Psychological Institute of Russian Academy of Education (Moscow, Russia)

Success in everyday and professional activities can be associated with individual differences in cognitive and executive functions. At the same time, the degree of involvement of specific cognitive functions, the use of different strategies (e.g., categorical versus relational) and processing different aspects of information (e.g., object versus context) can vary in people with different cultural background. The differences in the content of information stored and accessed by individuals in different cultures may also account for the observed differences in performance. These variations can represent the differences in task difficulty across cultures. The main goal of our study is to investigate cultural differences in cognitive and executive functions and intelligence in Russian and Kyrgyz adolescents. The sample included 212 adolescents from Kyrgyzstan and 117 adolescents from Russia aged 10 to 17 years (average age = 12.9 and 13.1 years, respectively; 59% are girls in Kyrgyz sample, 55% are girls in Russian sample). Raven’s Standard Progressive Matrices were used to assess general cognitive ability. Executive functions and specific cognitive abilities were measured using tests from CANTAB neuropsychological test battery. Results revealed that the groups differed in the average level of intelligence, with Russian adolescents yielded higher scores (F [1,235] = 27,627; p>0.001, eta-squared=0.11). The most noticeable differences were obtained for concurrent planning (F [1,267] = 19.790; p>0.001, eta-squared = 0.07). Kyrgyz adolescents applied concurrent planning more often than Russian adolescents. Significant differences were also found for working memory and pattern recognition memory measures. For both measures Russian adolescents also received higher scores than Kyrgyz (the effect size for all measures was 2%). The other possible sources of these differences will be discussed according to known cultural and economical features of two countries.
Depressive disorders are associated with faster cognitive decline and dementia in late adulthood. However, little is known about the link between depressive symptoms and cognitive function across the life course. The study aims to investigate whether depressive symptoms in adolescence and adulthood predict trajectories of cognitive function from middle to late adulthood. Data from the MRC National Survey of Health and Development (NSHD), a prospective cohort study of 5362 individuals born in mainland UK in March 1946, were utilised. Measures of memory and information processing speed were collected at ages 43, 53, 60-64, and 69 years. Linear mixed models were used to model cognitive trajectories over the period of three decades and to test for effects of depressive symptoms in adolescence (ages 13-15) and adulthood (ages 36 and 43) on cognitive function at baseline (age 43) and decline in cognitive function (from age 43 to 69). Models were adjusted for sex, childhood cognition, childhood socioeconomic position, and educational attainment. Results revealed that a quadratic model best fitted the data on memory and information processing speed. Fully adjusted models revealed that adolescent depressive symptoms were associated with lower levels of memory (b=-1.11, SE=0.53, p=.04) and information processing speed (b=-18.17, SE=7.53, p=.02) at baseline. Effects were significant for those with severe symptoms (b=-1.87, SE=0.81, p=.02) or moderate symptoms (b=-0.87, SE=0.42, p=.04) as compared to those with low/no symptoms. There were no associations of adolescent depressive symptoms with rates of cognitive decline over time: from age 43 to 69. No associations between adult depressive symptoms and cognitive trajectories (baseline or rate of decline) were found. Findings suggest that adolescent depression is an important predictor of cognitive function in midlife. Long-lasting effects of adolescent depression on cognitive health into midlife and beyond, are particularly concerning given the high prevalence of depressive disorders in adolescents. Early intervention to prevent and manage mental health present during adolescence can help protect cognitive function later in the life course.
SOCIOECONOMIC FACTORS SHAPE INDIVIDUAL DIFFERENCES IN INTELLIGENCE: LONGITUDINAL TWIN STUDY OF ADOLESCENTS FROM RUSSIA AND UK

Ivan Voronin  
Psychological Institute of Russian Academy of Education (Moscow, Russia)

Yulia Kovas  
Goldsmiths, University of London (London, United Kingdom)

Sergey Malykh  
Psychological Institute of Russian Academy of Education (Moscow, Russia)

The share of genetic and environmental effects in individual differences of intelligence varies substantially under different environmental contexts (Tucker-Drob & Briley, 2014). As an example, affluent environment is sensitive to individual’s specific features and promote expression of genetic propensities. In turn, poor environment restricts the range of developmental trajectories making individuals more alike and suppressing genetic component of individual differences. Current study aims to compare genetic and environmental setup in two groups of adolescents developed in contrasted socioeconomic and cultural environments. The sample included 215 pairs of twins from Russia (Russian School Twin Registry) and 3174 pairs of twins from the UK (Twins Early Development Study), only same-sex pairs were included. Russian twins were born in late 80s-early 90s and developed under conditions of post-Soviet Russia when the wealth of all Russian families dropped. All twins were assessed twice, in mid- and late adolescence. Russian twins completed Wechsler Intelligence Scale for Children at 13 and Wechsler Adult Intelligence Scale at 16. UK twins completed Vocabulary scale from WISC-III at 14, Mill Hill Vocabulary Scale at 16 and a modified version of Raven’s Standard Progressive Matrices in both assessments. Twin modeling approach was applied to estimate the shares of genetic, shared environmental and non-shared environmental variation of intelligence scores. In both Russian and UK twins the heritability estimates ranged between 25 and 30%. This is less than the aggregate heritability achieved in other twin studies (~50%, Polderman et al., 2015) and can be accounted by the exclusion of opposite-sex dizygotic twin pairs. In Russian twins 50% of the variation were explained by shared environmental effects, in UK twins 50% of the variation explained by person-specific environmental effects. The dynamic of genetic and environmental variability was similar in two groups: genetic effects were highly persistent, non-shared environmental effects were highly variable across the ages, shared environmental effects contributed to both stability and change of the variation of intelligence. Our study provides another evidence that environmental context plays an important role in shaping genetic and environmental setup of general cognitive ability.
TECHNOLOGIES AND SUICIDE PREVENTION

Ksenia Chistopolskaya
Alexey Kulikov
Gennady Bannikov
Moscow Research Institute of Psychiatry (Moscow, Russia)
Helen Christensen
Black Dog Institute (Sydney, Australia)
Victoria Ruzhenkova
Belgorod National Research University (Belgorod, Russia)

Abstract body. This symposium is dedicated to the role of technologies and the means of screening and prevention of suicidal behavior. Prof. Christensen will tell how to use digital technologies to create applications that help alleviate suicidal behavior. Dr. Bannikov will talk about the screening procedures in schools. Alexey Kulikov will talk about the need for antisuicidal sites on the Internet and what their content should be. Dr. Ruzhenkova will elaborate on her study of suicidal behavior in two groups of medical students, studying in Belgorod, Russia: Russians and Indians. Dr. Timerbulatov will tell about their screening of suicidal inclinations in schoolchildren of Ufa, Russia. Ksenia Chistopolskaya will be the convener. The symposium is best scheduled in the morning of the first day of suicidology section, before the lectures and panels.

SUICIDAL BEHAVIOR OF THE FIRST YEAR MEDICAL STUDENTS AS A RESULT OF ACADEMIC STRESS (RESULTS OF TRANSCULTURAL STUDY)

Victoria Ruzhenkova
Belgorod National Research University (Belgorod, Russia)

The training load in medical institutes is on average twice higher than in other higher educational institutions, which affects the level of mental and physical health of students. A high level of educational stress, accompanied by anxiety and depression leads to the suicidal behavior (suicidal thoughts and attempts) — from 32.5% to 83%. This study aimed to develop recommendations for overcoming the educational stress and prevention of suicidal behavior and socio-psychological disadaptation of medical students. Material and methods. A sample of the 184 first year medical students (100 Russian-speaking and 84 — trained in the English language) was examined using the medically-sociological and psychometric methods. Nonparametric statistical methods were used to process the database. Results. In the first months of education students experience stress, accompanied by internal forms of suicidal behavior in 26% of cases among Russians and 44% of foreign students. The most significant factors of educational stress were the high training load and the difficulties of organizing the day regime, life away from parents — for foreigners. Problems of living in a hostel, conflicts with classmates, disappointment in the profession and problems in personal lives were especially important for students with suicidal behavior. The main symptoms of stress are the influx of extraneous thoughts, depression, anxiety, vegetative symptoms (rapid heartbeat, shortness of breath, headaches, problems with the gastrointestinal tract) that are part of the depressive and anxiety-depressive syndromes which are the psychopathological basis for the suicidal behavior. Their early detection and correction is expedient. Depression was found in 32% of foreign and 34% of Russian-speaking students. Anxiety was more typical (D2=4,11 p=0,042) for foreign students (48,8% of cases) than for Russian-speaking (33%). Students communicate with friends, seek support from parents, spend time on the Internet and do sport to overcome stress. Students who had suicidal thoughts more often took sedatives (p=0.016). Conclusion. This indicate the need to train students in constructive ways to overcome stress (ways to resolve conflicts, overcome auto- and heteroaggressive trends, methods of relaxation, etc.), time planning, methods of optimal work with educational literature, informing about a healthy lifestyle, including the regime of the day and nutrition.
USING DIGITAL TECHNOLOGIES TO IMPROVE SUICIDE PREVENTION

Helen Christensen
Black Dog Institute (Sydney, Australia)

Suicide prevention requires the adoption of multi-modal, comprehensive and integrated approaches. Recognising the need for scale and reach, digital technologies, such as websites, apps and sensors have been employed by suicide prevention agencies to assist in suicide prevention. Scientific studies of the effectiveness of these interventions is emerging. In this keynote, the potential domains for the use of these technologies are identified: schools; workplaces; public online environments; primary care/healthcare settings; means restriction; and crisis and aftercare. Examples of the effectiveness of these interventions are described, with a focus on clinical treatment applications, using data from recent randomised controlled trials from the Black Dog Institute, and research trials from other leading centres. There is more replication required, and more comprehensive consumer informed research to be undertaken. However, these technologies are rapidly expanding ahead of research effectiveness, but, nevertheless have potential to be used as part of larger integrated suicide prevention approaches.

TECHNOLOGIES OF SCREENING THE RISKS OF SUICIDAL BEHAVIOR IN ADOLESCENT POPULATION

Gennady Bannikov
Moscow Research Institute of Psychiatry (Moscow, Russia)

Olesya Vikhristyuk
Center of Emergency Psychological Aid (Moscow, Russia)

Finding non-specific risk factors of suicidal behavior and self-harm in general population with the help of screening procedures is one of the basic forms of primary prevention of suicidal risk. The report presents the results of screening of potential and actual risk factors of suicide behavior of adolescents. The sample consisted of more than 6,000 minors aged between 13 and 18. The examination included testing (scale of hopelessness, loneliness, a questionnaire of tendency to aggression Bass-Perry, the index of well-being, the personality disorders questionnaire, the FACES scale-3, as well as individual counseling high risk youth. In the result of screening procedure and analysis of potential and actual risk factors 4 distinct groups of risks were distinguished: two groups with actual crisis state, and 2 groups with debilitaing potential factors with prevalence of aggression and character psychopathology. Differences in psychological conditions and strategies of psychological interventions for each group are discussed. The second stage of screening consisted of in-depth individual consultation with 225 teens of the risk groups. Detailed description of these groups is provided, especially of those who need prolonged psychological and specialized medical assistance. Authors conclude about the structural and organizational issues of screening and prevention strategies of suicidal and self-harm behavior among adolescent population.
ROLE OF INTERNET AND CHARACTERISTICS OF SEARCH BEHAVIOR IN PSYCHIATRIC PATIENTS

Alexey Kulikov
Evgeny Lyubov
Moscow Research Institute of Psychiatry (Moscow, Russia)

Issues of internet usage and of search behavior in psychiatric patients are important for the development of psychosocial rehabilitation and anticrisis actions, including such measures in the self-help societies. The objective of the study was to explore the internet usage and search behavior in psychiatric patient on the example of self-help society “New options”. The original semistructured questionnaire was sent to the regional departments of the society. It was filled out by 79 respondents (40 males (51.1%)) from 6 regions of the Russian Federation (Central Federal District — 37%, Northern-Caucasian FD — 39.1%, Privolzhskiy FD — 13%, Northern-Western FD — 6.5%, Southern FD — 2.2%, Dalnevostochny FD — 2.2%). 89.4% of the respondents live in the cities. Most (more than 65%) are 20-45 y.o., disabled — 50%, with vocational education or higher — more than 1/3, 1/3 of the respondents are working. Most of them receive supporting treatment and are satisfied with the medical help. But 17.7% had suicidal attempts in their history, acute thoughts, plans (in the last month) was registered in 25% of them, more than 70% are complaining about apathy, boredom, blues, though not calling this “depression. Most respondents (60%) use internet for 20 hours per week (about 3 hours per day), mostly in the evenings for entertainment, news reading, socializing in social networks. They are not interested much in the questions of health. None of them refer to “suicidal sites”, but antisuicidal are not interesting for them either.

Sociodemographic and clinical characteristics of respondents correspond to such of the society, and internet usage and search behavior correspond to such in general population, especially in youth (Russian Public Opinion Research Center, 2017). Notable is the frequency and “commonness” of the atypical subsyndromal depression in patients in remission with their high risk of suicidal behavior. It indirectly points to the low quality of the pharmacotherapy. No connection is found between suicidal behavior and frequenting suicidal sites. But low attractiveness of antisuicidal sites shows the necessity of their further development and enhancement.
The problem of suicidal behavior in youth is the most acute among other issues of contemporary society. Underage youth, living in the prefigurative society, where the environmental changes are so rapid, lack the experience of informational processing, and the variants of social interaction in the conditions of externally set standards by teen community are not enough, psychological ill-being may manifest itself with such forms of behavior as autoagression and even suicide. Teenagers now face the future, which they can't manage: they are afraid of exams, choice of profession, responsibility for significant others, and they enter virtual reality, which has too vague borders with real life. In 2017, 34 001 schoolchildren (grades 6-11) in the Ufa city were tested (73.4% of all schoolchildren) to monitor the factors that possibly activate suicidal behavior. The instruments were: Method of Psychodiagnostics of Suicidal Intentions (versions for children and adolescents) by A. Kuchera and School Anxiety Questionnaire by B. Phillips (adaptation N.P. Kondratieva). There is a certain stigma in parents, who are afraid to find out their child is prone to suicidal reactions, as the refusal rate was 22.4%. We suppose that besides stigma there is also a psychological defense — denial — at play, which helps to block the negative information, as it is incongruent with the positive image of one's child. This exact mechanism prevents parents from seeing the markers of suicidal risk in their children. We found that in suburbs of the Ufa city with high concentration of industrial plants and high population density the indices of the scales “Voluntary death” and “Loss of Meaning in Life” was statistically higher than in children from other, quieter suburbs. We suppose that the busyness of parents at the plants, low emotional connection in the family, psychological and emotional overload of the children in these regions are to blame here. The level of school anxiety is statistically higher in those suburbs as well. Suicidal behavior of schoolchildren is the result of complex interplay of social, psychological and cultural factors in extreme situations.

Abstract body. Assessment of suicidal risk is a topical question both in general and in clinical population. The participants of the symposium will talk of their studies and achievements in this area. Prof. Sun will talk about risk assessment in Chinese Rural Youth. Prof. Drapeau will elaborate on his meta-analysis study of the suicidal risk in sleep disorders. Dr. Calati and Dr. Galynker will present their instrument for assessment of imminent suicidal risk. Ksenia Chistopolskaya will be the convener. The Symposium is best suited for the second day of suicidology section, before or after the panels.

SLEEP DISORDERS AND SUICIDE: CURRENT FINDINGS AND FUTURE DIRECTIONS

Chris Drapeau
Valparaiso University (Valparaiso, USA)

Several sleep conditions have been associated with suicide-related thoughts and behaviors among youth and adults across multiple counties (i.e., Canada, China, Italy, Korea, Taiwan, and the United States; Drapeau & Nadorff, 2017); these conditions include insomnia, nightmares, sleep-disordered breathing, narcolepsy, hypersomnia, insufficient sleep syndrome, and restless legs syndrome (Bishop et al., 2018; Drapeau, 2018; Ohayon, 2012). Notably, these relations have largely remained significant when controlling for depressive symptoms and other suicide risk factors (e.g., hopelessness, substance use, etc.; Drapeau & Nadorff, 2017; Pigeon et al., 2016), highlighting the unique influence of sleep problems on one’s trajectory toward attempting suicide.

Hypotheses/Goals: Given the burgeoning literature linking sleep problems and suicide, the goal of this presentation is to outline the current sleep-suicide literature and discuss current opportunities for sleep and suicide research. These opportunities include investigating co-occurring sleep conditions, objective sleep indicators (e.g., polysonmogram), misaligned circadian rhythm, sleep-suicide theories, and healthy sleep as a potential protective factor.

Method: A search of all EBSCOhost databases, including manual electronic searches of Medline (no start date to May 2019), PsycINFO (no start date to May 2019), and Google Scholar (no start date to May 2019) is conducted to ensure a comprehensive presentation of the sleep-suicide literature. General terms used to identify relevant published work include SLEEP, SLEEP DISORDER, SLEEP DISTURBANCE, SUICIDE, SUICIDAL, SUICIDE RISK, and SUICIDALITY (similar to the method used in Drapeau & Nadorff, 2017). The seven major categories of sleep disorders (and individual sleep conditions) listed in the third edition of the International Classification of Sleep Disorders were also paired with each of the suicide search terms noted above. Results of this narrative review confirm what has been repeatedly shown: that several sleep disorders are uniquely related to suicide risk beyond known risk factors (e.g., depressive symptoms). Sleep problems have been identified as a distal and proximal factor in suicide attempts, and since patients may show greater comfort with disclosing sleep problems compared to suicide risk (Pigeon et al., 2012), assessing sleep may provide an indirect method for identifying and addressing suicide risk.
RISK ASSESSMENT ON SUICIDE DEATH AND ATTEMPT AMONG CHINESE RURAL YOUTHS AGED 15-34 YEARS

Long Sun
Center for Suicide Prevention Research (Jinan, China)

Jie Zhang
State University of New York (Buffalo, USA)

Dorian A. Lamis
Emory University School of Medicine (Atlanta, USA)

Although many suicide risk assessment tools are available, their validity is often not adequately assessed. In the current study, we aimed to develop and evaluate a suicide risk assessment model among Chinese rural youths aged 15-34 years. Two case-control studies were conducted in three provinces (Shandong, Liaoning, Hunan). Social-demographic, social and psychological variables were examined for the cases and controls. Logistic regressions based on data from Shandong and Liaoning provinces were conducted to test suicide risk assessment models. Receiver Operating Characteristic (ROC) and Area Under the Curve (AUC) analyses from Hunan were used to evaluate the performance of two models regarding suicide death and attempt.

We found that the risk factors for suicide death were also risk factors for suicide attempt, with the exception of very poor and lack of social interaction. The assessment model for suicide death included education years (OR=0.773, p<0.001), peasants (OR=2.091, p<0.05), physical health (OR=0.445, p<0.05), family suicide history (OR=6.858, p<0.001), negative life events (OR=1.340, p<0.001), hopelessness (OR=1.171, p<0.001), impulsivity (OR=1.151, p<0.001) and mental disorder (OR=8.384, p<0.001). In the training sample, the AUC was 0.950 and 0.857 for suicide death and attempt, respectively. In the verification sample, the AUC was 0.967 and 0.942 for suicide death and attempt, respectively.
Our research team recently developed the Modular Assessment of Risk for Imminent Suicide (MARIS), a short-term suicide risk assessment tool. MARIS includes four modules: two are patient-rated modules and two are clinician-rated ones. The patient-rated modules assess the pre-suicidal state—primarily entrapment feeling and ruminative flooding—and attitudes towards suicide. The clinician-rated modules assess traditional suicide risk factors and emotional responses of the clinician regarding the patient. Preliminary findings showed good sensitivity, specificity, and predictive validity of MARIS administered to 136 psychiatric patients following hospital discharge. Patients who exhibited suicidal behaviors in the period between initial assessment and follow-up had significantly higher MARIS scores. These findings supported the validity of multiple data types and sources, including clinicians’ emotional responses, to improve our ability to identify those at imminent risk for suicide. To replicate and extend these findings, the MARIS was administered to a large sample of psychiatric inpatients and outpatients and their clinicians. Patients were screened with the Columbia-Suicide Severity Rating Scale (C-SSRS) together with an assessment battery on standard suicide risk factors. Reliability, construct and predictive validity, and sensitivity/specificity of MARIS will be presented.
A MULTI-INFORMANT PREDICTION OF SHORT-TERM SUICIDAL OUTCOMES

Igor Galynker
Mount Sinai Beth Israel Associate Chairman for Research (New York, USA)

Previous research has shown that clinicians’ emotional responses to suicidal patients and meeting the proposed DSM criteria for Suicidal Crisis Syndrome (SCS) by those patients could individually predict short-term suicidal outcomes. In this study, we examined if the multi-informant combination of these two predictors would render incremental predictive validity over each separately and over the standard suicide risk assessments. SCS DSM criteria scorecard, which DOES NOT include suicidal ideation (SI) or intent, was filled out based on a battery of multiple scales for 451 adult psychiatric outpatients at their intake, while the Therapist Response Questionnaire-Suicide Form (TRQ-SF) was filled out by 59 clinicians immediately following the intake. Suicidal thoughts and behaviors were assessed at a follow-up 4-8 weeks from the initial assessment using the Columbia Suicide Severity Rating Scale (CSSRS). The Modified Sad Person Scale (MSPS) was administered and standard suicidal risk factors were assessed. Receiver Operator Characteristic analysis was used to determine the optimal cutoff points for TRQ-SF and MSPS. Chi-squared analysis was used to examine the association between the combination of TRQ-SF and SCS and short-term suicidal outcomes. A high TRQ-SF score was associated with both suicide attempts ($D^2=5.971$, $p=0.015$) and suicide plans ($D^2=7.069$, $p=0.008$) within 4-8 weeks, while SCS was only associated with suicide attempts ($D^2=5.987$, $p=0.014$). Meeting either SCS criteria or exceeding cut-off on TRQ-SF was associated with short-term suicide plans ($D^2=11.449$, $p=0.001$) and attempts ($D^2=11.893$, $p=0.001$), while meeting both conditions did not predict subsequent suicidal outcomes. In binary analysis, MSPS total score was not predictive of suicide attempts, neither were history of suicide attempts, self-reported intent to die, substance abuse, or high-risk age, while SI was predictive of suicidal plans and attempts. Multiple regression analysis showed that only TRQ-SF/SCS and SI had significant predictive validity for short-term suicidal plans and behaviors. The SCS and clinicians emotional responses to suicidal patients appear to predict short-term suicidal plans and behaviors through different mechanisms. Modular multi-informant risk assessment approaches, not relying on patient self-report, may be superior to traditional suicide risk assessments in identifying patients at imminent suicide risk and warrant further study.
COMPETENCE AS A COMMON LANGUAGE FOR PROFESSIONAL IDENTITY AND INTERNATIONAL RECOGNITION. PART 1

Sverre Leonhard Nielsen
Norwegian Psychological Association (Oslo, Norway)

Waikaremoana Waitoki
University of Waikato (Waikato, New Zealand)

Buxin Han
Institute of Psychology, Chinese Academy of Sciences (Beijing, China)

Dragos Iliescu
University of Bucharest (Bucharest, Romania)

Tholene Sodi
University of Limpopo (Mankweng, South Africa)

Abstract body. The International Declaration on Core Competences in Professional Psychology, developed by The International Project on Competence in Psychology — IPCP, was adopted by both IAAP and IUPsyS in June/July 2016. The Declaration has been translated into many languages and is being referred to in a number of countries. An updated report on the use of the Declaration, together with proposals for a continuation, will be forwarded to the relevant international associations and members of the IPCP network in May 2019. At this ECP 2019 session the status quo of the project will be presented by IPCP WG members: Sverre L. Nielsen, Norway, (Convenor & chair). Indigenous aspects by Moana Waitoki, New Zealand, Situation in Asia by Buxin Han, China, Situation in Africa by Tholene Sodi, South Africa, Situation in the Americas by Janel Gauthier, Canada, and situation in Europe by Dragos Iliescu, Romania. The following session (Panel Discussion) will be organized as an “open meeting”. See “Competence as a Common Language for Professional Identity and International Recognition. Part 2.”

General summary of the Symposium. The International Declaration on Core Competences in Professional Psychology, developed by The International Project on Competence in Psychology — IPCP, was adopted by both IAAP and IUPsyS in June/July 2016. The Declaration has been translated into many languages and is being referred to in a number of countries around the world. An updated report on the use of the Declaration, together with proposals for a continuation, the next step of the project, will be forwarded to the relevant international associations and members of the IPCP network in May 2019. At this ECP 2019 session the status quo of the project will be presented by IPCP WG members: Sverre L. Nielsen, Norway, (Convenor & chair). Indigenous aspects by Moana Waitoki, New Zealand, Situation in Asia by Buxin Han, China, Situation in Africa by Tholene Sodi, South Africa, Situation in the Americas by Janel Gauthier, Canada, and situation in Europe by Dragos Iliescu, Romania.
UNDERSTANDING THE SELF AS A BEARER OF CULTURE IN THE INTERNATIONAL DECLARATION ON CORE COMPETENCIES

Moana Waitoki
University of Waikato (Waikato, New Zealand)

This paper describes how bearers of culture can influence the uptake, or not, of culture in psychological spaces. While more developed psychological societies may argue that they have much more complex and detailed standards of competencies than those promoted in the current declaration, equitable status in psychology for culturally marginalised peoples has yet to be realised. How then does one ‘demonstrate cultural competence’ when the bearers of culture who work in regulatory authorities, schools of psychology, and psychological societies are yet to demonstrate their cultural competence? How too does one ‘work with an understanding of the historical, political, social and cultural context of clients, colleagues and others’ when the bearers of mainstream cultural epistemologies typically marginalise culturally diverse worldviews? Understanding how culture is carried in psychology is critical to understanding the impact this declaration can have in the everyday lives of the world’s most marginalised peoples. There is hope in this declaration, that we as bearers of culture—dominant, or otherwise, recognise and address our role in creating an equitable world.

IDCCPP: SITUATION IN THE ASIA-PACIFIC REGION

Buxin Han
Institute of Psychology, Chinese Academy Sciences (Beijing, China)

This presentation will give an overview of translations and use of the International Declaration on Core Competencies in Professional Psychology in the Asia-Pacific region.

THE IPCP IN EUROPE

Dragos Iliescu
University of Bucharest (Bucharest, Romania)

The International Declaration on Competence in Psychology (IPCP) has had maybe a slower and less direct impact on European countries, due to the fact that (a) many of not all of these countries already had regulatory systems in place, and (b) a constant dialogue about regulatory frameworks and competencies describing competent practice in psychology had already been going on for some time under the auspices of the European Federation of Psychologists’ Associations (EFPA). Direct impact of the IPCP on psychological practice and regulations is therefore low in Europe—but impact on academia and on competency-based education is likely, in those countries where educators and policy-makers explicitly focus on competencies. These evolutions and likely influences are discussed in the presentation.
IN SEARCH OF A COMMON LANGUAGE FOR PROFESSIONAL IDENTITY: THE IPCP DECLARATION IN AFRICA

Tholene Sodi
University of Limpopo (Mankweng, South Africa)

In Africa, the development of psychology as an academic discipline and profession has gone through many twists and turns, with many countries in the continent not having any professional psychology training. In some cases, psychology is not even offered in the curriculum of universities as a stand-alone discipline. In this presentation, I will outline some of the challenges that psychology has faced in the continent. I will also look at the potential benefits that Africa may get if the IPCP Declaration gains traction and support throughout the continent. I will conclude the presentation by suggesting that the IPCP Declaration could as well serve as a catalyst for the development of professional psychology in Africa.

THE IPCP IN THE AMERICAS

Janel Gauthier
Laval University (Québec, Canada)

This presentation will discuss the impact of the International Declaration on Core Competences in Professional Psychology (2016) on the accreditation of education and training programs in professional psychology and the regulation of psychological practice in the Americas. Examples of the impact of the International Declaration will be provided. They will show that the impact of the Declaration is greater in countries that are in the process of developing standards of competences for the training and licensing of psychologists. They will also highlight how the Declaration might influence the revision of standards of competences in countries that have had comprehensive and detailed standards of competences for quite some time.
GEROPSYCHOLOGY CONTRIBUTIONS TO CONTEMPORARY AGEING ISSUES – PART 1: NEW ISSUES AND INNOVATIVE PRACTICES

Jasminka Despot-Lučanin
University of Zagreb, Croatian Studies (Zagreb, Croatia)

Constança Paúl
CINTESIS University of Porto (Porto, Portugal)

Reinhard Guss
Hastings & Rother Assessment and Treatment Service, Sussex Partnership NHS Foundation Trust (Hastings, United Kingdom)

Santo Di Nuovo
University of Catania (Catania, Italy)

Isabelle Albert
University of Luxembourg (Luxembourg, Luxembourg)

Abstract body. In the symposium, scholars from five European countries will report on their new research contributions to the field of geropsychology, related to current and future social and technological developments and collaborations. The first part of symposium is on New issues and innovative practices in geropsychology. Results will be presented on: a recent inquiry to psychologists working in the field of ageing in Portugal, on teaching, training, and development of geropsychology; an overview of policy and practice in the development of co-production with persons with dementia in United Kingdom psychology services; innovative practices in Italy involving social robots in the care for elderly people, as a way to address human resources and economic pressures on social care systems; research findings on the adjustments of elder care in Luxembourg, in the context of migration; research findings on wellbeing of older family members in contemporary work conditions in Croatia.

Press paragraph. In the symposium, scholars from five European countries will report on their new research contributions to the field of geropsychology, related to current and future social and technological developments and collaborations. The first part of symposium is on New issues and innovative practices in geropsychology. Paúl (Portugal) will present the results of a recent inquiry to psychologists working in the field of ageing in Portugal, on teaching, training, and development of geropsychology in Portugal. Guss (United Kingdom) will present an overview of policy and practice in the development of co-production with persons with dementia in UK psychology services. Di Nuovo (Italy) will present innovative practices involving social robots in the care for elderly people, as a way to address human resources and economic pressures on social care systems. Albert (Luxembourg) presents research findings on the adjustments of elder care in the context of migration. Finally, Despot Lučanin (Croatia) will present research findings on wellbeing of older family members in contemporary work conditions.

General summary of the Symposium. Generation changes are apparent in European population as the post-World War II cohort is becoming old, however, with longer life expectancy, higher education level, fewer children, working longer, and more active lifestyles. New generations’ potentials, views and expectations of their own old age put new challenges to public policies, scientific disciplines and professional practices. Psychology, and especially Geropsychology, continue providing the research-based knowledge, theories, and education about diverse psychological processes underlying human ageing. In light of generation changes, geropsychologists are developing innovative approaches and practices that will improve the quality of living and subjective well-being in older age. In the symposium, scholars from five European countries will report on their new
research contributions to the field of geropsychology, related to current and future social and technological developments and collaborations. The first part of symposium is on New issues and innovative practices in geropsychology. Paúl, Ribeiro, Biscaia, Sobral, & Santos (Portugal) will present the results of a recent inquiry to psychologists working in the field of ageing in Portugal, on teaching, training, and development of geropsychology in Portugal. Guss (United Kingdom) will present an overview of policy and practice in the development of co-production with persons with dementia in UK psychology services. Di Nuovo & Conti (Italy) will present innovative practices involving social robots in the care for elderly people, as a way to address human resources and economic pressures on social care systems. Albert, Kretschmer, Malerba & Hoffmann (Luxembourg) presents research findings on the adjustments of elder care in the context of migration. Finally, Despot Lučanin, Lučanin, Košćec Bjelajac & Hanzec Marković (Croatia) will present research findings on wellbeing of older family members in contemporary work conditions.
TEACHING AND TRAINING OF GEROPSYCHOLOGY IN EUROPE: INSIGHTS FROM PORTUGAL

Oscar Ribeiro
Margarida Sobra
Paúl Constança
CINTESIS, University of Porto (Porto, Portugal)
Constança Biscaia
University of Évora (Évora, Portugal)

The demographic ageing appears as a new reality, particularly in Europe, due to increased life expectancy (e.g., EU-28, estimated at 80.9 years in 2014, OCDE, 2016), falling fertility and migration issues. The growing population 65+ and particularly the 85+ subgroup is a challenge to psychology to learn more about the last decades of life and to customise services and interventions to the needs of this population. When does development end and ageing begin? What human characteristics change or endure along life span? What about the ageing self and how to achieve psychological wellbeing facing ageing related diseases and losses? What is to expect from psychologists working with old people in the community or within social or health services? Do the actual assessment tools and psychotherapeutic models work with older clients? Those are some of the main issues we want to raise and discuss based on existing evidence, and on the results of a recent inquiry to psychologists working in the field of ageing in Portugal. Scope review of literature about education and training in geropsychology in Europe, and an online questionnaire hosted by the Portuguese College of Psychology (OPP) website. Psychologists received an email asking to participate in the study through a link to an anonymous inquiry covering topics about their background education, specific training, years working with older adults, context and job profile type, and motivations to work in the field of ageing.

Actual needs concerning training were also asked. participants (N=500) mean age 35.19 (SD 9.02), with a majority of women (433, 86.6%), most of them (64.8%) working for 1 to 5 years answered the inquiry. The geropsychology state of art and adequacy of tools and non-pharmacological therapies are briefly debated. The responses are analysed and discussed considering the available courses in geropsychology in Portugal and, compared with available data from other countries. Faculties of Psychology need to enlarge the offer of courses (pre and postgraduate) and professional training associations should include a focus on training psychologists to work with old clients and/or institutions, either from a preventive or therapeutic perspective.
THE DEVELOPMENT OF CO-PRODUCTION WITH PERSONS WITH DEMENIA IN UK PSYCHOLOGY SERVICES — AN OVERVIEW OF POLICY AND PRACTICE

Guss Reinhard
Sussex Partnership NHS Foundation Trust (Hastings, United Kingdom)

25 years ago psychological work with people with dementia made a very small proportion of geropsychologists’ work in the UK and was restricted to cognitive testing for diagnostic purposes and the application of behavioural programmes in long stay institutions. 20 years ago Tom Kitwood’s approach to a psychological understanding of dementia in its social context was followed shortly by the first publication by a person with dementia, Christine Bryden’s "Dancing with Dementia", and the first examples of self-advocacy. This presentation charts the development of involvement of people with dementia over the intervening years and gives an overview of current practice of co-production between Psychologists and people with dementia in individual practice, in local service development, in national policy work, in research funding application, in project oversight and in the production of professional guidance of the British Psychological Society (BPS). The presentation will identify the key policies that have facilitated involvement, review key projects of involvement and co-production that paved the way for current practice, and introduce the present day landscape of national collaboration, particularly focusing on the contributions of psychology to their development, support and maintenance. The benefits to services as well as service users will be identified. Difficulties arising for practitioners, for example form professional practice codes around boundaries versus "collegiate working" with potentially vulnerable "patients" will be highlighted, and remedial approaches discussed. Implications for professional practice with people with dementia will be summarised for psychologists in research, service development and clinical practice. Suggestions will be made for more structured research and evaluation, particularly for countries and sectors where co-production is less developed.
SOCIAL ROBOTS AND ELDERLY PEOPLE: A WAY TO ADDRESS HUMAN RESOURCES AND ECONOMIC PRESSURES ON SOCIAL CARE SYSTEMS

Daniela Conti
Di Nuovo Daniela
Sheffield Hallam University (Sheffield, United Kingdom)

The growing number of older people living alone in need of care is one of the great challenges for the social care systems. Social robotics is a way to address human resource and economic pressures on social care systems. Indeed, the increasing evidence from the scientific research is leading the growth of the robotics market focused on services for ageing well. A specific solution are robot companions (e.g., pet-like shape robots), which embody advanced Artificial Intelligence functionalities to conduct social interaction in complete autonomy. Humanoids robots can provide greater support to elderly people, since they are able to pick things up, move around, and have a more natural way of interaction, including speech and gestures. Scientific research is also exploring multi-robot systems to favor independent living, improve the quality of life and the efficiency of care for elderly people. Moreover, the acceptability of the use of robotic companions by elder people is being studied. We will present studies from the international Robot-Era project, which developed different services to support elderly users individually at home, or collectively in the building and outside. The results of the experiments show that elderly participants are keen to accept robot companions at home as a way to help the family with their care. A general increase in the quality of life, in the different settings studied experimentally, has been found. The research evidence confirms that humanoid social robots can provide a solution for the ageing population challenge, e.g. to reduce social isolation and loneliness. References: Hutson S., Lim S.L., Bentley P.J., Bianchi-Berthouze N., Bowling A. (2011). Investigating the suitability of social robots for the wellbeing of the elderly. ELDER CARE IN THE CONTEXT OF MIGRATION

Mirjam Kretschmer
Angela Malerba
Martine Hoffmann
Albert Isabelle
University of Luxembourg (Luxembourg, Luxembourg)

Demographic changes related to ageing and migration are key societal issues of our days. Cultural diversity in elder care will increase considerably in the next years especially in Northern and Western European countries due to a large share of first generation immigrants from the 1950s to 1970s. Culture-specific needs, expectations and behavioural tendencies become particularly salient in times of frailty. Cultures differ in how they arrange old age care and intergenerational co-residence patterns. When families migrate from a more collectivist, family-oriented to a more individualist cultural context, the question arises in how far traditional care patterns from the country of origin are retained or adapted to the host cultural context. Ageing migrants have been found to be more reluctant regarding formal care due to cultural, religious or language issues which might put specific pressure on their close family members who are often responsible for care arrangements, even if not providing hands-on care. The aim of the present study was to examine how established formal assistance should be modified in order to fit the special needs of both informal caregivers and care receivers with migration background. For this purpose, we will draw on two sub-studies: a) a qualitative study with n = 3 in-depth expert-interviews in the field of elder care and migration, and b) a survey in a daycare centre with a large population of elder care receivers with migrant background. Preliminary results show different starting points for a culture-sensitive adaptation of the services. First, as the existence of help services is often unknown to migrants, it is important to provide low-threshold information, involving multipliers. Second, an important aspect is the culture-sensitive training of staff, increasing their awareness of cultural aspects in care and introducing an individualized as well as relationship-oriented approach. Finally, the exchange of caregivers with other concerned turned out to be a helpful resource and therefore it shall be facilitated and supported by formal services. A structural integration of cultural sensitive care services in the existing elder care system is highly suggested in order to meet the future challenges.
WELLBEING AND FAMILY ENGAGEMENT OF OLDER ADULTS IN FAMILIES EXPOSED TO CONTEMPORARY WORK CONDITIONS

Jasminka Despot-Lučanin
Ivana Hanzec Marković
University of Zagreb, Croatian Studies (Zagreb, Croatia)

Damir Lučanin
University of Applied Health Sciences (Zagreb, Croatia)

Adrijana Košćec Bjelajac
Institute for Medical Research and Occupational Health (Zagreb, Croatia)

Eva Anđela Delale
Institute for Anthropological Research (Zagreb, Croatia)

Little is known on how new ways of working, which imply flexible work designs, and employees’ control of the time and place of their work, affect employees and their families. Recent research has started focusing on determining factors explaining the relationship between the new ways of working and employee wellbeing, and that of their family members. The aim of the present research was to explore the associations of contemporary work conditions with wellbeing and family engagement of oldest family members. Participants were 100 older adults in Croatia, members of three-generations families consisting of: children, working parents and oldest members — grandparents. Observed variables were: sociodemographic (age, sex, education, marital status, work status), health status, family engagement, self-perceived health, functional ability, sleep quality, stress, and life satisfaction, all measured by self-report scales. Data were collected individually, in the form of structured interview, at participants’ homes, by trained interviewers. Analyses confirmed the association between participants’ family engagement and their life satisfaction (correlations from $r = .23$ to $r = .55$). The frequency of different aspects of family engagement and its effects on observed factors of participants’ wellbeing were discussed. Recognizing the factors that affect life satisfaction in older adults with regards to their family engagement suggests how to intervene in order to improve wellbeing in older family members.
COMMUNITY PSYCHOLOGY VISION AND BEST PRACTICES FOR RESEARCH AND INTERVENTIONS

Abstract body. The symposium tackles with the roots of community psychology—vision, methodologies, tools—and some innovative examples of their use in facing social issues and at the same time proposes new roles and functions for psychologists. In academic and professional contexts there is a strong debate concerning the potentiality of psychology and its peculiarity in addressing social and individual issues in communities and social domains. What do we need?

Strengthening the role of clinical and social psychology in all domains and bringing their peculiar view is extremely important. We need also to connect sound disciplinary-based ‘deep knowledge’ to sub- or meta disciplines to detect, set up, and evaluate helpful links to address and solve real world problems (Stark 2018). The symposium will address these topics presenting the visions of community psychology and adding to the discussion relevant action research.

Press paragraph. The symposium deals with psychological competencies not only related to practices and health therapeutic settings, but also oriented to solve societal issues. The symposium aims to introduce the specific community psychology goals and tools describing the potentiality of this branch of psychology, sometime improperly simplistically overlapped to a merely social or educational intervention. Francescato presents new social challenges that psychology could face and Ornelas (Portugal) describes aims, methods and tools of community psychology. Furthermore Mebane describes how psychological knowledge depicts obstacles that women are more likely to encounter in their political career and how the latter cope with them suggesting new visions.

Moreover, Arcidiacono and colleagues describe then the theoretical background that brought EFPA to the celebration of the 25th November as a day against gender violence focussing on the importance of psychology in pursuing that objective. Finally, Salvatore and al., discuss the results of a participatory action research held in Italy to promote an incubator of new professional profiles for psychologists. Therefore, the whole symposium introduces some theoretical problems facing social challenges, proposes community psychology knowledge as a useful intervention tool and presents two action research on social gaps and opens new psychological profiles.

General summary of the Symposium. Community Psychology (CP) concerns the relationships of individuals with communities and societies at intrapsychic, organizational, cultural and political level (Orford, 2008, Nelson Kloos, Ornelas, 2014; Arcidiacono, 2016). Therefore CP is not based either in the individual or in the community but in their linkage proposing visions for the future of individual and human contexts (Francescato, Zani 2016). At the same time Community ‘psychology’ focuses on people’s experiences: their feelings, thoughts, and actions as they interact to resist oppression and strive to create a better world (Arcidiacono, 2016). What characterizes and makes a psychologist’s competence peculiar for social well-being? How can we act, as experts in the interconnection between individuals and contexts? How can we define our competencies when we are not in a health and therapeutic domain? Is there a space for psychological knowledge, or, as Morin has affirmed (2012), the unavoidable need for hybridization of the various social sciences, in a certain way cancels the distinction between the professions by virtue of a variegated and composite interweaving of knowledge? These are the questions that moved this symposium in a double way. On one hand we underlined the
importance of creating a system of alliances with scholars from other disciplines who analyse the development of our world by focusing on resource management, justice, and inequalities and therefore we define community psychology a linking science (Stark, 2012). On the other hand we developed research and intervention methodologies that allow us to discover new social problems and to deal with them as Mebane investigation pointed out. Similarly we proposed to consider the 25th of November as day against gender violence a best practice that highlights the potential role of psychologists in Emergency Unit, women protection and services for perpetrators awareness. A last contribution depicts how social issues are intertwined with psychological knowledge discovering what solutions the psychological background can offer them as Salvatore and colleagues propose in their interinstitutional action research.

**INTEGRATING ENVIRONMENTAL, SOCIOPOLITICAL, CLINICAL AND FEMINIST PERSPECTIVES TO PROMOTE THE FUTURE OF COMMUNITY PSYCHOLOGY IN EUROPE**

Caterina Arcidiacono  
ECPA/ APPsyc/EFPA Standing Committee Università Frederico II (Naples, Italy)

Donata Francescato  
ECPA University (Rome, Italy)

Economic globalization processes and the growth of terrorism have created great environmental problems, huge inequality, multiplied the number of war refugees and economic migrants seeking entry in Europe, promoting the growth of nationalist and populist parties and political polarization. To explore what new occupational challenges these macro changes have created for community psychologists. Methods: a) Critical analysis of liberation community psychologists ‘s theories about how these problems have their roots in the uncritical worldwide adoption of a libertarian free market ideology and a growth model based solely on the GDP. b) Critical analysis of ecofeminist theories that maintain there is a tie between the subordination of women in society, domestic violence, the abuse of natural resources and the increase of local wars and ethnical conflicts (Marcomin and Cima 2018; Raworth, 2017). c) Analysis of which problems can be best tackled by which CP intervention modalities. Activist community psychologists should support environmental struggles and policies to decrease inequalities. They could partner with those (Hickel 2018) who want to build other indicators of progress, besides the GDP (such as Buthan’s).
COMMUNITY PSYCHOLOGY AS A SCIENCE AND A PRACTICE DISCIPLINE: PERSPECTIVES AND CHALLENGES

Caterina Arcidiacono
ECPA/ APPsCyC/EFPA Standing Committee University
Frederico II (Naples, Italy)

Jose Ornelas
ECPA/ APPsCyC/ISPA – Instituto Universitário EFPA
Standing Committee (Lisboa, Portugal)

Community Psychology has probed for the last three decades to advocate for the advancement of the systematic understanding of the links between individuals and communities, probed to respond to pressing community problems, integrating science and socially relevant interventions, and changing public policies. In this presentation, it is examined how community psychology has established bridges among basic science and applied science, generating knowledge from a diversity of sources at multiple levels of analysis, using quantitative and qualitative methods. Research and practice examples are provided on the transposing of substantive knowledge into concrete applications: prevention, intervention, policy approaches that facilitate the effective and efficient use of evidence-based practices, through the promotion of empowerment and social justice, respect for diversity, sensitivity to contexts, and the enhancement of citizens’ capacities and participation. By addressing significant social problems, community psychology requires expertise in transformative systems change, that is the process of shifting and realigning the structures that drive system behaviour such as policies, values, resources, the actors inside the system (e.g., organizations, individuals), and their interactions. Change efforts need to be targeted at multiple ecological levels will lead to more effective, and sustainable solutions.
HOW CAN WE PREVENT THE WIDENING OF GENDER POLITICAL GAP?

Caterina Arcidiacono  
ECPA/ APPsyC1/EFPA Standing Committee Università Frederico II (Naples, Italy)

Minou Mebane  
ECPA/ Università Giustino Fortunato (Benevento, Italy)

M. Giacomantonio

M. Lauriola  
University La Sapienza (Rome, Italy)

In spite of decades of women’s political battles, there is a persistent underrepresentation of women in legislative bodies: 23.8 per cent worldwide (IPU, Inter Parliamentary Union, 2018). Political power continues to be unequally distributed favoring male gender. A review of the literature, involving top and middle level women politicians, reveals that few research have explored if they perceive the obstacles they encounter in their political career are deriving from situational, gate keeping, gender differences or mass media variables, and how well they can cope with the obstacles they face. Understanding which barriers women still face in their climb to the top and which are harder to cope with is a crucial step in promoting equal participation and preventing gender inequality in politics. What measures need to be taken to prevent the widening of the gender political gap? We believe it is important to understand what kind of obstacles women are more likely to encounter in their political career and how they cope with them.  

Methods: Our study involved 233 Italian national politicians (46% females), 425 local politicians (56% females). We explored what kind of obstacles female politicians are more likely to meet and how they cope with them. The (WO) Women’s Perceived Obstacles and (WOC) Women’s Coping Efficacy in Politics were administered. Our findings show that both local and national politicians perceived more external obstacles, deriving primarily from hostile attitudes of their male colleagues, as gatekeeping theory will suggest. Moreover, our research indicates that both local and national politicians found it hardest to cope with the difficulties of accessing media, particularly national television. These results suggest that to prevent a widening of the gender gap in politics it is critical for women to be trained to have better access to media and to fight against unequal gender representation in the media.
Some time is difficult to describe a psychological intervention in an ecological perspective. Therefore as best practice we want present the network action that brought EFPA together with its Community psychology standing committee and associated member ECPA to propose the 25th of November to became for all European associations of psychologists the day fighting gender violence against women. Violence against women was identified as a health priority in 2013 by WHO and the 67th World Health Assembly resolution on strengthening the role of the health system in addressing violence emphasized the urgent need for better care for women who have experienced violence. Commonly recognized today by all health organizations (WHO, AMA, UN, NIH, etc.) is the gender violence, particularly the intimate partner one. It is widespread in the world in about 30% of the female population and involves high risks of physical — mental illness, but also high risk for life (femicide). Domestic violence (intimate partner violence — IPV) involves physical injury and psychological ill-treatment by a male partner. Violence within a relationship usually results from coercion and comprises controlling behaviours, verbal abuse, and economic control, in addition to physical assault. Therefore WHO stressed the importance of training all levels of health workers to recognize when women may be at risk of partner violence and to know how to provide an appropriate response. Aims: The aim of this presentation is then to make explicit all the professional actions that psychologists can do in different contexts dealing with gender violence: Emergency Unit, Prevention, Therapy, Taking in charge, empowerment, resilience support ecc A joint experts’ research group shared all its knowledge on the topic arriving by consensus to a final document submitted to the institutional organizations An international team of scholars and professionals engaged in fighting gender violence using new communication technologies was able to prepare a document wider implemented and discussed in all institutional contexts. This action developed at cultural level — referring to Prilleltensky (2008)ecological model- enhanced the awarness about psychological competencies and strenghtens in facing gender violence.
COMMUNITY PSYCHOLOGY METHODOLOGIES AS PROMOTER AND INCUBATOR OF NEW PROFILES FOR PSYCHOLOGISTS

Caterina Arcidiacono  
University Federico II (Naples, Italy)

Salvatore Sergio  
University of Salento (Lecce, Italy)

Arcidiacono Caterina  
University Federico II (Naples, Italy)

Bozzaotra Antonella  
Campania Region Psychologists Association (Naples, Italy)

Freda M. Francesca  
University Federico II (Naples, Italy)

Starting from the traditional use of psychological competences in the health domain, there is now the need to enlarge its area of intervention: Generalized anomie impacts individual and collective life in terms of uncertainty, precariousness and breakdown of consolidated reference frameworks; discomfort, feelings of loneliness, loss of meaning, distrust of institutions, value drifting, defensive castling on identity, nemicalization of Otherness are emerging questions historically associated with the action of other competences and professions — eg. economists, lawyers, political scientists, communication experts. Psychology, however, has the scientific and methodological resources to reverse this historical trend. The complexity and novelty of the phenomena at stake urges us to move in this direction. On the one hand, it is necessary to develop the intervention models currently available so as to make them appropriate to the new potential areas of intervention. On the other, it is necessary to promote the visibility of the contribution that psychology can offer in these areas to the interested parties. These two lines are closely intertwined and complementary. This circularity implies that the construction of innovative profiles of psychological function can hardly precipitate from the spontaneous action of individual professionals. It is therefore necessary to define institutional incubators that determine the conditions useful for scientific-professional innovation and commissioning to meet and mutually translate into a source of value. Main goals are investing in the construction of innovative profiles of psychological function to give answers to the needs and to the problems that are at the heart of the contemporary world. Interinstitutional participatory action research will be conducted and monitored. The research design, the actors and the stakeholders will be presented. This experimental 3 years project running in Italy with the collaboration of scholars, professionals, institutions and the Campania Region Psychological association will highlight the preliminary results. A systematic analysis of the process and of the first outcomes of the interventions and the contextual factors intertwined with them will be described and evaluated. The presentation will also discuss the verification protocols made available to the technical-scientific staff and defined in agreement with the Campania Region Psychological Association.
CREATING POLICIES FROM BEST PRACTICES - PSYCHOLOGICAL INTERVENTIONS FOR BENEFITS OF INDIVIDUALS AND SOCIETIES

Vita Poštuvan
University of Primorska, Slovenia

Damir Lučanin
University of Applied Health Sciences, Zagreb, Croatia

Rifkat J. Muhamedrahimov
Saint-Petersburg State University (St. Petersburg, Russia)

Inauen Jennifer
University of Bern (Bern, Switzerland)

Abstract body. Psychology offers a very broad spectrum of the knowledge and evidenced based interventions. Many of the aspects of interventions eventually become policies, but the translation of individual interventions to broader accepted and implemented practices is a process. The symposia will focus on presenting best practices from different areas, as a part of the work of Board of Promotion and Prevention of European Federation of Psychologists’ Associations (EFPA).

Press paragraph. Rifkat J. Muhamedrahimov: Promoting Infant/Toddler Mental Health and Development through Early Intervention and Prevention of the Social Orphanhood Programs based on the early childhood systemic theories show positive impact on the mental health and development of infants and toddlers with special needs living in biological families and in institutions. The interventions helped to improve national practices and policies in the field of infancy and early childhood. Damir Lučanin: Psychological care in the function of improving health and quality of life in older age. The aim of this paper is to present some psychological dimensions of an individual and the psychosocial aspects of care for the elderly related to the health, quality and length of life in old age.

Jennifer Inauen: Leveraging psychological theory and mobile technology for effective health promotion and prevention. Healthy lifestyles, including healthy eating and physical activity play a major role in preventing chronic diseases. However, changing lifestyles is difficult. In this presentation, we will illustrate how psychology and mobile technology can be combined to achieve effective behavior change. Vita Poštuvan: Impact of policies and psychological best practices on suicide rates. Suicide is a complex phenomenon, therefore the interventions to prevent it need to reflex the complexity. Among the most evidenced based interventions are policies that restrict the access to means, guidelines to promote responsible media reporting and several multi-layer psychological interventions.

General summary of the Symposium. Psychology offers a very broad spectrum of the knowledge and evidenced based interventions. Many of the aspects of interventions eventually become policies, but the translation of individual interventions to broader accepted and implemented practices is a process. We will present examples of best practices, on how psychological care is in the function of improving health and quality of life in older age, how psychology can promote infant orphans mental health and development, how the mobile technology can be leveraged for effective health promotion and how policies in suicidology can have direct impact on decline of suicide rates. The symposia will focus on presenting best practices from different areas, as a part of the work of Board of Promotion and Prevention of European Federation of Psychologists’ Associations (EFPA). GEROPSYCHOLOGY CONTRIBUTIONS TO CONTEMPORARY AGEING ISSUES — PART 2: COGNITIVE FUNCTIONING, AGEING, AND MENTAL HEALTH

Abstract body. In the symposium, scholars from five European countries will report on their new research contributions to the field of geropsychology, related to current and future social and technological developments and collaborations. The second part of symposium is on Cognitive functioning, ageing, and mental health.

Results will be presented on: the role of cognitive reserve accumulated over the lifespan for cognitive functioning in older adults in Switzerland; evaluation on the effect of individual psychotherapy provided in Denmark to elderly care recipients with low well-being; research findings on mental health, chronic diseases, and limitations in activities of daily living in later life in Lithuania; research findings on correlation between needs and behavioural problems in patients suffering from dementia in Austria.

Press paragraph. In the symposium, scholars from four European countries will report on their new research contributions to the field of geropsychology, related to current and future social and technological developments and collaborations. The second part of symposium is on Cognitive functioning, ageing, and mental health.

Kliegell (Switzerland) will present the role of cognitive reserve accumulated over the lifespan for cognitive functioning in old age. Larsen (Denmark) will present evaluation on the effect of individual psychotherapy provided to elderly care recipients with low well-being. Zamalijeva (Lithuania) will present research findings on mental health, chronic diseases, and limitations in activities of daily living in later life. Gatterer (Austria) will present research findings on correlation between needs and behavioural problems in patients suffering from dementia.

General summary of the Symposium. Generation changes are apparent in European population as the post-World War II cohort is becoming old, however, with longer life expectancy, higher education level, fewer children, working longer, and more active lifestyles. New generations’ potentials, views and expectations of their own old age put new challenges to public policies, scientific disciplines and professional practices. Psychology, and especially Geropsychology, continue providing the research-based knowledge, theories, and education about diverse psychological processes underlying human ageing. In light of generation changes, geropsychologists are developing innovative approaches and practices, often in collaboration with other disciplines and connecting to new technologies, that will improve the quality of living and subjective well-being in older age. Functional ability, cognitive functions and mental health are important determinants of quality of life in older adults, and also domains of potential loss in old age. In the symposium, scholars from four European countries will report on their new research contributions to the field of
geropsychology, related to current and future social and technological developments and collaborations. The second part of symposium is on cognitive functioning, ageing, and mental health. Kliegell & Ihle (Switzerland) will present the role of cognitive reserve accumulated over the lifespan for cognitive functioning in old age. Larsen (Denmark) will present evaluation on the effect of individual psychotherapy provided to elderly care recipients with low well-being. Zamalijeva, Kairys, Jurkuvenas, & Pakalniskiene (Lithuania) will present research findings on mental health, chronic diseases, and limitations in activities of daily living in later life. Gatterer & Süss (Austria) will present research findings on correlation between needs and behavioural problems in patients suffering from dementia.

THE ROLE OF COGNITIVE RESERVE ACCUMULATED OVER THE LIFESPAN FOR COGNITIVE FUNCTIONING IN OLD AGE

Andreas Ihle
Kliegel Matthias
University of Geneva (Geneva, Switzerland)

In this presentation, we will discuss our interdisciplinary research efforts on explaining the enormous interindividual differences in cognitive reserve accumulated over the life course and its role for cognitive functioning in old age. First, we will talk about the build-up of cognitive reserve in early, mid-, and late life (through education, occupation, leisure activities, etc.). Another focus will be on presenting several Swiss and European studies investigating the role of cognitive reserve for cognitive functioning in different groups of vulnerable individuals in old age (chronic diseases, metabolic syndromes, frailty, stress, etc.). Moreover, we will discuss the interplay of cognitive reserve with other individual-difference characteristics such as personality and social aspects of older adults’ life.
INDIVIDUAL PSYCHOTHERAPY IMPROVES THE WELL-BEING OF ELDERLY DANISH CARE-RECIPIENTS

Larsen Lars
Aarhus University (Aarhus, Denmark)

Historically, psychotherapeutic treatment of psychological problems in old people have had low priority among clinical psychologists, especially in regards to non-psychiatric problems. There are several possible explanations for this. Firstly, ageist attitudes on the developmental potential of old people may play a role. Often old people are wrongly believed to have no mental plasticity and capacity for change, hence no therapeutic potential. Secondly, in recent years the public focus has been very much on cognitive decline and dementia in frail old people. This may cause both overgeneralizations about the frailty of “normal” old people and a disregard for more existential and emotional themes in the life of the old person. Objective: To evaluate the effect of individual psychotherapy provided to elderly care recipients with low well-being. The WHO-5 Well-being Index, which is a brief five item self-report inventory, was used to measure the effect of psychotherapy. The overall WHO-5 results range from zero to 100, with scores of 50 and above are considered a sign of normal well-being. Scores of 35 or lower indicate severe stress and a great risk of depression. The WHO-5 Well-being Index was supplemented by the Common Mental Disorder Questionnaire (CMDQ), which measures anxiety, depression and loneliness. The Center for Quality of Life is a municipal center that offers free psychotherapy to elderly care recipients living either at home or in nursing homes. Clients receive up to eight one-hour sessions. Follow-up measures are collected approximately three months after ended treatment. On average, our clients scored approximately 35 on the WHO-5 at the beginning and improved more than 20 point during treatment. This improvement was significant with a large effect size. The effect remained three months after the last session. Scores on anxiety, depression and loneliness also decreased significantly. Psychotherapy seems to be an efficient way to improve the well-being of frail elderly persons in non-psychiatric populations. Possible ways of promoting psychotherapeutic treatment in the elderly are discussed.
MENTAL HEALTH, CHRONIC DISEASES, AND LIMITATIONS IN ACTIVITIES OF DAILY LIVING IN LATER LIFE

Olga Zamalijeva
Antanas Kairys
Vytautas Jurkuvenas
Vilmante Pakalniskiene
Vilnius University (Vilnius, Lithuania)

Multiple chronic conditions often become constant companions among middle aged and older adults. Moreover, physical health problems in later life that are accompanied by mental health issues result in greater limitations in activities of daily living (ADL), higher suicide risk and increased utilization of healthcare services. Even though personality traits were found to be associated with ADL limitations, mental health outcomes as well as physical health, they are often disregarded in the analysis. The aim of this research is to examine links between ADL limitations, mental and physical health outcomes, while controlling for personality traits and sociodemographic variables. 682 subjects aged 50 and older (age M(SD)=64.1(10); 50-64 n = 384; 65+ n = 298) with no history of mental illness were included in this analysis. Mental health outcomes were assessed using Beck Depression Inventory-II, Beck Anxiety Inventory, Beck Hopelessness scale. Personality traits were measured using NEO-FFI. Subjects were also asked to evaluate ADL limitations due to their physical condition and a checklist of common chronic diseases was used to assess physical health. Analysis of covariance showed that individuals with multiple chronic conditions had significantly more depression and anxiety symptoms, as well as higher levels of hopelessness than subjects with no or only one chronic condition, even after controlling personality and sociodemographic variables. Hierarchical regression analysis, overall explaining 37% of variance, indicated that mental health outcomes have significant contribution to the self-reported ADL limitations and are particularly important among the old age group (65+) adding up to 12% to the explained variance. Older adults with multiple chronic physical conditions are at greater risk of mental health problems and this result is beyond the effects of personality and sociodemographic variables. Moreover, mental health issues play an important role in self-reported ADL limitations, especially among individuals aged 65 and older. Thus, mandatory screening for mental health issues, preventive action, and early interventions should be considered when working with elderly individuals suffering from multiple chronic diseases.
CORRELATION BETWEEN NEEDS AND BEHAVIOURAL PROBLEMS IN PATIENTS SUFFERING FROM DEMENTIA

Elisabeth Süss
Vienna Hospital Consortium (Vienna, Austria)

Gatterer Gerald
Sigmund-Freud Private-University (Vienna, Austria)

Behavioural problems are a common occurrence within dementia. One cause for these challenging behaviours are unfulfilled needs of the people affected. Especially at later stages of dementia, basic requirements can often not be verbally communicated anymore. Conspicuous behaviour is shown as a consequence, in an attempt to express unmet needs. Thus, a system of care that is tailored towards the needs of people suffering from dementia is becoming increasingly significant. This work deals with the acquisition of needs of people with dementia in a stationary setting. Additionally, care options are evaluated in order to reveal the discrepancy between needs and care options. The results show which needs are particularly common, which of those can or cannot be fulfilled, as well as the requirements that are “disruptive” in care settings. A second questionnaire was given to determine needs that might be disguised by certain behavioural patterns. Based on the results, possible causes for challenging behavior should be more easily recognised and understood by care personnel. The needs of 42 male and female dementia patients in a nursing home were collected. As part of the procedure, the patient’s behaviours were precisely observed by the nursing staff and evaluated according to their impressions. The results show that the needs for “freedom/autonomy”, “cleanliness” and “communication” as well as “food” are the most disruptive in a care setting. Out of 15 requirements, only those for “communication”, “food”, “drinking”, “movement” and “love” can be sufficiently met. Unfulfilled needs for “communication”, “freedom/autonomy” and “closeness/intimacy” are often disguised by aggressive, depressive, anxious and intrusive behavior. Utilizing this knowledge, care can be shaped and adapted more towards needs. Key words: dementia, need-orientation, behavioural and psychological symptoms of dementia.
PSYCHOPHYSIOLOGY OF CREATIVITY AND INSIGHT

Natalia Shemyakina
iEPHB RAS (Saint-Petersburg, Russia)

Olga Razumnikova
Novosibirsk State Technical University (Novosibirsk, Russia)

Mark Leikin
University of Haifa (Haifa, Israel)

Abstract body. The proposed multidisciplinary symposium aims to present studies on psychophysiology of creative thinking and insight, factors that can influence creative output. The concept "insight" is thought to refer to the moment of breaking out of an impasse. It enables one to move suddenly, thanks to an "Aha!" moment from a state of not knowing how to solve a problem to a new state of knowing. The cognitive and neurocognitive mechanisms involved in both phases of insight-based problem solving (the current state and goal state) suffer from a lack of detailed characterization. The symposium will combine data from the researches employing psychological and neuroscience methodologies such as EEG/ERP and will allow considering functional underpinnings of insight in creativity processes for use of psychologies, pedagogues, psychophysiologyist. The special talks will be done to clarify the influence of external factors (i.e. hypoxia) on creative processes. Creative thinking in bilinguals will be also considered.

Press paragraph. What is creativity and why is it so important to explore, preserve and enhance creative abilities in people. What can influence person's creativity looking through the prism of personal characteristics and external circumstances — will be clarified and suggested as the interpretations in talks of Olga Razumnikova (Novosibirsk, Russia), Natalia Shemyakina (St. Petersburg, Russia), Mark Leikin (Haifa, Israel) and Zhanna Nagornova (St. Petersburg, Russia). Prof. Olga M. Razumnikova will present data on neurophysiological differences in creative thinking and insightfulness connected with the personality trait (intuition) in different experimental models of creative thinking including heuristic, verbal, figural, and social creative tasks. Prof. Mark Leikin will present findings to confirm the hypothesis that balanced bilingualism positively influences divergent thinking. Natalia Shemyakina will describe physiological signs underlie original and insightful decisions in verbal associative search and long-term memory stereotypes overcoming. One of the discussing points will be the influence of the personal traits on neurophysiological and psychological mechanisms of creative thinking. Zhanna Nagornova will give a glance on environment conditions that influence creative thinking.

General summary of the Symposium. The symposium will provide participants an opportunity to discuss new psychological and neurophysiological data on creativity and insight-based problem solving as well as to go into the question how education can benefit from the neurophysiological findings in the problem. The symposium will help to promote integration of the developmental, cognitive and neuroscience experts for multidisciplinary consideration of psychophysiological mechanisms underlying and influencing creativity. It aims to present different studies on psychophysiology of creative thinking and insight, psychological and neurophysiological factors influencing creative outputs. Generally, the concept "insight" is thought to refer to the moment of breaking out of an impasse. It enables one to move suddenly, thanks to an "Aha!" moment of insight, from a state of not knowing how to solve a problem to a new state of knowing. The symposium will combine data
from the researches employing psychological and neuroscience methodologies such as EEG/ERP and will allow considering functional underpinnings of insight in creativity processes. Participants will learn about the neurophysiological signs underlie original and insightful decisions, neurophysiological differences in creative thinking and insightfulness connected with the personality traits (intuition) in different experimental models of creative thinking including heuristic, verbal, figural, and social creative tasks, different external conditions (hypoxia) and developmental environment (bilingualism) that influence creative output. It is supposed to provide participants an opportunity to learn and exchange information on different aspects of creative thinking and how psychology and education can benefit from the neurophysiological findings.

THE INTERPLAY OF BILINGUALISM, EXECUTIVE FUNCTIONS AND CREATIVITY IN PROBLEM SOLVING AMONG MALE UNIVERSITY STUDENTS

Mark Leikin
Anna Waldo
University of Haifa (Haifa, Israel)
Esther Tovli
Shaanan College (Haifa, Israel)

Twenty eight Russian/Hebrew/English trilinguals, and twenty five non-balanced Hebrew/English bilinguals participated in the study. All participants performed several standard tasks on executive functions and two tests on creativity: TTCT and RAT (in appropriate languages). The findings showed that the Russian-speaking participants performed better on the TTCT, particularly in flexibility and fluency measures. On the RAT test, balanced bilinguals outperformed non-balanced bilinguals in the English version and exhibited the same results in the Hebrew version of the test. In this case, there were significant correlations between the RAT results in all three languages in the Russian group. The findings seem to confirm the hypothesis that balanced bilingualism positively influences divergent thinking. The hypothesis that performance of bilinguals on creativity tasks is linked to distinctions in the development of their executive functions was not confirmed.
NEUROPHYSIOLOGICAL MARKERS OF INSIGHT IN ASSOCIATIVE SEARCH

Natalia Shemyakina
IEPHB RAS (Saint-Petersburg, Russia)

An insight is the most intriguing stage of creative thinking that is not investigated enough. "Aha" effect is the time of suddenly coming and fitting the task correct decisions (Keller,1930; Wagner et al.,2004). The series of studies aimed consideration of similarities/differences in event-related synchronization/desynchronization (ERS/ERD) markers of insightful solutions. The EEG/ERP studies using RAT alike tasks (Mednick,1968) for remote associative search and a task for overcoming long-term memory stereotype were carried out, with participation of 33 right-handed healthy adults (mean age 23.6±3.1[SD]). In RAT alike tasks the subjects were to create the fourth word that is somehow related to each of the three presented words from different semantic fields; in the second — to suggest own ending of the well-known saying ("Proverbs"). Subjects had to decide if their answers appeared through insight. EEGs were registered with 31AgCl electrodes in 0.3-30Hz range with 500Hz sample rate (Mitsar Ltd., Russia). ERS/ERD was analyzed on artifact-free (ICA corrected) trials for each subject using Morlet wavelets applied for 4 s (2 s before and after a marker of the decision). Statistics were performed with RM ANOVA and T-tests. The data suggest involvement of the frontal and right parietal cortex. Creative decisions in “Proverbs” were characterized by higher ERS at 7Hz in the left frontal area (F3) at 800-400ms prior the answers in comparison with memorizing. Insightful decisions in classical RAT compared to those, that were not marked as insight demonstrated an increase of 4-6Hz power 1000-800 ms before the answers in frontotemporal areas bilaterally (FStatexZone(30,360)=2.2, e(H-F)=0.26, p<0.05)). The data corresponds with RAT performance (Razumnikova et al.,2007) and insight solutions in math (Wu et al.,2014) and stressed the role of low frequencies synchronization prior the answers in the frontal cortex in the tasks connected with associative search or insight decisions. Supported by RFBR 19-015-00412-a.
Insight is a form of creative cognition. Despite long interdisciplinary studying the mechanism underlying insight remains undiscovered. A set of distributed insight-activated regions, including the frontal, anterior cingulate cortex, amygdala, and hippocampus variably recruited during problem solving was shown by the meta-analyses of fMRI data. Using EEG was revealed that the insight accompanied by paradoxical enhancement of both high-frequency gamma and low-frequency alpha synchronization. So, aim of the study was to analyze the regional patterns of EEG oscillations as balance between inhibition and activation processing at cortex during creativity testing by performing different insight-induced tasks. We have studied creative thinking using different experimental models including heuristic, verbal, figural, and social creative tasks. Multichannel EEG registration was performed during generating ideas during creativity testing. The cortical oscillations were analyzed from delta to gamma frequency ranges. Specific frequency oscillations associated with heuristic task solving were found at the alpha and beta 2 bands. These EEG patterns varied due to intuition as personality trait. When intuition was dominant, more original solutions to problems corresponded to desynchronization of the alpha biopotentials in the posterior cortex, while low levels of intuition were associated with synchronization. The most informative for differentiation of both verbal and figurative creative thinking were the alpha2 and beta2 rhythms characterized gender differences with greater alpha 2-effect for verbal functions in women and the beta2 oscillations for figurative functions in men. Solving socially significant problems in experimental conditions was accompanied by an increase in the power of the delta and gamma2 bands and desynchronization in the alpha2 band. Revealed intelligence-related different forms of interaction between the frontal cortex and posterior areas were hypothetically associated with predisposition to potential flexibility of information selection strategies during creative thinking. So, creative thinking, regardless of the experimental conditions, is accompanied by integration of low- and high frequency oscillations presented a top-bottom balance of inhibition and activation processing in networks of left-right and anterior-posterior cortical areas that may reflected correspondingly a dominance the logic or insight strategies of idea generation during creative problem solving. This work was supported by 17-06-00166-a and 19-015-00412 grants of the RFBR.
CREATIVE TASK PERFORMANCE UNDER THE NORMOBARIC HYPOXIA

Zhanna Nagornova
Natalia Shemyakina
Russian academy of sciences (Saint-Petersburg, Russia)

The experimental hypoxia is a model that can help to evaluate border states, that causes behavioral changes. The study aimed to explore EEG spectral power changes during creative story generation (ST) under moderate experimental Hypoxia (breathing with oxygen-nitrogen gas mixture with low (11.5%) oxygen content). Subjects (mean age 24±3[SD]) generated creative stories: before (Normoxia) and after Hypoxia, at the beginning & the end of 1/2 hour hypoxic influence, using pictures from Guilford, Sullivan (1975) test. EEGs were recorded during creative ST and during eyes opened REST(R) in the same time periods during 2 visits of each subject. EEGs were registered monopolarly from 16 AgCl electrodes (“Encephalan-131-03”, Medicom-MTD, Russia). Signals were filtered between 1.6-30 Hz (sample rate 250 Hz) and analyzed on artifact free (ICA decomposed) EEGs at ST & R (WinEEG, copyright Ponomarev, Kropotov). By means of ANOVA were separately analyzed EEG spectra dynamics during R & ST, also were compared EEG spectra ST vs R in D(1.5-3.5), T(4-7.5) A1(7.5-10Hz), A2(10-13Hz), B1(13-18Hz), B2 (18-30Hz) before, after & during hypoxia. For states above in comparison with Normoxia was obtained gradual increase of slow activity during different stages of Hypoxia, reflecting the cortex deactivation. Increase of power in D, T & A1,2 bands in R is described (Babiloni et al.,2014), while there are no too much data for mental tasks (Temme et al.,2013). The cortex deactivation during creative tasks could be meaningful for forming defocused attention important for ideas search (Fink et al.,2006; Razoumnikova et al.,2009; 2013). Explored differences between EEG spectral power at ST & R at different stages revealed differences in Normoxia, first minutes of Hypoxia & after it. Spectral power was higher for R vs ST in Normoxia in T (TASKxZONE (F15,105=3.06, p<0.05; e(H-F)=0.31)) & A2 (TASK (F1,7=5.7; p<0.05)) bands. There were no significant power differences for ST vs R at the end of Hypoxia influence. While hypoxia influence was removed there were obtained power differences for ST vs REST in D, T, A1,2 bands, that might reflect compensation hypoxia state for successful cognitive tasks fulfillment. Supported by I.42P
A HUMAN IN INFORMATION SPACE

Victoria Dmitrieva
Russian Social State University (Moscow, Russia)

Abstract body. During the period of globalization and the network culture the boundaries between countries disappear, but the originality, related to the anthropological aspects and belonging to a particular culture, remains. Realizing this originality, psychology, and in particular counseling, can provide professional assistance and support to a human in the information space. Informational environment can have both a positive and a negative influence. Studying a personality in its interaction with the surrounding reality enables us to obtain data on the interference of information and personality. The aim of the discussion is to help a person in every situation to use all proper integral intelligence and creativity. It makes possible to find the most efficient methods of exchanging information, which will lead to development of the society as a whole.

Press paragraph. High speed of changes in the social reality of the contemporary world suggests an active dialogue of man with the surrounding world, including his more pro-active approach to life, and stimulates modern scientists to draw their attention to ontological elements of human being. The symposium reports will present the results of researches, conducted on the international samples and launch our discussion with the theme of leadership in its modern apprehension in terms of the informational society. In the modern understanding, leadership is regarded as an active position in the interaction with the surrounding world which reveals itself in the development of social, professional and personal spheres of man; behavioural strategies used in critical situations; the combination of motivation to achieve social success and to reach economic results along with the motivation of self-fulfillment and creativity; a specific mode of life.

General summary of the Symposium. A modern person lives in a 'global informational society'. So psychology should study the means and particularities of interaction in the information space and use information resources efficiently. The majority of the information space is created by mass media where a person is both a producer and a consumer. The aim of applied psychology can be seen as studying of the effects of the features of the personality who acts as an information intermediate. Informational exchange takes place in an integral information space which includes both the verbal and non-verbal ones. Studying these aspects enables us to understand the mechanisms of mutual interference within interaction between the subjects and also increase the efficiency of communication. In the information space of today a person is surrounded by images, the visual ones are the most influential. The ontopsychological approach to the practical use of visual art images and their interpretation examines a person at the moment of interaction with a film of a piece of fine arts. This enables us to define how this experience affects an individual. The problem of humanization of higher education is the practice of developing a mature holistic personality, which is capable of responsible guidance in information space. Management of enterprise through the leadership potential in information society is crucial to form a personality capable of active construction of productive environment and increasing enterprise efficiency. Informational environment can have both a positive and a negative influence. Studying a personality in its interaction with the surrounding reality while using the ontopsychological approach enables us to obtain data on the interference of information and personality. This make it possible to find the most efficient methods of exchanging information, which will lead to development of the society as a whole.
THE ROLE OF PERSONAL FACTORS IN CREATING AND TRANSFERRING INFORMATION

Tatiana Vereitinova
Russian Social State University (Moscow, Russia)

Alexey Shtanko
Consulting Group FOIL (Moscow, Russia)

In today’s «global information society» the volume of information supplied to everyone is constantly increasing and information resources are becoming more accessible. In this information space mass media and modern media in general play a significant part in creating and transmitting information. How is the information space created? What individual actions can be motivated by information? How do people select information? When creating and presenting any information, mass media often strive to achieve a form that would provoke a major emotional response. At the same time, the content is influenced by various factors, the most important being the personality of the one who produces it, as our research has shown. According to the ontopsychological approach, the properties of the psychic structure of human personality define specific features of human predisposition to perceive a certain type of information, to a certain type of emotion that it evokes. At the same time, we can introduce a criterion for evaluating the message in terms of its functionality for the individual, the ability or inability to provoke creativity, predetermination of a certain mode of communication and behaviour of the subject. Our studies of the effects of personal characteristics of the individual in creation, transmission and perception of information in the field of journalism and the mode of presentation and perception of news by the reader have shown that journalists who have different personal characteristics, tend to describe the same fact differently, thus changing the attitude of the readers towards the fact. The research has also demonstrated the personal characteristics that predispose a different attitude to the information proposed to the reader. Emotional state of the subject has been found to be another factor which defines the attitude towards presented information. First and foremost, the information affects the subject where they have already been emotionally structured through memories and re-activates those memories. These studies confirm that certain information becomes a sort of a lever in specific psycho-emotional cycles of the subject associated with a specific thematic selection of their psyche.
Intersubjective communication is a complex process that includes interaction, comprehension, interpretation of senses and meanings and self-presentation as a communication subject. The specific character of interpersonal information exchange is determined by whether there is psychological feedback, if there are any communicational barriers; the content transfer is defined by interpersonal influence, space and time and by the multiple levels of information exchange. The concept of “semantic field” (Meneghetti, 2012) describe the mechanisms a non-verbal component of the intersubjective communication, apart from the kinetics, the proxemics and the paralinguistic systems. It is a type of distant communication, mechanisms of which are not fully explored although its phenomenology has been largely described. Semantic field can be related to the mechanisms of empathy or the action of mirror neurons. The aim of the research was to study psychophysiological and individual features of emotional state recognition in non-verbal communication. 20 experiments were carried out with 2 participants and an identical scheme in each — one was the sender of the information (presented with some stimuli to affect their emotional state), and the other one was the recipient (the one, who interpreted the state of the sender). We measured both participants’ psychophysiological parameters, as well as the level of empathetic ability, intuitivity, anxiety and biographic data. The experiments showed that people can receive information about the emotional state of another person in the absence of the usual visual channel provided that the subject presented with various stimuli affecting their emotional state is in the immediate proximity. In the experiment the ability to accurately recognize the emotional state was related both to the ability to empathize and personal anxiety (as a feature of the organism’s reactivity). While using both verbal and non-verbal communication the biggest significance is attributed to the mimics and changes in the other person’s speech, in the absence of visual contact and verbal information the participants were more guided by the sensations in their own body and their own mental images.
By images of visual art which can be applied to psychological practice we understand figurative images of both contemporary and classical visual arts. The wide variety of phenomena of visual arts enables us to study and use images from painting, cinematography, photography, design, advertising etc. Due to ever-growing use of images of visual arts in communication, the applied aspect of psychology is gaining more importance. Images of visual arts in modern information space enables psychology both to manipulate the psychological state of the audience and help them recognize their own integrity. Studying images of visual arts makes it possible to define psychological factors of their creation and interpretation. We are carrying out experimental research of the way images of classical and contemporary arts are perceived at museum exhibitions. The results of this research are used to develop educational programs. Studies have been carried out in the field of contemporary visual art, such as painting, advertising, photography and design. This has enabled us to define internal factors at the basis of creative processes around visual images. Studies of individual preferences regarding the choice of visual images can be used in developing recommendations for designers, artists, photographers and ad makers. The studies of application of cinematographic images in psychological practice have shown both diagnostic and therapeutic abilities of cinema. In onthopsychology there is a method known as cinemology, which uses cinema within group counselling. A carefully chosen film can provoke a strong emotional reaction showing the most significant aspects that concern and identify the person. This helps them recognise their own features and modify their behaviour, making more accurate decisions. Combining studies in the field of several types of visual arts provides us with an opportunity to identify the internal criterion of visual perception and visual creativity. The internal criterion of creating and perceiving images of visual arts is unified within modern information space.
THE PROBLEM OF HUMANIZATION OF EDUCATION IN HIGHER TECHNICAL SCHOOL

Marianna Mikhailova
Moscow State Technological University (Moscow, Russia)

The current stage of development of society is becoming quite problematic for the development of the most sensitive intellectual part of youth, which will have to take a leading position in scientific and technological progress. This stage is due not only to a change in the educational paradigm, general informatization and sharply increasing narrow profile of specialists, but also to the growing superficial attitude towards the meaning of one’s own life fostered by globalized mass consumption culture. The purpose of the study was to analyze the perception of the concept of humanization of higher education as well as the image of a graduate of a technical university in the views of faculty members and graduate students of a Moscow based technical university. The theoretical and methodological basis of the study was the ontopsychological concept of pedagogy. The study involved 212 people among whom 30 teachers are candidates and doctors of technical sciences and 182 graduate students of 1-3 courses of the technical university. (N = 212; 79% are men, 21% are women; average age is 27 years). Research tools included author questionnaire and semi-structured interviews. As result demonstrated, the graduate of the technical university is a professional who is able to creatively solve tasks. The formation of professionalism is hampered by the lack of practice during the learning process, an insufficient level of personal responsibility, a lack of positive positioning of the domestic engineering school. The main values are patriotism, love, and family. The group of graduate students has a high level of desire for knowledge, a high level of ambition and low self-confidence and practical skills. The concept of humanizing higher education among respondents raises more questions than answers. Although, humanization has the most important social function: formation of an all-round skilled specialist with well-balanced high professionalism, intelligence, creative approach to solve issues, high social activity and responsibility. As the aim of the modern higher engineering education is not only fundamental training of a specialist but a formation of his professional and personal features, it makes difference of the role of Humanities position in hierarchy of education courses.
MANAGEMENT OF ENTERPRISE THROUGH THE LEADERSHIP POTENTIAL IN INFORMATION SOCIETY

Olena Babina
Private Higher Educational Institution (Kiev, Ukraine)

In today’s business environment, leadership in the organization is the driving force. The XX-XXI century is marked by questions of conceptual and practical value of definitions “leadership” and “psychology of leadership”, however existing results of developments have more theoretical, than practical. The question of leadership is still relevant and not solved until the end. Today is require rethinking: I. The research of the issue “psychology of the leader”. II. Development of leadership potential at the enterprises. III. Change management in the context of development of leadership potential in the enterprises.

The aim of the presented study is to develop theoretical and practical bases of formation of change management system in the enterprise through the development and management of leadership potential. Most of the definitions are based on research of how a leader manifests himself, and what are the consequences of leadership. Today, the development and integration of psychological science in management highlights the problem — how to create leaders in society and how to maximize their use in the management of business structures. The following tasks were specified: 1) To analyze and evaluate the development of the leader’s potential at the enterprises of Ukraine and to develop the regulation. 2) To offer tools for assessing the dynamics of changes in the enterprise with the help of leadership potential. The research involved fifteen enterprises of the textile industry of Ukraine. The sample comprised 300 respondents. The analysis of the dominants of the activation of the Change Management System on the basis of the Resultant Leadership, it has been revealed that the key factor of change is the leadership potential, which provides an integrated link between all subsystems of the potential of an enterprise for change. Our research suggests that leadership potential is a socio-psychological characteristic of a person that reflects the individual’s ability to successfully lead a situation. It is the level of leadership potential that determines the possibility of using other functional capacities of an enterprise. The results of the study were tested at five Ukrainian enterprises. The work has its practical significance for various industries and the state as a whole.
COMMUNITY PSYCHOLOGY PERSPECTIVES ON PREVENTION. THEORETICAL AND PRACTICAL APPROACHES FROM EUROPEAN COUNTRIES

Bernd Dr. Röhrle
(Germany)

Abstract body. This Symposium aims at describing new and innovative approaches in preventing social and mental problems among the younger generation. To enrich traditional perspectives on prevention, projects from a wide range of national contexts (Germany, Norway, UK and Spain) demonstrate how problems can be reduced by using community psychology methods and competencies in prevention.

Press paragraph. Symposium for ECP2019 Moscow EFPA Standing Committee on Community psychology Theme; Community Psychology perspectives on prevention. Title; Community Psychology Perspectives on prevention. Theoretical and practical approaches from European countries. Convenor; Nicholas Carr Clinical Community Psychologist Convenor Efpa Standing Commitee on Community Psychology Haukeland University Hospital Authors; Susanne Wilson, Mphil, Msc, Bsc Research Fellow in Social Inclusion and Community Engagement Westlakes Campus University of Central Lancashire Isabel M. Herrera Sánchez, Silvia Medina-Anzano, Samuel Rueda-Méndez Departamento de Psicología Social Universidad de Sevilla Facultad de Psicología. Universidad de Sevilla Prof. Dr. Bernd Röhrle P: Verdistr. 8 *72768 Reutlingen-Sickenhausen Nicholas Carr Clinical Community Psychologist Convenor Efpa Standing Commitee on Community Psychology Haukeland University Hospital Bergen Norway

General summary of the Symposium. The situation in West Cumbria (UK) is seen as parallel to Russia's post-industrial areas. By collaborating with the local authorities, it is possible to build trust and safety among children growing up in deprived areas with limited services. Creating safe and relational spaces for children is described to prevent children from being excluded from civil society. A new study describes the storytelling technique in preventing substance abuse and addiction of cannabis in juvenile offenders. To meet the lack of adherence and motivation to treatment, storytelling has been shown to reduce risk behaviour. This approach takes into account the different contextual and cultural identities of substance abuse. The growing figures of mental health problems cannot be handled by curative measures alone. Results from meta analyses of effectiveness to prevent mental disorders are discussed and evaluated. Potential strategies for evaluating prevention programs of mental disorders are discussed from various theoretical perspectives. Suicide prevention is a major challenge both in eastern and western European countries, and a community psychology approach is recommended by the WHO for member nations. The role and methods used by a community psychologist in supporting and facilitating the process leading up to the political decision to adopt an Action Plan in the Community is outlined. Volunteer groups are crucial partners in order to reach people without a visible or known risk. To apply a zero suicide vision as guiding principle can stimulate cooperation between services and users.
STORYTELLING AS A STRATEGY FOR THE SELECTIVE PREVENTION OF HARMFUL USE AND DEPENDENCE ON CANNABIS IN JUVENILE OFFENDERS

Isabel M. Herrera Sánchez
Silvia Medina-Anzano
Samuel Rueda-Méndez
Social Universidad de Sevilla (Sevilla, Spain)

Recent research has shown how Storytelling interventions can boost motivation to abandon risk behaviour. This technique can generate intentions for change, help set behavioral goals, and facilitate the control of change. In addition, from a community approach, storytelling addresses ecological diversity, understood as all those contextual, cultural and differential aspects including the different sections of identity and substance abuse. Storytelling approaches the problem of substance abuse from a fully identitarian perspective. The aim of this study is to test the effectiveness of the storytelling technique in preventing the use of cannabis in juvenile offenders. In particular those who begin to experiment with this substance in order to prevent harmful consumption and dependence on cannabis in juvenile offenders who already manifest harmful consumption to reduce this pattern of consumption. Its effectiveness will be shown in juvenile offenders with similar contextual and psychosocial characteristics. A mixed sequential design will be used with two phases of information collection. A qualitative phase will address the phenomenon of cannabis use, examine personal experiences of harmful use and analyse their life trajectories. Keywords: Selective prevention, cannabis, narratives, juvenile offenders.
PREVENTION IN MENTAL HEALTH. NEW EVIDENCE ON EFFICACY AND EFFECTIVENESS IN PREVENTIVE MENTAL HEALTH STRATEGIES

Bernd Dr. Röhrle
(Germany)

The growing number of mental health problems cannot be treated by curative methods alone. A shift to more prevention and mental health promotion is needed. Methodological approaches such as meta-meta-analyses are proposed in search of evidence in prevention of mental disorders. Numerous reviews reporting on the moderate efficacy of strategies to prevent mental disorders are methodological inconclusive. More convincing is the following meta-meta-analysis based on a random effect model that reports a moderat effect size. This effect is based on numerous meta-analyses grounded on a heterogeneous database. Differences in results stem from different approaches, such as competence or disorder orientation, specific life events focus, and setting specific forms. Selective or indicated prevention programs did not differ significantly from each other. Effects for pathogenic or salutogenic characteristics did not differ significantly. Prevention programs for adults were more successful compared to those for children and adolescence or mixed population. A meta-regression analysis indicated that disorder- and proportion-oriented interventions negatively predict effects, thus contrasting results for the adult population. These results are discussed with respect to potential strategies for the evaluation of the prevention of mental disorders. Results from controlled prevention studies are far from successful. Whether and how these results can be implemented in practice with widespread impact, is the question that remains. The results from such efforts are promising, but the number of prevention studies reporting on implementation with sustainable effectiveness is still comparatively low. Keywords: prevention, mental health promotion, mental health, mental disorders, meta-analyses, meta-meta-analyses.

ACTION PLAN IN THE COMMUNITY — A ZERO SUICIDE VISION
PREVENTING SUICIDE

Nicholas Carr
Haukeland University Hospital (Bergen, United Kingdom)

This presentation aims at describing the role and methods used by a community psychologist in supporting and facilitating the prosess leading up to the political decision by the City Council in 2018. The Action Plan is a coordinated structure between services involved in prevention, and includes a commitment by the leadership with responsibility for the services. The city parliament decided in 2016 that Bergen should adopt an Action Plan as a guiding tool for suicide prevention including new proposals to strengthen the services. To reach people without a visible or known risk, has been the main challenge in prevention. The first task for the Psychologist was to promote Community Suicide Prevention competencies at all stages in the two year process. The second task was to facilitate contact between policy makers, volunteers and mental health institutions. NGOs and volunteers are important partners as they can make implicit knowledge known to the community. The Action Plan links up the volunteers with Higher Educational Institutions, Private Clinics, Student organizations and Public Resource Centres. To apply a zero suicide vision as guiding principle can stimulate cooperation between services and users.
TEMAS (TELL-ME-A-STORY), A MULTICULTURAL TEST AND TREATMENT MODALITY FOR THE 21ST CENTURY

Erminia Costantino  
American Multicultural Institute (Flushing, USA)

Elsa Cardalda  
Instituto Sexológico Educativo y Psicológico de Puerto Rico (San Juan, Puerto Rico)

Maryse Costantino  
TEMAS Test Publishing (Flushing, USA)

Ernesto Pais  
Universidad Abierta Interamericana (Buenos Aires, Argentina)

Vito Tummino  
Azienda Ospidaliana S. Anna di Como (Como, Italy)

Abstract body. TEMAS is a multicultural test that has been validated in different countries and more recently has evolved into several applications of evidence-based Narrative therapy. In the USA the TEMAS test was standardized on 650 children aged 5 to 13 and normed on four culturally diverse groups: Black, Puerto Rican, Other Hispanic, and White. As an evidence-base therapy, TEMAS was first used with Hispanic children in 1994 and showed to be effective in reducing anxiety and aggressive behavior. It was also successfully implemented as trauma treatments with Hispanic children in a 9/11 terrorist attacks multisite study. Three years ago, the TEMAS was used in a large school-based trauma-based intervention project with Hispanic schoolchildren in USA. The objectives of this symposium are: to show that the TEMAS is a clinically useful tool for multicultural children, adolescents, and adults; and to demonstrate the validity of evidence-based TEMAS trauma therapy in multicultural populations.

Press paragraph. TEMAS is a multicultural test that has been validated in different countries and more recently has evolved into several applications of evidence-based Narrative therapy. In the USA the TEMAS test was standardized on 650 children aged 5 to 13 and normed on four culturally diverse groups: Black, Puerto Rican, Other Hispanic, and White. As an evidence-base therapy, TEMAS was first used with Hispanic children in 1994 and showed to be effective in reducing anxiety and aggressive behavior. It was also successfully implemented as trauma treatments with Hispanic children in a 9/11 terrorist attacks multisite study. Three years ago, the TEMAS was used in a large school-based trauma-based intervention project with Hispanic schoolchildren in USA. The objectives of this symposium are: to show that the TEMAS is a clinically useful tool for multicultural children, adolescents, and adults; and to demonstrate the validity of evidence-based TEMAS trauma therapy in multicultural populations.

General summary of the Symposium. Multicultural nations such as the United States and the European Union require nonbiased psychological assessment and models of treatment that can help municipalities better understand and deal with the influx of refugee and immigrant groups. The TEMAS was first standardized in the USA as the sole multicultural narrative test with Black, Puerto Rican, Other Hispanic, and White children adolescents. Recently it was normed in Italy with Italian, Latin-American, and Arabic children. Other multicultural research with the TEMAS has been conducted with children living in Puerto Rico, El Salvador,
Argentina, China. This symposium aims to show the multicultural validity of TEMAS in its different facets and applications. This TEMAS Symposium will gather a cadre of international academics and professionals who are experienced researchers and clinicians. The first presentation focuses on the recent developments in the USA using the TEMAS techniques for trauma-based interventions with Hispanic children. The second presentation will cover recent advances in Argentina, using the TEMAS with older populations. This presentation and the third one, will explore the specific issues in using the TEMAS in clinical practice. The last and fourth presentation will address the study conducted in Italy with the TEMAS. In conclusion, we will show the historical path of the development of the TEMAS techniques and how numerous studies in the USA and other countries support the multicultural and cross-cultural validity of the TEMAS. This knowledge can be helpful for the multicultural populations living in the EU as immigrants or refugees.
DEVELOPMENT OF THEORY OF MIND IN CHILDHOOD

Francisco Pons
University of Oslo (Oslo, Norway)

Aleksander Veraksa
Lomonosov Moscow State University (Moscow, Russia)

Abstract body. Theory of mind is the ability to understand mental states (emotions, desires, beliefs, intentions etc.) of oneself and of others that is heavily based on research of J.Piaget school (Piaget, 1947; Bruner, 1982; Wimmer, Perner, 1983). Nevertheless, the way children understand the nature, causes and consequences of emotions and the way they use this understanding to explain, predict and change their own emotions and the emotions of others in their everyday life has emerged as one of the best predictors of their psychological well-being, pro-social competences and school achievement (Harris et al., 2016; Wellman 2014 for reviews).

Press paragraph. One of the most actively developing areas of modern research in developmental psychology aims to study theory of mind and its connection with other psychological characteristics of child development (e.g., Apperly et al., 2011; Bock, Gallaway, & Hund, 2015; Wellman, & Peterson, 2013). This cognitive ability underlies children’s social skills that along with executive function development provide for a child’s successful adaptation to school education (Willoughby et al., 2012). In our joint symposium we combine different perspectives of research from Europe. The symposium addresses the following problems and prospects: (1) The development of theory of mind and emotion understanding in preschool age; (2) The impact of the culture of the children on their understanding of emotions; Speakers’ titles, full names, affiliations, countries, and contact details: Francisco Pons, PhD, Professor, University of Oslo, Department of Psychology, e-mail: francisco.pons@psykologi.uio.no Aleksander Veraksa, PhD, Professor, Lomonosov Moscow State University, Faculty of Psychology, e-mail: veraksa@yandex.ru Olga Almazova, PhD, associate professor, Lomonosov Moscow State

General summary of the Symposium. The term “theory of mind” denotes a cognitive ability to understand one’s own mental states such as thoughts, desires, beliefs and emotions, as well as other people’s mental states (Perner, Lang, & Kloo, 2002). This line of research is based on J.Piaget’s idea of egocentrism as being a specific feature of the pre-operational thinking stage which implies that a child constantly discovers its relative inability to take the position of another person, i.e., to treat one’s own point of view only as one of many possible others and coordinate it with the latter (Flavell, 1963). A qualitative leap in the development of the theory of mind (taking different perspectives, development of the ability to detect and understand deception, irony, sarcasm, etc.) occurs at preschool age and ensures the ability to cooperate with others (Apperly et al., 2011; Miller, 2009, 2012; Willoughby et al., 2012). Numerous studies show the connection between the theory of mind and the development of an understanding of emotions, executive functions, play and imagination at preschool age (e.g., Devine, Hughes, 2014; Bock, Gallaway, Hund, 2015; Carlson, Claxton, Moses, 2015; Cantin et al., 2016). However, the mechanisms of their interrelationships are not yet fully understood. The way children understand the nature, causes and consequences of emotions and the way they use this understanding to explain, predict and change their own emotions and the emotions of others in their everyday life has emerged as one of the best predictors of their psychological well-being, pro-social competences and school achievement (Harris et al., 2016; Wellman 2014 for reviews). However, despite the importance of emotion understanding, the impact of the culture of the children on their understanding of emotions is rarely addressed and the findings are
incomplete and inconclusive. In our joint symposium we combine different perspectives of research from Europe. The symposium addresses the following problems and prospects: (1) The development of theory of mind and emotion understanding in preschoo age; (2) The impact of the culture of the children on their understanding of emotions; The topics will be: — The connection between theory of mind and executive functions in preschool age — Emotion understanding in African Fon Children.

META-ANALYSIS OF CHILDREN’S EMOTION UNDERSTANDING DEVELOPMENT: RESULTS BASED ON TEC 1

Daria Bukhalenkova
Lomonosov Moscow State University (Moscow, Russia)

Today, it is possible to find many instruments to assess emotion understanding from early childhood to adulthood (e.g. Castro et al., 2015 for a review). However, many of these instruments need expertise, take time to administer and score (limited reliability), assess only one or two core components of emotion understanding (often rather simple), can be used either with young children or old children (not both), are demanding in terms of language production and/or comprehension, and are occasionally rather expensive (limited accessibility). While, the Test of Emotion Comprehension– TEC (Pons & Harris, 2000), which can be used between 3 to 11 years old children, overcome these limitations. It has now nearly 20 years and it has been translated and adapted so far into more than 25 languages. In the present study, the meta-analysis technique was used to analyze the studies which used TEC, in order to (i) identify trends of the overall development of emotion understanding, (ii) explore different developmental patterns of the development of nine components of emotion understanding, and (iii) examine potential culture difference. After searching the literatures, 54 reports or articles including 95 separate age groups encompassed in current analyses. The relation between age and mean TEC score is nonlinear. The R2 of quadratic model (R2=0.87) is higher than linear model (R2=0.85). The relationship between age and mean scores on the nine components (total sample groups=31) are also examined. Using the curve linear estimating method, we find that Recognition, External, Desire and Regulation are fully mastered before 11 years of age. While other components are still being acquired after 11 years of age. Children’s data from four countries, China, Germany, Italy, and UK, were compared to assess cultural differences. Multilevel regression was used to test for the effect of country. The main effect of country was significant. Inspection of each pair of countries showed that Chinese children performed better than British (t=2.70, p<0.01) and German children (t=2.30, p<0.05). The analyses helps us have a better understanding of development of emotion understanding in children.
LINKS BETWEEN THEORY OF MIND, EXECUTIVE FUNCTIONING AND EMOTIONAL RECOGNITION AND REGULATION IN PORTUGUESE PRE-SCHOOLERS

Carla Martins  
School of Psychology, University of Minho (Braga, Portugal)

Joana Baptista  
Instituto Universitário de Lisboa (Lisbon, Portugal)

Ana Osório  
Mackenzie Presbyterian University (Sao Paulo, Brazil)

Sara Martins  
School of Psychology, University of Minho (Braga, Portugal)

Preschool age is a fast-growing developmental period for several milestones, such as theory of mind, executive functioning and emotional regulation, that will set the stage for later outcomes (e.g., academic performance, social competence). Given researchers’ continued interest in advancing the understanding about the development of these abilities in early childhood, the goal of this talk is to explore their inter-relations in a normative sample of Portuguese pre-schoolers. The sample comprised 67 children (36 boys, 53.7%) recruited from childcare centres in northern Portugal for participation in a broader longitudinal study on the developmental predictors of school readiness. Children were assessed at two time points: 4.5 years of age (Time 1, T1) and approximately 1 year later (Time 2, T2). Children’s ToM was assessed using a set of standardized and well-validated tasks (Hughes et al., 2000; Wellman & Liu, 2004) at T1 and T2. Inhibitory control was assessed using the Head–Toes–Knees–Shoulders task (Ponitz, McClelland, Matthews, & Morrison, 2009), while cognitive flexibility was measured based on the Executive Function Scale for Early Childhood (Carlson & Schaefer, 2012), both at T1 and T2. Emotion recognition was assessed at T1 using the Emotion Recognition Questionnaire (Head Start REDI, 2004). At T2, mothers completed the Emotion Regulation Checklist (Shields & Cicchetti, 1997). Descriptive statistics revealed high individual variability in all study variables. ToM at T1 was found to be significantly associated with ToM at T2, r=.41, p=.001. A significant association was also observed between cognitive flexibility assessed at T1 and T2, r=.51, <.001. Such developmental continuity was not found, however, for inhibitory control or emotion recognition and regulation (all p>.05). Regarding the relations between developmental domains at T1, we found a significant association between child emotion recognition and inhibitory control, r=.36, p=.003, and cognitive flexibility, r=.41, p=.001. At T2, emotion regulation and inhibitory control were found to be related, r=.28, p=.021. No significant associations were observed between children’s ToM and the other study variables. The potential implications of the results for developmental science and practice will be discussed.
EVALUATE THE UNDERSTANDING OF EMOTIONS AND MENTAL STATES IN TYPICAL AND ATYPICAL DEVELOPMENT: RESULTS FROM TWO INNOVATIVE TOOLS.

Emotion Understanding and Theory of Mind are two complementary, although different, aspects of child social cognition, and the TEC (Pons & Harris, 2000; Italian version: Albanese & Molina, 2013) and the ToM Storybooks (van Geert, Hoogewys, Loth & Serra, 1998; van Geert & Hoogewys, 2017; Italian version: Molina & Bulgarelli, 2012; Bulgarelli, Testa & Molina, 2015) are two innovative tools conceived to evaluate these aspects. Our research aims at verifying (i) the correlation between the two instruments, both in typical and atypical development; (ii) the developmental trend of competences by age, in typical and atypical children as well; and (iii) the relationships with verbal and non-verbal cognitive competence. We observed 223 typically developing children, 40 children with Autism Spectrum Disorder (ASD) and 43 children with Specific Language Impairment (SLI), from the Italian standardization sample of the two tools. Preliminary results showed a good correlation (.726, p < .001) in typical population, and in ASD (.713, p < .001) and SLI samples (.602, p < .001) as well. The developmental trend by age, on the contrary, was different for ASD children in comparison with typical and SLI children. Results will be discussing in term of theoretical relationships between the two constructs and in term of instrument validation. Theory of mind. Emotion comprehension. Tom Storybooks. TEC. Concurrent validity.
WHAT IS THEORY OF MIND FOR? IMPACT OF CHILDREN’S UNDERSTANDING OF THE MIND ON THEIR SOCIAL INTERACTIONS AND PERFORMANCE IN COOPERATIVE PROBLEM-SOLVING TASKS

Daria Bukhalenkova
Lomonosov Moscow State University (Moscow, Russia)

Research on Theory of Mind (ToM) has provided substantial knowledge about the development of children’s ability to understand cognitive and emotional mental states and processes in the self and others. Research shows that social interactions boost ToM development in preschool years. However, the reverse relationship, i.e., the impact of children’s ToM on their social interactions, has been less examined and the findings are scarce and unclear, particularly, with regard to the role of ToM for cooperative problem-solving among school-age children. The studies to be presented in the symposium examine to what extent children’s ToM (i.e., cognitive and emotional aspects) impacts their individual problem-solving performance and the way they interact in cooperative problem-solving tasks. Sixty-eight Brazilian children between 4 and 9 years of age were assessed for their ToM, cognitive performance and social interactions in both individual and cooperative conditions of a spatial transformation task and a sensorimotor task.

The main findings showed that: 1) ToM impacts children’s performance in both the spatial transformation and sensorimotor cooperative tasks; 2) higher ToM explained more openness to a peer’s perspective during a socio-cognitive conflict, while lower ToM was associated with more rejection to the peer’s point of view. By showing how ToM relates to the way children interact and their performance in problem-solving tasks, the findings suggest that ToM is a socio-cognitive mechanism underlying cooperation. We compare the findings with other European studies examining the relations between ToM and cooperation and discuss how a circular relationship between ToM as declarative knowledge and ToM as a procedural skill might explain the overall pattern of findings. Knowledge about when children develop an understanding of minds and the ability to apply this knowledge can have implications across social learning contexts, including school settings. Thus, educational implications are also discussed.
PRESCHOOLERS’ EMOTION UNDERSTANDING AND THEIR IDEAS ABOUT EPISTEMIC STATES (BELIEFS)

Arkadiusz Gut
Catholic University of Lublin (Lublin, Poland)

Francisco Pons
University of Oslo (Oslo, Norway)

Krystian Macheta
Pedagogical University of Cracow (Cracow, Poland)

In our presentation, we elaborate the relationship between the emotion understanding measured by Test of Emotion Comprehension (TEC) and epistemic states understanding measured by four different tasks: (1) Unexpected Content (deceptive box) traditional FBT; (2) Appearance-Reality Tasks [deceptive object]; (3) Intensionality Tasks; (4) Second Order False Belief. Our study is based on Polish preschoolers (N=106, aged 3-6). The study established the general developmental trajectory of emotion understanding of Polish children. Children ideas and understanding about beliefs were measured by four types of tasks. We were interested in how (and in what stages and order) knowledge about different aspects of beliefs develops in children and how the competence measured by different tasks correlates with emotion comprehension. We distinguished the following aspects of understanding beliefs in regards to the four aspects of beliefs: a) unexpected content; b) appearance-reality task; c) intensionality task; d) second-order false belief task. In all tasks children have to cope with a distinction of two perspectives: (a) one shared by the child; and b) one not shared by the child, as well as to provide explanations of their decisions in each task. We showed that emotion understanding positively correlates with different tasks that measure belief understanding. The smallest but still significant correlation was found between emotion understanding and sum of answers from the four tasks (taking into account both perspectives). In addition, the connection between emotion understanding and children ability to explain their choice in all theory of mind tasks were found as significant.

However, the regression analyses showed that the most significant emotion understanding predictor is the sum of correct answers (together with explanations) in Intensionality Task, less in First Order FBT; Appearance-Reality Task and in Second Order FBT.
REFLECTIVE AND ACTIVITY APPROACH TO COUNSELLING HELP IN LEARNING ACTIVITY

Viktor Zaretskii
Moscow State University of Psychology and Education (Moscow, Russia)

Abstract body. The symposium is devoted to the experience of developing, implementing and transmitting a reflective and activity approach (RAA) to counselling help in learning activity. RAA is considered as a direction within the framework of cultural-historical psychology, based on its main concepts of the connection between learning and development. The reports present a multi-dimensional model of the zone of proximal development, on the basis of which counselling help is built and explanations of the work of psychological mechanisms are provided, in which the overcoming of learning difficulties contributes to the cognitive and personal development of students in various directions (along various dimensions). The author analyzes the experience of creating developmental conditions for orphans with disabilities with severe somatic diseases, the experience of overcoming children's limitations due to their particular social situation of development.

Press paragraph. In report "Reflective and activity approach in learning activity: application experience and problems of transferring" V.K. Zaretskii, M.M. Gordon and Y.V.Zaretskii, employees of MSUPE, experts who were at the origins of the reflective and activity approach, describe the experience of applying and transferring technologies and principles of the reflective and activity approach. In report "The Psychotherapeutic Effect of counselling help in Overcoming Learning Difficulties" Mi.M. Gordon, teacher of ROU, psychotherapist and I.A. Nikolayevskaya, teacher at MSUPE, a counsellor of RAA, presents practical cases of counselling work in learning activity. In report "Experience in creating conditions for learning and development of orphans with somatic diseases" D.V. Alamuri, psychologist at Visiting Neznaika Center and O.A. Lizunova, teacher at Visiting Neznaika Center, talks about the experience of providing comprehensive counseling for children. In report "Structured reflexivity writing for secondary school students: a moving identity", Alexander Busse, professor of psychology at Laval University, describes work with students, based on use of reflection as way to analyze one's own activity. In report "Transferring RAA to Swiss students of higher education", the professor of psychology at the University of Neuchâtel, Laura Klotzer, reveals experience of transferring the principles and technologies of RAA to foreign students.

General summary of the Symposium. The symposium is devoted to the reflective and activity approach (RAA) to the provision of counselling help in learning activity. RAA is considered as a direction of cultural-historical psychology, based on its basic concepts and realizing them in the practice of helping students in schools and children with special needs of various categories. The main question is the connection between learning and development: under what conditions can learning difficulties become a resource for development. The theoretical basis of the reports at the symposium consists of the provisions of L.S. Vygotsky about the zone of proximal development, about the cooperation of the child and the adult, about development, as a process occurring during the child's internalization of the experience gained in cooperation between the child and the adult. The development of the theory and technologies of the RAA led to the idea of a multi-dimensional model of the zone of proximal development; on the principles and limitations of counselling help; about the mechanisms by which one step in learning can contribute to many steps in development. The objectives of the symposium include the formulation and development of these problems in the practice of the RAA and the presentation of their experience using the example of a project to assist students in overcoming learning difficulties. The main
questions to which the speakers will seek to answer: 1. What is the RAA in learning activity, as the direction of cultural and historical psychology? 2. What conditions for the cognitive and personal development of children are created in learning activity while counselling help of the RAA? 3. What problems arise while transferring the RAA in Russia and abroad? 4. What are the foreign analogues of the RAA based on the cultural-historical psychology of Vygotsky? Speakers from three countries and six different institutions (Russia, Canada, Switzerland) in their presentations give answers to the questions asked.

**REFLECTIVE AND ACTIVITY APPROACH IN LEARNING ACTIVITY: APPLICATION EXPERIENCE AND PROBLEMS OF TRANSLATION**

Viktor Zaretskii
Margarita Gordon
Moscow State University of Psychology and Education (Moscow, Russia)

In the practice of helping children to overcome difficulties arising in learning activity, the term “reflective and activity approach” (RAA) is introduced to designate a special position of a student, initiated and supported by a counselor (teacher, adult), the position of the subject of his own activity and its reflection, which allows him to be not a “learner”, but a subject of overcoming his own difficulties, a subject of self-development to which an adult assists. The relationship between the child and the adult in learning activity can be viewed as a joint activity in which the child makes efforts to overcome his difficulties, and the adult assists him in the process of solving the problem, i.e. counseling. Such an understanding of the child’s position, which later begins to be regarded as subjectness, allowed us to review the practice of helping to overcome difficulties in learning activity, to consider the difficulty resource development, to describe the mechanism of occurrence of newformations and implement ideas about the counseling help that promotes development in a number of projects. Reflection of the practice of providing help in learning activity to various categories of children contributed to the development of a new understanding of one of the key concepts of cultural-historical psychology — the concept of “zone of proximal development” (L.S. Vygotsky). The multi-vector model of the zone of proximal development (ZPD) has become a theoretical basis, an explanatory principle and a technological tool for organizing development assistance. Work in the RAA imposes certain requirements for the competencies of a counselor, which partly combine the competences of a teacher-employee, facilitator, psychologist-counselor, and partly — specific to this type of counseling (ability to build emotional, semantic and positional contact from a position of cooperation and support, initiate and support the child’s subjectness position, organize and support the processes of self-determination, building a joint plan, reflection, track the semantic side of the process, work with the living situation and use its resources to support the development of the child according to different dimensions, etc.).
THE PSYCHOTHERAPEUTIC EFFECT OF COUNSELING HELP IN OVERCOMING LEARNING DIFFICULTIES

Irina Nikolayevskaya
Moscow State University of Psychology and Education (MSUPE) (Moscow, Russia)

Michail Gordon
Russian Orthodox University (ROU) (Moscow, Russia)

In the course of counseling on overcoming learning difficulties, the subject of purposeful teamwork is the development of subject skills and methods, and as a direct consequence, cognitive dimensions develop (reflection, work with the method, etc.). But you can also observe additional, side effects, which can be called a psychotherapeutic effect. It is characterized by personal dynamics (development at personal dimensions, such as subjectivity, self-confidence, the ability to seek and accept help, etc.) and is associated with the actual resolution of problems and the release of many areas of development, which were hampered by a particular problem epicenter. This work is a resource primarily for work with children of primary and secondary school age, because Learning difficulties are often the result of a certain difficulty in the personal sphere – problems with self-esteem, fear of error, hyper-responsibility, perfectionism, negative attitudes towards studying, etc. The "direct" work with personal difficulties is often impossible or extremely difficult for a child. In this situation, personal difficulty manifests itself indirectly in the framework of the learning activity, blocking the possibility of further progress.

Reflective work, organized by the counsellor, based on subject-subject interaction, makes it possible, through the analysis of its methods of activity, to overcome the problem epicenter and take development steps in dimensions, which are defined as personal ones within the framework of the concept of reflective and activity approach. Overcoming a blocking difficulty frees up energy and a resource for advancing along several dimensions of development, including in the learning activity. Thus, we get a direct effect of advancement in the learning activity and a side effect of positive personality changes, referred to as the therapeutic effect of counseling. In the report, the psychotherapeutic effect of counselling help in overcoming learning difficulties based on a reflective and activity approach is justified using a multi-dimensional model of development and is illustrated with specific examples from counselling practice. The identification and justification of the psychotherapeutic effect allows us to explore the possibility of a targeted use of technology and the principles of the reflective and activity approach in psychotherapy.
EXPERIENCE IN CREATING CONDITIONS FOR THE TRAINING AND DEVELOPMENT OF ORPHANS WITH SEVERE SOMATIC DISEASES

Darya Alammury
Olga Lizunova
Foundation "Deti.msk.ru" (Moscow, Russia)

In the orphanage "Visiting Dunno", all specialists work together, focusing on the individual trajectories of the development of each child, creating a resource, formative environment. Work with each child is built in accordance with the humanistic ideas of assistance and development assistance, all help is personally oriented. The help in overcoming difficulties is implemented within the framework of the reflective and activity approach; it is carried out within the framework of the zone of proximal development of each child; thus, an individual approach is realized. Joint activities with an adult enable each child to feel their abilities, to feel talented and able to overcome difficulties. Even in severe cases of resistance to the process, a consistent, systematic, constant activity allows one to overcome resistance and to achieve the initiation of personal interest, the subjectness position of the child. In this interaction, each child feels his involvement. Teachers and counselors always provide support, negative assessment or high expectations towards the child are unacceptable. Various types of activities allow us to expand personal psychological competences, acquire versatile skills and abilities, and be in a constant process of personal growth. The most intensive and psychotherapeutic activity takes place within the framework of a theatrical project, where it is possible to live together emotions and experiences, emotional elaboration, "collision" with the world, meeting with the audience, self-presentation and reflection. Counselors provide comprehensive assistance, creating the conditions for the emergence of situations of success, joint activities focus on both the process and the result.
Students face a multiplicity of activities during their studies. These miscellaneous learning activities, each influenced by peculiar epistemologies, bring the students to position themselves towards their learning, and contribute to the elaboration of learner identities for each of these fields of study. Learners develop peculiar ways to treat the information, reason, take into account information and emotions, that are compatible with this activity. We can say that they develop corresponding learner identities that are as coherent with what there is to learn, that is the learner’s activity in a specific field of study, but also with their global identity. This leads to tensions that are too often not considered nor talked about. Unfortunately, aside from these tensions, these learner identities also collide with out of school activities, for instance social network involvement. This identity can further be fragilized or enriched by these, sometimes competing, activities. These activities also influence their identity as whole, and hence contribute to sometimes unresolvable tensions, sometimes even potentially leading to mental health disorders or disinvestment from school activity. Students of secondary schools often have the opportunity to take part in optional artistic activities, further adding to the complexity of their learner identity. Although part of their curriculum and object of an evaluation, they are seldom reflected upon. Our research aims at providing students an opportunity to reflect on their learning and skills. This if achieved through a structured approach to reflexive writing during a series of workshops. Students are asked to develop answers to a series of question to choose among according to their need for scaffolding. During the workshops, the researchers interact with the students to simulate their writing and deepen their reflection according to an approach derived from RAA. We present this method and the preliminary results of analysis of their written productions. This analysis is based on the coherence of indicators of internalized processes and the coherence among them. We conclude with suggestions to emphasize the use of reflexive approaches in and around all teaching to influence positively learning and mental health.
TRANSFERRING RAA TO SWITZERLAND: CHALLENGES AND RECEPTION BY SWISS STUDENTS IN HIGHER EDUCATION

Laure Kloetzer
Nechatuel University (Neuchâtel, Switzerland)

In November 2018, a first international RAA workshop, led by Prof. V. Zarestky, with I.A. Nikolayevskaya, counsellor in RAA, was run at the University of Neuchâtel, Switzerland. This workshop was dedicated to introducing the RAA approach, and training our students in the RAA counselling approach. The workshop was opened to Bachelor, Master and Doctoral students from the Institute of Psychology and Education, based on their curiosity for this approach. Most of them had a background as teachers (primary and secondary school teachers, special needs education, teachers in out-of-school activities like Martial Arts), or were in contact with school-age children (for example, as homework assistants).

The workshop raised a number of challenges: (a) although our students are trained in cultural-historical psychology, counselling as such is not a topic in Psychology and Education in Switzerland. Therefore, both the theoretical background of self-development through the multi-vector model of the zone of proximal development (Zaretskii, 2007) and the approach of counselling, as a specific way to interact and collaborate with a child, were new to the students. (b) The workshop, run in English, required translation into English and deep understanding of key concepts (like subjectness, or reflection, for example), which may be foreign to the students, as they are anchored in a long history in Soviet psychology. (c) It also required (at least initial) appropriation by the students of principles and technologies of RAA (like identifying the problem epicenter, asking reflective questions, supporting awareness or reflective fixation), which was achieved primarily thanks to collaborative close analysis of short video-recordings of counselling interventions in school settings and at Dunno. The reception by the Swiss HE students was very positive, with strong interest, the will to overcome language and conceptual difficulties, and finally a satisfying level of appropriation. This paper will present the structure of the workshop, comment on these challenges, and analyze RAA reception by Swiss students, based on their final evaluations of the workshop as well as analysis of their written productions reporting on their own experiences with RAA after the course.
GLOBAL BRAIN HEALTH IN DEVELOPMENT

Samuel Forbes  
University of East Anglia (Norwich, Australia)

Prerna Aneja  
University of East Anglia (Norwich, Australia)

Sobanawartiny Wijeakumar  
University of Stirling (Stirling, United Kingdom)

Laura Kischkel  
University College London (London, United Kingdom)

Abstract body. A number of factors, such as poverty, lack of sleep, and childhood trauma and stress, place considerable strain on development. As well as affecting behaviour developmentally, these factors may also affect the health of the developing brain. The present symposium ties together evidence from multiple countries, naturalistic and laboratory settings, and behavioural and neurological data to discuss the impact of these factors on early development. The studies included here assess the effect of early childhood adversity on a number of different key cognitive processes, including visual working memory, habitual and novel stimulus detection, and dyadic interaction. The results of these studies combined further highlight the need to conduct research into early adversity affecting development, and suggest possible avenues for early intervention to take place.

Press paragraph. This symposium aims to address the effects of adverse factors, such as poor sleep, poverty, and childhood trauma on early brain health and development, as well as how they affect behaviour. In particular, this symposium focuses on children of a very young age, and what factors may be crucial for their healthy development, while also considering the possibility of interventions in the future. Samuel Forbes, from the University of East Anglia, will discuss how different patterns of sleep, including late versus early sleep, may affect visual working memory in young infants, and how that is related to myelin development. Sobanawartiny Wijeakumar, from the University of Stirling, will discuss the global impact of poverty on brain and cognitive development, using fNIRS to examine visual working memory in a rural community of Uttar Pradesh, India. Laura Kischkel, from University College London, will examine the neural correlates of habituation and novelty preference in infants based in both the UK, and in the Gambia. Prema Aneja, from the University of East Anglia, will be presenting work examining dyadic interactions between mothers and infants in the UK and in India, comparing caregiver behaviour in the naturalistic settings, with infant performance in laboratory-based tasks.

General summary of the Symposium. Early adversity can be a defining aspect of development. Factors such as poverty and inconsistent sleep can have effects on early behaviour, but also on the cognitive abilities and milestone attainment of developing infants [1]. In particular, there is a lack of research on infant development in low- and middle-income countries, which contain a large proportion of the global population. There is, therefore, an imperative to understand the full implications of these factors on early child development, and in turn, understand the developmental aspects of these factors. The present symposium aims to take a broad view of this problem by examining different key areas of development, including visual working memory, habituation and novelty preference, as well as dyadic interaction and shared attention between mothers and infants. Through the use of a variety of techniques, including fNIRS, ERP, MRI, actigraphy, and head-mounted eye-tracking, the present symposium will examine various aspects of global brain health in the context of early development and adversity. This symposium raises important questions about cognitive development in a global context, and through the studies presented, aims to pave the way for the possibility of future interventions. It is also an intention of this symposium that the work

UNDERSTANDING THE ROLE OF SLEEP IN BRAIN AND WORKING MEMORY: A NEURODEVELOPMENTAL APPROACH

Lourdes Delgado Reyes
Jeevun Grewal
Joe Cassidy
John Spencer
Forbes Samuel
University of East Anglia (Norwich, United Kingdom)

The association between sleep and cognitive ability has long been established. In children, loss of as little as one hour of sleep has been shown to affect cognitive capacity throughout the day, while later sleep has been associated with poorer cognition and working memory. Visual working memory (VWM) is a core cognitive system with a highly limited capacity, and has been found to be predictive of general fluid intelligence. The present study aims to examine the role that sleep patterns play in the development of VWM in 6-month-old infants, and to compare that with their myelin development. In the present study, infant VWM was measured with a preferential looking task, where they were presented with two side-by-side flickering displays, one of which changed one of the colours on the display each time. Infants with developed VWM would be able to encode the non-change side, and thus would fixate more on the change side. Throughout this task, optical neuroimaging data were collected from the bilateral frontal, temporal, parietal and occipital regions, using fNIRS. Infant mcDESPOT sequences were collected from participants, and myelination was assessed. Infant sleep data were collected over at least 5 days using an actigraphy device, attached to either a wrist or an ankle, which can be used to measure temperature and movement, allowing inferences to be made regarding sleep quality. The behavioural results demonstrated different patterns of attentiveness for later and more irregular sleepers than for those who slept regularly and early. The optical neuroimaging results further demonstrated this effect, demonstrating lower activation in the harder tasks for the irregular and later sleepers. These results were compared to the myelin development of each participant to establish the relationship between sleep, working memory, and brain health. The findings of the present study suggest a critical role for sleep in the early development of the VWM network. These results lend further weight to, and extend upon, previous studies that have demonstrated that fragmented sleep can lead to delays in the development of executive functions, and suggest that sleep-based interventions may be effective during early development.
USING FNIRS TO ASSESS THE IMPACT OF EARLY ADVERSITY ON BRAIN HEALTH IN INDIA

Lourdes Delgado Reyes
University of East Anglia (Norwich, United Kingdom)

John Spencer
University of East Anglia (Norwich, United Kingdom)

There is a growing need to understand the global impact of poverty on early brain and behavioural development, particularly with regard to key cognitive processes that emerge in early development. One such important cognitive process is visual working memory (VWM), which is central to daily visual cognition, detecting changes in the world when they occur. VWM is an early marker of cognitive capacity that has been assessed reliably in early infancy and is predictive of later academic achievement. Here, we focus on two studies investigating functional brain networks underlying VWM processing in a rural community in Uttar Pradesh, India. In the first study, fNIRS data was collected from the frontal cortex while children between 4 – 48 months of age (N=34) completed a Preferential Looking (PL) task. In this task, two flashing displays of coloured squares were presented side by side. One of the sides contained a square that constantly changed its colour. VWM load was manipulated by increasing the number of squares presented. Change preference (CP) was calculated as a preference to look at the changing side over the non-changing side and this was a measure of the ability to detect change. Image reconstruction was used to move fNIRS data from channel-space to voxel-space. Our findings showed that children with better CP came from families with a higher socioeconomic status (SES). Greater CP was also associated with suppressed activation in the left dorsolateral prefrontal cortex, replicating findings from a Midwestern US sample. Further, children from families with low maternal education and income showed weaker brain activity in the left frontal cortex. Following this, the second study will present findings from a larger sample, on the effects of SES on behaviour and brain activation in the frontal and parietal cortices in 6-month-old infants (48 high SES and 48 low SES) engaging in the PL task. These results will be projected on segmentations from first ever structural scans of children from this sample. Implications of this work are far-reaching: it is now cost-effective to localize functional brain networks in early development in low-resource settings, paving the way for novel assessment methods.
HABITUATION AND NOVELTY DETECTION OF YOUNG INFANTS IN RURAL AFRICA AND THE UK: AN AUDITORY ERP STUDY

Laura Kischkel
Luke Mason
Clare Elwell
Sarah Lloyd-Fox
University College London (London, United Kingdom)

A large proportion of young children in low-and middle-income countries show compromised neurodevelopmental outcomes at school age [1]. There currently is a lack of early neurocognitive markers of atypical development in these populations, impeding the implementation of early identification and intervention. This study assesses neural correlates of habituation and novelty detection in infant cohorts in the UK and The Gambia, West Africa at 1 and 5-month of age. This work forms part of the Brain Imaging for Global Health (BRIGHT) project which investigates markers of cognitive development in Gambian and UK infants from birth to 2 years. The ability to habituate to recurrent and detect novel stimuli is a fundamental process of cognitive development, which has been extensively studied using ERP’s. Infants (n=89) were presented with an ERP paradigm, including frequent tones, and two types of deviant stimuli, infrequent but repeated pure tones and a range of trial-unique novel sounds. Past research has shown a developmental change in the amplitude of P3 ERP component to these deviant stimuli in the first six months of life, with an increase in P3 amplitude to novel stimuli and a decrease in amplitude to infrequent but repeated deviant stimuli [2], which has been interpreted as an emerging novelty preference. Modelling mean amplitude of the P3 component by Condition (Frequent/Infrequent/TrialUnique), Age (1/5months) and Cohort (UK/Gambia), our data indicate a significant P3 amplitude change to the infrequent stimuli at 1 month in both cohorts, however the anticipated emerging novelty response preference (as indicated by a significant response change to TrialUnique sounds) at 5 months was only observed in the UK cohort. Further analyses revealed that this finding can be partly explained by a lack of habituation to the infrequent tones in the Gambian cohort at 5 months of age. Reduced habituation and novelty responses seen in this ERP study generalise across imaging modalities and have also been observed in an fNIRS habituation and novelty detection study, implemented in the same cohorts [3]. These cross-modal findings provide an indication for recurrently observed developmental changes, which help guide the definition of early markers and might ultimately inform intervention.
UNDERSTANDING CAREGIVERS’ VISUAL EXPERIENCE AND INFANTS’ COGNITIVE OUTCOMES: A CROSS-CULTURAL STUDY

Samuel Forbes
Prema Aneja
Lourdes Delgado Reyes
John Spencer
University of East Anglia (Norwich, United Kingdom)

Interactions with caregivers are critical to early learning. Joint attention between infants and caregivers is longitudinally associated with cognitive outcomes such as social communication and facilitates word learning (Yu & Smith, 2012). We present data from an ongoing study of dyadic interactions between caregiver-infants in Low and relatively High SES samples from India and UK. Ten-minute naturalistic play sessions with 60 caregiver-infant dyads (six-month-olds) from each group were recorded. Distribution of attention was measured via head-mounted eye-trackers. Preliminary analyses include caregivers mean fixation duration, fixation switch rate, and dispersion of fixation on normalised X and Y positions (N=30). Caregivers from the High SES Indian and UK samples showed more latterly dispersed eye movements, presumably to follow their crawling infants. Qualitatively, groups differed in their lateral dispersion with UK caregivers picking up a toy and bringing it centrally to show and, then hand it to the infant. While High SES India caregivers tended to manipulate objects singularly while handing another toy to the infant. Low SES groups often held all the toys together, centrally, placed in a way that’s between their face and the infant’s, presumably to keep the child entertained. Importantly, caregivers from Low SES Indian sample showed longer fixations; suggesting slow visual information processing (Colombo, Mitchell, Coldren & Freeseman, 1991). They also made more switches with little variability in the group, suggesting a stereotypical rate of visual interaction. Regardless of the group, caregiver’s performance in naturalistic task correlated with infant’s cognitive performance in the laboratory. A negative correlation between caregiver’s fixation duration and infant’s engagement in task (r= -.43; p=.038) suggests that caregivers with lower visual information processing have infants who are less engaged with cognitive task. Caregivers with higher switch rate had infants with low change preference scores (r= -.44; p=.030); associated with poor cognitive performance. Research shows that caregivers who follow and hold their infants’ gaze at a location, those infants tend to learn more. We discuss how these data fit with prior ethnographic research indicating that caregiver-infant interactions embody cultural goals and values reflective of differing cultural values related to child development (Göncü, 1999).
MODERN APPROACHES TO PSYCHOTHERAPY OF EATING DISORDERS: FROM THE UTOPIA OF A SINGLE PROTOCOL TO THE REALITY OF COLLABORATION OF EVIDENCE-BASED APPROACHES

Svetlana Bronnikova
Center for Intuitive Eating IntuEat (Moscow, Russia)

Cynthia Bulik
University of North Carolina (Chapel Hill, USA)

Abstract body. The symposium deals with the modern state of psychotherapy of eating disorders. For a long time, the main tool for the treatment of ED was considered cognitive behavioral therapy (CBT), both classical and specialized. The results of the use of CBT show that only about 30% of patients actually achieve stable improvement. For a long time, experts believed that the problem was the insufficient specialization of CBT and tried to develop CBT protocols specifically for the treatment of ED. Now, due to the large amount of accumulated research data, it has become obvious that the population of patients with ED is heterogeneous even within a single nosology, and that creating a single treatment protocol for this nosological group remains a utopia. The purpose of the symposium is to discuss the prospects for the use of various approaches of modern psychotherapy for the treatment of ED and to present the review of existing evidence-based methods to participants and listeners.

Press paragraph. The symposium covers the current state of the problem of evidence-based psychotherapy of ED. This topic is one of the most challenging in the field of treatment of ED, and is particularly relevant for presentation and discussion in Russia, where the opportunity to receive professional assistance for ED using evidence-based protocols remains extremely limited. Leading professionals from various countries of the world (Russia, USA, Sweden, UK) will discuss the prospects for the use of various modern evidence-based approaches to the treatment of various nosological variants of the ED. In recent decades, other areas of therapy have shown promising results in the treatment of ED: Family-Based Treatment (FBT), Acceptance and Commitment Therapy (ACT), Dialectical Behavioral Therapy (DBT), Radically Open Dialectical Behavior Therapy (RO-DBT), Compassion-Focused Therapy (CFT), are showing more than promising results. What are the prospects and first results of applying these methods to the treatment of ED and how is psychotherapy of ED changing on top of the development of the «third wave of CBT» and mindfulness?

General summary of the Symposium. Starting from the classic psychoanalytic couch, the psychotherapy of ED remains one of the most dramatically developing areas of psychotherapy. This is not surprising — EDs, the most deadly of all existing mental illnesses (S. Bulik, 2015), remain one of the most difficult and challenging disorders. Nowadays, cognitive behavioral therapy (CBT) is one of the most common treatments for ED in adults, including specialized protocols for treating certain nosologies, for example, CBT-E for the treatment of anorexia nervosa (C. Fairburn, 2002). Nevertheless, the percentage of cures is still quite low, and the creation of a single transdiagnostic protocol for the treatment of ED remains a utopia. Major scholars see the reasons for this in the enormous heterogeneity of this nosological group, and the imperfection of the diagnostic criteria, due to which about 60% of ED cases qualify as «nonspecific eating disorders», as well as in the problem of motivation of patients with ED requiring close attention of a specialist (G. Waller , 2012). Nevertheless, the rapid development of the methods of the «third wave» and the achievements of neuroscience opened up a new perspective in the psychotherapy of ED. What is the future of psychotherapy of ED? Should we expect the integration of promising approaches or the differentiated development of various trends? Leading researchers and specialists working with ED will present the current state of the problem and discuss prospects.
PSYCHOLOGY IN EUROPE: DEVELOPMENT OF THE PROFESSION

Abstract body. Psychology is rapidly growing body of scientific knowledge. Translation of this scientific knowledge into practice and integration in the various interdisciplinary fields in society in which psychologists are active requires the development of legal and organizational regulations. In these regulations the profession has to be clearly described, as do addressed societal needs, rendered services, competences and required training of these professionals. This represents a challenge for all countries. Given the historical and cultural differences, harmonizing this process on a European level is an even greater challenge. In this symposium the speakers introduce key aspects of the development of psychology as a profession in Europe. Information will be given on the state of affairs of regulations on a European level and in various European countries. The importance of the EFPA standard for psychologists’ training, the EuroPsy, will be discussed and case examples of countries in various stages of legal regulations will be presented.

Press paragraph. Psychology is rapidly growing body of scientific knowledge. Translation of this scientific knowledge into practice and integration in the various interdisciplinary fields in society in which psychologists are active requires the development of legal and organizational regulations. In these regulations the profession has to be clearly described, as do addressed societal needs, rendered services, competences and required training of these professionals. In this symposium the speakers introduce key aspects of the development of psychology as a profession in Europe. Information will be given on the state of affairs of regulations on a European level and in various European countries. The importance of the EFPA standard for psychologists’ training, the EuroPsy, will be discussed and case examples of countries in various stages of legal regulations will be presented.

General summary of the Symposium. Psychology is rapidly growing body of scientific knowledge. Translation of this scientific knowledge into practice and integration in the various interdisciplinary fields in society in which psychologists are active requires the development of legal, organizational and educational systems. In these systems, the profession has to be clearly described, as do addressed societal needs, rendered services, competences and the education and training of these professionals. This represents a challenge for all countries. Given the historical and cultural differences, harmonizing this process on a European level is an even greater challenge. In the process of professional development, information is needed on the existing regulations on a European and national level, on the education and training systems and on the transversal challenges countries are confronted with in their respective processes of development. In this symposium the speakers introduce key aspects of the development of psychology as a profession in Europe with the hope that this will be of use for other countries. Eleni Karayianni addresses the important question on the need for regulation in Europe and the actual situation. In her presentation, she discusses the actual European Commission directives and their implications at national and
European level for psychology as a profession. Next, Nady Van Broeck will present the results of a review the state of affairs of regulations in 37 European countries what the application and integration of psychology in Health care is concerned. The importance of the EFPA standard for psychologists’ training, the EuroPsy, will be discussed by the chair of the EAC of EFPA, Rosaleen McElvaney. Nady Van Broeck and Koen Lowet will present a case study of the recently accomplished process of legal regulation in Belgium. They will discuss the conceptual and strategic challenges that were addressed in the process of legal regulation of psychology in health care in their country.

Many countries in various stages of development of a regulation and integration of psychology in various domains of society such as health care are confronted with these challenges so case examples can offer inspiration for their respective processes.
FROM CHILDHOOD TO ADOLESCENCE: RECENT DEVELOPMENTS AND TRACKS FOR STRENGTHENING POSITIVE YOUTH DEVELOPMENT

Teresa Maria Sgaramella
Margherita Bortoluzzi
Lea Ferrari
University of Padova (Padova, Italy)
Paola Magnano
Kore University of Enna (Enna, Italy)

Abstract body. Several perspectives have been proposed in the literature to facilitate a successful development from childhood to adolescence, namely Positive Youth Development, Positive Psychology and Life Design with their attention to values and strengths. All are relevant to address the complexity and dynamics, which characterize current times, and the difficulties individuals experience in constructing life trajectories (Savickas et al., 2009). Several intervention programs aimed at promoting strengths, behaviours, attitudes, and positive resources have been recently proposed such as hope, optimism, career adaptability and future time perspective showing a specific attention to personal resources and future perspective (Sgaramella, Ginevra, Di Maggio, Santilli & Ferrari, 2015) and less to context and social participation. Several studies will be described in the symposium with the aim of providing a framework and a set of core themes as well as suggestions on components of a model of intervention addressing current challenges and future goals.

Press paragraph. This symposium aims to present recent developments and interventions for a positive youth development from childhood to adolescence and to provide suggestions for a model of intervention in line with recent international approaches. Margherita Bortoluzzi, Alice Marchetto e Teresa Maria Sgaramella with their presentation will focus on the relevance of executive life skills in learning difficulties and the role of related educational actions in promoting positive development and social participation in children. One of Professor Ferrari interests is the role of teachers as active agents of positive development. With the training aimed at promoting school participation of all children with booklets reading and story writing she will show the link and advantage of taking into account the international 2030 Agenda for sustainable development. Paola Magnano and Andrea Zammitti with their training on Personal and work context resources in vulnerable adolescents will take into the symposium their applied research dealing with one of the most compelling emergency in Europe, that is unaccompanied immigrants, and will introduce theoretically based career guidance fostering positive development. Finally, Teresa M.Sgaramella together with Camilla Madsen will show the effectiveness of a double lenses approach in facilitating positive behaviours, active participation and positive future perspectives in adolescence.
PROMOTING A POSITIVE FUTURE DESIGNING: THE PREVENTIVE MEANING OF EXECUTIVE SKILLS TRAININGS

Margherita Bortoluzzi
Teresa Maria Sgaramella
University of Padova (Padova, Italy)

Alice Marchetto
Artemisia Association (Berlin, Germany)

Executive functions (EF) are the skills required to plan, monitor and control cognitive processes, are linked to many important educational and developmental outcomes. These skills develop throughout childhood into adolescence and early adulthood (Blakemore & Choudhury, 2006; Diamond, 2013), are related to a number of important outcomes, including social functioning (Miller & Hinshaw, 2010), and academic success (Blair & Pieper, 2013). Because of the importance of EF, there has been considerable research on the topic, and great interest in developing successful interventions for improving EF. Recent studies have also found that EF skills are related to an effective future time perspective in children, and in particular in those who have learning difficulties and developmental disabilities (Bortoluzzi, 2015). The aim of the study was then to analyse the effectiveness of an Executive Skills training in developing not only problem solving skills but also social skills and future time perspective. Eighty students were involved in the study, half of them as active participants to the program and half as a control group. The program developed over a 5 thematic weekly group activities. Main executive components were addressed with the aim of increasing knowledge and strategies use. Practice activities in natural contexts, encompassing both school and family context, were used to facilitate generalization. Dimensions analyzed were: career adaptability (Di Maggio, Ginevra, Nota, Ferrari, & Soresi, 2015); Visions About Future (Ginevra et al., 2015); resilience and time perspective with Design My Future (Santilli et al., 2015); adaptive behaviors, personal relationships and self-disclosure (Soresi & Nota, 2007). A multivariate analysis of variance showed significant changes in the level of hope, resilience, and time perspective. Adaptability resources they ascribe themselves also increased. As regards participation in the school context and involvement in school, a higher interest in interpersonal relationships and commitment with school goals was observed. Developing awareness of executive skills and practicing useful strategies may increase the level of resources children attribute to themselves as well as attitudes toward persons in the current context and toward the future with a preventive value against nonadaptive and risky behaviours.
PROMOTING SCHOOL PARTICIPATION OF ALL CHILDREN WITH BOOKLETS READING AND STORY WRITING

Lea Ferrari
University of Padova (Padova, Italy)

Life Design supports the idea that during childhood more efforts should be devoted to promoting participation of all children to school life. Positive youth development should use instruments and personalized programs to respect and value the heterogeneity and diversity of each child (Santilli et al. 2018). All children participation is also included as a goal of the UN 2030 Agenda. One step in this direction is represented by promoting positive attitudes toward children with vulnerabilities providing adequate knowledge and suggesting behaviours (DeBoer, Pijl, & Minnaert, 2012). This study aims to verify the efficacy of the training program ‘Together we can!’ in acquiring adequate knowledge about Autism Spectrum Disorders (ASD) and facilitating positive behaviours towards peers with disability in primary school children. The 4 weekly sessions included the reading of two booklets on ASD and story writing. In the study 33, 2nd grade children were involved, 18 in the experimental group. Assessment included ‘How much do I know disabilities?’ (Nota, Ginevra & Soresi, 2015), ‘How do I behave with people with disabilities?’ (Nota, Ginevra & Soresi, 2015) and the Moreno’s Sociogram. R-Manova was used to test the training program’s efficacy. Results show knowledge about disabilities and ASD increased as well as the positive attitudes toward disability. Moreover, qualitative analysis of the stories written by children of experimental group highlighted at least two key contents among stimulating the participation of the child with disability, being aware of disability aspects, helping and advocacy behaviours, positive attitudes.

The program was successful in promoting positive attitudes and social behaviors. The program’s strengths and weaknesses support the necessity to involve teachers and parents to maximise its effects.
PERSONAL AND WORK CONTEXT RESOURCES IN VULNERABLE ADOLESCENTS: CAREER GUIDANCE EXPERIENCES WITH UNACCOMPANIED IMMIGRANTS

Paola Magnano
Kore University of Enna (Enna, Italy)

Andrea Zammitti
University of Catania (Catania, Italy)

Unaccompanied foreign minors are migrant children without parents, relatives or other adults. An increasing number of young immigrants arrives in Italy to search for new life and work opportunities. Despite this increasing phenomenon, interventions to support them in a career project are limited and occasional, although it is important to improve career construction through a wider knowledge of work, including values, meanings and representations. We designed some different career guidance paths under the framework of Life Design paradigm (Savickas et al., 2009) to promote the construction/reconstruction of life stories, of identities, and of cultural models, together with social representations associated with them. The study will compare the effectiveness of these paths. The career guidance activity has been conducted by career counselors, with the support of a cultural mediator; the setting of the interventions was individual or in small groups according to the language of participants (15 male adolescents). Instruments and procedures were predominantly qualitative. The scopes of the eight sessions were: the re-construction of professional story, facilitating the awareness of individual strengths and improving areas; the development of personal resources to cope with difficulties, the increase of knowledge about professions and rules of the labour market, and the development of a professional project. The monitoring and the evaluation of the interventions highlighted their strengths and weaknesses and showed the impacts in terms of career planning and temporal perspective of the young immigrants involved. The career guidance intervention presented allowed young immigrants to broaden the knowledge of the Italian market labour, to become aware of their professional interests and to restructure their representations of work. Career counselling can help vulnerable adolescents "re-appropriate" their past experiences to build a new vision of their futures, as the best indicator that they are leading good-quality lives and positive development is doubtless the possibility of foreseeing work inclusion.
PROMOTING ACTIVE PARTICIPATION AND POSITIVE FUTURE PERSPECTIVES: A DOUBLE LENSES APPROACH INTERVENTION WITH ADOLESCENTS

Teresa Maria Sgaramella
University of Padova (Padova, Italy)

Recent approaches, and capabilities approach in first line (Amartya Sen, 2000) underlines the relevance of providing opportunities for actions and the need for an attention to both at individual level, increasing individual resources and reducing inequalities, and at the context level on competencies and skills fostering inclusion and a responsible participation in community life. At the same time school is a privileged place for fostering the development of solidarity, inclusive attitudes and behaviours (Koller, 2017) crucial for students constructing their sustainable society. This study aims to verify the efficacy of the training program ‘Designing together my future community’ in activating attitudes, skills and intentional behaviours A 5 weeks program was proposed aimed at developing knowledge of personal and others’ strengths, more inclusive attitudes and behaviours, roles that can be played in the community to foster well-being for all. In the study 93 students were involved, 35 females and 17 males, 52 of them were in the experimental group. The other participated in a program were involved in a series of presentation of university courses. Assessment included resilience and future time perspective (Design My Future; Soresi, Nota, Ferrari, Sgaramella, 2012), components of adaptability namely concern, curiosity, confidence, control and cooperation; Savickas, 2009), satisfaction with life scale (Diener, Emmons, Larsen, Griffin, 1985). A mixed design, repeated measures Manova was used to test changes activated in the experimental group with respect to controls. The two groups did not differ in the baseline, they significantly differed after the training in both curiosity, confidence, cooperation and future time perspective. A qualitative analysis showed that 15 out of 17 participants who showed limited level of resources showed a significant increase after the training. The changes activated underline the sensitivity of these activities in developing personal resources which are relevant for both for a positive personal development as well as for active participation, in particular for those who show a vulnerable levels of resources. The actions were effective in pursuing some of the goals proposed by the UN Agensa, namely fostering social inclusion in a sustainable community development.
Abstract body. Suicide has not only psychiatric, but also cultural and psychological aspects, which we try to cover in this symposium. Prof. Michael Chandler will open the discussion with his talk on the need of cultural continuity to prevent suicide, especially in indigenous youth. Prof. Evgeni Nikolaev will tell about his studies in dissociated identity as a risk factor for suicidal behavior. Prof. Paul Hewitt will talk on the problem of perfectionism over the life span. Prof. Ksenia Syrokvashina will speak about the psychological factors of suicidal behavior in adolescents on the basis of her autopsy study. And psychologist Olga Kalashnikova will tell about her study on meaning in suicidal patients.
CULTURAL CONTINUITY & INDIGENOUS YOUTH SUICIDE

Michael J. Chandler  
University of British Columbia (Vancouver, Canada)

Much of Euro-American thought about health and wellbeing continue to be dominated by what Cushman (1990) has called the West’s historical commitment to “self-contained individualism.” As such, whenever we are moved to minister to various collective troubles (the problems of Indigenous youth suicide, for example) the usual treatment strategy is to attempt to save one soul at a time. Picking away at such troubles by focusing on the psycho-dynamics of individual patients is not, however, a particularly well thought out public health strategy. The alternative promoted here works instead to identify problem-related socio-cultural markers seen to index the collective efforts of whole communities to right earlier social injustices. This talk will work to scale-down what would otherwise prove to be a boundary-less task by focusing attention on the problems of youth suicide as they manifest themselves in Indigenous First Nations communities in Western Canada. The presentation will unfold in two parts. Part I is largely about matters of aggregation, and the middle-school mathematics involved in arriving at some culturally fair way of computing the suicide rates characteristic of various Indigenous groups. Part II details a range of social determinants subsequently shown to successfully distinguish Indigenous communities with unusually high and low suicide rates. This program of research began as a surveillance project in which: a) community-level suicide rates were first calculated separately for each of British Columbia’s 203 First Nation bands; before, b) theory-driven social-culture factors were sought out that served to discriminate between Indigenous communities with high and low youth suicide rates. In short, the very band characterized as possessing all of what were termed “culture continuity factors” suffered no youth suicides across a 15-year study period, whereas bands lacking these protective factors experienced suicide rates often hundreds of times provincial averages. Taken together, these findings are seen to make a compelling case that the well-being of First Nation youth, as measured by community-level suicide rates, is strongly associated with the extent to which their communities are hard at work both rebuilding connections to its traditional past and struggling to regain control over its own civic futures.
THE DISSOCIATED CULTURAL IDENTITY OF A NEUROTIC PERSONALITY AS A RISK FACTOR FOR SUICIDAL BEHAVIOR

Evgeni Nikolaev
Vladimir Ivanov
Ulianov Chuvash State University (Cheboksary, Russia)

Elena Suslova
Center of Child Neuropsychology (Cheboksary, Russia)

The specifics of cultural identity is connected with many characteristics of personal life, including psychiatric health. (Matsumoto, Juang, 2016). We aimed to understand the relationship between psychological state of personality and dissociated variant of cultural identity, and find, whether and to which degree this variant of cultural identity corresponds to higher suicidal risk. Sample consisted of 143 patients with neurotic disorders (67.8% females, mean age 31.9±1.77). 55.2% of the patients are Chuvash people, 37.1% — Russians, 7.7% — other ethnic background. During interview one of 3 variants of cultural identity was registered: differentiated, diffuse or dissociated (Nikolaev, 2012). Besides, the battery of tests were used (SCL-90R, Stolin personality self-relationship Questionnaire, Family emotional communication Questionnaire (Kholmogorova, Volikova), the social support questionnaire (F- SOZU-22, G. Sommer, T. Fydrich, 1989, adaptation developed by A. Kholmogorova, 2006), coping strategy indicator (J.H. Amirkhan), coping mode inventory (E. Heim), the Morosanova Behavior Self-Regulation Style Questionnaire. The group of 41 subjects with dissociated identity (DI) was formed during the interview. These patients identified their ethnicity as different from the parents’. Also descendants from mono- and biethnical families with cultural hypo- or negative identity were included. Patients from biethnical families stated their language to be different from those of their parents. National traditions and rituals were ignored by them, they practiced religions, non-traditional for their ethnos. Low psychological well-being in patients with DI manifested in higher level of depression (p<0.01). 29.4% had pronounced suicidal tendencies. The results of psychological questionnaires showed higher indices of emotion elimination, induced distrust, parental critics in the parental family; lower satisfaction with social support. They had non-adaptive cognitive, emotional and behavioral models of coping strategies; lower processes of modeling in conscious self-regulation (all p<0.05). The dysfunctional regulative processes significantly limit adaptive abilities of coping resources of these patients. Low general level of regulation lowers compensatory abilities, which manifest in low general productivity of behavior. The specifics of non-adaptive models of self-conception and coping styles mostly comes from parental family and creates affectively charged psychological background, which promotes depressive symptoms, and further heightens the suicidal risk.
PERFECTIONISM, SOCIAL DISCONNECTION, AND SUICIDE BEHAVIOURS OVER THE ADULT AGE SPAN

Paul Hewitt
University of British Columbia (Vancouver, Canada)

Perfectionism is a pernicious personality vulnerability and transdiagnostic factor that underlies many forms of distress, dysfunction, and both psychological and physical disorders (Hewitt, Flett, & Mikail, 2017; Sirois & Molnar, 2017). One of the most significant and important outcomes of perfectionism involves suicide behaviors including suicide ideation and high intent suicide attempts among children, adolescents, and adults. There have been many reports of the relationship between trait perfectionism and suicide behaviors (e.g., Flett & Hewitt, 2014; Hewitt et al., 1999; Smith et al., 2018) and there is very strong evidence that one interpersonal trait component of perfectionism, socially prescribed perfectionism (i.e., the perception that others require perfection of oneself; SPP) is important in suicide behavior. In the Perfectionism Social Disconnection Model (PSDM; Hewitt, et al., 2006; Hewitt et al., 2017), we theorized that the interpersonal components of perfectionism, including SPP, and perfectionistic self-presentation (PSP, the drive to appear to others as if perfect; Hewitt et al., 2003) are related to suicide behavior by creating and exacerbating social disconnection and alienation and a sense of “not fitting” in one’s world. We assessed the relationship among perfectionism traits and perfectionistic self-presentation, social disconnection, and suicide behaviors and tested the PSDM in a community sample of 174 men and 306 women (ages 35-90 years). This was done by administering, at two time-points with a 6 month time lag, measures of trait and self-presentational perfectionism, social disconnection, and suicide ideation, attempts, and ratings of the likelihood of a future suicide attempt. We tested whether social disconnection mediated the relationship between perfectionism components and suicide behaviors and the findings suggested that various perfectionism traits and suicide behaviors and the findings suggested that various perfectionism traits and self-presentational facets create social disconnection resulting in suicide ideation, attempts, and ratings of future likelihood of attempting suicide. The findings are discussed in terms of the importance of assessing perfectionism as a relevant risk factor in suicide across the adult age span and in approaches to reduce and ameliorate perfectionistic tendencies.
PSYCHOLOGICAL FACTORS OF SUICIDAL BEHAVIOR IN EARLY AND LATE ADOLESCENCE

Ksenia Syrokvashina
Elena Dozortseva
Valentina Badmayeva
Dmitry Oshevsky
Svetlana Terekhina
V. Serbsky National Medical Research Center for Psychiatry and Narcology (Moscow, Russia)

Psychological autopsy is one of the important sources of information about suicide, its origins and reasons, which is conducted within the framework of forensic psychological or joint psychiatric-psychological expertise in the course of criminal investigation. In cases of juvenile suicides experts have to analyze psychological development of the adolescent, his / her social and interpersonal situation, psychological conflicts and problems in the period prior to the suicide on the basis of criminal files data. The psychological reconstruction of the adolescent’s life in social context allows formulating conclusions about the main factors contributing to the suicide. However, little is known about the dynamics of such factors during the adolescence period. Goal of the study: identification of the dynamics of suicide factors in early and late adolescence. Materials and methods. The sample consisted of 285 reports of post-mortem psychological-psychiatric forensic assessment of juveniles aged 11 to 17 years (average age — 14,92±1,82) who died by suicides. The method of document analysis, as well as clinical-psychological, qualitative and statistic methods were used. Results and conclusions. Within the age period from 11 to 17 years an exponential growth of suicide rate is observed. A significant increase in the number of suicides in adolescence may be due to a number of reasons. This period is characterized by the complication of the social situation of development and the manifestation of problems and conflicts. Escalation of psychological problems in the family, education conditions, as well as in relationships with peers, especially partners, is typical for the group of juveniles who died by suicide from 15 to 17 years old. Suicidal behavioral patterns (thoughts, self-injury behavior, suicidal attempts) and maladaptive individual features also increase with age. Younger adolescents, as well as older ones, had emotional instability and dysfunctional features in the form of sensitivity, introversion, impulsivity, which differentiated and became more complex with age, creating the basis of psychologically vulnerable character types. The combination of external growing problems and internal vulnerability led to social and psychological maladjustment of juveniles, which contributed to the auto-aggressive and self-harm behavior of minors and, ultimately, to death by suicide.
In suicidal behavior it is decisive how a person reacts to internal and external circumstances. Theoretical basis for the study includes the Leontiev’s model of suicide (2008), which deals with the existential dimension of personality. The model highlights predictors of suicide rejection: the presence of reflexive distance from one’s own life, which allows to take an active position; the feeling of meaningfulness, which is determined by connection with yourself, other people and the whole world. The hypothesis is that the groups with different clinical symptoms of suicidal behavior have different patterns of meaningfulness. The research was held in the Crisis Department of the Moscow City Yeramishantsev Clinical Hospital. 148 patients (16-69 years old; 107 women and 41 men) filled a test of psychodiagnostic methods about the features of self-regulation and the meaning sphere of personality. The research uses new methodological tool “The Sources of Meaning and Meaning in Life Questionnaire” (Schnell, 2009; Bolotova, Leontiev, 2016). Common meaningfulness is understood as two relatively independent variables: “meaningfulness of life” (ML) and “crisis of the life’s meaning with a tense desire to look for it” (CLM). The data on suicidal ideation, self-harm and suicidal behavior were taken from the patients’ medical history. We used One Way ANOVA, z-score, hierarchical cluster and cross-tabulation analysis. There is approximately an equal amount of crisis patients’ groups with such patterns of meaningfulness as: Meaning-loss: low ML at different CLM (often high); Meaning-stressed: high ML and medium-high CLM; Meaning-stable: high ML and low CLM. Patients with suicidal attempts have 1.5–2 times more Meaning-loss pattern, patients with only suicidal ideation have the Meaning-stressed pattern, and the patients without suicidal symptoms have the Meaning-stable pattern 1.5–2 times more often than the other groups. In case of the Meaning-loss the predictor of real suicidal risk is low ML, not the level of CLM: the group with suicidal attempts is distinguished by the alienation and low index of ML while the other two groups have high index of ML. The psychological diagnosis of meaningfulness patterns predicts the dynamics of the crisis much better than the clinical data.
MEDICAL PROFESSIONALS AND SUICIDAL PATIENTS: AN INTERACTION

Konrad Michel
University Hospital of Psychiatry (Bern, Switzerland)

Olga Boyko
Mental Health Research Center (Moscow, Russia)

Galina Romanova
Yeramishantsev City Clinical Hospital (Moscow, Russia)

Abstract body: This symposium is dedicated to interaction of suicidal patients with medical professionals (doctors, psychologists, psychotherapists). Suicidal patients are known to be the “difficult ones”, to elicit fear and confusion due to heavy topics of death that they raise during their treatment sessions. So what can be done about it? Prof. Konrad Michel will tell the audience about his new treatment method, when the patient is confronted with his difficult feelings. Psychologist Ksenia Chistopolskaya will talk about her study of both psychiatrists and people in acute postsuicide, and point out the differences and the alikeness of these two groups. Psychologist Olga Boyko will share her experience of group therapy of psychiatric patients, when then they start talking about their suicidal feelings. Psychologist Galina Romanova will tell about her study of patients’ notions of psychotherapeutic help, and her thoughts of what to do, when the concept is not a “working one”.

THE ATTEMPTED SUICIDE SHORT INTERVENTION PROGRAM ASSIP. A BRIEF AND EFFECTIVE THERAPY FOR REDUCING SUICIDAL BEHAVIOUR

Konrad Michel
University Hospital of Psychiatry (Bern, Switzerland)

Attempted suicide is the main risk factor for suicide reattempts and suicide. Our group has developed a specific therapy for individuals who are seen after a suicide attempt. ASSIP (Attempted Suicide Short Intervention Program) is a manual-based three-session therapy developed from the concept of suicide as a goal-directed action, and aimed at establishing a strong collaborative, patient-centred working alliance. The therapy protocol includes an extensive and video-recorded narrative interview, a video self-confrontation, a psychoeducative handout, and a collaborative case formulation with personal warnings signs and safety strategies. The face-to-face sessions are followed by regular letters over 24 months. Patients who had recently attempted suicide were randomly allocated to treatment as usual (n = 60) or treatment as usual plus ASSIP (n = 60). Clinical exclusion criteria were habitual self-harm, serious cognitive impairment, and psychotic disorder. Study participants completed a set of psychosocial and clinical questionnaires every 6 months over a 24-month follow-up period. The primary outcome measure was repeat suicide attempts during the follow-up period. Secondary outcome measures were suicidal ideation and health-care utilization. The study represents a real-world clinical setting at an outpatient clinic of a university hospital.

At 24 months 5 suicide reattempts were recorded in the ASSIP group, and 41 reattempts in the control group. The rates of participants reattempting once or more were 8.3% and 26.7%, respectively. In a survival analysis an 80% risk reduction in the ASSIP group was found. Suicidal ideation was reduced in both groups, without significant difference. The ASSIP group spent significantly fewer days in hospital during follow-up. ASSIP is an effective, brief, and easy to understand low-cost therapy for patients who attempt suicide. ASSIP has a strong potential for dissemination to other healthcare systems, for increasing treatment provision for patients who attempt suicide, and for reducing healthcare costs. The novel therapeutic elements of this brief therapy and the possible implications for future directions in clinical suicide prevention will be addressed.
PATIENTS IN ACUTE POSTSUICIDE AND PSYCHIATRISTS: WHAT ARE THE DIFFERENCES?

Ksenia Chistopolskaya  
Moscow Research Institute of Psychiatry (Moscow, Russia)

Sergey Enikolopov  
Mental Health Research Center (Moscow, Russia)

Research in terror management theory shows that all people are vulnerable to the topic of death and when caught off guard are prone to adverse defenses. This finding may be topical for psychiatrists who work with suicidal patients, as they have to deal both with their own fears of death and fears of patients. Our study was aimed to find out the differences in attitudes toward life and death in these groups of people. There were 185 patients in acute postsuicide (from 2 to 14 days after the attempt, 64 men, 121 women, aged 18-25), 43 with denial of an attempt, 105 with one attempt and 37 with several attempts. They filled in questionnaires concerning attitudes and fears toward death, romantic attachment, time perspectives, hardiness. The same instruments were given to 168 psychiatrists (49 men, 119 women). Besides quite expected differences in time perspective (higher orientations to negative past and fatalistic present, lower orientation to positive past in suicidals), we found a range of differences between these groups that can be estimated as conflicts of worldviews: suicidal patients had higher orientation to hedonistic present and lower orientation to the future; they were more anxious and less avoidant in their attachment (i.e. “needy”); they had higher fear of consequences of their death for family and friends; and they were less neutral towards death. Still, there was no statistical difference in death experience between doctors and patients with several attempts. These potential “hot spots” may lead to feelings of annoyance in psychiatrists and lessen the rapport between doctors and patients. That’s why acknowledgement of these divisions is needed in medical professionals, so that they could deal with them as with expected difficulties and define them as possible psychotherapeutic targets. Still, such death attitude as fear for family and friends may be of special importance for suicidal patients, holding them alive, and shouldn’t be “corrected”, but implemented as one of many possible meanings in life. Non-neutral attitude toward death is also a delicate construct, which needs to be alleviated with care.
SUICIDOLOGICAL ASPECTS OF PSYCHOTHERAPEUTIC SUPPORT GROUP FOR PEOPLE WITH MENTAL DISORDERS

Olga Boyko
Sergey Enikolopov
Mental Health Research Center (Moscow, Russia)

Suicidal behavior is often observed in people with mental disorders. When psychologists do not set themes of group work and the level of trust is high enough, the suicidal theme inevitably comes up in the group discussion. The work with it in a group format is associated with difficulties and is poorly represented in modern professional literature. We discovered this gap, when we discussed our group work with suicidal issues.

Methods: qualitative analysis of opportunities and restrictions of supportive group work for people with mental disorders. It’s impossible to ignore suicidal themes in group work because they may indicate deterioration in the psychical condition of the patient and be acute for other members of the group, and this might lead to declining trust and sense of safety in the group. Preliminary measures that psychologists must take before the start of group work are: resolve for themselves the question of the possibility of continuation and the conditions of work with a participant, whose suicidal motivation is true, and discuss with the participants the possibility of contacting their relatives or doctor in case of deterioration in their condition, including increase of suicidal risk. Psychological group work with suicidal themes include: (a) Action planning for a situation of acute suicidal crisis; (b) Conversation about suicidal themes, which aim is suicide prevention. We define four tasks to achieve this goal: (1) specify severity of suicidal behavior and presence of protective factors; (2) work on prevention of «normalization» of suicidal behavior, when it is perceived as natural and justified way out of the situation or means to achieve the goals; (3) reveal personal suicidal motivation in all members of the group and help them to find other, socially acceptable and available ways to satisfy their needs manifested in suicidal behavior; (4) reveal relationship between suicidal motivation and deterioration of mental condition, support compliance, discuss the increased pharmaceutical support during this period. Knowledge of suicidological aspects of group work improves the quality of aid for people with mental disorders.
PATIENT’S CONCEPT OF PSYCHOTHERAPEUTIC HELP: A PHENOMENON TO STUDY, TO MAKE CONTACT, AND TO WORK WITH...

Galina Romanova
Yeramishantsev City Clinical Hospital (Moscow, Russia)

One of the important practical problems of the psychotherapy in crisis, and especially in suicidal state – is the problem of client’s concept of help. Traditionally person-in-crisis is full of ambivalence; and nowadays their concepts of self-diagnostics and “right help” is even more overloaded with ill-structured amateur knowledge, different kinds of spiritual experiences etc. But, after all, it is a concept, and sometimes very strong concept which often lays in latent opposition to the doctor or some other helping professional. It must be a good idea for practice to free patient’s natural ambivalence toward the psychotherapeutic help from the negative connotations, explore and use it as a normal part of the everyday work. And psychotherapeutic practice still needs some new methods “psychodiagostics-included”. Our phenomenological study in Moscow clinic of crisis conditions was directed to actual motivations and conceptualizations of psychotherapy in patients at the beginning of the therapeutical contact – and was purposed to make the contacts easier and more cooperative. The most popular spontaneous narrations of our patients about their ideas and experiences of psychotherapy was collected. Then a short questionnaire was composed from them – to describe in short words the whole picture. Then the procedure was standardized – for the respondents to estimate and discuss all the possible pluses and minuses of psychotherapeutic intervention, using the ready-made statements from the questionnaire.

Results and discussion. Finally, the questionnaire was offered to crisis and suicidal patients and demonstrated its validity for practical tasks, good potential for discriminability. The data can reveal some visible traits and tendencies in client’s attitudes towards therapy and highlight those who, from a sample of all the subjects surveyed, is readier at the moment to active and thoughtful collaboration – and why. After pilot study it became a compact (24 items), easy-going technique of multi-task use. The procedure was approved as a useful method: a) helpful for quick anamnesis; b) facilitating self-expressions of the patient; c) opening some sufficient parts of client’s concept of psychotherapeutic help; d) suitable for collecting psycho- and sociometric data. A cross-cultural project based on the questionnaire is now on the way.
THE RELEVANCE OF PSYCHOLOGY IN AUSTRIAN PUBLIC HEALTH? A LIFESPAN APPROACH OF PSYCHOLOGICAL SUPPORT

Beate Wimmer-Puchinger
Hilde Wolf
Professional Association of Austrian Psychologists (Vienna, Austria)

Marion Kronberger
Austrian Association of Psychologists (BÖP) (Vienna, Austria)

Gerald Gatterer
Institute of Age Research, Sigmund Freud Private University (Vienna, Austria)

Abstract body: Challenging conditions of the society in Europe will cause in future according to WHO an increase of mental illnesses especially depressions. This symposium presents public health psycho-social projects of the Austrian Psychological Association (BÖP): The Ministry of Health and Social Affairs (BMASGK) responded to the emotional challenge of home care and asked BÖP to organize psychological support for nursing relatives facing an exhaustion syndrome. To save healthy aging in future, geronto-psychologists developed prevention strategies for retirement homes. Serious mental problems are one of the most frequent reasons for pre-retirement resp. unemployment. BMASGK and Retirement Pension Insurance have asked BÖP to organize psychological treatment to support re-employment. Physical, emotional and sexual violence is a severe global issue. According to the European Union Agency for Fundamental Rights and WHO-EURO appr. 62 Mio women are victims of violence. This problem also popped up in Austrian skiing training camps. The Austrian Skiing Association (ÖSV) requested BÖP to develop a violence prevention program.
HOW TO PREVENT SEXUAL HARASSMENT, ASSAULT AND VIOLENCE IN COMPETITIVE ALPINE SKIING?

Prevention Modules for Training Settings — Combining Sports-, School- and Child Protection Psychology Background

Unfortunately, it is a widespread "hot issue" that especially in competitive sports kids are becoming victims of sexual harassment, assault or violence by their trainers. This is also very delicate for trainee-trainer-relationship in competitive alpine skiing. There is a special emotional and physical close relationship. There already exist international experiences that emotional support of the victims by special trained sports psychologists is a MUST. A recent German study (Rulofs, 2016) shows that 45% of female and 23% of male athletes have to experience sexual harassment and sexualized violence. There are already established some European-wide general sports projects like: "Sports respect your rights": A project financed by EU. "Safe Sport": Protection of kids and young people in organized competitive sports in Germany. "Project Voice": Voices for truth and dignity — Combatting sexual violence in European sports through the voices of those affected. Methods

Therefore sport psychology experts developed special prevention modules. The Professional Association of Austrian Psychologists (BÖP) was invited to work out a prevention strategy after popping up of this topic in the public. A special expert team of sports-, school-, clinical and child protection Psychology developed training modules to be implemented in top alpine training settings in Austria. These modules include special separate workshops for their students as well as for trainers, teachers and parent-teacher-conferences. An ethic-codex for a respectful interaction has to be also developed. Discussion

These prevention modules will be realized in alpine skiing schools and training settings in the very near future and organized by BÖP who has compiled special interdisciplinary teams for this order. An evaluation will be realized. Research questions will be: — If the interaction of trainer and trainee will be more sensitive — If the body-confidence of the trainee's has been empowered — If the trainers are more confident in their everyday coaching sessions — If the atmosphere of mutual respect has been improved.
WORKING TOWARDS MENTAL FITNESS: HOW CAN PSYCHOLOGICAL INTERVENTION SUPPORT RE-EMPLOYMENT

Beate Wimmer-Puchinger
Alice Grundböck
Andrea Stoick
Professional Association of Austrian Psychologists (Vienna, Austria)

Serious mental health problems are one of the frequent reasons for pre-retirement and respectively unemployment. To support this target group to be able to return to work again the ministry of health and social affairs as well as the Austrian Retirement Pension Insurance have reacted in funding an Austrian-wide psychological and psychotherapeutically support project and is managed by the Austrian Association of psychologists (BÖP). This project started 2013 and is still ongoing. One third of the participants was on sick leave due to psychological issues. 15% had several hospitals stays in the last 3 months. 71% of the clients are regularly taking psychopharmaceutical medication. Two-thirds of the people concerned are women. The average age of the clients is 46 years and one third had a finished apprenticeship. Their psychological assessment overwhelmingly showed affective disorders, posttraumatic stress disorders as well as depression. The clients are referred by the Austrian Service for the Unemployed (AMS) or directly by companies. 6.000 people have had a first psychological diagnostic interview. About 4.500 went on to have a psychological treatment or psychotherapy. On average 31.6 psychotherapeutically sessions or 25.3 psychological treatment sessions were needed to achieve a stable improvement. The program is served by about 300 clinical psychologists and psychotherapists. The program was evaluated independently by the Department of Psychology, University of Vienna. The aim of the evaluation was to assess the benefits of the program and furthermore, to compare the effectiveness psychological treatment and psychotherapy.

The research sample consisted of 509 clients. The Beck depression scale (BDI-II), the Brief Symptom Inventory (BSI) and the Global Assessment of Functioning (GAF) was administered. One of the striking results was the improvement of the performance capacity: 81% showed significant improvement. An significantly reduction of psycho-pharmaceutical medication as well as a significant reduction of hospitals stays. But the most striking and impressive result was that it could be shown that the psychological treatment was more effective (less session needed and better long-term effect) than psychotherapy.
CARING FOR THE CAREGIVERS: AUSTRIAN’S SUPPORT SERVICE FOR EXHAUSTION SYNDROME PREVENTION PROGRAM

Beate Wimmer-Puchinger
Professional Association of Austrian Psychologists
(Vienna, Austria)

Margarethe Grasser
Ministry of Labour, Health and Consumer Protection
(Vienna, Austria)

To look after, to care, to nurse and be responsible for high aged and/or disabled family members in their homes, is undoubtedly very burdensome. There is evidence, that the caregivers, being mostly women, have a very high risk to develop a depression. It is even more stressful, if the relative- or mother or father- suffer from Alzheimer disease or dementia. Because of this mental risk the ministry of social affairs and health has asked the Austrian psychological association to organize psychological support for these caregivers. About 2oo clinical psychologists are engaged in this program and may offer 1 or 2 sessions, which are payed by the Austrian Ministry. Intervention procedures include focused relief, empowerment to reinforce resilience, as well as ensure their health literacy and information to get social and financial support. The clients are identified as being mentally burdened by home visits of the evaluator of the level of financial care support. Another pathway is the counseling after inpatient hospital discharge. This psychological service has already been adopted so well, that the scope of the service to the clients will be enlarged in 2019. Furthermore, a systematical evaluation of the outcomes will be implemented. Finally, it has to be stressed that this issue is under represented in the public health opinion and thus this project is meaningful contribution to value the care-givers.
Most times aging is seen as a process of losses and is only associated with dementia, depression and dying. Most times therapy is oriented on medical interventions and nursing. So we will focus on the main topics of Gerontopsychology in this specific area. In Austria, Gerontopsychology is seen as a sub discipline of Clinical Psychology influenced by many additional disciplines such as Developmental psychology, Health psychology, Geriatrics and Gerontosociology. Gerontopsychology is gaining importance in the light of recent epidemiological developments. Main topics of Gerontopsychology are to assist healthy older people in ”successful aging”, to help older couples to have a good relationship with satisfying sexuality and finding new social roles and to cope with problems in the job. Further on in people suffering from different diseases clinical Gerontopsychology is an important part in the diagnostical- and treatment-process of dementia and depression but also helpful to cope with different somatic diseases. In this presentation those aspects of Gerontopsychology will be presented in a practical way on the basic of gerontopsychological findings. In addition the working group Gerontopsychology of the Austrian Psychological Association has taken the initiative and developed a specialized Curriculum. Its content is described in this presentation.

NEUROPSYCHOLOGICAL ASSESSMENT AND SUPPORT APPROACHES

Abstract body: Different kinds of brain damages and disturbances of higher mental functions lead to multidimensional consequences, affecting mobility, cognition, emotions and communication. The main consequences concern everyday life, loss the connection with society and loss of quality of life. Neuropsychological assessment and rehabilitation and psychological and neuropsychological support people (children and adults) with the impairment of functioning, disability and health limitation and help solve their problems and integrate them into society.

General summary of the Symposium. Presentations. The symposium will begin with a presentation describing neuropsychological analysis of school education difficulties of children after cochlear implantation. This study presents an overview of rehabilitation problems of children after cochlear implantation. Various approaches to teaching deaf children with cochlear implants are considered. The second and the third presentations give data on the assessment of nervous system functional state by neuropsychological and psychophysiological methods of children 6-9 years and on the assessment of hyperactivity and fatigability in primary school age children. Next will be described the psychosocial rehabilitation after brain injury in Russia on the way towards the holistic model. The last presentation will be theoretical and will compare International Classification of Functioning, Disability and Health (ICF) and A.N. Leontiev’s Theory of Goal-Directed Activity in the Russian clinical psychological rehabilitation. Finally, discussion will be open to all participants.
ASSESSMENT OF NERVOUS SYSTEM FUNCTIONAL STATE BY NEUROPSYCHOLOGICAL AND PSYCHOPHYSIOLOGICAL METHODS IN CHILDREN 6-9 YEARS OLD

Vyacheslav Lebedev
Lomonosov Moscow State University (Moscow, Russia),
Center of Neurotherapy "Neurofitness" (Moscow, Russia)

Elena Lysenko
Tamara Muromtseva
Evgenia Rybchinskaya
Vladislav Shvirev
Center of Neurotherapy "Neurofitness" (Moscow, Russia)

The success of child learning depends on many factors, one of the main becomes neurodynamic indicators of the nervous system functional state (NSFS). There are different methods of assessment these factors in neuropsychology and psychophysiology. The aim of this research is to establish the relationship of these indicators in different approaches. It is necessary for more precise prediction child’s school adaptation, timely detection of psychophysiology desadaptation and its prevention (including bio/neurofeedback method). Also it helps to establish the neurological diagnosis. Study involved 97 children 6-9 years old with learning disabilities and adaptation to school conditions. Children’s NSFS assessed by based on electrocardiogram recording followed by a spectral analysis of heart rate variability (HRV) psychophysiology method and then compared with indicators of neuropsychological assessment approach. The neurodynamic indicators in neuropsychological approach expressed in fatiguability, time performance, impulsivity, inaction and hyperactivity. These parameters were summarized to fatigue index (FI) and hyperactivity index. The assessment of psychophysiological indicators expressed in total spectral power (TP), high-frequency spectral components (HF) and the stress-index (SI) according to R.M. Baevsky. There are the significant correlations between TP of HRV and FI, HF of HRV and FI, HF of HRV and inaction, SI and inaction.

The NSFS indicators with the use of HRV analysis at rest are connected with behavioral characteristics of the neurodynamic resource according to neuropsychology assessment. The HRV reflects the adaptive potential of child’s nervous system. It can be stable prognostic indicator of the development the different desadaptation states, which are primarily reflected on school adaptation. The reported study was funded by RFBR according to the research project № 17-29-02169 «The modern informational technologies (virtual reality, eye tracking, neurofeedback) included in the clinical and psychological diagnosis and rehabilitation of persons with impaired cognitive and emotional processes system». 
INTEGRATIVE APPROACH TO THE ASSESSMENT OF HYPERACTIVITY AND FATIGUABILITY IN PRIMARY SCHOOL AGE CHILDREN

Vyacheslav Lebedev  
Lomonosov Moscow State University (Moscow, Russia),  
Center of Neurotherapy "Neurofitness" (Moscow, Russia)

Elena Lysenko  
Tamara Muromtseva  
Evgenia Rybchinskaya  
Vladislav Shvirev  
Center of Neurotherapy "Neurofitness" (Moscow, Russia)

Modern conditions impose the increased requirements to child. It reflects in school adaptation process, peculiar behavior and subsequent learning disabilities. Peculiar behavior is often expressed in increased motor disinhibition and impulsivity or in increased fatiguability and sluggishness. The comparison of peculiar behavior with psychophysiology indicators of peripheral nervous system (PNS) permit to predict the difficulties of adaptation and the possibility of their prevention. Study involved 47 children 7-8 years old with peculiar difficulties in behavior. According to neuropsychological assessment there are gets summarized fatigue index (FI) and hyperactivity index (HI). These index compared with the indicators of PNS at rest: total spectral power (TP), heart rate variability (HRV), high-frequency spectral components (HF) of HRV and stress-index (SI) according to R.M. Baevsky. These indicators of PNS were assessed by psychophysical method based on electrocardiogram recording with subsequent spectral analysis of HRV. There are excluded children with different dysregulations of HRV. There are the significant negative correlation between TP and FI, significant positive correlation between HF and HI. Fatiguability and sluggishness in the child’s behavior is expressed in reduced productivity and efficiency. This is expressed in negative connection of TP and FI, because the TP parameter expressed the complex resource nervous system condition. The increased motor disinhibition not always directly related to the amount of the child’s resource. So it was obtained positive connection of HF and HI. The results of the research makes the contribute to better understanding of correction approach including bio/neurofeedback therapy. The reported study was funded by RFBR according to the research project № 17-29-02169 «The modern informational technologies (virtual reality, eye tracking, neurofeedback) included in the clinical and psychological diagnosis and rehabilitation of persons with impaired cognitive and emotional processes system.»
PSYCHOSOCIAL REHABILITATION AFTER BRAIN INJURY IN RUSSIA: ON THE WAY TOWARDS THE HOLISTIC MODEL

Nataliya Varako
Olga Dobrushina

Acquired brain injury leads to multidimensional consequences, affecting mobility, cognition, emotions and communication. An interplay of the functional deficit, pre-injury identity, family and environmental factors in every case form a unique pattern. A holistic neuropsychological rehabilitation model was developed by G. Prigatano, Y. Ben-Yishay, B. Wilson and other in order to address this complexity and to achieve the goal of social readaptation of brain-injured individuals. In the current work, we describe the experience of implementation of the holistic model of rehabilitation in Russia. For three years, we are developing a model of psychosocial rehabilitation for patients with brain injury on the base of a private outpatient center. Two interventions are analysed. First, 45 patients brain injury entered an intensive short-term (3 weeks) program consisting of 27 hours of rehabilitation (15 group, 12 individual). Second, 7 of these patients entered a low-intensity long-term (once a week, 1 year) program consisting of 100 hours of rehabilitation (60 group, 40 individual). The following barriers for holistic rehabilitation were identified. First, the holistic model is not widely accepted by the professional medical community. Second, infrastructure for social adaptation of disabled people is very limited. Third, mental disability leads to strong stigmatization. Therefore, there is very limited request and funding for holistic rehabilitation. Still, major effort is spent at attempts for restoration of the pre-injury state, even when it is obviously unrealistic. In these circumstances, short-term programs do not lead to sustained effects, they only allow to correct misleading beliefs about rehabilitation. Prolonged participation in individual and group therapy is necessary for psychosocial rehabilitation after brain injury. During the long-term program, the center becomes a micro society that promotes acceptance of brain injury, implementation of compensatory strategies, development of self-esteem and self-efficacy. Transfer of the progress towards macro society requires continuous support.
INTERNATIONAL CLASSIFICATION OF FUNCTIONING, DISABILITY AND HEALTH (ICF) AND A.N. LEONTIEV’S THEORY OF GOAL-DIRECTED ACTIVITY IN THE RUSSIAN CLINICAL PSYCHOLOGICAL REHABILITATION

Nataliya Varako
M. Kovyazina
E. Rasskazova
Y. Zinchenko
Lomonosov Moscow State University (Moscow, Russia)

The International Classification of Functioning (ICF) is one of the instruments proposed by WHO for describing and comparing health-related data used in the health care system for diagnostic and rehabilitation aims. Today, the possibilities of application as well as the problems of introducing and using the ICF into the practical work of clinical psychologists within the framework of the Russian psychological tradition are being discussed. In this regard, the need arises for the operationalization of ICF domains for specialists of the multidisciplinary rehabilitation team, which will facilitate the use of the ICF in rehabilitation work for diagnostic, planning and implementing a rehabilitation programs and evaluating their efficacy. The possibility of filling ICF domains with clinical and psychological content is being considered, which will allow a specialist to understand better what specific techniques are used in his work and how they contribute to the active return of a person to the social environment. We propose to use the cultural activity approach as a methodological basis for clinical and psychological rehabilitation, corresponding the structure of activity (according to A. Leontiev) with the main components of the ICF. A comparison of the components of the ICF (in particular, “structures”, “functions”, “activity”, “participation”) with levels of activity (psychophysiological functions, operations, actions and activities) according to A.N. Leontiev is suggested. We argue that the effective process of clinical and psychological rehabilitation can take place only at the level of specific actions, and not at the level of the whole goal-directed activity or operations. Psychological theoretical and methodological content of domains of the International Classification of Functioning (based on cultural activity approach, including syndromic analysis for higher mental functions disorders) allows to develop a framework for clinical and psychological rehabilitation at the activity level, and to implement at the level of actions in the structure of activity (according to A.N. Leontiev).
NEUROPSYCHOLOGICAL ANALYSIS OF SCHOOL LEARNING DIFFICULTIES IN CHILDREN AFTER COCHLEAR IMPLANTATION

Nataliya Varako
Maria Baulina
Lomonosov Moscow State University (Moscow, Russia)

This study presents an overview of rehabilitation problems of children after cochlear implantation. Various approaches to teaching deaf children with cochlear implants (CI) existing in different countries are considered. The necessity of prolonged neuropsychological assistance in choosing an educational path is argued. Education systems for children after cochlear implantation in different countries include the study in general classes, special classes for the deaf and hard of hearing children within the general school, specialized schools for children with hearing impairments. The study used quantitative and qualitative data meta-analysis of 26 published retrospective studies from 2002 to 2017 years. The main parameter of the quantitative analysis was the percentage of children with CI reaching the norm level of educational and social skills development. Qualitative data analysis included selection of the most commonly found in children with CI disorders of higher mental functions described in these studies. The quantitative analysis of the results distribution of educational and social achievements in pupils with CI revealed a significant variation of the data. The most discrepancies were revealed in such indicators as progress in mathematics and reading, in the frequency of the sign language, which characterizes the presence of a negative attitude towards the use of sign language instead of speech. Qualitative data analysis showing the specific problems of mental functions development that may become targets for correctional training. The weak link among the higher mental functions of children with CI can be not only speech or auditory perception, but also other processes such as spatial perception, compilation of information, insufficiency of connections between the visual image of the object and the auditory image of its name, understanding the figurative meaning of statements. It is important to pay attention not only to the format of the educational process and the type of institution, but also to the content characteristics of learning, including the active and regular use of visual assistive devices, the awareness of teachers about the features of child development after CI. The neuropsychological diagnostics is feasible for assessment of readiness for school education of children with CI.
**MILITARY PSYCHOLOGY. EXTREME PSYCHOLOGY. PSYCHOLOGY IN SPECIAL CONDITIONS**

**Aleksandr Karayani**  
Military University of the Ministry of Defense of the Russian Federation (Moscow, Russia)

**Yulia Shoigu**  
The Center of Emergency Psychological Aid EMERCOM of Russia (Moscow, Russia)

---

**Abstract body:** The Symposium is devoted to the consideration of important professional tasks and the ways of their implementation in the activities of psychologists working in the military, law enforcement, as well as in complex and dangerous industries. The reports presented in the program of the symposium are devoted to the tasks of psychological support for extreme profile specialists: professional psychological selection, psychological training, ways to prevent the occurrence of problems related to professional activity, ways of recovery and correction. It also discusses how to help people in difficult life situations, victims of emergency situations, military operations, fires, natural disasters.
Military Psychology in the XXI Century: Blossoming or Crisis?

Aleksandr Karayani
Military University of the Ministry of Defense of the Russian Federation (Moscow, Russia)

Research objective — estimating current state of military psychology in the world and revealing the main tendencies of its development. Research method: content analysis of scientific publications, documents, literary sources, professional Internet sites. Research course: scientific articles, textbooks, manuals, websites of psychological communities of 22 states (n=212) were studied. Results of research: It is established that military psychology is a dynamically developing branch of psychological science and practice. Continuously psychological structures in armies of Australia, Israel, Canada, Russia, the USA become stronger. Psychologists in armies of many European countries and China act actively. It is discussed questions of psychological work in armies of many countries. "Center" of activity of military psychology moves to space of the international military-psychological cooperation. Influence of the USA in the theory and methodology of the analysis of military-psychological problems remains considerable. However, the understanding of the question that the regularities of manifestation of mentality of the soldier opened in the USA in fight, can't directly be extrapolated to armies of other countries increases.

Scientific researches of military-psychological prospects are actively conducted. The subject field of military psychology extends. Considerable financial means are allocated for functioning of psychological services, training of military psychologists, psychological work with the military personnel. At the same time, expectations of commanders in relation to military psychology in many respects aren't met. The greatest volumes of PTSD, suicides, drug addiction and alcoholism are marked out in armies where number of psychologists highly and above their financing. There are no "breakthrough" psychological technologies in the major branches connected with behavior of the military personnel. The culture of using of psychological knowledge isn't formed among the military personnel. Psychologists pay too much attention to psychodiagnostics and work with documents. The military psychology is in a bifurcation point now. Growth of number of military psychologists isn't followed by decrease of psychological problems. Credibility to military psychology thaws. Cooperation of military psychologists in the field of psychological help, partnership with actively developing branches of science and practice is necessary.
SUMMARY PREVENTION OF RADICALISATION THE NEEDS OF FAMILIES

Magda Rooze
TERRA, convenor Standing Committee Crisis and Trauma Disaster Psychology (Amsterdam, Netherlands)

Radicalisation that leads to terrorism is one of the phenomenon that has dominated both national and international agenda in the recent decades; it also has its disturbing impact on families and societies. Our interviews with several families, who were dealing with the process of radicalisation of their children, confirm this. The devastating effects of radicalisation was observable. There are several reasons why radicalisation occurs. Sageman (2004) argues that social bonds (friendship, kinship and discipleship) have forced many individuals to radicalise and to participate in terrorist activities. Similarly, Bakker (2006) after analysing 242 individuals concludes that there are many socio-economic factors like unemployment, injustice, kinship, criminal record behind radicalisation and terrorist activities. Bloom (2005), Ganor (2009), Hundley (2011) and Walker (2007) discuss the same motives but from different perspectives. Finally, Arian (2012) former Deputy Director of the Department of Human Rights at the Ministry of Foreign Affairs in Afghanistan admits that the process of radicalisation which finally leads to terrorism is a highly complex phenomenon in terms of its concept and motivations. He adds that despite scholarly efforts to address the root causes of radicalisation and terrorism there are still significant uncertainties. There are also several reasons why families fail to deal with the process of radicalisation of their children. Lack of knowledge around the topic, taboo, inability to recognise its signs and unawareness where to ask for help are some reasons why parents fail / failed to prevent their children from radicalisation. This research explores the role of families in the process of radicalisation leading to violent extremism. Results of interviews with families of radicalised youngsters are being presented and first conclusions are presented on the impact of these insights.
EXTREME PSYCHOLOGY. MYTHS AND REALITY

Yulia Shoigu
EMERCOM (Moscow, Russia)

The presented report is devoted to the consideration of the most urgent issues related to the organization and implementation of emergency psychological assistance to victims, as well as relatives and friends of victims and those who died in emergency situations. Over the past decade, the provision of emergency psychological assistance took shape in a separate professional area of activity of psychologists of extreme profile, and also received regulatory consolidation, through a separately existing term in the field of extreme psychology. The basis for the preparation of materials for the report was the experience of participation in the elimination of the consequences of large-scale emergencies by specialists of the psychological service EMERCOM of Russia. The main focus is the description of the features of the organization of work, depending on the conditions and circumstances of a particular emergency. The report presents a number of concrete examples describing the provision of emergency psychological assistance in the aftermath of emergency situations such as the accident at the Sayano-Shushenskaya HPS; a fire at the “Lame Horse” Club; accident at the Raspadskaya mine; flooding of the “Bulgari” motor ship; the crash of the Yak-42 HC Lokomotiv; flooding of the floating Kolskoye drilling rig in the Okhotsk Sea; flood in Krymsk; flooding in the Far Eastern Federal District; the fire collapse of the shopping center “Admiral”; the crash of a trawler in the Okhotsk Sea; Airbus A321 crash, the Arab Republic of Egypt, Sinai Peninsula; incident on the water, the Republic of Karelia, Lake Syamozero; Accident, 926 km of Highway Tyumen — Khanty-Mansiysk; flooding Stavropol Territory, Pervomayskiy and Levokumka Settlements; shooting at the school, Ivanteevka; the crash of the AN-148 “Moscow-Orsk” aircraft. The report describes the main approaches to the organization of work of specialists of the psychological service EMERCOM of Russia, the principles of forming the task force of the specialists involved, as well as the substantive aspects of providing emergency psychological assistance, including the application of ethical principles in working with the victims and relatives.
METHODOLOGY FOR ASSESSMENT SAFETY CULTURE IN HIGH-RISK ORGANIZATIONS

L. Andryushina  
Joint Stock Company «Concern for Production of Electric and Thermal Energy at Nuclear Power Plants» («Rosenergoatom» Concern JSC) (Moscow, Russia)

E. Chernetskaya  
Rosatom Technical Academy (Rosatom Tech) (Obninsk, Russia)

The human factor plays a crucial role in many problems of accidents and injuries in modern organizations, but the problems caused by it are still far from being solved. Their relevance has led to the emergence of a new branch of knowledge—a safety culture aimed at maintaining and improving the professional reliability of staff and ensuring the safe and effective operation of the organization. It is especially important to deal with the formation of safety culture in high-risk organizations as the level of responsibility of the personnel of these organizations is very high, and consequently the price of mistakes is high. One of the largest enterprises of the electric power industry in Russia and the only company in Russia that performs the functions of the operating organization of nuclear power plants (hereinafter NPP) is the Joint Stock Company «Concern for Production of Electric and Thermal Energy at Nuclear Power Plants». «Rosenergoatom» Concern JSC sees its mission as bringing consumers with electrical and thermal power produced by the NPPs with guaranteed safety as its top business priority. In 2015-2016, «Rosenergoatom» Concern JSC with the scientific and methodological support of the Rosatom Tech developed a methodology for assessing safety culture at nuclear power plants. Methodology for assessment safety culture in high-risk organizations is based on the methodology of the International Atomic Energy Agency (IAEA), World Association of Nuclear Operators (WANO). The purpose of the methodology is to identify the level of commitment of NPP personnel to safety in the performance of production activities, the level of implementation of leadership potential of managers in the field of improving the safety culture, allows to identify current problems in the management system that require increased attention, and can also serve as a feedback mechanism in assessing the adequacy and effectiveness of previous management decisions. The psychometric testing and the research results confirm that the proposed methodology is a reliable and valid tool for assessing the levels of commitment to safety culture.
THESES OF THE SPEECH ON: “MATTERS OF PROFESSIONAL SELECTION OF THE MILITARY SPECIALISTS”

Y. Radchenko
Research and Development center of the General Staff Military Academy of the Russian Federation (Moscow, Russia)

One of the tools providing high quality staffing of the Armed Forces with military specialists is professional psychological selection. In the Russian army professional selection was appeared in the beginning of the XX century first of all aiming at defining personal professional qualities and capabilities of airplanes pilots. First psychological and psychology—physical laboratories were created in the military institutions of the Red army in the 20-es. Professional psychological selection was actively developed in the Armed Forces of the Soviet Union. The Program of development of the system of professional psychological selection for the Armed Forces of the Russian Federation was started in the early 90-es. Nowadays the professional psychological selection is a set of measures aimed at acquiring a high quality staffing of military positions at all levels, basing on personal professional qualities and capabilities of the chosen civilian and military staff, in complete accordance with the requirements of the professional military activity. The mentioned above set of measures is carried out in: a.) in military commissariats and offices for contractors; b.) in military units and military institutions. Military-scientific support of professional psychological selection is held in the scientific departments of the military institutions by the means of developing special data, criteria and methods of professional qualities estimation of personal ability for military service; the chief psychological selection department is the Research and Development center of the General Staff Military Academy. Certain research has been carried out for a few years to improve the methodology of professional psychological selection. Some requirements to the test structure and order as well as the qualitative characteristics of responses such as their adequacy, amount, sufficiency and reliability, and the general estimation of the responses have been outlined. Professional psychological selection is the future trend of the work with staff. The results of this activity generally enhances the staffing quality of the Armed Forces with military personnel.
METHODOLOGICAL DEVELOPMENT OF PSYCHOLOGICAL SUPPORT OF THE INVESTIGATION

I. Kamenev
The Investigative Committee of the Russian Federation
(Moscow, Russia)

The creation and development of the psychological support service of the investigation in the system of the Investigative Committee of the Russian Federation is due to the need for a systematic approach to the organization of a new for investigative bodies of the Investigative Committee of the Russian Federation type of service activity consisting in the active participation of psychologists in the production actions and verification activities carried out in the framework of Articles 144 – 145 of the Criminal Procedure Code of Russian Federation, but also in ensuring the service activities of personnel. Psychological support of the investigation is a combination of theoretical and practical views, allowing to form special psychological tools and methods for use in the investigation of crimes. Such specialized units are charged with solving two main tasks: The first task, traditional for all law enforcement agencies, is to provide psychological support for the activities of the personnel. These are participation in the conduct of professional selection, psychological preparation for the implementation of professional activities, participation in the training of personnel, correction and restoration of mental health, solution of psychological problems arising in connection with the performance of professional duties. The second, unique task is to provide a psychological support in the investigation of crimes. This is the psychological and forensic support of the investigation: the activation of the memory of victims and witnesses; building a searchable psychological portrait of the alleged offender; comprehensive psychological analysis of the behavior of participants in criminal proceedings using a variety of methods, including methods of psychophysiological research using special technical means; psychological support of investigative and other legal proceedings involving minors; providing psychological assistance and support to victims, witnesses and their relatives in the first hours after the crime. The involvement of psychologists to provide practical assistance to investigators in the investigation of crimes significantly affects the effectiveness of the investigation, in general.
THE SYSTEM OF PSYCHOPHYSIOLOGICAL SUPPORT OF NUCLEAR POWER PLANTS PERSONNEL’S PROFESSIONAL RELIABILITY

E. Chernetskaya  
Rosatom Technical Academy (Rosatom Tech) (Obninsk, Russia)

L. Andryushina  
Joint Stock Company «Concern for Production of Electric and Thermal Energy at Nuclear Power Plants» («Rosenergoatom» Concern JSC) (Moscow, Russia)

To ensure the safe and efficient operation of nuclear power plants, since 1982 the laboratories of psycho-physiological support (LPPS) started being established at Russian NPPs. The LPPS’ activity and professional development of LPPS specialists are currently supported by the scientific-methodological center “Psycho-Physiological Support of Professional Personnel Reliability” (PPSPPR) of Rosatom Tech. The main purpose of the laboratories is achieved by realization of main activities: D psychophysiological examination of candidates/employees (PFE); D psychological and physiological support of workers (PPS); D socio-psychological aspects of safety culture; D psycho-pedagogical support of the educational process. The PFE purpose is a psychological selection of NPP candidates/employees and control of psychophysiological properties and professionally important qualities to detect early signs of psychological maladjustment and other disorders that reduce professional personnel reliability affecting the NPP operating safety. The purpose of PPS is to recover, maintain and improve the professional performance to prevent wrong actions of the staff. The socio-psychological aspects of safety culture are implemented in the NPPs activities taking into account the recommendations of the IAEA, WANO. The LPPS specialists perform a psychological analysis of the causes of incorrect actions of employees when the LPPS specialist works in the commission on investigating the violations/deviations in the NPP operation. The LPPS specialists carry out social and psychological research of the socio-psychological climate of the NPP workforce; on shift staffing, manpower selection and deployment in the NPP divisions; on assessment of safety culture at NPPs. Within the framework of psycho-pedagogical support of the process of NPP employees training the LPPS’s experts conduct classes on the psychological training, carry out psychological support of emergency drills and individual appraisal practice of the operational personnel at a full-scale simulator, develop psycho-pedagogical recommendations on an individual approach to education. The results of the corporate peer review by WANO, Rosenergoatom have shown that the involvement of LPPS specialists in the investigation of violations, staff selection and preventive management of stressful situations positively affects the operation of nuclear power plants. This comprehensive work of LPPS increases the reliability of the human factor and safety of NPPs.
PSYCHOLOGICAL RELIABILITY OF SPECIALISTS IN SAFETY CRITICAL DOMAINS

V. Barabanshchikova
Lomonosov Moscow State University (Moscow, Russia)

The study aims to develop a predictive model for the performance of professional tasks in conditions associated with the danger to life and health, excessive effort and other safety critical domains. The focus of the study is on specialists who carry out their professional activities using complex technical devices in closed locations (rescue workers n=40, isolated operator stations n=134), during night shifts or in conditions of irregular duty chart. Such conditions create overwhelming workloads, which lead, on one hand, to potential failures and emergencies, and on the other, to threats to health and lives of working people. At the same time, the practice of work routine at the far North, at space stations and nuclear submarines makes it possible to assume that there are physiological and psychological mechanisms of adaptation and resistance to impacts even to the most adverse conditions. The identification of the factors that contribute to the reduction or, on the contrary, increase the adaptive capacity and maintain the reliability of professional activity, is one of the key problems of modern work psychology in general and extreme psychology in particular. The proposed study considered following factors: age and work experience, physiological characteristics and actual functional states; behavioral patterns and habits; psychological attitudes and motivational dispositions. Analysis of these factors in groups of professionals highlighted the strategy of psychological adaptation/disadaptation to extreme working conditions. The reliability of specialists was examined through the prism of the system of factors’ balance that determines the specifics of the performance of professional tasks in extreme conditions of working activity. The study also considered the factors that lead to failures in the reliability and the imbalance of the system. On the basis of the collected data, conclusions were drawn about the predictors of the reliability of professional activities of specialists working in extreme conditions, the specificity of their adaptive and disadaptive strategies that allows them to complete professional tasks in extreme conditions. The results form the basis for the development and implementation of psychological technologies to support professionals of “extreme” types of work.
The phenomenon of interpersonal contact is considered in psychological science from different points of view, complementing each other, and presenting us the opportunity to characterize it as a single, but at the same time, multifaceted phenomenon. In Russian psychological science G.M. Andreeva, A.A. Bodalev, E.L. Dotsenko, V.N. Kunitsina, O.I. Mironova, B.D. Parygin, A.N. Sukhov, L.B. Filonov and others were engaged in a detailed study of the nature of psychological contact. The direction of development, effectiveness, continuation and depth of contact largely depend on the sociopsychological conditions in which interpersonal interaction occurs, which internal and external factors influence this process. Improving the effectiveness of interpersonal contact occurs in the case of adjusting it on the basis of existing knowledge about the psychological characteristics of the contact and the competent application of developed skills by its participants. The concepts of "contact", "psychological contact", "interpersonal contact", "sustained contact", "direct contact" communication and interaction are applied in various spheres of human life, but most of the scientific works is devoted to interpersonal interaction in the process of learning and professional activities. The original polysemy of the term "interpersonal contact" in psychology found itself in a variety of phenomena that were brought under this concept. In particular, interpersonal contact was understood as: condition, reception, stage of interaction, condition of participants of interaction. Analysis of approaches to the study of interpersonal contact allows you to define the following approaches to understanding it: — the special situation of interpersonal interaction, where people converge, as well as the result of such interaction; — the component of communication as a condition for successful professional activity; — the certain stage of interpersonal interaction; — the psychological connection that occurs in the process of communication between people; — the process in which partners stay during the whole time of communication; — the forced interaction for one or two participants.
The analysis of scientific approaches to studying of intrinsic human nature and its mental organization, its determination allows to allocate the main subject of this theoretical analysis — the factors of psychological influence connected with the main views regarding psychological science. Deepening in a psychological essence of objective and subjective determinants at which means influences are developed is defined by further logic of a research of this phenomenon. Consequences of experience of the extreme, psychoinjuring factors to which emergency situations of technogenic, natural and anthropogenic character belong are shown and can be shown in forms of the mental disadaptation of the individual which is characterized by mental states as acute and traumatic stresses and, as a result, PTSD. Except threat to mental health of the population, extreme factors undermine feelings of safety and make change to cognitive perception of a picture of the world — emergence of new trait of character — “cautious vigilance”. The conducted researches of psychological consequences of extreme situations testify to the scale of prevalence of psychopathological symptomatology. Unfortunately, similar symptoms of acute and posttraumatic stress arise not only at the people who directly endured traumatic events but also at those, who witnessed them indirectly, through mass media (further — SMK). The information technology development, taking into account the opportunities (interactivity, efficiency, mass character of use, etc.) given by them allows to consider SMK as the main tool of remote influence on mass consciousness. Individual and psychological features of the person become a subject of studying of interested persons for the organization of impacts through SMK on the population for the purpose of its traumatization, change of the individual and group mental phenomena. In case of purposeful influence, the danger to mental wellbeing and psychosomatic health of the population increases repeatedly. Thus, accounting of specifics of influence of information technologies and the virtual environment on mentality of the person is necessary for identification of the specified forms of negative impact on society. Purposeful work and participation of psychologists of security agencies in use of effects of increase in group solidarity and transformation of group identity in the conditions of threat of life becomes the perspective direction for counteraction, engaging in active regulation of new models of relationship between the society and government, minimizing impact on mass behavior.
SOCIETY VS. PERSONALITY VS. JOB: RESOURCES AND CHALLENGES

Valentina Barabanshchikova
D. Horoshilov
A. Kachina
O. Melnikova
A. Rikel
Lomonosov Moscow State University (Moscow, Russia)

Abstract body: Within the framework of the Congress, a round table will be held on the problems of personal development in modern society, including the logic of professional development. At the round table, topics such as global (transmissions of values in modern society, the role of art in social-psychological practices) and applied processes (human development as a professional, work psychology, economic and marketing measurement of an individual’s existence) will be raised. Key speakers will be presenting Russian Federation (V. Barabanshikova, D. Horoshilov, A. Kachina, O. Melnikova, A. Rikel, F. Vinokurov, Department of Psychology, Lomonosov Moscow State University) and Japan (A. Takashi, Department of Psychology, Graduate School of Arts and Letters, Tohoku University). The goal of the Round Table will be to unite different branches of the science within Russian and Japanese applied and fundamental psychology.

SOCIAL MEDIA MINING IN CULTURAL MEMORY RESEARCH: A CASE OF HOLIDAYS IN RUSSIA

Fedor Vinokurov
Tatiana Folomeeva
Lomonosov Moscow State University (Moscow, Russia)

We present the preliminary results of studying the translation of cultural memory about four national holidays on the most popular social media website in Russia (vk.com). The automatic analysis of 13,800 posts on holiday dates published by a representative sample of 2,200 authors older than 14 years involved explorative topic modelling with LDA algorithm. The resulting topics were mostly connected with consumer behavior on holidays, but one topic was found to be specific for authors older than 39 years — greeting cards — the most accessible, affordable and familiar element of a festive ritual. Our research illustrates the advantages and limitations of automated analysis of big textual data in social psychology.
The aim of this research is to investigate the specific manifestations and predictors of procrastination in employees of modern Russian industrial organization. Based on the conception of conscious self-regulation of activity (Konopkin, 1995), complex methodology of occupational stress analysis (Leonova, 2004), theoretical researches of procrastination predictors (Ferrari, Johnson, McCown, 1995; Steel, 2007), and used Tuckman General Procrastination Scale (Kryukova, 2010; Tuckman, 1991), we constructed theoretical model of relationship between procrastination and personal characteristics, self-regulation features, job satisfaction of employees. We asked 213 employees of Russian industrial organization (men=93, women=120, managers=88, specialists=125, mean age=39, mean seniority=7). The organization specializes in the production of electric buses. The study involved engineers and employees of office services, including design engineers, process engineers, production managers, supply service employees, quality service employees, etc. The results of structural equation modeling showed a good fit for the hypothesized model ($\chi^2=26.902; \text{CFI}=0.994; \text{GFI}=0.977; \text{RMSEA}=0.024$) and revealed three significant predictors of procrastination such as occupational stress syndrome, the coping strategy of avoidance and the level of job satisfaction. The stability of the model confirmed in different parts of the sample. In addition, this research revealed specific parameters to different subgroups by gender, age, job category and seniority.
The paper discusses the qualitative research methods in the history of cross-cultural, clinical and social psychology in Russia since the early 20th century. The roots of the qualitative research in Russian psychology are found in the ethnography before the Revolution in 1917. The later works of L. Vygotsky, M. Bakhtin and V. Propp are widely discussed today from the retrospective point of view in the context of the discursive and narrative psychology, though these classical authors didn’t consider the qualitative methodology as the special research tool in psychology. The first mention of the qualitative analysis as the research strategy is possible to discover in the A. Luria’s book «On the Historical Development of Cognitive Processes» (Moscow, 1974). The famous text presented the early study of the cultural determination of cognition, performed in the mountainous areas of Uzbekistan in 1930s, with the interview as the basic method. After the Second World War B. Zeigarnik linked Luria’s methodological ideas and the principles of K. Lewin’s field theory in the clinical psychology (pathopsychology). She introduced the special type of diagnostic procedure — the «patopsychological experiment» as the reconstruction of the real life situation in the dialogue between the researcher and the patient. Her student and follower, E. Sokolova, the author of the first Russian handbook of qualitative research («Projective methods of personality research», Moscow, 1981), writes that the priority for the Russian pathopsychology in the diagnostics was always the qualitative analysis and the interpretation of the decision task. The 1990-2000s is a period of the formation of a research methodology, which integrates the experience of the English and Russian qualitative psychology for the study of social representations and identities.

Nowadays the qualitative research methods develop in social psychology as the framework for analyzing social and political changes in modern Russian society and mass culture. Qualitative methodology is becoming close to the critical psychology and transforms to the critical hermeneutics of the politically and ethically neutral science.
GENERATION Y INFANTILISM AS A SOCIAL-PERCEPTIONAL AND SOCIOLOGICAL PHENOMENON RESEARCH

Alexander M. Rikel
Anna V. Milukhina
Lomonosov Moscow State University (Moscow, Russia)

Nowadays, the difference between generations is becoming more obvious. There is an increasing violation of the intergenerational transmission of values, more and more distinguished between generations than common features. Highlighted features that distinguish modern generations from each other are value orientations and behavioral features. Some researchers note that the modern young generation (generation Y), compared with their parents (generation X, Baby-boomers), is prone to infantilism, but there are almost no studies that affect this topic. Infantilism can be opposed to “maturity”, which can be understood in line with the psychological formation of a person or as matching a number of sociological criteria. As part of a two-stage (quantitative and qualitative) study (first stage, N = 349; second stage N = 15), the basic hypothesis about differences in attitudes regarding maturity (age of marriage, the appearance of children in the family, the beginning of work, education, etc.) in the young (Y) and older (X) generations was confirmed. Significant differences in attitudes regarding maturity between the older and younger generations were revealed: according to the criteria of family availability and work activity for 20 years of age and the presence of children for 25 years of age, older people are more likely to receive positive responses than the younger generation. In addition, to some extent between generations ideas about mature behavior and the causes of mature and immature forms of behavior differ. Differences in attitudes towards maturity between the older and younger generations were also revealed: representatives of the older generation more negatively than the younger generation evaluate situations that illustrate immature behavior and more positively evaluate situations that illustrate mature behavior.
Studies of personal resources of adaptation to dynamic work conditions and job content form one of the most important domains in work and organizational psychology. Contemporary baseline research is targeted to reveal the factors that contribute to effective work, unimpaired health, and well-being. In this domain the studies of various professional disadaptations and the elaboration of psychological support programs are growing rapidly. In spite of a broad range of investigations revealing the psychological resources needed for successful professional development, the problem of adaptation to the demands of difficult and tense work situations is on the agenda. The precise nature of the relationship between hardiness and stress remains to be determined so the research aim was to analyze hardiness (Maddi et al., 2006) as a personal resource of adaptation that ensures successful coping and leads to a risk decrease of stress-syndrome development and its negative outcomes. The sample included 385 participants (average age = 36.5). It was found that hardiness correlates to planning coping, escape-avoidance and accepting responsibility coping. The participants with high level of hardiness more often chosen planning strategies and positive reappraisal to cope with professional tense and stress and less often escape—avoidance strategies and acceptance of responsibility. Hardiness is associated with resistance to maladaptive stress-response and negative stress outcomes. Significant differences regarding negative functional states manifestations and burnout symptoms were revealed in low and high hardiness groups of participants. The group of participants with low hardiness demonstrated expressed level of negative functional states — fatigue, monotony, stress and burnout whereas "hardy" participants didn’t manifest negative stress outcomes. According to the results we can presume that in professional context hardiness has significant effect on negative stress outcomes and therefore on the performance.
PSYCHOLOGISTS CAN MAKE THE DIFFERENCE: CULTURAL AND INDIVIDUAL DIVERSITY

Ulrike De Ponte  
Applied University Regensburg (Regensburg, Germany)

Bruna Zani  
European Federation of Psychologists’ Associations (Germany)

Abstract body: The challenge of dealing with cultural and individual diversity has reached the daily work of all of psychologists, no matter if they work on international level (either in other countries or on international issues like the observance of the Human Rights) or in their cities with colleagues or clients raised on one or more other cultural backgrounds. But what does that mean to psychologists of nowadays? It means that psychologists work constantly in situations of the quality of a cultural overlap. Most of them are not or insufficient prepared for this yet. Regarding a psychologists’ core work of understanding and supporting people from a psychological point of view, this work is not only done with "looking through different glasses" but means building up a hermeneutic attitude which enables multiplying and differentiating perspectives like a mutual prism. This all leads to the conclusion: There is a responsibility to implement intercultural psychology mandatorily in the study programmes of Psychology already on Bachelor level.

COMMENT OUT OF THE PERSPECTIVE OF THE BOARD ON EDUCATIONAL AFFAIRS

Ulrike De Ponte  
Applied University Regensburg (Regensburg, Germany)

Ioulia Papageorgi  
School of Humanities and Social Sciences (Nicosia, Cyprus)

The second presentation will comment on the statement out of the view of the Board of Educational Affairs, focusing on curriculum-related issues in education of psychologists (practitioners and scientists) and psychology students. The BEA acknowledges that psychologists nowadays face the challenge of working with cultural and individual diversity. It is thus imperative to discuss how psychology curricula can be enhanced to better prepare psychologists in meeting contemporary demands of the profession. Research and theories from various domains of the psychology discipline (e.g. social, community, developmental, cultural, clinical, dynamic, organizational) have the potential to provide significant conceptual insights and methodological indications for designing policies and interventions targeting this challenge at its core. Psychological science can and should play a strategic role in these developments because it encompasses both individual and collective levels of analysis, and can thus facilitate the recognition of reciprocal and recursive linkages among these levels.
COMMENT OUT OF THE PERSPECTIVE OF THE BOARD ON HUMAN RESOURCES & PSYCHOLOGY

Ulrike De Ponte
Applied University Regensburg (Regensburg, Germany)

Ulrich Wagner
Philipps-University Marburg / Social Psychology
(Marburg, Germany)

The third presentation will comment on the statement out of the view of the Board on Human Rights and Psychology dealing with issues due to the observance of the Human Rights. Diversity offers chances and challenges for individuals and societies. It stimulates creativity and innovation, but can also lead to misunderstanding, devaluation and discrimination. Psychology knows a lot about the preconditions for these opposing effects — both about the individual preconditions of diversity competence as well as about the situational and social circumstances.

PRESENTATION OF THE STATEMENT OF THE BOARD ON CULTURAL AND ETHNIC DIVERSITY TOWARDS INTERCULTURAL AND INDIVIDUAL DIVERSITY AND SUGGESTIONS FOR CURRICULUM COMPONENTS

Ulrike De Ponte
Applied University Regensburg (Regensburg, Germany)

Iva Žegura
(Croatia)

Lukasz Stecko
(Poland)

The Board on Cultural and Ethnic Diversity will open this session with presenting the statement of the Board on Cultural and Ethnic Diversity about cultural and individual diversity. After that, they will share their first ideas for curriculum components as a base of discussion.
OUT OF THE BOARD ON EDUCATIONAL AFFAIRS: THE RELEVANCE OF INTERCULTURAL PSYCHOLOGY FOR EDUCATION

Ulrike De Ponte  
Applied University Regensburg (Regensburg, Germany)  
Ulrich Wagner  
Philipps-University Marburg (Marburg, Germany)

The Board of Educational Affairs will share their view on the relevance of intercultural psychology for the education of Psychologists and students of Psychology nowadays. Migration to Europe and mobility within Europe have consequences for social and cultural integration and inclusion. This is an upcoming field for professional psychological activities, as psychologists need to be prepared to deal with the inherent challenges of the changing social landscape in Europe. The BEA concurs that there is a need for psychology curricula to develop components on intercultural psychology at Bachelors and Masters levels in the framework of EuroPsy.

OUT OF THE BOARD ON HUMAN RESOURCES & PSYCHOLOGY: DIVERSITY COMPETENCE AS PRECONDITION FOR SUPPORTING INNOVATION AND AVOIDING DISCRIMINATION

Ulrike De Ponte  
Applied University Regensburg (Regensburg, Germany)  
Ulrich Wagner  
Philipps-University Marburg (Marburg, Germany)

The Board of Human Rights and Psychology will present how the issues of intercultural psychology link with issues of the observance of the Human Rights. Diversity offers chances and challenges for individuals and societies. It stimulates creativity and innovation, but can also lead to misunderstanding, devaluation and discrimination. Psychology knows a lot about the preconditions for these opposing effects – both about the individual preconditions of diversity competence as well as about the situational and social circumstances. In addition, psychology knows about the cultural dependence of its own theories and explanations which has consequences for their applicability in different cultural contexts. Prerequisite for working professionally in a world of increasing individual and cultural diversity and to avoid discrimination and Human Rights violations is to make this knowledge available to psychological professionals. This implies appropriate implementation of diversity and intercultural training in graduate and postgraduate education for psychologists.
EUROPEAN PSYCHOLOGISTS’ NEEDS IN FACING DIVERSITY

Ulrike De Ponte
Applied University Regensburg (Regensburg, Germany)

Iva Žegura
(Croatia)

Bruna Zani
(Italy)

Abstract body: Cultural and individual diversity is getting more and more part of the daily work of each psychologist nowadays, but still this issue is less or insufficiently addressed in the study programmes all over Europe. Therefore, psychologists work repeating in situations of the quality of a cultural overlap being not or insufficient prepared for this yet. The psychologists’ core work of understanding and supporting people from a psychological point of view lacks knowledge as well as the performance of taking in account multiple and differentiated perspectives. The conclusion is: The subject Intercultural psychology needs to be mandatorily included into the curricula of study programmes of Psychology and this already on Bachelor levels. This joint-symposium is supposed to aim in working groups after the input-presentations in order to collect all kind of psychologists’ views on the needs that are seen out of the view of the divers working fields of psychologists.

General summary of the Symposium. Chair Symposium: Iva Žegura, B CED Discussant: Bruna Zani, EC B CED and B EA

PSYCHOLOGICAL RESILIENCE AND HUMAN HEALTH

Valeria Matsuta

Natalia Kozlova

Elena Gutkevich

Inna Atamanova
National Research Tomsk State University (Tomsk, Russia)

Abstract body: New trends in the development of society view human health, both physical and mental, as one of the fundamental values. Within a variety of fairly representative scientific research there is a lack of analysis of the specificity of models for assessing mental and physical health of different age and professional groups, so further research is needed into insufficiently investigated and systematized criteria of mental and physical health, methods and techniques of psychological health care. There is a lack of effectiveness of the existing system of rehabilitation and preventive measures, which does not take into account the totality of all markers, including a person’s psychological characteristics, his/her psychological deficits (not only cognitive, but also emotional, personal and behavioral ones). The Symposium involves a discussion of new scientific knowledge that allows a comprehensive and generalized assessment of human physical and mental health.

Press paragraph. 1. Natalia V. Kozlova — Dr. of Sci. (Psychology), professor, head of the genetic and clinical psychology department of National Research Tomsk State University, head of the educational programme in Clinical Psychology. Presentation: Rehabilitation of disabled people: The role of clinical psychologists. 2. Elena V. Gutkevich — Dr. of Sci. (Medicine), professor of the genetic and clinical psychology department of National Research Tomsk State University, leading researcher of the Research Institute of

General summary of the Symposium. Health should be considered as a condition for successful realization of a person’s mission, life purposes and meaning of existence in the society. Nowadays, psychological and mental health as a set of personal characteristics that are prerequisites for one’s stress resistance, social adaptation and successful self-realization is becoming the leading characteristic of one’s resource potential. The ongoing transformation of the family and the peculiarities of its functioning in the modern world, the current trend towards integrating knowledge in the field of mental health, the use of transdiagnostic approach in new methodological contexts of clinical practice and the undoubted impact of social challenges determine the relevance of interdisciplinary approaches to solving mental health problems, focusing on the family. It is also important to discuss the issues of rehabilitation of persons with disabilities, considering it within the legal framework adopted in the world community. According to the biopsychosocial model of rehabilitation, in the pathogenesis of a disease or disorder in humans an important role belongs to a complex of biological disorders, psychological factors (including mental processes, individual psychological characteristics of a person and behavior) and social ones (in particular, socio-economic, social micro-environmental and cultural). The rehabilitation potential of a disabled person is an indicator that can be evaluated based on a complex of medical, psychological and social factors to reveal his/her real possibilities of recovering impaired functions and abilities, including participation in professional activities. It is the competence of clinical psychologists. Qualitative analysis of the rehabilitation potential helps specialists of the multidisciplinary team to develop an optimal rehabilitation route for the disabled and to determine the effectiveness of the funds spent on rehabilitation and the effectiveness of the rehabilitation measures.
PSYCHOLOGICAL STATES PREGNANT WOMEN AND MATERNAL ATTACHMENT TO FETUS AS A FACTOR OF CHILD’S PSYCHOPHYSIOLOGICAL DEVELOPMENT

Olga Terekhina
Svetlana Leshchinskaia
Yulia Kovas
Tatiana Bokhan
Anna Silaeva
Marina Shabalovskaya
National Research Tomsk State University (Tomsk, Russia)

Studying the factors of children’s mental development and health during early childhood stems from the significance of this period for the future well-being of a child, lack of longitudinal studies and cross-cultural comparison. Purpose: to identify the possibility to assess a mediating role of psychological states of pregnant women on the relationship between the nature of maternal attachment to fetus and psychophysiological development of a newborn child with a longitudinal design. longitudinal, The Maternal-Fetal Attachment Scale (Cranley, 1981), Irritability, Depression, Anxiety Scale (Snaith, 1978), data from newborns’ medical records, Mann-Whitney U-test, Pearson’s correlation coefficient, regression analysis. The sample included 225 women with natural pregnancy (NP) and 93 women with IVF (IVF women) in the third trimester of pregnancy, and their newborn children informed consent of women. All respondents are the participants of Russian “Prospective Longitudinal Interdisciplinary Study-PLIS”. Results. The mean scores of characteristics of maternal attachment to fetus (“Giving of self” (GIVINGSL), “Differentiation of self” (DIFFSLF), “Role taking” (ROLETAK), “Attributing characteristics and intentions” (ATTRIBUT), “Interaction with the fetus” (INTERAKT), composite score of attachment (MFA)) in the IVF group lie within the normal range and are significantly higher than in the natural conception group (NCG). The mean scores of depression and outward irritability of women in both groups, the anxiety level of IVF women are in the normal range. An increased anxiety level was observed in some women with NP, of inward irritability was diagnosed in women of both groups. Anxiety level is significantly higher in women with NP. IVF women have significantly higher MFA. In the NCG, negative correlations (p<0.05) were observed between GIVINGSL and outward irritability, DIFFSLF and anxiety, MFA and depression, anxiety and outward irritability. In the IVF group, anxiety negatively correlated with DIFFSLF. Regression analysis revealed (p<0.05) the effect of anxiety and inward irritability on child’s weight, the effect of inward irritability on the 5-minute Apgar score, INTERAKT on newborn’s height, and DIFFSLF on 5-minute Apgar score in NC group. In the IVF group INTERAKT has effect on the Apgar measurement. Results of correlation and regression analysis revealed the effect of psychological state and maternal attachment on newborn’s psychophysiological development. The research was supported by The Tomsk State University competitiveness improvement programme.
PSYCHOLOGICAL STATES AMONG PREGNANT WOMEN AND MATERNAL ATTACHMENT TO FETUS AS A FACTOR OF CHILD’S PSYCHOPHYSIOLOGICAL DEVELOPMENT

PSYCHOLOGICAL CHARACTERISTICS OF THE LIFE-WORLD AMONG THE ELDERLY WITH EXPERIENCE OF ELDERLY ABUSE

Olga Terekhina
Ksenia Bozhenkova
Tatiana Bokhan
Edward Galazhinsky
Anna Ulyanich
National Research Tomsk State University (Tomsk, Russia)

The main contradiction that determines the need for scientific development of the problem of the gerontological violence psychology is, on the one hand, the increase in the number of elderly people and the task of protecting them from violence, maintaining the quality of life, on the other hand - the limited scientific data on the gerontological violence psychology. The average prevalence of elder abuse is 4 to 6% (Etienne G., 2002). High rates of suicide are recorded among people aged 80 years and over (Pridemore W.A., 2003).

Purpose of the study is to identify the conditions and features of the experience of gerontological abuse in the structure of the life-world of elderly.

Methods: transspective analysis; questionnaire for the study of elderly abuse (Puchkov P.V.); the Questionnaire of the openness degree; "Psychological autobiography" (Korzhova E.Yu.); the Questionnaire of quality of life SF-36 (Ware J.E.); "Diagnosis coping strategies" (Heim E.). Statistical methods: descriptive statistics, U Mann-Whitney criterion, factor and regression analysis. The sample included 277 people aged 55 to 85 years: with experience of gerontological abuse - 204; without it - 73 people (men – 56, women – 221 people).

Persons with experience of gerontological abuse significantly more often experience moral and physical suffering from humiliating, offensive words from the outside, loneliness, helplessness. The regression analysis results indicate the possibility to consider the closeness of the psychological system in the social world as a predictor of the deterioration of vitality (no feeling of fullness of strength, energy). Reduced physical functioning and deterioration of somatic health, for example, the performance of daily activities related to physical stress, pain, are directly related to the lack of openness of the psychological system in the world of culture, where they can find information about opportunities (institutions), ways to improve their physical well-being. Closeness to the world of culture is accompanied by closeness to themselves, so older people cannot both extract useful information from the objective world, and use it to improve their physical condition. The degree of openness of the psychological system can act as a predictor of the quality of life in old age.

The study was supported by the grant of the Russian Science Foundation, project No 18-18-00480 "Subjective indicators and psychological predictors of quality of life".
MODERN UNIVERSITY YOUTH: KEY FACTORS OF PERSONAL AND PROFESSIONAL DEVELOPMENT: A CROSS-CULTURAL STUDY

Irina Atamanova
Sergey Bogomaz
National Research Tomsk State University (Tomsk, Russia)

Ekaterina Perikova
Saint Petersburg State University (Saint Petersburg, Russia)

Tatyana Filippova
Karaganda State Technical University (Karaganda, Kazakhstan)

Elena Ivanova
Irkutsk State University (Irkutsk, Russia)

The paper addresses the issue of university students’ personal and professional development, focusing on identifying its key factors from the cross-cultural perspective. Three major dimensions are supposed to be taken into account for exploring the interplay between personal and environmental aspects when analyzing the problem in question, namely culture-specific value orientations, self-determination and personal readiness for activity. The dimensions mentioned can be viewed as basic criteria to evaluate possible trajectories of university students’ personal and professional development. The paper presents a cross-cultural study aiming at a complex analysis of university students’ cultural values characterizing socio-economic and cultural aspects of their environments, their self-determination as a factor of one’s own activity and parameters of their psychological system of activity viewed in terms of one’s personal readiness for activity. The total sample (N=613) was made up of university students from Russia (Saint-Petersburg, Tomsk and Irkutsk), N=318, and Kazakhstan (Karaganda), N=295. The research tools involved a number of questionnaires aimed at evaluating cultural dimensions (G. Hofstede; R. Inglehart), self-determination in terms of one’s needs for relatedness, competence and autonomy (K. Sheldon, J. Hilpert), achievement and affiliation scales (D. Jackson) and one’s personal readiness for activity (self-organization of activity (E. Mandrikova), systemic reflection (D. Leontiev), satisfaction with life (E. Diener)). The data collected were statistically treated by means of descriptive statistics and analysis of variance (ANOVA). The study findings showed a number of statistically significant (p<0.05) differences between the subsamples (university students from Russia and Kazakhstan). For example, there was a difference in some cultural values, namely long-term orientation (G. Hofstede’s measure) and traditional values (R. Inglehart’s measure). In addition, there were between-group differences in purposefulness, achievement and affiliation. The study outcomes can contribute to a deeper understanding of the interplay between culture-specific personal and environmental factors of university students’ personal and professional development to enhance their personal readiness for activity via adequate psychological support programs in higher educational settings. The study was conducted within the research project (18-013-00781) supported by the Russian Foundation for Basic Research.
REHABILITATION OF DISABLED PEOPLE: THE ROLE OF CLINICAL PSYCHOLOGISTS

Valeria Matsuta
Natalia Kozlova
Tatiana Levitskaya
Inna Atamanova
National Research Tomsk State University (Tomsk, Russia)

The paper addresses the biopsychosocial approach to rehabilitation of people with disabilities and discusses the role of clinical psychologists in this process. Psychological techniques can be highly effective in enhancing disabled people's motivation for healing, developing new behaviour patterns in them to improve their interpersonal relationships, highlighting positive factors of their life and counteracting negative ones. In this context the idea of rehabilitation potential can contribute to a better understanding of the interplay between medical, psychological and social factors in the rehabilitation process. The paper presents theoretical considerations and practical implementations of the concept mentioned, viewing rehabilitation potential as a systemic biopsychosocial characteristic of a disabled person's status. From the biopsychosocial perspective, the focus of the rehabilitation process shifts from evaluating one’s impaired functioning and consequences of one’s disease to seeking for functional resources in a disabled person for possible recovery or compensation of the functions damaged based on a complex of biological, personal and social factors. The paper describes key components of the rehabilitation potential (physiological, psychophysiological, professional, educational, social, and environmental) and its levels (high, medium, and low). It also analyses current practices of implementing such a complex approach to rehabilitation of disabled people. One more important aspect is connected with evaluating the effectiveness and efficiency of the rehabilitation process. The paper discusses psychodiagnostic techniques to be applied to provide such a complex assessment. Thus, the developed conceptual biopsychosocial model of rehabilitation supposes active involvement of clinical psychologists in the system of comprehensive rehabilitation of disabled people. It is this approach that can contribute to their positive life experience, ensuring their successful social integration into the society and improving their quality of life in general. The paper was prepared within the research project (18-013-00937) supported by the Russian Foundation for Basic Research.
PSYCHOLOGICAL SAFETY AND BASIC VALUES OF MODERN YOUTH IN RUSSIA: THE URBAN ENVIRONMENT EFFECT

Valeria Matsuta
Natalia Kozlova
Inna Atamanova
Tatiana Levitskaya
National Research Tomsk State University (Tomsk, Russia)

The paper presents a study on the relationship between modern youth's value orientations and their sense of psychological safety with respect to the effect of their sociocultural environment. Addressing the issue of personality-environment interaction reflects current trends in exploring young people's personal and professional development to identify its key factors, growth points and constraints. The interplay between the determinants of the urban environment and goals and values of young people living there is specific in terms of their psychological safety. In connection to this, the main research objective becomes to study a set of young people's psychological characteristics, their system of attitudes and values that determine their potential to overcome various adverse impacts, ensuring their psychological safety in their local settings. Psychological safety is viewed as a condition for one's wholesome development in the modern society, as a part of one's system of values, allowing one to maintain one's integrity, self-development and to realize one's meaningful goals. The study presented also took into account the issue of gender to find out possible differences in young people's social expectations. The total study sample involved 2162 university students from Russia (Saint-Petersburg, Yekaterinburg, Tomsk, Vladivostok, Barnaul, and Petropavlovsk- Kamchatsky). The research techniques applied were the following: 1) the Basic Values Realizability technique (S. Bogomaz) for examining young people's subjective evaluation of basic values realizability in their local settings and 2) the Portrait Values Questionnaire-Revised (Sh. Schwartz) for measuring 19 value types. The data collected were statistically treated and then analyzed. We used descriptive statistics, analysis of variance (ANOVA) and factor analysis. The study results revealed a number of statistically significant (p<0.05) differences in values between the subsamples (male and female university students). The study findings are discussed in the context of the urban environment effect from the psychological safety perspective. The study outcomes enable ones to gain a deeper insight into the relationships between personal and environmental factors of university students’ personal and professional development in terms of their involvement in various activities in their local settings. The study was conducted within the research project (18-013-00781) supported by the Russian Foundation for Basic Research.
SCIENTIFIC AND PROFESSIONAL PSYCHOLOGY IN BRICS

Purnima Singh
Indian Institute of Technology Delhi, Delhi, India

Lisiane Bizarro
Universidade Federal do Rio Grande do Sul (Rio Grande do Sul, Brazil)

Buxin Han
Chinese Academy of Sciences, Beijing, China

Tholene Sodi
University of Limpopo, Limpopo, South Africa

Aleksander Veraksa
Lomonosov Moscow State University (Moscow, Russia)

Abstract. BRICS countries’ collaboration is developing in various dimensions. Not surprisingly, BRICS psychologists have decided to start a dialogue to explore opportunities for collaboration, best science and practice exchange, and ways to strengthen the links among psychologists in the five countries. The first step has been made in Canada, during iCAP2018, when the established representatives from the five countries met and agreed to facilitate communication among professional societies. This symposium resulted from their information exchange.

Press-paragraph. During the Symposium the nominees from respective psychological societies will talk about state of scientific and professional psychology in their countries. Prof. Lisiane Bizarro will be talking about Brazil, Prof. Purnima Singh will discuss state of affairs in India, Prof. Buxin Han will describe situation in Chinese psychology, and Prof. Tholene Sodi will be sharing on key issues for psychological science and practice in South Africa. Prof. Telmo Mourinho Baptista will be discussant for this symposium.

General Summary of the Symposium. The symposium will cover the following issues for BRICS countries: 1) The societal needs of psychology in BRICS countries, common features and specific aspects; 2) The needs for psychology as a profession and a discipline, their development in line with psychology worldwide and demands of a specific country; 3) Cultural similarities and differences comparing the social adaptation of modern psychology for the welfare and well-being of local people. Emerging economies and societal challenges: Role of psychological science.
The BRICS countries are emerging as a new-fangled centre in the economic world today. Economic development is linked to social, cultural, and educational and scientific progress as can be seen in the expansion of educational opportunities and institutions resulting in, among other things proliferation of interest in psychological science and recognition of its role in human and societal welfare. With economic development, however, newer societal challenges emerge which also not only confront psychological science but also make the discipline question its relevance. Though modern psychology developed in the Euro-American context and got imported to other parts of the world, including BRICS countries, but now psychological science in these countries have acquired roots and is prepared to meet the emerging societal challenges. This paper examines the development and challenges faced by psychological science in the context of India. Postindependence expansion in the discipline in terms of programmes and research have been noteworthy with departments of psychology opening up in universities as well as expanding to technology, science and management institutions. The discipline had strong roots in philosophy as major psychology departments emerged from philosophy departments but later developed as an independent scientific discipline. Vast expansion in terms of number of psychology professionals, professional psychology associations, publications as well as academic journals happened. Concerns related to quality of training and licensing in case of professionals and publications are raised and some restlessness is visible but slowly and steadily efforts are being made by psychologists in the country to assuage these apprehensions. What is promising is the cultural sensitivity shown by psychological science seen in the discussions and debates centering around culture-based concepts, methods and practices in the field.

It will not be unfair to say that India today is at cross-roads. Being a fast growing economy like other BRICS countries but also facing a galore of issues related to health and mental health, environment, inequality, social justice, poverty, unemployment etc., puts a challenge to efforts to ensure societal welfare within the confines of democratic processes. Psychological science and psychology professionals have to face up to these challenges. Psychology associations have to play a major role in expansion of psychological science and also in internationalization. NAOP India’s member to IUPsyS and Indian psychology in general look forward for greater collaboration with psychology organizations and psychologists of BRICS countries as we believe that our collaboration would facilitate development of contextually relevant psychological science to serve humanity and meet the societal challenges in a better way.
REGULATION FOR THE PROFESSIONAL PSYCHOLOGY IN CHINA — EFFORTS IN THE PAST

Buxin Han
Chinese Academy of Sciences, Beijing, China

Modern psychology was introduced to China for more than 100 years, but the regulation and legislation is just in recent 20 years. While the first lab of psychology was established in 1917, first diploma program of psychology was developed in 1921, and the Chinese Psychological Society was founded in the same year, the National Standard for psychological counseling was issued until 2003, as a formal recognition of psychology as a profession by the Chinese government. Ethical code for the practice of the professional psychologists was issued and published in 2007, and revised in 2018 About 400 universities offer 4-year Psychology programmes for degrees of bachelor, master, and PhD, including clinical psychology and some others from different background (in relation with education, medicine, law, military, social work, etc.). About 2000 graduate degrees of psychology (MSc and PhD) were issued every year, including some continuing education program officially approved by the Ministry of Education. Psychology as both a discipline and a profession have been playing important role in ensuring the health and well-being of Chinese people, but there are apparently over expectation of psychology and psychologists from either governmental official, civilian, and even psychologists themselves. Other challenges were also discussed with respect to the political vulnerability, professional competition with psychiatry, and market oriented training.

REGULATION OF THE PROFESSION OF PSYCHOLOGY IN SOUTH AFRICA

Tholene Sodi
University of Limpopo, City, South Africa

Regulation of the practice of medical and allied professions (including psychology) in South Africa can be traced back to the late 19th century when the Colonial Medical Council of the Cape Province was established in terms of the then Medical and Pharmacy Act of 1891 Subsequent developments led to the establishment of a statutory body known as the Health Professions Council of South Africa (HPCSA). The Professional Board for Psychology is one of the twelve (12) Boards that constitute the HPCSA. Among others, the Professional Board for Psychology has the authority to “control and to exercise authority in respect of all matters affecting the education and training of persons in, and the manner of the exercise of the practices pursued in connection with, any health profession falling within the ambit of the professional board”. To legally practice the profession of psychology in South Africa, one is expected to be registered in any of the following categories: psychometrist; registered counsellor; clinical psychologist; counselling psychologist; industrial psychologist; educational psychologist, or research psychologist. Some recent developments pertaining to the profession and scientific discipline of psychology will be discussed. The paper will also address some of the challenges (historical and current), and prospects associated with the profession and scientific discipline of psychology in (South) Africa.
SCIENTIFIC AND PROFESSIONAL PSYCHOLOGY IN BRAZIL

Lisiane Bizarro
Universidade Federal do Rio Grande do Sul (Rio Grande do Sul, Brazil)

The first Psychology programme in Brazil started in 1953 in the Pontifícia Universidade Católica do Rio de Janeiro. The Brazilian government formally recognized psychology as a profession in 1962. A federal law established the 5-year professional training program at universities that leads to licensure as a psychologist. The main regulatory agency in the country is the Conselho Federal de Psicologia or CFP (Federal Psychology Council) which sets the legal and ethical guidelines for the practice of the profession. There are more than 326 psychologists (90% women), registered in CFP today, most in southeast region. A total of 882 universities offer 5-year Psychology (over 4000h) programmes with a broad background and extensive supervised trainingships. Public (federal and state) universities offer tuition-free, highly competitive and prestigious programmes, but private paid intitutions offer 80% of total courses. About 90,5% of Psychologists did not pursued graduate degrees despite of the generous offer of hundreds of lato senso and 92 strictu senso (MSc and PhD) programmes. Thanks to the sustained Brazilian Graduate System, federal and state supported research, Brazil ranks in 14th on number of published papers in Psychology among 215 countries, although 24th in H-index. Current trends and conditions suggest that the progress of Brazilian psychology over the past decade will endure. Both discipline and profession will have vital roles to play in ensuring the health and well-being of Brazilian society. Major challenges are psychological (and scientific) literacy and the translation of scientific research into public policies.

RUSSIAN PSYCHOLOGICAL SOCIETY: CHALLENGES OF THE DIGITAL ERA

Aleksander Veraksa
Lomonosov Moscow State University (Moscow, Russia)

Russian Psychological Society (RPS), established in 1885, currently has more than 50 branches in different regions of Russia, embraces representatives of more than 100 universities and research institutes. RPS coordinates its work with the Ministry of Sciences and Higher Education of Russia, Ministry of Health, The Ministry of the Russian Federation for Civil Defence, Emergencies and Elimination of Consequences of Natural Disasters and other governmental bodies. Of great importance is participation of RPS in education on the level of educational standards for schools and elaboration educational programs for preschool age. Special attention is given to supporting research projects. In coordination with the Lomonosov Moscow State University and Russian Academy of Education the research "Growing in Russia" was launched on the basis of 4 RPS branches. It is aimed at exploring current childhood developmental trends and changes in social situation of development, leading activities of children and influence of digital world. More than 40 researchers take part in the project and more than 3000 children and their parents, starting from 5 y.o. and 300 teachers are participants of the study. Possibilities of international research groups participation in the study are discussed.
The divorce rate has increased in the United States and most European countries since the 1960s. As a result there has been an influx of publications on the topic of divorce and marriage in the West. However, the situation is very different for the Middle East, especially Egypt. While divorce rates are high (14%-61%- depending on the source) and continuing to climb, there is very little literature and even fewer research studies analyzing the causes and systemic impact of divorce. This panel discussion will focus on how family psychology and interpersonal theory view divorce in four areas: 1) stigma, secrecy and other factors which keep couples, especially women and children unhappily together, 2) The mental factors that impact the couple and the family, 3) What the Fisher Divorce Adjustment Scale and the Beck Depression scale indicate through qualitative and quantitative analysis, and 4) The findings of our research which analyze the systemic phenomenon of divorce in Egypt in order to cultivate culturally based answers on why today’s Egyptian marriages are more vulnerable, how we can strengthen them, and how we can help couples can contain and overcome the negative impacts of divorce.

This panel discussion will present the findings of our pilot study and follow up data. The information will include responses from men and women who are at different decades of their life, length of marriage, and years away from their divorce. Each discussant will present their findings and subsequently the Panel Chair will start a Q&A session. We seek to engage with students, professionals and practitioners in the field of social psychology, marriage and family therapy, couples and family Psychology, clinical psychology and counseling psychology. We are interested to hear culturally diverse ideas and experiences in regards to the overarching questions of our discussion which is primarily: 1) what breaks-up marriages; 2) what can we do about it that is culturally appropriate to our region of the world so that we can mutually create stronger marital environments; and 3) what can we do together to strengthen today and tomorrow’s marriages and families.
THREE DECADES OF REFORM-ORIENTED RESEARCH AND PRACTICE IN MENTAL HEALTH SERVICES IN KYRGYZSTAN

Elena Kosterina
Elena Kim
Elena Molchanova
Nina Bagdasarova
American University of Central Asia (Bishkek, Kyrgyzstan)

Horne Sharon
University of Massachusetts Boston (Boston, USA)

Kyrgyzstan is an example of a small yet steadily developing post-soviet country where many initiatives in mental health are currently taking place with efforts of local and international specialists, local government and non-profit sector. During the past 10+ years, mental health services have been gradually developing and a number of critical initiatives took place, which laid the way for improvement of the system of care delivery and improvement of well-being of a number of vulnerable populations. High-quality research is discussed in this panel as a prerequisite for designing well-informed mental health services for local underserved populations. This panel summarizes some of the most influential research initiatives, which are grounded in local tradition of psychology and culture, while at the same time are aiming at informing policy and service-delivery changes. Barriers faced by psychological service providers as they engage in gender-based violence prevention practice in scarcely-funded crisis centers in contemporary Kyrgyzstan will be discussed to demonstrate how everyday frontline work by Kyrgyzstani professionals is permeated with ideological discourses pertaining to global development agenda and powerfully shape routine psychological practice ultimately producing contradictions for the end clients, i.e., women suffering from violence. The process of current deinstitutlization in mental health will be discussed with such drawbacks as increase of homeless people and increase in societal stigmatization of patients with mental disorders. The panel members will also discuss the gap in understanding of subjective well-being by care providers and beneficiaries from vulnerable populations. Among other initiatives, during years 2017-2019 Kyrgyzstan has been working on the National Policy on Elderly Services for the country, where non-governmental agents, academics and government worked together to define the roadmap for development of multiple services for elderly. Also, the preliminary results of a study on subjective well-being among LGBT individuals in 2018, demonstrated existence of a gap in understanding of factors influencing well-being between service-providers and members of vulnerable communities, in particular LGBT representatives. The panel members will also discuss the first steps in the affirming practices for LGBTQ individuals in Kyrgyzstan in the context of conflicting moral traditions and emerging ethical guidelines in psychology. The research discussed in this panel was partially or fully financially supported by: Social Charity Fund Babushka Adoption DCA Central Asia National Society of Red Crescent, Kyrgyzstan USAID.
REFLECTING ON PSYCHOTHERAPY PRACTICE FOR PSYCHOLOGISTS: TOWARDS GUIDELINES FOR COMPETENCIES AND PRACTICES

Anne Plantade-Gipch  
School of Practitioners’ Psychologists (Paris, France)

Maria Karekla  
University of Cyprus (Nicosia, Cyprus)

Nady Van Broeck  
Catholic University of Louvain (Leuven, Belgium)

David Neto  
Order of Portuguese Psychologists, Specialty Council of Clinical Psychology and Health (Lisbon, Portugal)

Koen Lowet  
Belgian Federation of Psychologists (Brussels, Belgium)

Following the Amsterdam statement on psychotherapy practiced by psychologists, a subgroup was created in 2018 within the Board of Psychology and Health with the aim of constructing a conceptual framework and guidelines for psychotherapy practiced by psychologists. In order to do so, maintaining a dialogue with the profession is crucial. First, the discussants will briefly present on the following topics: psychotherapy as practiced by psychologists, competencies, initial training, continuing education, and ethics. Then, the following issues will be discussed, with the audience in order to feed the work of the EFPA psychotherapy subgroup: How should we define psychotherapy as practiced by European psychologists? What kind of psychological care in general and psychotherapeutic care in particular is indicated to meet the health needs of European populations? What profile of advanced competencies do psychologists need in order to establish a working relationship and offer the most appropriate psychotherapeutic care to various patient / client groups with various health care needs? What are the ingredients of an adequate initial training for psychologists practicing psychotherapy? By what principles should continuing education be underpinned? What ethical reasoning can allow a reflexive practice of psychotherapy? How to help psychologist construct this reasoning during their training and their professional life? This round table will take into account the need to articulate the theoretical, technical and relational dimensions of the practice of psychotherapy in our profession.
EVERYTHING YOU EVER WANTED TO KNOW ABOUT TEST REVIEWS ...

Helen Baron  
(London, United Kingdom)  

Nigel Evans  
Nigel Evans Consulting Ltd (Stroud, United Kingdom)  

Ian Florance  
European Test Publishers Group (Hampton, United Kingdom)  

Mark Schittekatte  
Ghent University (Ghent, Belgium)  

The EFPA Board of Assessment developed a model for test reviews which has been used in developing review processes (e.g. in UK, Norway, Czech Republic, Denmark, Spain). Other countries have their own models (e.g. Netherlands, Germany) and some use a simplified version of the EFPA model (e.g. Belgium). There are many issues in setting up a review process and this session will provide an insight into the different approaches that can be used and their drawbacks and benefits. Examples of issues that need to be addressed in setting up a review process include selecting who the reviewers will be (e.g. academics, practitioners, test developers), who will manage the review process (e.g. the national psychological society, an independent accreditation body, a consortium of academics), who pays for the review process (e.g. the national psychological society, the test publisher, a government agency, users of the reviews) and who decides which tests are reviewed (e.g. test publishers, reviewers, test users). The panel members represent highly experienced practitioners and academics in the field of testing who have all had extensive experience of the test review process from different perspectives. Helen Baron (Chair) is an experienced test reviewer and a consultant editor for the British test review process for over 10 years. Nigel Evans uses test reviews both as a teaching tool and as a resource for his work training non-psychologists in test use. He provides both the perspective of a teacher and test users. Ian Florance is the Executive Director of the European Test Publishers Group as well as a test publisher himself and understand the perspective of publishers submitting their instruments for review. Mark Schittekatte is an academic who has worked with a number of organisations in Belgium to develop a test review process. Psychological tests are used for many purposes across all areas of psychology and therefore this session will be of interest to practitioners from all streams as well to academics interested in teaching and researching on the use of instruments. It will be of particular relevance to those considering developing a test review process in their own country.
WHAT PSYCHOLOGIST SHOULD KNOW AND BE ABLE TO DO: EDUCATIONAL PERSPECTIVE

Tatjana Kanonire
Evgeny N. Osin
Institute of Education National Research University Higher School of Economics (Moscow, Russia)

Sverre L. Nielsen
Norwegian Psychological Association (Oslo, Norway)

Irina Simonenkova
Psychologists Certification Council of State Education Quality Service, Ministry of Education, Latvia (Riga, Latvia)

Vladimir F. Spiridonov
Department of Psychology Institute for Social Sciences RANEPA (Moscow, Russia)

Quality of psychologists’ preparation is a crucial matter with short and long-term consequences for all involved parties – psychologists themselves, professional and general society, educators. Core competencies for psychologists are discussed on national and international levels, for example, in educational standards or in International declaration on core competencies in professional psychology. The focus of the proposed discussion is the core competencies of graduates from bachelor and master programs in Psychology. During discussion the following additional questions will be raised: what differs education in psychology from other educational programs in social sciences; how to balance theory and practice in educational programs and what is the role of scientific training for different professional trajectories; what competencies are expected from graduates in psychological assessment and do graduates of psychological programs are ready for ethical challenges of professional life. It is planned that each discussant presents his or her point for 5-7 minutes and then the general discussion will start. The discussion on the quality of education in Psychology will be interesting for academics and professionals, as well as for employers and psychology students.
E-HEALTH: FROM DYSTOPIA TO UTOPIA. AN EFPA TF ON E-HEALTH PERSPECTIVE ON WHAT WE REQUIRE TO BETTER USE TECH AND IMPROVE CARE

Tom Van Daele
Thomas More University of Applied Sciences / EFPA (Antwerp, Belgium)

Valerija Vidović
University of Zagreb / EFPSA (Zagreb, Croatia)

Maria Karekla
University of Cyprus (Nicosia, Cyprus)

David Daniel Ebert
Vrije Universiteit Amsterdam / International Society for Research on Internet Interventions (Amsterdam, Netherlands)

João Manuel Castro Faria Salgado
Instituto Universitário da Maia ISMAI (Maia, Portugal)

For the last two decades, treatments have been suggested as one way to meet the high need for psychological therapies for mental health disorders. Numerous controlled studies, literature reviews and meta-analyses have documented that therapist-guided internet-based interventions are more effective than waiting-lists, more effected than unguided internet interventions and as effective as face-to-face treatment, with attrition in line with face-to-face treatments. Still, uptake in clinical practice remains low, limiting the potential of e-mental health to help tackle the ever-increasing need for easily accessible and affordable mental healthcare. This panel discussion commences with a brief overview of main findings from two recent review (in part) conducted by the EFPA TF on E-health (Ebert et al., 2018; Karekla et al., in press) on the state-of-the art of internet and mobile-based psychological interventions and on digital interventions to improve engagement and adherence in chronic illness sufferers, respectively. The panel members will subsequently explore why uptake of e-(mental)health remains limited. They will discuss where current gaps are located in policy, research, practice, higher education, and continuous education. The final aim of the panel discussion is to formulate a number of specific suggestions on how digital tools and interventions could be put to better use. Given the broad application area of e-Health and the diversity of the actors involved in successfully optimizing its usage, psychologists from all different professional backgrounds are warmly welcomed to attend. They will furthermore also be offered the opportunity to weigh in on this discussion.
ADVANCING THE LEADERSHIP OF PSYCHOLOGY ACROSS EUROPE TO MAKE A DIFFERENCE TO PEOPLE; DEVELOPMENT AND IMPACT

Nicola Gale  
The British Psychological Society (Leicester, United Kingdom)

Teresa Espassandim  
Ordem dos Psicólogos Portugueses (Lisbon, Portugal)

Tor Levin Hofgaard  
Norsk psykologforening (Oslo, Norway)

David Murphy  
University of Edinburgh (Edinburgh, United Kingdom)

Waikaremoana Waitoki  
New Zealand Psychological Society / Te Rōpū Mātai Hinengaro o Aotearoa (Wellington, New Zealand)

Many psychologists are leaders, leading research teams, leading services, and in contributing to the wellbeing of individuals, families, and communities. Psychology as a discipline has much to offer in solving the world’s complex and intractable problems. Yet while for some, the picture is of a highly influential and well-regarded profession whose knowledge and expertise is sought after, for others psychology is side-lined. What factors lead to success as leaders? Waikaremoana Waitoki will describe the role of leadership to drive an equitable, culturally-relevant psychology. Drawing on examples from psychology in the Pacific, she will outline how successful leadership requires a relational approach that includes those who are most often excluded in psychological services. Teresa Espassandim will consider the role of the professional association, and their responsibilities in leadership development, and share innovative initiatives such as: facilitating access to internships; providing training; support for employability and career management; accreditation of training; access to specialties and internationalisation. David Murphy will talk about how practitioner psychologists have great potential to develop as leaders, particularly in response to current trends towards collective and compassionate leadership. David and colleagues’ longitudinal research has begun to provide valuable insights into leadership development in psychologists. Tor Levin Hofgaard will challenge delegates as to, in a world where what is defined as a fact has become a matter of opinion, how we as advocates for knowledge and science in psychology “get to yes” when it comes to policy makers and key stakeholders? How the ideas of behavioural science could guide our advocacy work. Nicola Gale will talk about how psychologists can be equipped and enthused to take on leadership roles. She will consider the organisational experiences beyond psychology that can demonstrate wider leadership capability. The leadership of professional bodies is central in achieving impact. This panel aims to inspire psychologists to work together to develop the leadership capability and capacity that the profession needs, to ensure psychology is well placed to create a better future for the people, communities and societies we serve throughout Europe and beyond.
Numerous individuals use the internet daily as a primary means of finding health related information, both as a supplement and a replacement of traditional sources of information. Sometimes, users even rely on the internet and internet-and mobile-based psychological interventions to help improve their mental health. In these different contexts, users may report a plethora of benefits (e.g., convenience of time and space, anonymity, lack of stigma). However, the absence of a physical presence of a therapist may present with several challenges regarding ethical considerations. Perhaps one of the most significant concerns is privacy of sensitive information. Other ethical issues may however also include confidentiality and emergency (i.e., dealing with a crisis). This panel discussion brings together experts from three EFPA committees (Ethics Board, Psychology and Health Standing Committee and e-health Task Force) to discuss these ethical issues in relation to various digital media usage. The panel aims to highlight concerns and offer suggestions for both researchers and practitioners when working with digital interventions.
Psychology associations’ discourse has long been characterised by words such as evidence, science, profession, research, training, members, academic, practitioner. It has more recently included concepts such as influence, the public, and tentative mentions of impact. But their advocates often struggle to be heard among the more established notions of what psychology associations are here to do. It is becoming evident however that psychologists themselves want their professional associations to have significant public benefit. Policy makers, and the public too, are also looking to psychology to provide insights into complex and intractable global problems that threaten human, environmental, and other species’ wellbeing and in some cases very existence. The panel will discuss how, drawing on the strength of our regional and international collaborations, we can begin to make a difference. Some of the big picture issues facing our world today include: • Climate Change • Poverty/Inequality • Refugees/Migration • Mental Health • Community cohesion / wellbeing Panellists will consider and debate a fundamental challenge for psychology which is that these issues and others such as technological leaps in health services, increasing political polarisation, disinformation and fake news, while being issues of global importance, are not immediately associated with psychology. How can psychology and psychologists share our science and evidence in a way which is compelling and contributes real insights into how to address these difficult problems? What is the nature of the problem in achieving impact? Capacity? Overlapping and competing interests? How can we address it? Panel members explore creation of a coalition of psychological membership organisations to demonstrate thought leadership around one of the identified global problems, how engagement events, marketing and communications channels can be used, and finally share results with regional and global bodies which can then amplify the shared message with their regional and global constituencies (e.g. EU, UN, WHO). The panel will aim to build consensus around the contribution that Psychology needs to make in addressing global problem(s), positioning psychology associations at the country, regional and global level as thought leaders who are essential partners to politicians and civic leaders grappling with the urgent and existential problems of today.
OCD OR SCHIZOPHRENIA? CORRECT DIAGNOSIS LEADS TO CORRECT TREATMENT

Yakov Kochetkov
Center for cognitive therapy (Moscow, Russia)

Darya Maryasova
Hospital of the Russian Academy of Science (Moscow, Russia)

There are some specific forms of obsessive-compulsive disorder, which is often misdiagnosed with schizophrenia in Russian psychiatric practice. These patients have mental compulsions, mental contamination obsessions, obsessive thoughts about going crazy or losing control. Their safety seeking behaviors include thoughts checking, fixation on mental processes and "sensations in brain". The anxiety level is very high and sometimes they experience almost constant anxiety with depersonalization. Psychotic disorder-related misdiagnosis leads to stigmatization of both patients and their families, maltreatment with significant side effects, relational and employment discrimination, social disadaptation, increased risk of suicide. The aim of the clinical panel discussion is to discuss these cases from a differential diagnosis point of view and implement effective clinical strategies in the practice.

DIALECTICAL BEHAVIORAL THERAPY AS A TREATMENT FOR BORDERLINE PERSONALITY DISORDER

Estefany Lissette Arriaga Domínguez
(Monterrey, Mexico)

Dialectical behavioral therapy, created by Linehan in 1994, offers a satisfactory recovery in patients suffering from emotional imbalance, anxiety, depression among other personality disorders such as borderline, reaching almost 4-6 % of the world population. These patients being those whose treatment is complicated due to a poor diagnosis, lack of interest of the patient and above all, ignorance of psychological treatments by the client and therapist. This therapy integrates the individual sessions with the patient, psychiatric medical treatment if necessary, group training, psychoeducation and patient therapist contact in case of crisis. The four blocks: Mindfulness, Emotional Regulation, Interpersonal Effectiveness and Stress Tolerance, promote the patient a cognitive restructuring, acceptance, validation as well as behavioral methods for his recovery. The advantage of this therapy is that blocks can be modulated in time and structure depending on the needs of the patient, reinforcing the treatment skills It is an advent in the cognitive behavioral area for the treatment of these patients with results from six months of therapy up to a year and a half.
SUICIDE POSTVENTION – HOW CAN THE SCHOOL HELP YOUNG PEOPLE LEFT BEHIND AFTER A SUICIDE?

Ksenia Chistopolskaya
Gennady Bannikov
Moscow Research Institute of Psychiatry (Moscow, Russia)

Kari Dyregrov
Western Norway University of Applied Sciences (Bergen, Norway)

Olga Boyko
Mental Health Research Center (Moscow, Russia)

Suicide at school is a delicate topic to tackle with children, especially if there is a suicide attempt or even death occurred in the class. How to deal with it carefully? How to alleviate children’s fears and other difficult emotions, not promoting such type of behavior? Two specialists with experience in emergency psychology (Prof. Kari Dyregrov and Gennady Bannikov, PhD), as well as a clinical psychologist who has experience in talking this topic over in groups of psychiatric patients, will discuss potential pitfalls and possible solutions of this much needed activity. Target audience: school and clinical psychologists, teachers. Prof. Kari Dyregrov will start with her point of view, then other discussants will add to her position; Ksenia Chistopolskaya will lead the discussion, asking questions.

COGNITIVE THERAPY FOR SOCIAL ANXIETY DISORDER IN ADULTS AND ADOLESCENTS

David Clark
Experimental Psychology University of Oxford (London, United Kingdom)

Yakov Kochetkov
Center for cognitive therapy (Moscow, Russia)

Social anxiety disorder is common and typically starts in childhood or adolescence. Cognitive Therapy for Social Anxiety Disorder (CT-SAD) in adults is a well-established treatment that shows strong evidence of differential effectiveness when compared to other active treatments. In contrast, CBT approaches to social anxiety in young people have yet to demonstrate differential effectiveness and there is some evidence that young people with social anxiety disorder respond less well than those with other anxiety disorders.
THRIVE: HOW PSYCHOLOGICAL THERAPIES TRANSFORM LIVES AND SAVE MONEY

David Clark
Experimental Psychology University of Oxford (London, United Kingdom)

The persistence of social phobia is a puzzle. Individuals with other phobias such as claustrophobia, height phobia, and small animal phobias are able to successfully avoid most encounters with their phobic object and it is generally thought that this avoidance is the main reason for the persistence of their fears. In contrast, the nature of modern society is such that patients with social phobia often have to enter feared social situations. This distinction is recognized in recent versions of the Diagnostic and Statistical Manual for Mental Disorders (APA, 1987, 1994) where avoidance is necessary for the diagnosis of all phobias except for social phobia where it is specified that the phobia situation must be either “avoided or endured with intense distress” (APA, 1994, p. 417; emphasis added). Why does social phobia persist despite regular exposure to feared social situations? The present panel discussion provides an overview of a recent cognitive model of social phobia (Clark & Wells, 1995; Clark, 1997; Wells, 1997, 1998; Wells & Clark, 1997) that was specifically developed to explain such persistence. Following a description of the model, research testing key aspects of the model is summarized, a treatment programme which aims to reverse the maintenance processes specified in the model is outlined, and preliminary evaluations of the treatment and its components are reviewed.

THE FUTURE OF CBT FOR ANXIETY DISORDERS

Yakov Kochetkov
Center for cognitive therapy (Moscow, Russia)

Jurgen Margraf
Silvia Shneider
Alexander von Humboldt
Ruhr-Universität Bochum (Bochum, Germany)

CBT undoubtedly outperforms drug treatments (benzodiazepines, antidepressants) for anxiety disorders such as panic and phobias. Since the 1980s, Western governments have also been warning that benzodiazepines are addictive and should not be used on a long-term basis. Moderate to strong withdrawal syndromes, worsened anxiety, cognitive impairment, and functional decline are consistent consequences of long-term use, and there is a clear dose–response relationship. Regarding depression, it was initially claimed that 70% of the patients responded to antidepressants and 30% to placebo. Today, these numbers are actually closer to 40 and 30% (Khan & Brown, 2015). The average effect size of antidepressants in trials submitted to the FDA is 0.30 (Gibertini et al, 2012), and when looking at clinical significance and “real-world” patients, they are on average not better than placebo (Kirsch, 2010). Even more dubious results in children and adolescents led official institutions such as the UK’s MHRA to conclude that most selective serotonin reuptake inhibitors (SSRIs) to treat depression are both ineffective and harmful.
DIALECTICAL BEHAVIOR THERAPY: RECENT DEVELOPMENTS

Yakov Kochetkov
Pushkarev Dmitry
Center for cognitive therapy (Moscow, Russia)

Dialectical behavior therapy (DBT) was developed as a treatment for parasuicidal women with borderline personality disorder and has been adapted for several other populations. This article describes standard DBT and several adaptations of it and reviews outcome studies with borderline patients in outpatient, inpatient, and crisis intervention settings, borderline patients with substance use disorders, suicidal adolescents, patients with eating disorders, inmates in correctional settings, depressed elders, and adults with attention-deficit/hyperactivity disorder. This treatment outcome review is followed by discussion of predictors of change in DBT, possible mechanisms of change, and current developments in theory, practice, and research.

CBT FOR ANXIETY DISORDERS IN RUSSIA: CULTURAL EXPERIENCE

Yakov Kochetkov
Center for cognitive therapy (Moscow, Russia)

A large amount of research has accumulated on the efficacy and effectiveness of cognitive-behavioral therapy (CBT) for anxiety disorders including posttraumatic stress disorder, obsessive-compulsive disorder, panic disorder, generalized anxiety disorder, social anxiety disorder, and specific phobia. The purpose of the current article is to provide an overview of two of the most commonly used CBT methods used to treat anxiety disorders (exposure and cognitive therapy) and to summarize and discuss the current empirical research regarding the usefulness of these techniques for each anxiety disorder.

Additionally, we discuss the difficulties that arise when comparing active CBT treatments, and we suggest directions for future research. Overall, CBT appears to be both efficacious and effective in the treatment of anxiety disorders, but dismantling studies are needed to determine which specific treatment components lead to beneficial outcomes and which patients are most likely to benefit from these treatment components.
CBT FOR ANXIETY DISORDERS: RUSSIAN EXPERIENCE

Yakov Kochetkov
Alla Kholmogorova
Natalia Garanyan
Center for cognitive therapy (Moscow, Russia)

A large amount of research has accumulated on the efficacy and effectiveness of cognitive-behavioral therapy (CBT) for anxiety disorders including posttraumatic stress disorder, obsessive-compulsive disorder, panic disorder, generalized anxiety disorder, social anxiety disorder, and specific phobia. The purpose of the current article is to provide an overview of two of the most commonly used CBT methods used to treat anxiety disorders (exposure and cognitive therapy) and to summarize and discuss the current empirical research regarding the usefulness of these techniques for each anxiety disorder.

Additionally, we discuss the difficulties that arise when comparing active CBT treatments, and we suggest directions for future research. Overall, CBT appears to be both efficacious and effective in the treatment of anxiety disorders, but dismantling studies are needed to determine which specific treatment components lead to beneficial outcomes and which patients are most likely to benefit from these treatment components.
Psychology training standards and models vary among European countries. As a discipline and science, there have been challenges in developing common language and understanding. The European Certificate in Psychology - EuroPsy, the European standard of education, professional training and competence in psychology set by EFPA and the International Declaration on Core Competences in Professional Psychology exist as guiding tools. New teaching areas have to be integrated into current courses to address emerging fields. We are called upon to work on the unity of our discipline to safeguard the quality of the proposed and implemented standards, as well as the quality of the services and research. Christoph Steinebach will discuss the challenges between the development and application of rules and procedures for standardization and the increasing differentiation among psychology. He will also talk about the role of national associations and European organizations in the adoption of the standards. Rosaleen McElvaney will discuss the development and application of EuroPsy as a common training benchmark for professional psychology across Europe. She will consider the role that EuroPsy has had on member countries with respect to legislative changes on regulation and curriculum development in universities across Europe. Nady Van Broeck will describe the model of education and training for clinical psychologists that was adopted in Belgium and will situate this in a larger conceptual framework. The emphasis here will be on the basic competency profile of psychologists active in health care and the training programs available to prepare students for professional practice. Ioulia Papageorgi will consider the current discussions on the Board of Educational Affairs with a focus on the academic education of psychology at all levels. Daryl O’Connor will consider the research aspect of the discipline, the discussions on the development of research competences for doctoral programs in psychology and the challenges considered by the Board of Scientific Affairs. The panel aims to identify current challenges for developing a common language amongst psychologists concerning education and research training standards. The discussion will put in context current practices and future developments to keep psychology evolving as a discipline.
A COMPREHENSIVE MODEL OF SUICIDE BEHAVIOR: ARE WE READY FOR IT?

Ksenia Chistopolskaya
Moscow Research Institute of Psychiatry (Moscow, Russia)

Rory O’Connor
University of Glasgow, (Glasgow, UK)

Igor Galynker
Mount Sinai Hospital (New York, USA)

Konrad Michel
University of Bern (Bern, Switzerland)

There are a lot of models of suicidal behavior nowadays in suicidology, so the question is: are we ready to build a one big (or small and neat) unifying model? Or the situation today is the best we can have, and multiple models are needed to fit every phenomenon? Acclaimed specialists in the topic and authors of the most known and interesting theories are going to meet in order to try and answer these questions. Prof. Rory O’Connor as the author of the most recent and well-known model will start the conversation, Dr. Igor Galynker will present his critique and his own model – the comprehensive narrative-crisis model of suicide. Then Prof. David Klonsky will defend his 3 Step theory of suicide, and Prof. Konrad Michel will give his own view on suicidal behavior as a goal-directed (or not?) action. Questions and comments from the audience will be most welcome. This Panel Discussion is targeted to suicidologists, psychologists and psychiatrists.

WHAT DO WE NEED TO STUDY TO UNDERSTAND SUICIDAL BEHAVIOR BETTER?

Jie Zhang
Paul Hewitt
Fabrice Jollant
Ksenia Chistopolskaya
Moscow Research Institute of Psychiatry (Moscow, Russia)

There is a lot to study in suicidal behavior, starting from psychiatry, psychology, sociology, and to neurobiology and internet behavior. Specialists in the field will talk about their approaches to suicidal behavior and tell the audience what they found in their studies, and what they are hoping to find in the near future.

Prof. Zhang will start from the sociological perspective, Prof. Hewitt will talk of his perfectionism studies. Prof. Christensen will tell what she managed to do in suicide prevention on the Internet – what are the pitfalls and the advantages in this sphere. Prof. Jollant will look at suicide behavior from the neuropsychological point of view. Ksenia Chistopolskaya will lead the discussion. Questions and comments from the audience are most welcome. The Panel will be interesting for specialists, interested in the field.
COMPETENCE AS A COMMON LANGUAGE FOR PROFESSIONAL IDENTITY AND INTERNATIONAL RECOGNITION. PART 2

Sverre Leonhard Nielsen
Norwegian Psychological Association (Oslo, Norway)

This session will be organized as an "open meeting" with discussions around the themes that were presented in the previous session with the same title. Representatives of international, regional and national associations will be specially invited to participate. All colleagues interested in this issue are welcome to the meeting. Convenor: Sverre L. Nielsen, Norway. Panel consists of Dr. Steve DeMers, USA (Chair),

Pr. Dr. Christine Roland-Lévy, France, president of the International Association of Applied Psychology (IAAP), Dr. Pam Maras, UK, president of the International Union of Psychological Science, (IUPsyS), Dr. Kurt Geisinger, USA, president of the International Test Commission (ITC), Dr. Amanda Clinton, USA Senior Director, APA. Dr. Sverre L. Nielsen, Norway, Chair of the IPCP Work Group.
SCHEMA THERAPY WITH CHILDREN AND ADOLESCENTS EXPERIENCING DIFFICULT LIFE SITUATIONS

Maria Galimzyanova
Elena Romanova
Paul Kasyanik
Yakov Kochetkov

Center for cognitive therapy (Moscow, Russia)

Schema Therapy (ST) is an enhancement and further development of cognitive behavioral therapy (CBT). It integrates elements of cognitive therapy, behavioral therapy, object relations, and gestalt therapy into one unified, systematic approach to treatment. Originally Schema Therapy was designed to treat the long standing emotional difficulties. As the difficulties are presumed to have origins in childhood and adolescent development, in the field of psychological work with children and adolescents schema-therapy is particularly suited to generate action-guiding, diagnostic and therapeutic concepts. ST is based on a model of schemas, modes and the basic needs and their development during the life course. If basic emotional needs (secure attachment/nurturing/acceptance; autonomy; realistic limits; self-esteem; spontaneity and play) are not adequately met in childhood, specific maladaptive schemas, schema modes and coping styles can develop. For example, a child with unmet needs of secure attachment and nurturing, that were deprived after parental loss as a result of death, divorce, or addiction, might develop an Abandonment/Instability schema. In this panel discussion, first the schema therapeutic conceptual model (schemas, modes, coping strategies), the underlying theory (central importance of core needs in the context of developmental tasks), and requirements in the therapeutic relationship (concept of "limited re-parenting" and "empathic confrontation") are going to be discussed. Later, panelists are invited to share their experience regarding the use of diagnostic techniques (exploration, survey, projective and imagery techniques, case conceptualization) and schema therapeutic strategies that are proved to be successful in treatment of children, experiencing difficult life situations. Schema therapeutic strategies with children and adolescents include: working with drawings and pictures, mode-based play therapy, working with stories, finger and hand puppets, metaphors, chair work, imagery. During this panel discussion ST therapists will share their experience and ideas in a field of schema therapy with children and adolescents, experiencing various difficult life situations.
LEARNING FROM MISTAKES; HOW DO WE DEAL WITH COMPLAINTS CONCERNING UNETHICAL BEHAVIOR IN OUR PROFESSIONAL ASSOCIATIONS?

Kristina Taylor
Swedish Psychological Association (Stavsnäs, Sweden)

In a meeting in Paris in May 2018 members on the EFPA Board of Ethics hosted a symposium at Nanterre University where we described and discussed the different complaint procedures of our respective national Ethics committees, and the philosophical principles underpinning them. French colleagues attending the symposium expressed great interest in the discussion and we thought there would be even more learning to be made if we expanded the idea to the ECP. In this panel discussion we wish to explore the implications of the procedural differences for the European community of psychologists when it comes to how we understand and face a number of essential and difficult tasks of our profession, such as:

• possible unethical behavior in fellow psychologists

• our mutual professional ethics in general

• teaching professional ethics

• how we facilitate learning and ethical reflection throughout our professional lives

The aim of this panel discussion is to share procedures and experiences from different countries, individuals and professional associations. Through reflective dialogue - including the participants - we hope to inspire and explore the philosophical and practical reasons for procedural differences, and also the possibilities and a risk of the different "takes". The ultimate goal is to find new understandings and paths in quest for an ever deepening and continuous ethical reflection and new ways of learning from mistakes that colleagues and we make.
INTERNATIONAL PERSPECTIVES ON THE PSYCHOLOGY OF IMMIGRATION

Amanda Clinton
Sofia Ramalho
Anders Wahlberg
Simon Goodman
Ellen Garrison

Background
Immigration is a critical issue for nations across the world, ranging from governmental shifts in places like the United States to the refugee crisis on the European continent. Currently, controversy surrounds policies and programs aimed to address immigration. These range from how to determine if an immigrant qualifies for legal status to the kinds of services that may be provided. Controversy
The aim of this symposium is to explore the role of psychology in relation to immigration across four nations: Portugal, Sweden, the United Kingdom, and the United States. Experts on the psychology of immigration from each country will present organizational, public health, clinical and policy-oriented work. Specifically, efforts by psychological associations to educate policy makers about immigration, public health and refugee access to care, clinical implications related to lack of psychological intervention for immigrants and data related to policy development will all be addressed. Conclusions address future contributions of psychology designed to address immigration needs at several levels. Viewpoints
Portugal: The Portuguese Order of Psychologists will discuss advocacy for public policies informed by psychologists that address major societal challenges related to migration and refugee issues. Specifically, efforts to influence literacy of the general population as well as to enhance the mental health and refugees in Portugal. Sweden: Over 1/5 of Sweden's inhabitants are first or second-generation immigrants, a demographic that means mental health care for immigrants is an important issue in the country. In particular, the Swedish Psychological Association dedicates significant work to addressing psychological service for immigrants and ways in which government policy limits services to this population. In particular, the SPA addresses ethical dilemmas that occur when government policy is incongruent with mental health needs and professional conduct codes of psychologists who serve critical populations. United Kingdom: The psychological impact of migration policies on refugees and asylum seekers is of critical import in the psychology community in the United Kingdom. Immigration and detention facilities in the UK are among the largest in Europe and the conditions exacerbate psychological damage endured by asylum in the process of fleeing their home country. The hostility that exists in detention systems is discussed in the context of ways in which psychologists should be advocating for increased supports and opportunities as part of the immigration process. United States: Recent policies by the Trump administration aimed at constructing walls – both actual or in the form of travel bans – to restrict immigration on the basis of race, religion, national origin, and social class run counter to the promise of the iconic Statue of Liberty. This American Psychological Association focuses on the leading role taken by the APA to advocate on behalf of the application of psychological science to key psychological issues at stake in the national debate over immigration, to offer mental health assistance to detainees – notably children and their families.
HELP ME GET PUBLISHED! WRITING FOR PEER REVIEWED JOURNALS

Gewirtz Abigail
Zhu Liqi
Obschonka Martin
Piehler Timothy
Abigail Gewirtz

This panel discussion aims to provide perspectives and tools for those at all stages of their career who would like to have their papers published in peer reviewed psychology journals. The panel includes the Editorial team (Editor-in-Chief and Associate Editors) of the International Journal of Psychology, the flagship journal of the International Union of Psychological Science, the membership organization of the world’s psychological societies. All are well-published authors and each will present their perspective on the conceptualization, preparation, writing, and submission of peer-reviewed articles. In addition to general issues regarding peer-reviewed publishing, the panel will cover specific issues such as: journal metrics, developing creative and accurate article titles, how to avoid unintentional self-plagiarism, and open science/data sharing. The panelists come from and/or are faculty in institutions in Europe, China, Australia, and the USA, and will also discuss publishing in journals with broad psychological foci vs. narrow disciplinary foci. The panel presentations will be followed by a discussion with the audience and between panelists.
XVI European Congress of Psychology

2–5 JULY 2019 MOSCOW, RUSSIA

ORAL PRESENTATIONS
PSYCHOANALYTIC STUDIES OF FEMALE SEXUALITY

Edgar Alfonso Acuña Bermúdez
Acuña Bermúdez Edgar Alfonso
Universidad de San Buenaventura de Cartagena
(Cartagena, Colombia)

The present material is aimed at describing the intrapsychic experience from the dynamic and psychoanalytic foundations of the functioning of sexuality in women in their verbal and corporal expression, repression and personal and cultural self-improvement, with the presence of the different moments of the oedipal conflict and their respective departures; analyzing conflicts, castration, their primary and current relationships, drive, enjoyment, and family, so that in her emotional life woman must be not only an object of desire but also a subject who desires, her realization in favor of her emotional satisfaction.

The importance of women with the understanding of processes from the unconscious psyche to consciousness through serious classical and contemporary psychoanalytic studies of female sexuality, studying the vitality of the link with the mother and father figure in the oedipal conflict with her components in the pre-genitality of the girl and her second sexual awakening in adolescence that extends and points the right way to her later sexual and couple life, viable in the processes of psychotherapy facilitating the experience and professional practice for several years in clinical psychology and psychoanalysis applicable with excellent results and that can be extended to different contexts, facilitating attendees an approach and a view from the social disciplines and mental health in the approach to interpret her development process.
The paper is going to present research findings with Bulgarian Turkish and Romani speaking minority preschool children. The connection of Theory of Mind and language knowledge by minority bilingual children is investigated, but the research findings are controversial. The knowledge of two languages sometimes create problems in the understanding of the Theory of Mind Tasks. However very little attention is paid to the children’s knowledge of the syntactic structures of their mother tongue and its role in the process of understanding of Theory of Mind. The ideas of J. de Villiers about the influence of language on Theory of Mind is investigated. Two groups of minority children from Bulgaria (Turkish speaking and Romani speaking) are involved in the study. The number of the children is 120 (60 Turkish speaking and 60 Romani speaking) divided in 3 age groups: 1 gr (3;7 – 4;0 years old), 2 gr. (4;1 – 4;6 years old) and 3 gr. (4;7 - 5;0 years old). The children were tested with 2 verbal and 4 non-verbal False Believe Tasks. From language tests the children were tested with 8 wh- questions and 8 Evidentality tasks. All the tests were done only in the mother tongue of the children. The results of the children are analyzed with ANOVA. The research findings show that there are statistical correlations between the wh-questions and verbal False Believe Tasks and between the Evidentiality Task and the non-verbal False Believe Tasks. The results show that the level of the knowledge of complex syntactic structures in the mother tongue help the children to understand the Theory of Mind earlier — between the age of 3;7 - 4;0 years old.
RUSSIAN PSYCHOLOGY FACING THE RISE OF GLOBAL SCIENCE

Irina Mironenko
Saint Petersburg State University (Saint-Petersburg, Russia)

In contemporary globalizing world, a global psychological science inevitably arises, which presupposes general renovation of the domain of psychology, new objects of research, as well as changes of the subject of research activity — the international scientific community. The concept of "global psychology" appeared in the international discourse and is being intensively developed since the 1990s. The discourse of global psychology is aimed at elaboration of a science that can adequately respond to the challenges of the global world, reflect psyche of contemporary human being, who is living in the reality, where different cultures merge, interact and coexist. In the international science the discourse is generally positive and marked with the spirit of emergence of new schools and growth of diversity, of the liberation from the outdated dogmas. Meanwhile, in the Russian scientific community ideas of isolationism and autarky are not completely overcome, based on the language problem and fear of the loss of specificity. It seems apropos to renounce isolationist tendencies, to develop cooperation and integrate into the new stage in the development of science. In the network of the global science, Russian psychology can take a worthy place, possessing a serious theoretical and methodological heritage and knowledge of psychological characteristics of a multimillion people. At the same time, Russian psychology can and should preserve its unique character, its specificity, because it is by this uniqueness that it can be of interest and in demand for the international scientific community. The formation of global psychological science does not mean unification. It presupposes not only processes of integration of "local" traditions and schools, but also processes of differentiation, so that theoretical models of human nature that have been firmly rooted in the mainstream in the second half of the twentieth century are now being called in question as well as methodological foundations of these theories. Global psychology is formed as a multipolar network, including very different centers. It appears as a bifurcation reaction, a divergent development of new and reinterpreted old psychological theories in an attempt to explain the new empirical realities generated by the era of globalization.
NEW TRENDS IN THE PSYCHOLOGY OF LIFE SITUATIONS

Elena Korzhova
The Herzen Russian State Pedagogical University (Saint Petersburg, Russia)

Life problems involve a special layer of psychology bringing research to the ontological level. Psychology of life situations is currently very relevant and popular direction of psychology. Life situation in form is a fragment of environment as external objective circumstances of life in direct contact of a person. Life situation in content is a situation of personal life, i.e. the most significant for a person life circumstances. These differ from similar concepts of "social situation", "critical situation" or "crisis situation" et all. Such a direction was formed since the late 90-ies of XX century and allows to consider the psychology of a person as not isolated, but in conjunction with the life circumstances (Burlachuk L.F., Korjova E.Yu., 1998). During this time the concept of a person as a subject of life course has been worked out (Korjova E.Yu., 2015). The phenomena of internal picture of life and attitude to life, the choice of strategies of behavior and actions, the subject-object orientations and general personality orientation fall into the focus of view. The subjective aspect of a person interaction with life situation allows to understand the role of single life situations in a whole life course. The objective aspect of a person interaction with life situation involves the analysis of behavior and its strategies. The life orientations characterize the direction of interaction with life situation and play a decisive role in the life course. There were selected the components of life orientations characterizing the degree of subjective involvement in life situations: life variability (desire for self-transformation), life locus of control (location of responsibility), focus of the exploration world (the vector of direction of the being), life mobility (the desire for new life situations). The typology of life orientations at the intersection of axes "life creativity" and "life responsibility" has been created. On its base the hierarchy of theoretical models of personality has been presented. The types of life course have been developed and their psychological characteristics have been highlighted. The methods for study a person interaction with the life situation phenomena have been developed and psychometrically justified. The study was supported by the Russian Foundation for Fundamental Studies № 17-29-02438 "Psychological, social and ecological resources of students’ health in modern Russia".
DESIGNING AND TESTING A MODEL OF SOME ANTECEDENTS AND OUTCOMES OF WORKPLACE ENVY

Nasrin Arshadi
Armaghan Eslami
Shahid Chamran University of Ahvaz (Ahvaz, Iran)

The purpose of this study was designing and testing a model of some antecedents and outcomes of workplace envy. The participants of the study were 304 employees of NISOC, in Ahvaz (215 males; 74 females) that were selected by stratified random sampling method. The instruments which used in this study were workplace envy, leader-member exchange (LMX), core self-evaluation (CSE) prosocial behavior, social undermining, and moral disengagement questionnaires. The fitness of the proposed model was examined through structural equation modeling (SEM), using SPSS-23 and AMOS-23 software packages. The indirect effects were tested using the bootstrap procedure in Preacher and Hayes (2008) SPSS Macro program. Findings indicated that the proposed model fit the data and all hypotheses have been confirmed. Effect of leader-member exchange (LMX) and core self-evaluation (CSE) on workplace envy and effect of workplace envy on prosocial behavior, social undermining, and moral disengagement were significant. Moral disengagement also mediated the relationship between workplace envy and social undermining.
INTERPERSONAL INSECURITY AND RISK-TAKING PROPENSITY ACROSS DOMAINS AND AROUND THE GLOBE

Jingyi Lu
Yi Zhang
Jiayi Liu
East China Normal University (Shanghai, China)

During social interactions, individuals frequently experience interpersonal insecurity, including feelings of not being loved, trusted, or cared for; these feelings cause numerous behavioral consequences. The present research explores the relationship between interpersonal insecurity and risk-taking propensity. Risk-sensitivity theory posits that risk taking is a product of need. Risk is defined by outcome variance such that a high-variance option is riskier than a low-variance option. Need refers to the disparity between a status quo and a goal. Seeking high-variance options provides a chance to obtain a better outcome, thus satisfying the need to obtain essential resources and contributing to a successful life. Given that interpersonal security with in-group members (vs. out-group members) is more fundamental, a lack of interpersonal security with in-group members (vs. out-group members) will evoke a higher need to obtain more resource. Therefore, we hypothesize that interpersonal insecurity, in general, will be positively associated with risk-taking propensity. Moreover, the positive relationship between interpersonal insecurity and risk-taking propensity will be stronger with in-group members than with out-group members. In Study 1, participants (N = 209) reported their interpersonal insecurity and indicated their likelihood of engaging in risky behaviors across seven risk domains (natural/physical, moral, financial, reproduction, cooperation, safety, and gambling risks). The results show that risk-taking propensity generally increases with interpersonal insecurity. However, this relationship was negative in the cooperation domain and null in the financial domain. In Study 2 (N = 128,162), archival data from the World Values Survey from 77 countries reveal a positive correlation between risk-taking propensity and interpersonal insecurity with in-group members but a negative relationship between risk-taking propensity and interpersonal insecurity with out-group members. This research reveals a general tendency in which risk-taking propensity increases with interpersonal insecurity, based on both small- and large-sample surveys. However, this association has two boundary conditions: risk domain and group identity (in-group or out-group members). Interpersonal insecurity is not associated with risk-taking propensity in the financial domain and is negatively associated with risk-taking propensity in the cooperation domain. Furthermore, risk-taking propensity increases with interpersonal insecurity with in-group members but decreases with interpersonal insecurity with out-group members.
THE MEDIATING ROLE OF WORK ENGAGEMENT BETWEEN JOB CRAFTING AND JOB PERFORMANCE AMONG NATIONAL SECONDARY SCHOOL TEACHERS

Alia Azalea
Bhargkavi Pari
Universiti Tunku Abdul Rahman (Kampar, Malaysia)

Employees who are able to craft their working atmosphere are expected to be more engaged with the tasks in their job, which eventually will boost their job performance. Based on Job Demands-Resources theory, this study hypothesised that work engagement mediates the relationship between secondary school teacher's job crafting and job performance. A quantitative design using questionnaires consisted of Job Crafting Scale, Utrecht Work Engagement Scale, Task-Based Job Performance Scale and Organizational Citizenship Measure was utilized. Four hundred secondary school teachers from the northern region of Malaysia were recruited for this study. Using PROCESS, a technique by Hayes (2015), this study yields an indirect effect of .333. This implied that two teachers who differ by one unit in their reported job crafting were estimated to differ by .333 units in their reported job performance, as a result of those who craft their work feel more engaged with their work, which in turn translates into greater job performance. The direct effect of job crafting, .346, means that the teacher who craft their job more but is equally engaged with their work is estimated to be .346 units higher in their reported job performance. The total effect of job crafting on job performance is .679, where two teachers who differ by one unit in job crafting are estimated to differ by .679 units in their reported job performance, thus, teachers with higher job crafting behavior report higher job performance. To conclude, there is a decrease in the effect of job crafting on job performance when involving work engagement, suggesting that mediation has occurred. Thus, this study supports its hypothesis. This study has contributed to the literature of job crafting in the Malaysian context. Its findings can be used by educational policymakers and school management to promote teacher's job crafting behavior as it uplifts teachers' work engagement and eventually their job performance.
THE RELATIONSHIPS BETWEEN RECOVERY EXPERIENCE, PAY SATISFACTION AND WORKERS’ HAPPINESS

Tzyy Jiun Lung
Lung TzyyJiun
Hsuan Chuang University (Hsinchu, Taiwan)
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

From 2016, Taiwan government tried to reduce the working hours in Labor Standards Act from 44 hours to 40 hours for per week, to protect labor physical and mental health, but over time, more than more employers and employees hold opposite this opinion. In 2017, Ding emphasized working hours and payment should be equivalent, when the government reduced working hours in labor Standards Act, but any study did not show the relationships of working hours, payment and workers’ happiness. For this reason, this study is to investigate the relationship between workers’ recovery experience, pay satisfaction and workers’ happiness. 172 workers participated in this study. To test the hypotheses, descriptive statics, Pearson’s correlation analysis t test, one way Anova and multiple regression analysis are used. Our results showed: (1) Pay satisfaction has a significant positive influence on workers’ happiness; (2) the relationship between pay satisfaction and works’ happiness is partially mediated by workers’ recovery experience; (3) the activities after working 8 hours makes workers’ recovery experience differently; (4) the different level of wages and educations make pay satisfaction differently. For conclusion, before modify the working hours of the Labor Standards Law, workers’ pays satisfaction is first.
CARDIOVASCULAR REACTIONS TO EMOTIONAL STRESS IN DAILY LIFE: THE RESULTS OF THE PSYCHO-PHYSIOLOGICAL INVESTIGATION

Larissa Burruano
AMEOS Psychiatry and Psychotherapy Hospital
(Hannover, Germany)

The aim of this work was to assess the differences in cardiovascular reactivity between men’s and women’s blood pressures and heart rates resulting from emotional influences on their blood circulation in daily life. In addition, the work tested various hypotheses such as whether a general drop in blood pressure and its cardiovascular parameter actually takes place. On the basis of continual, non-invasive blood pressure monitoring, the mean day and night blood pressure values and their cardiovascular parameters (heart rate, blood pressure amplitude, pressure frequency product, stroke volume, cardiac output) under normal conditions were compared with the help of standardized stress tests in 39 test subjects who had high blood pressures between 130/85 and 159/99 mmHg and who were not having antihypertensive therapy. Whilst the measurement was taken, both the location of the trial subject and emotional and situational factors were recorded in 30 minute intervals via an electronic diary with standardized questions. A negligibly significant lower heart rate (1st day = 83,0 beats/min vs. 2nd day = 80,0 beats/min; p = 0,05), pressure frequency product (1st day = 10,0 mHg/min vs. 2nd day = 8,8 mHg/min; p < .05) and additional systolic blood pressure (1st day = 2,34 units/min vs. 2nd day = 1,81 units/min; p < .05) were in evidence among the trial subjects on the second day of the trial. Gender specific differences were able to be established in a drop in the mean day heart rate value (1st day men = 83,6 beats/min vs. 2nd day men = 77,7 beats/min; p < .05) and additional systolic blood pressure in men (1st day men = 2,3 beats/min vs. 2nd day men = 1,9 beats/min; p < .05). Men and women react differently to emotional stresses under everyday circumstances. The results of this psychophysiological investigation support the hypothesis that an elevated blood pressure in both men and women in daily life is associated with irritation, fear and problems in dealing with stress, as well as an elevated cardiovascular reactivity.
PERCEIVED SOCIAL SUPPORT AND FUNCTIONAL DEPENDENCE IN THE ELDERLY WITH PAIN

Ara Mercedes Cerquera
Universidad Pontificia Bolivariana Bucaramanga
(Bucaramanga, Cordoba, Colombia)

The idea that old age is synonymous with disease has historically prevailed in the minds of health professionals and the general population. Although Gerontology highlights the physiological aspect as one of the main characteristics of aging, it is also a stage in life where vulnerability to diseases and disabilities grows (Ortigosa, Riquelme and Martín, 2010), due to the physical, psychological and social decline brought about by the increasing age (Melguizo et al., 2014). The objective of the present investigation was to describe the level of functional dependence and perceived social support in the elderly with musculoskeletal pain in the city of Bucaramanga, Colombia. Methodologically, a cross-sectional descriptive investigation was carried out with non-probabilistic convenience sampling with a sample of 200 older adults. The Londoño perceived social support instrument, the Barthel test and the McGill questionnaire were applied. As a result, it was found that there is a higher prevalence of married women between the ages of 65 and 75 belonging to strata 3, with a level of schooling without primary completion. The participants described their pain as sharp 58.5%, cruel 71.5% and annoying 61.0%. Besides, 72% did not know the medical diagnosis. Regarding the variable of social support, it was found that the majority has high levels of social support and 86.5% are totally independent. It is found in different investigations that, the greater the presence of pain, the higher the dependency level. Despite the fact that in the sample of this investigation there is presence of pain, there are no high levels of dependence. Perhaps the subjective perception that the older adult has about their condition influences the experience of pain and the feelings of utility and independence. Finally, it is important to point out the need to continue developing descriptive studies that make it possible to delve into psychosocial aspects of the elderly population and their involvement at the individual level, with the purpose of characterizing these variables and determine the relationship among them through subsequent correlation studies.
RESILIENCE AND ASSOCIATED VARIABLES IN INFORMAL CAREGIVERS OF PATIENTS WITH ALZHEIMER’S TYPE DEMENTIA

Ara Mercedes Cerquera
Università Pontificia Bolivariana Bucaramanga
(Bucaramanga, Cordoba, Colombia)

Resilience, as a form of intervention in the informal caregiver, involves informative, behavioral and emotional aspects. Gómez (2010), defines it as a universal capacity that can be promoted throughout life cycles, and that is linked to human development and growth. For the present study, variables such as overload, coping strategies, perception of social support and depression were determined, to identify how they are associated with resilience. This work consists of a quantitative study of transversal type with descriptive-correlational scope. The convenience sample consisted of 101 informal caregivers of patients with Alzheimer’s type dementia, from the city of Bucaramanga, Colombia. The instruments used were the Wagnild and Young Resilience Scale (1993), the Caregiver Load Scale (Zarit, 1980), the Coping Strategies Scale (Londoño, 2006), the Social Support Questionnaire (Sherbourne & Stewart, 1991) and State-Trait IDER Depression Inventory of Spielberg, Buela and Agudelo (2008). Furthermore, the guidelines of Law 1090 of 2006, referring to research with humans and respect for the dignity and well-being of people who participate with full understanding of the research, were taken into account to carry out the research. The study found that informal caregivers are resilient, have moderate and intense rates of overload, and an adequate perception of social support. As for coping strategies, it was found that religion is the most used. No depressive symptomatology was identified. Among the correlations of resilience with the study variables, a positive correlation was found with social support and with the problem solving coping strategy; and a negative correlation with depression. The analysis carried out highlights the fact that protective factors (such as social support, resilience and problem solving) and risk factors (such as depression) can be found in caregivers, serving as a basis for the design of intervention programs. Thus, it is recommended for subsequent studies to work on the design, implementation and evaluation of intervention programs for caregivers.
THE EFFECT OF CRANIOPLASTY ON NEUROPSYCHOLOGICAL OUTCOME: EXPERIENCE OF PSYCHOLOGICAL INTERVENTIONS AT THE STAGE OF CRANIOPLASTY

Elena Sinbukhova
N.N. Burdenko National Medical Research Center of Neurosurgery (Moscow, Russia)

Cranioplasty is considered as a primary treatment for correction of skull defects after traumatic brain injury (TBI), to eliminate the cosmetic disadvantage of appearance and to protect brain. In our study we assessed emotional symptoms and cognitive function at the stage of the cranioplasty after TBI. To evaluate the dynamics of anxiety, depression, and cognitive functions in patients after TBI, at the stage of cranioplasty. Patients were tested by the same psychologist before cranioplasty, on the 7-8th day after surgery. Trail Making Test, Verbal Fluency Test, Wechsler Adult Intelligence Scale (WAIS) (Working Memory Index: arithmetic, digit span), Montreal Cognitive Assessment (MoCA), neurocognitive tests according to Luria, 10 words test, visuospatial memory testing (complex images), HADS Depression Inventory, Spielberger-Hanin anxiety test. Patients were asked to self-evaluate their appearance in the period of life before acquiring the defect, as well as before and after cranioplasty. All patients had sessions with a psychologist directed to lower the level of anxiety and depression after TBI during their stay in hospital (cognitive behavioral therapy and art-therapy). Results: We examined 40 patients (avg. 34.7 y.o.) undergoing cranioplasty. A statistically significant increase in MoCA scores was observed by the 8th day after surgery (p= 6.553e-07). Depression and anxiety (personal and situational) were significantly reduced by the 8th day (p= 2.114e-12; p= 7.339e-14 and p= 3.194e-13). We revealed a significant early improvement of cognitive functions at 92.5% of patients undergoing cranioplasty. Depression is the most common complication after TBI. Severe depression after TBI is worsening the quality of life and the results of further rehabilitation. Psychological interventions help to reduce anxiety and depression at the stage of the surgery.
ANXIETY, DEPRESSION AND RISKS OF THE EATING DISORDER IN ECUADORIAN ADOLESCENT WOMEN

Geovanny Genaro Reivan Ortiz
Universidad Católica de Cuenca (Cuenca, Ecuador)

The present investigation counted on a non-experimental transverse design with a type of descriptive correlational study. Its objective was to determine the relationship between anxiety and depression factors and the risks of anorexia nervosa and bulimia nervosa; also know if age is related to the risk of suffering from anorexia nervosa and bulimia nervosa. The population was made up of an equiprobabilistic sample of n = 190 women from 11 to 18 years of age (M = 14.11, SD = 1.73) of the "Particular Educativo Católica de Cuenca" of Ecuador selected by a mono-phase conglomerate sampling design stratified using the Epidat 4.2 software. The instruments used were: the Food Attitude Test (EAT-40) and the Goldberg Anxiety and Depression Test. The data were analyzed in the statistical package SPSS 24.0. The results show that there is a statistically significant association between the risks of anorexia and bulimia nervosa with the factors of anxiety and depression, as well as age.

BOYS’ INVESTMENT IN MASCULINE GENDER NORMS AND THEIR USE OF BODY CHANGE STRATEGIES

Marita McCabe
Swinburne University of Technology (Hawthorn, Australia)

Gemma Tatangelo
Deakin University (Burwood, Australia)

Catherine Connaughton
Australian Catholic University (Melbourne, Australia)

David Mellor
Deakin University (Burwood, Australia)

By the age of 8 years, boys experience body dissatisfaction and use strategies to become thinner and more muscular. The factors contributing to these outcomes are not well understood. This study examines boys’ investment in masculine gender norms and how this relates to their body esteem and their use of body change strategies. Participants were 321 boys aged 7 to 11 years in Melbourne, Australia. They completed an anonymous questionnaire in a classroom setting that evaluated investment in masculine body change strategies, body esteem and sociocultural influences on body change strategies. The results indicated that boys are invested in masculine physical ideals of strength and athleticism. Investment in these masculine ideals predicted boys’ use of body change strategies. In addition, investment in masculine gender norms moderated the relationship between pressures from peers and boys’ use of body change strategies. The findings highlight the importance of gender norms in shaping boys’ body change strategies at a young age. They also identify several avenues for further research, including the ways in which boys may feel pressure to display gender congruent characteristics and how this is related to their development.
AN EXISTENTIAL CRITERION OF NORMAL AND ABNORMAL PERSONALITY

Sergey Kapustin
Lomonosov Moscow State University (Moscow, Russia)

I propose a new so-called existential criterion of normal and abnormal personality that is implicitly present in the works of Erich Fromm. According to this criterion, normal and abnormal personalities are determined, first, by special features of the content of their position regarding existential dichotomies, and, second, by particular aspects of the formation of this position. Such dichotomies, entitatively existent in all human life, are inherent, two-alternative contradictions. The position of a normal personality in its content orients one toward a contradictory predetermination of life in the form of existential dichotomies and the necessity of searching for compromise in resolving these dichotomies. This position is created on a rational basis with the person's active participation. The position of an abnormal personality in its content subjectively denies a contradictory predetermination of life in the form of existential dichotomies and orients one toward a consistent, noncompetitive, and, as a consequence, one-sided way of life that doesn’t include self-determination. This position is imposed by other people on an irrational basis. Abnormal personality interpreted like this is one of the most important factors influencing the development of various kinds of psychological problems and mental disorders—primarily, neurosis. I have shown that this criterion is implicitly present in the personality theories of S. Freud, A. Adler, C. Jung, C. Rogers and V. Frankl, although in a more specific way, towards more special existential dichotomies of nature–culture, superiority–community, the opposites, self-actualization–conditional value, determinism–self-determination. The fact that existential criterion is present in six theories of personality, developed within totally different approaches, is an evidence of high degree of its theoretical justification. If we also take into account that all these theories were created based on analysis of clinical cases from psychotherapeutic practice of their authors, this criterion can be considered as having a relatively high degree of empirical justification. Revealed in these theories of personality general provisions indicates the possibility of their integration. I have shown in a number of empirical studies that the existential criterion can be successfully used to diagnose normal and abnormal personality and to identify the causes of many psychological problems in humans.
STUDIES ON STUDENTS WITH LEARNING DISABILITIES IN CHINA: TRENDS AND CHallenges

Yuehua Tong
Shanggui Song
University of Jinan (Jinan, China)

As a concept originated in western countries, learning disability (LD) has been translated into different terms in Chinese research context. However, the definition remains the same. Students with LDs are an important group of population in the field of school psychology and special education. Current research is mainly focused on cognitive and social aspects in students with LDs. Other research issues include definition and classification, etiology, evaluation and diagnosis, and intervention and remediation.

Results indicated that studies on students with writing disability are limited, comparing with reading disability and math disability. In China, students with LDs are not included in special education category. Future research should address such topics as operational definition, evaluation and diagnosis, appropriate educational placement, and effective intervention. How to improve inclusive practice for students with LDs is a big challenge in China.

PSYCHOLOGICAL ASPECTS OF FAMILY PLANNING AND REPRODUCTIVE HEALTH IN THE REPUBLIC OF BELARUS

Yuliya Shuplyuk
«LODE» ltd., Medical multipurpose center (Minsk, Belarus)

The problem of infertility is very relevant in the republic of Belarus. The number of infertile couples reaches 16%. Causes of non-occurrence of pregnancy as a presence of medical problems and environmental influences (Chernobyl disaster, 1986). Also there is a great importance of psychological components in the way of overcoming infertility. Nowadays there are 5 private centers and 2 state centers specializing in IVF and ART in Belarus. Each regional city has one perinatal center where patients with infertility are assisted. Psychologists work both in the women’s polyclinics and in the state perinatal centers. The problem of psychological assistance in private centers is still open. Patients of family planning centers and especially of IVF centers need psychological correction of their state of mind. There are about 3000 cycles of IVF per year in Belarus and only about 30-40% of them will be successful and will lead to pregnancy. Only about 25% of couples will wait for the birth of the baby. The remaining ones are supposed to re-enter the IVF in the next few years. It is obvious that emotional state, fears, anxiety of 75% of couples remain unprocessed, which lead to a decrease in the effectiveness of new ART programs. Thus, it is necessary to pay great attention to psycho-prophylaxis and psycho-correction of the psychological health of infertile couples. There is an active position of the government towards psychological work on family planning and reproductive health. At the same time, the algorithm for psychological assistance to a couple who gets ART treatment is not developed enough in our country. Therefore, in the subject of psychological health of such categories of citizens, it is expedient to use the active position and experience of colleagues from the CIS countries, especially from Russia. Long-term developments and methods of work of colleagues in this industry can become popular with our specialists working with infertile couples in the republic of Belarus. Paying a wide-ranging (both medical and psychological) professional attention to couples with infertility, we have a chance for a more favorable outcome of ART treatment.
CONSTRUCTION AND VALIDATION OF SUPEREGO QUESTIONNAIRE

Koorosh Parviz
Payame Noor University (PNU) (Gilan-e-Gharb, Iran)

The purpose of this study is to validate and standardize a superego questionnaire based on theories in analytical psychology. The study population consisted of the students of Ferdowsi University of Mashhad. The sample numbers that were available for selection were 344 people. To validate the questionnaire the formal-content (expert opinions) and structure (exploratory-confirmatory factor analysis) validity and to be reliable the Cronbach’s alpha method were used. In the results of factor analysis, two factors (feeling of guilt/self-blame and conscientiousness) were identified. Considering the Cronbach’s alpha coefficient, the reliability questionnaire can be considered as satisfactory. The findings of this study show that based on different ideas about superego and conscience, a questionnaire on superego can be validated and standardize which can measure and separate both superego and conscience.

THE LOGIC OF THE PARENT'S THEORY OF MIND AS A METACOGNITIVE PHENOMEN

Vladimir Solondaev
Yaroslavl Demidov State University

Theory of mind and metacognitive process share the common idea of subject (Sergienko, 2017). As Smirnov (2017) showed, each situation can be represented in two logical systems: the logic of process and the logic of substance. The aim of our research was to assess the impact of the logic of theories of mind used by parents on their mental state and probable behavior. Sample: 90 women (median age 29) having children of different age (median age of the youngest child – 2 years). The state of mind was measured using the Prohorov’s method. Resilience was measured by adapted method given by Maddy. The subjects were presented with three narratives describing parent-physician interactions concerning the health of a child. Two narratives were involving vaccinations, one – a sickness. Whether the logic of a theory of mind was process-type or substance-type was evaluated on the parents’ interpretation of the situation. Each of the two types of logic was used by equal numbers of tested subjects. Resilience and mental state were independent on the logic. The logic of process was related to refusal of vaccination and to noncompliance. Independence of resilience and mental state on the logic of theory of mind conforms with the main proposition of logic-and-meaning theory (Smirnov, 2017), stating that any reality can be understood with equal adequacy using process or substance logic. The relationship of process logic of theories of mind with noncompliance is a new fact which requires further investigation. The influence of the logic of theories of mind on understanding of situations allows us to treat the logic of theories of mind as a metacognitive phenomenon.

The study was supported by Russian Foundation for Basic Research, project 17-03-00672.
READINESS OF STUDENTS TO FORM A PROFESSIONAL FUTURE

Sergei Gilmanov
Yugra State University (Khanty-Mansiysk, Russia)

The readiness of students to form professional future can be defined as the integration of the image of their professional future and orientation to purposeful and meaningful learning and self-change under the influence of this image. The purpose of this study is to establish the factors and personal qualities associated with the level of readiness of students of pedagogue-psychologists to form their professional future.

89 students of pedagogue-psychologists participated. They were offered descriptions of situations that contained in stories (“In your professional future, occurs the case...”), which must be completed. Students also wrote an essay “The future of my profession and my professional future”. Achievement, gender, level of conceptual thinking, interest in the profession were recorded. Qualitative analysis of texts based on the criteria developed by the researchers (J.Nuttin, F.Polak, R.Seginer, A.Suleyman, a.o.). Topics were: 'It's me', 'Values', 'Practical actions'. Units of meaning were: depth of presentation (duration, generality, brightness a.o.); manner of description (use of scientific concepts, logical ordering, a.o.); willingness to cooperation. Correlation and factor analysis were carried out. Findings Only 6.7% of respondents had a high level of readiness to form a professional future. The average — 28.1, low — 65.2%. The strongest links with the personal qualities are established with the degree of general interest in the profession (rxy = 0.52) and academic achievement (rxy = 0.47). A factor analysis of the results showed that most of the connections are due to factors that we called "Will to the future", "Clarity of the future image", "Willingness to cooperate." The most important conclusion of the study is the need to orient education towards a professional future. It is necessary to include to the interaction of the participants in the educational process the recreation and comparison of models of the past, present and future of profession. In the content of education, it is necessary to introduce images of the personal future through actualization of oneself as a personage of professional activity, experiencing different situations and making decisions jointly with colleagues.
ASSOCIATIONS OF SEARCH FOR AND PRESENCE OF MEANING IN LIFE WITH WELL-BEING-RELATED ORIENTATIONS

Fatih Özdemir  
Bursa Uludag University (Bursa, Turkey)

E. Olcay İmamoğlu  
Middle East Technical University (Ankara, Turkey)

Selen İmamoğlu-Tezcan  
Bahcesehir University (İstanbul, Turkey)

Gizem Çeviker  
Middle East Technical University (Ankara, Turkey)

Search for meaning in life (SML) has long been considered as a basic human motivation. However, although the related literature has consistently pointed to a positive link between the presence of meaning in life (PML) and well-being (WB), the nature of the link between SML and WB appears to be inconsistent, but mostly negative. Our aim was to explore the association of meaning variables with hedonic and eudaimonic WB, by considering (a) SML and PML not only separately, but also conjunctively, via profiles representing combinations of their presence or absence; and (b) controlling the roles of self-construal- and other WB-related variables. We expected that although SML, by itself, would be negatively associated with WB, "search in the presence of meaning" would be associated with a higher level of well-being than even "presence of meaning in the absence of search". 904 Turkish adults responded to scales/questionnaires of Meaning in Life, Multidimensional Psychological Well-Being, Satisfaction with Life, Balanced Integration-Differentiation, Self-Compassion, Authenticity, Cognitive and Affective Mindfulness, Positive Future Expectation, Gratitude, and reported their perceived similarities to four profiles representing combinations of search and presence of meaning. Data were analyzed by correlations and stepwise regression analyses. Controlling for demographic (sex, age, education, SES, religiosity), self-construal (relatedness, individuation), and WB-related (positive future expectations, gratitude, cognitive-affective mindfulness, authenticity, self-compassion) variables, (a) SML and PML, respectively, appeared as negative and positive predictors of WB; (b) regardless of search, profiles representing absence of meaning were negatively associated with WB; (c) the profile, representing presence of meaning in the absence of search, was associated only with hedonic WB whereas the profile, representing search in the presence of meaning, was positively associated with both hedonic and eudaimonic WB (and a balanced self-construal). Results have shed light on the controversy in the literature by suggesting that although search in the absence of meaning represents a negative state of being, continuing the search in the presence of meaning represents an optimal state of WB, in terms of all the indicators considered. Findings are also discussed in relation to self-construal- and WB-related psychological mechanisms involved in different meaning profiles.
T CASE STUDY OF WIFE AND PARTNER BATTERING IN THE PHILIPPINES

Sophia Francesca Lu
Queensland University of Technology (Quezon City, Philippines)

In the country, the most prevalent form of violence against women is physical abuse/maltreatment or wife/partner battering based on both records of the Philippine National Police, and the Women in Especially Difficult Circumstances. This study looked into the psychological effects of abuse and battering on wives-partners. This paper will also give a description on how battered wives acquire a learned helplessness behavior due to uncontrollable events or situations. The methods used were structured interview method and case method, and interview with a psychiatrist in the hospital where the three cases had consultations. Wife battering refers to violent acts such as psychological, sexual or physical assault—by an assailant against his partner with the intent of controlling by inducing fear and pain. It is a common incident being violated under RA 9262 in the Philippines. Three cases were studied. One was stabbed 12 times by her live in ‘matador’ partner who works in a slaughter house. The second case was about a partner who was forced to do sexual favors for her husband that were animalistic and perverted. On the third case, while married, she noticed that the man was also sexually pervert. He also raped their daughter. All three cases also manifested depression in various forms with varying symptoms. A was diagnosed with post-traumatic stress disorder (evaluation made by the psychiatrist). Case A manifested symptoms of depression, panic of being attacked again by assailant who is at large.
EFFECT OF WORK AND ORGANIZATIONAL CULTURE ON HEALTH OF WOMEN LABORERS IN AN INTERNATIONAL LABOUR MARKET

Jinky Leilanie Lu
National Institutes of Health (Manila, Philippines)

The women workers such as those in manufacturing industries in the Philippines are connected to the international labour market as they produce for the global market. This study examined the association between effect of work and organizational culture on occupational health of women workers in certain manufacturing work in the Philippines. This was a cross sectional study involving 23 establishments and 630 women labourers using survey questionnaire, ten sessions of focus group discussions, and workplace environment monitoring. Results of focus group discussions showed adverse work conditions, hazard exposures among women workers, fast pace of work, close supervision, and prevalent occupational illnesses. These result from both work intensification and work extensification. Likewise, the focus group discussions showed management style that do not comply with the national work standards; and there was work intensification such as more workload for each worker, as well as work extensification such as less deadtime or work rest and more overtime. Workplace environment monitoring revealed exposure to hazards such as noise, chemicals, poor ventilation, and poor illumination. The most prevalent health symptoms were headache, and coughs and colds, due to work overload, and shiftwork. Burnout was a psychological response among those that experienced work overload and lesser work-rest period. This study resulted in three major analytic observations on the engagement of women workers in the new global labour market and these are: new work culture, impact on occupational health, and work issues of women. The results indicate that the new organizational culture characterized by work intensification and work extensification can affect the state of well-being health of the women laborers.

PREDICTORS OF EMOTIONAL & BEHAVIOURAL PROBLEMS (EBP) AMONG INSTITUTIONALISED ADOLESCENTS

Shefali Mishra
Guru Nanak Dev University (Delhi, India)

Emotional & behavioral Problems (EBP) are increasing all over the world at a rapid rate (Polaha, 2011). Juvenile crime is one of the major components of EBP. Earlier, adolescents were limited to an infraction and were not often engaged in violation of law but nowadays they are committing a heinous crime. The current study was interested in examining the predictors of Emotional & Behavioral Problems (EBP) in a sample of 100 institutionalized adolescents (12-18yrs). Self-reported versions of Inventory of Parent and Peer Attachment (Armsden & Greenberg, 1987); Emotional Regulation Questionnaire (Gross & John, 2003); Coping Strategies Scale (Srivastava, 2001); Strength & Difficulties Questionnaire (Goodman, 1997) were used as data collection tool. Discriminant analysis was applied in order to find the predictors contributing to high and low Emotional & Behavioral Problems (EBP) among adolescents. Problem focused coping strategies, father & peer attachment, cognitive reappraisal found to be the strongest predictor in contributing low EBP. Emotion focused coping strategies and maternal, peer attachment emerged as the strongest predictor in contributing high EBP among institutionalized adolescents.
The participants will be able to recognize the predictors of Binge Eating addiction among women who suffer from psychological abuse in their relationships and will recognize the role of woman’s defense mechanisms in moderating the association between psychological abuse and Binge Eating addiction. A convenience sample of 380 Israeli women in relationships were located via the Internet, and after consenting to participate in the study, they completed a series of structured questionnaires (The Yale Food Addiction Scale; The Defense Style Questionnaire; Psychological maltreatment of women by their male partners; Level of Differentiation of Self; sociodemographic questionnaire). The higher the level of differentiation and mature defense mechanisms, the less addictive a woman is. However, the level of addiction among women who experience psychological abuse with in their intimate relations, is higher than women who do not experience psychological abuse in their relationship. Among women who experienced psychological abuse in their relations, the defense mechanisms moderate the association between psychological abuse within intimate relations and the extent of the addiction to binge eating. The study contributes to the therapy of women with Binge Eating addictions, as it raises awareness of therapeutic-related content that could strengthen women and help them to cope with situations in their lives without the need to Binge. One of the significant variables for therapeutic work is the level of differentiation of the self. In addition, identifying the types of defense mechanisms might help to match treatment to the woman’s emotional needs. The current study found also that it is important to identify the environmental systems by which the addict is surrounded, such as whether woman is in an abusive relationship. Finally the study leads to the recognition that Binge Eating, which is usually treated with an emphasis on nutritional behavior change, is an addiction, and as such, it requires a combination of mental, nutritional and behavioral therapy. In view of this approach it is recommended that treating a woman who is addicted to Binge Eating should involve a multi-disciplinary team comprised of physicians, clinical dietitians and clinical psychotherapists.
Creativity is the ability of individuals to produce novel and unique ideas and products. It is not only the advanced expression of human intelligence, but also plays an important role in the field of scientific creation, social progress and technological innovation. In China, lots of graduate students are working hard to create fresh troops of scientific enterprise. They shoulder the mission of scientific and technological innovation. This paper expounded the relationship between teaching and research from three aspects. First, they are integrated; second, they are mutually reinforcing; third they are independent of each other. Next, analyzed the feasibility and necessity of promoting the creative performance of postgraduates through the combination of teaching and research. Through the combing and summarization of previous Chinese and foreign studies, this study obtained the path of improving divergent creativity and convergent creativity by combining teaching and research and pointed out that the combination of teaching and research can also enhance their creative performance by creating a good research atmosphere and improving the problem solving ability of postgraduates. Through this measure, it is conducive to improving the comprehensive quality of postgraduates, promoting collaborative innovation of teaching and research, and cultivating high-quality graduate students with innovative spirit.
THE EFFECT OF FACE ATTRACTIVENESS ON JUDGMENT OF LEARNING

Chen Gongxiang
Li Kaiyun
Ren Fen
University of Jinan (Jinan, China)

Faces are a kind of social stimuli with rich information. Facial attractiveness is a long-term concern in social psychology as an important dimension in evaluating faces. In the past, the research focused on the factors influencing the attractiveness of the face, and how the face attractiveness influence preference judgment and interpersonal behavior. However, few studies have explored the influence of face attractiveness on advanced metacognitive monitoring. Judgment of learning (JOL) is an important form of metamemory monitoring judgment, which is a predictability judgment of the recollect in the later recall test done by the individuals after learning. This study aims to explore whether face attractiveness (human and animal faces) influence individuals’ monitoring and judgment of their own memory through eight experiments. The experimental materials in Experiments 1-4 were 40 human faces (20 high and low attractive faces, half male and female) and 40 neutral Chinese words. The experimental materials of Experiments 5-8 were 40 animal faces (20 high and low attractive faces, half each for cats and tigers) and 40 neutral Chinese words. All experiments used the classical paradigm (learning-judgment-recall) under the starting conditions, that is, a human or animal face was presented as a starting stimulus, and participants were asked to judge face ugly (EXp1 and EXp5), gender (EXp2) or animal type (EXp6), preference (EXp3 and EXp7) and threshold hole (EXp4 and EXp8) without judgment; then present neutral words, ask the participant to study for 4s and judge the probability that he still remembers the word after 15 minutes (0-100 score judgment). After learning all the learning—judgment is over, the participants are asked to recall the neutral words. It turns out that face attractiveness has an influence on JOLs of neutral target words, JOLs of low attractive faces are significantly higher than high attractive faces condition. The above experimental results showed that the attractiveness of the face influenced the individual’s metacognitive judgment.
RESILIENCE OF GERMAN EMERGENCY RESPONDERS: RESULTS OF A QUANTITATIVE SURVEY

Sophie Kröling
Lars Gerhold
Freie University Berlin (Berlin, Germany)

Emergency responders have to face various stressful situations according to their daily work (Beerlage, 2017). Based on theoretical concepts of psychological stress theories, resources and different coping strategies can be helpful to cope with these events (e.g. Lazarus & Folkman, 1984). Former research e.g. shows an important role of self-efficacy for emergency workers, as it is significant negative related to burnout and compassion fatigue (Cicognani et al., 2009) and depressions (Regehr, Hill & Clancy, 2000). Thus, individual resources could be of particular importance. This contribution focuses on the question, how emergency responders in Germany cope with stressors like emotional proximity in duty or aggressive behavior against them and how their resilience can be improved. Results from a quantitative survey of more than 700 emergency responders, conducted in 2018 will be presented. We identified relevant resources and successful coping strategies, promoting resilience. The results show that emergency responders in Germany are exposed to different stressors, that occur on deployment-related and organizational levels. A lack of information and bureaucratic hurdles are e.g. perceived as very stressful. A regression model has been analyzed to identify relevant predictors of resilience. Though, emergency responders possess individual, social and organizational resources and coping strategies that enhance their resilience: Problem-focused coping e.g. is found to increase resilience whereas emotion-oriented coping however seems to be negatively related to resilience. Individual resources, especially self-efficacy and ambiguity tolerance hold special esteem in explaining resilience, as assumed. Suggestions for the improvement of the emergency responder’s resilience through strengthening individual resources will be given and it will be discussed how this can make a contribution to strive for civil protection. Results will be incorporated in prospective trainings for emergency responders.
MINDFULNESS AND COGNITIVE BEHAVIOUR THERAPY FOR ANXIETY WITH DEPRESSION: A CLINICAL CASE STUDY OF IDENTICAL FEMALE TWINS

Monica Sharma
The IIS University (Jaipur, India)

The present paper is a case study of 19 years old identical female twins diagnosed with anxiety and depression. CBT is a well established psychological treatment, due to the rise of third wave of CBT, Mindfulness is emerging as a useful approach and there are a rising number of studies indicating the effectiveness of CBT and Mindfulness based therapies in the present disorder. But a lacuna was observed in the case of twins. So the present study describes the Mindfulness and CBT treatment approach adopted to treat the twin sisters. Several self report measures were administered at pre and post-treatment levels during the process of treatment and also at follow-up after 6 months including: Beck Depression Inventory, Beck Anxiety Inventory, Penn State Worry Questionnaire, The Intolerance of Uncertainty Scale and Inventory for Cognitive Distortions. In all 15 sessions of mindfulness along with CBT were conducted. Results indicated significant improvements in the condition of twin sisters indicated by reduction in the anxiety and depression levels, worry state, cognitive distortions and Intolerance of Uncertainty, also both the treatment approaches were beneficial when treating twins in terms of, difficulties encountered which were specific to them due to their upbringing, parenting and influence they had on each other. When Mindfulness and CBT are employed to treat anxiety with depression this combination proved to bring significant improvements not only in the condition of anxiety and depression but also specifically to identical twins as the sample under study.
DANGEROUS DRIVING BEHAVIOR ASSOCIATIONS WITH MORNINGNESS-EVENINGNESS PREFERENCE

Yan Ge
Weina Qu
Kan Zhang
Institute of Psychology CAS (Beijing, China)

Individual differences in morningness-eveningness preference may influence susceptibility and response to sleepiness. These differences could influence driving performance, which has not been comprehensively studied. So, we designed 3 experiments to study this issue. In Exp.1, we investigated how the interaction between morningness-eveningness preference and personality may be related to dangerous driving behaviors in a Chinese Sample. 295 drivers from China completed the reduced Morningness-Eveningness Questionnaire, the Dula Dangerous Driving Index, personality scales for agreeableness, conscientiousness and neuroticism, Demographic information and self-reported traffic violations (accidents, penalty points and fines). The results showed that self-reported dangerous driving behaviors and traffic accidents were all significantly correlated with more eveningness. Furthermore, a moderation effect was found: eveningness was more strongly associated with risky driving and negative emotional driving in those who scored high for trait agreeableness. Exp.2 explored the difference between Morning-type and evening type drivers in cognitive ability. 40 drivers participated in this study, half in each group. They completed a visual search task and a spatial working memory task. The results showed that there was a main effect of chronotype on the accuracy and reaction time of visual search, and the accuracy of spatial working memory. More specifically, the evening type persons demonstrated better visual search and spatial working memory ability than morning type persons. In Exp.3, we measured the performance of simulated driving behavior between Morning-type and evening type drivers. We found evening type drivers conducted more speeding and higher speed in the afternoon session than in the morning session. These results could provide some scientific basis for professional drivers’ selection and arrangement of their duty schedule.
Does higher social class predict increased unethical behavior? Past researchers have found that social class positively predicts unethical behavior. However, anecdotal evidence suggests that lower class individuals seem likely to act unethically. We address these inconsistencies by proposing that the relationship between social class and unethical behavior hinges on the social consensus of the unethical behavior. We further explore the mediation role of ego depletion as the psychological mechanism underlying such effect.

Methods — We conducted five studies to test our predictions. Study 1 examined whether social class positively predicts unethical behavior of low social consensus but negatively predicts unethical behavior of high social consensus. Study 2 tested the mediation role of ego depletion in the effects of social class on unethical behavior. Studies 3 and 4 unpacked the causal chain by manipulating social class and investigating its effects on people’s ego depletion (Study 3), and manipulating ego depletion and observing its effects on unethical behavior (Study 4). Thus, we tested the mediation role of ego depletion by two approaches: the measurement approach (Study 2) and the experimental-causal-chain approach (Studies 3 and 4). Study 5 tested our full theoretical model using an adult sample in a field study to enhance the generalization of our results. Hierarchical regression, ANOVA, and bootstrapping are used to test our hypotheses.

Results demonstrate that the effects of social class on unethical behavior were moderated by social consensus. The positive relationship between social class and unethical behavior was observed when that behavior was low social consensus. However, when unethical behavior was mostly considered as immoral, social class negatively predicted unethical behaviors. Furthermore, ego depletion drove the effects of social class on unethical behavior. Upper class individuals were less likely than lower class individuals to commit unethical acts of high social consensus as a result of increased ego depletion. Integrating theories on social consensus and dual-process decision-making, the current research extends social consensus research, makes an important clarification on the relationship between social class and unethical behavior, and sheds light on the specific psychological mechanism through which social class relates to unethical behavior.
HOW DECISIVENESS, SELF-EFFICACY AND INDEPENDENT/INTERDEPENDENT SELF-CONSTRUALS ARE RELATED WITH FUTURE HOPEFULNESS AMONG SENIOR STUDENTS

Fatih Bayraktar
Hakan Oztekin
Eastern Mediterranean University (Famagusta, Cyprus)

Hope is a future oriented reasoning that influences psychological assets of individuals. Hopeful standing towards future can positively influence individual well-being. Different standings in terms of hopefulness may create variations on psychological assets of persons. Many psychological scientists have studied on hope and developed different models which explained the nature of hoping process, origins of hope and the structure of hope. According to the Theory of Hope which have been conceptualized by Snyder and his colleagues, hope is a cognitive process, specifically "a cognitive set that is based on a reciprocally derived sense of successful agency (goal-directed determination) and pathways (planning to meet goals)" (Snyder et al., 1991). In the current study, we examined the associations of decisiveness, self-efficacy and self-construals with hopefulness. A total of 278 senior university students were recruited for the study from Eastern Mediterranean University in Famagusta, North Cyprus. Participants filled four questionnaires; Independent and Interdependent Self-Construals Scale, Multi Domain Decisiveness Scale, Dispositional Hope Scale and General Self-Efficacy Scale. Collected data has been analyzed by hierarchical multiple regression analysis.

Preliminary analyses were conducted to ensure no violations of the assumptions of normality, linearity, multicollinearity and homoscedasticity. Examination of the data indicated significance and assumption were met for VIF and Tolerance. Highest VIF for all variables was 1.370 for decisiveness. Lowest tolerance to hopefulness was .646 for self-efficacy. In the first step of regression analysis, age was entered as control variable. Model was insignificant (F (1,241) = 1.239, p=.267). Individual related variables; self-efficacy and decisiveness were entered in the second step while controlling age (F (5,241) = 77.683, p<.001). Second model explained 62.2% of the variation in hopefulness with decisiveness (β=.100, p=.031) and self-efficacy (β= .581, p<.001). Self-construals as culture related variables were introduced in the last step (F (7,241)=58.610, p<.001). Third model explained 63.7% of the variation in hopefulness with independent self-construal (β=.122, p=.005), self-efficacy (β=.544, p<.001), and decisiveness (β=.106, p=.022) Based on these findings, encouraging independence, self-efficacy and decisiveness seems to be important factors to develop hopefulness among emerging adults.
THE MULTIDIMENSIONALITY OF CONSCIOUSNESS AS A PROBLEM OF MODERN PSYCHOLOGY: THE TYPOLOGY OF APPROACHES AND THE CONSTRUCTION OF A SYSTEM OF CATEGORICAL SPACES

Garnik Akopov
Samara State University of Social Sciences and Education (Samara, Russia)

The relevance of the project is associated with a significantly increasing “gap” between the neurocognitive and sociocultural foundations of consciousness research, the potential possibilities for excessive pragmatization of scientific knowledge and their dehumanization (artificial intelligence, transhumanism, manipulation for "the good", etc.). Substantially complicating the solution of the problem is the inclusion of the consciousness itself in the used spectrum of research organization methods (including neurocognitive methods), qualitative analysis and interpretation. The reflection of the problem of consciousness in the language and the implicit regulation of the processes of cognition, through traditionally designed language discourses, can be manifested by comparing the conceptual (categorical) spaces of consciousness research in multilingual scientific cultures. Contemporary experimental studies of consciousness mainly affect the lower layers of consciousness. The higher mental functions that constitute the most important regulative part of consciousness remain unexamined. The construction of a universal paradigm of consciousness involves a new theoretical and practical understanding of the phenomenon of consciousness. The typologization of the problems of consciousness and the corresponding construction of categorical spaces will allow us to contaminate the natural-scientific and sociohumanitarian lines of consciousness research, to compare the temporal specificity of the English-speaking (from the 60’s to 1996 and further annually to 2021) and Russian-language terminology in the field of scientific research of consciousness, and to create the basis of modern informatization of the problem. The typological approach to the analysis of the problem of consciousness, including the logical relevance of the content and methods of research, will make it possible to systematize the existing variety of problematizations of consciousness in such topical dimensions as: unitarity-interdisciplinarity, scientism-sociohumanitarianism, pragmatism (technologicalism) – value dominant, etc. That determines the new applications in the areas of social, group and individual consciousness.
ETHICAL AND MORAL LEVELS OF THE PRACTICAL PSYCHOLOGIST’S PERSONALITY FUNCTIONING IN PROFESSIONAL ACTIVITY

Elena Veselova
The Herzen Russian State Pedagogical University (Saint-Petersburg, Russia)

The various innovative processes in Russian society and in sphere of education make particularly relevant the ethical and moral aspects of practical psychologist’s professional activity. Such psychologist’s professional activities as education, psychological assessment, psychological prevention may be effectively carried out at the role level of good knowledge and compliance with the code of ethics requirements. Counseling in the solution of client’s emotional and personal problems requires a deeper personal involvement in professional interaction and a higher level of moral functioning. Good knowledge of moral norms is not an indicator of personal high morality. It is the disadvantage of ethical regulation. External control is required to guarantee the safety of professional interaction subjects [Kolberg L., 1984]. There are two different approaches to the grounds of personality moral functioning explanation in psychology: the model of personal qualities defining moral behavior [Narvaez, D., Lapsley D. K., 2009] and the moral functioning integral model [Blasi A., 1983, 1995, 2004; Veselova E.K., 2002, 2003]. The existential and ontological concept of personality integral moral functioning [Veselova E.K., 2003] links maturity of individual moral consciousness, acceptance of ethical system norms and ideals awareness and state of conscience. Conscience is considered not only as a mechanism of moral behavior regulation, but also as a deep structure of personality allowing to learn own identity. Authenticity is a necessary condition for the consultant and psychotherapist effectiveness in interaction with the client, the manifestation of personality integral moral functioning based on the basic existential and ontological beliefs and autonomous conscience [Veselova E.K., 2009]. A number of author’s psychodiagnostic techniques, useful in the process of practical psychologists training, have been created on the basis of existential and ontological concept to assess the personality moral functioning level in various life situations. The study was supported by the Russian Foundation for Fundamental Studies № 17-29-02438 "Psychological, social and ecological resources of students’ health in modern Russia"
The current study is a cross-cultural test of conservation of resources theory. Specifically, it hypothesized that personal resources, including self-efficacy, optimism and subjective well-being have reciprocal relationships with goal commitment and goal attainment at work. In a two-wave longitudinal study, data were collected from 793 sales professionals in France, Pakistan and the United States. Furthermore, predictors and outcome variables were tested on time-lag basis. Values were incorporated to confirm cultural differences among three study countries. Findings from multigroup cross lagged path analysis confirmed the reciprocal model as the best fit to data (i.e. CMIN= 18.488, DF= 6, P< .05, CFI= .990 and RMSEA=.072) across all three countries. Corresponding waves from all three countries were partially invariant at metric and scalar level. Cross lagged path analysis for each country individually also confirmed reciprocal model as the best fit. This validates the dynamic relationships between all study variables over time and also indicate the portability of personal resources across cultures. Data collected at only 2 time points and English version of scales used for Pakistani sample are the main limitations of this study. Evidence from different cultures is another step towards further development of resource based goal striving concepts. Another contribution is the test of revised Portrait Values Questionnaire (PVQ-RR) in Pakistani settings. It justifies the importance of training interventions related to personal resource, commitment enhancement and self-regulation at work.
THREATS OF PERSONAL IDENTITY ON THE PART OF RADICAL IDEOLOGIES: PSYCHOSOCIAL ANALYSIS OF THE INVERSION OF VALUES

Aleksandr Guseynov
Victoriya Shipovskaya
Kuban State University (Krasnodar, Russia)

Under the conditions of a transitional and transitive period, the ubiquitously observed irrational outbursts of protest activity and the growing globalism of terrorist actions reflect the global trend of intensification of the processes of alienation and the negative transformation of universal values. The dangerous psychological trend of extremalization of consciousness and behavior is accompanied by the active spread of radical ideologies among youth. In the article the author discusses factors of susceptibility of young people to the radical ideology, which are examined through the lens of overcoming uncertainty, personal identity in relation to possible alternatives, problems of constructing personal and social identity. In this regard, this article is aimed at identifying the psychological mechanisms of inversion of moral values, causing changes in the existential essence of the subject, changing of identity and the implementation of destructive forms of protest activity. The leading approach to the study of these contradictions is the subjective-existential approach, which allows to consider this problem in the context of the fluctuations of personal agency in the dynamics of the scheming of individual being, which allowed to track the change of subject positioning to the objective one, to determine factors of negative transformation of values. As a method of identifying the character of determination of personal activity, distortions in moral values and the degree of readiness for perception of radical ideology, we used: “The test of life-purpose orientations” (LPO) in the adaptation of D.A.Leontyev, “The Terminal Values Questionnaire” (TVQ) by I.G.Senin, method of assessment of values by S.Schwarz, test of psychological defenses by R.Kellerman—G.Plutchik, questionnaire “Protest activity of personality”, consisting of the following scales: emancipation, negativism, opposition, escapism, nihilism. Correlation and regression types of analysis were used. For each form of protest activity (emancipation, negativism, opposition, escapism, nihilism) were revealed its own characteristic values due to the difference in the type of subject positioning, protective strategies, the preferred way of overcoming uncertainty, regulating personal choices and forming preference for a certain variant of a subjective personal activity and characteristics of its interaction with society. The study was carried out with the financial support of the Russian Foundation for Basic Research in the framework of project No.18-413-230020 “Extremism in the context of the protest activity of the personality: psychological factors of readiness, the system of prevention and overcoming”.
VIRTUALIZATION OF BEING AND UNCERTAINTY AS A CONDITION OF BEING OF THE SUBJECT OF THE DIGITAL AGE

Natalya Kramarenko
Moscow State Regional University (Moscow, Russia)

One of the fundamental characteristics of the modern world, the beingness of man of the digital era, is increasingly called uncertainty (A.G. Asmolov, D.A. Leontiev). The problems of being, many different aspects of the life of modern man are viewed today through the prism of this most important characteristic, and the challenge of uncertainty, among other things, stands out as the central problem of the psychology of personality (D.A. Leontyev). The understanding comes to the fore that today being of a person can be investigated only with regard to the comprehension of a personality as “a changing personality in a changing world” (A.G. Asmolov). In the conditions of complication of the world, the increasing importance of the virtual space of being, the uncertainty determines the sociocultural space in which the process of socialization takes place, the life and development of a person, the process of becoming as a subject. Being in the conditions of the existence of the real and virtual world, the “reality” of the virtual space of the Internet becomes the ordinariness of human life. Reality identified the trend of virtualization of human being as the most important and revealed the ongoing process of integration of the real and virtual world. The virtualization of being implies the acceptance of uncertainty as a necessary element, an integral part of the beingness of modern man. Acceptance of uncertainty, tolerance to it, is considered by researchers as the achievement of individual maturity, constancy and integrity of I (Sokolova, 2015). Uncertainty becomes the basis of the beingness of the modern man of the digital age, carrying out his life in the real and virtual world. Hence, the most important questions of the psychology of the subject and psychological science: how the subject manifests itself as an active transformer of itself and the world in the conditions of virtualization of being and challenges of uncertainty, what are the substantive features of subject activity that affect the authenticity of being of a person of the digital age in these conditions.
WORK LIFE BALANCE AND SUBJECTIVE WELL BEING AMONG EMPLOYEE ON LIFE SCIENCE COMPANY IN INDONESIA

Gianti Gunawan  
Yus Nugraha  
Marina Sulastiana  
Diana Harding  
Universitas Padjadjaran (West Java, Indonesia)

Regarding the WHO plan on 2020 to eradicate polio globally, Indonesia is one of the countries that supports this, with program called polio eradication. Life science company in Indonesia revealed that the company’s profit had decreased significantly because of the program. In order to survive in a competitive environment, the company must be able to follow the pattern of change. Organizational culture naturally depends on the market situation and needs to adapt to it in order to survive or to maintain its competitive position. Due to organizational culture change in life science company brings about problems in balancing in work and family life of the employee. This work life balance concept has not yet received special attention in Indonesia. Research from Dr. Ajay Kumar Singh and Ms. Amanjot shows the relationship between work life balance and subjective well being. Employee with higher subjective well being tend to be more productive in the work place and also predicted organizational performance. This study examines employee’s work life balance and subjective well being of 146 employees at a life science company in Indonesia. We used the work life balance questionnaire from Fisher (2009). Subjective well being measures compiled by Ed Diener and Robert Biswas-Diener (2009). This measuring instrument has two parts, namely the Satisfaction With Life Scale (SWLS) to see the degree of overall life satisfaction, and Scale of Positive and Negative Experience (SPANE) to see how often respondents experience positive or negative feelings. Result correlation between work life balance and subjective well being are low (0.240). Demographic characteristics also did not impact work life balance and subjective well being of respondents. Future research should provide a greater understanding regarding how subjective well being is related to others dependent variable, such as person organization fit, because employees will be more interested in organizations that have the same value, belief, and so instead, especially in Indonesia. Research in Indonesia show that person organization fit has strong correlation with subjective well being, same result as research by Park, Monnot, Jacob & Wagner (2011). The higher alignment of values, goals, needs, and personality of the individual with the organization, the higher subjective well being of employees.
TRUST AND NATURE CONNECTEDNESS AS ANTECEDENTS OF SUBJECTIVE WELLBEING IN PEOPLE WITH HIGH ENVIRONMENTAL CONCERN

Iryna Kryazh
V.N. Karazin Kharkiv National University (Harkov, Ukraine)

Environmental concern is an important condition for people to solve global environmental problems, hence the task of informing people about the depth of these problems. However, this can lead to increased environmental anxiety and reduced subjective wellbeing. M. Ojal's research (2005, 2012) shows that the meaningfulness of life and existential emotions such as trust, hope, and anger, can serve as a buffer against reducing subjective wellbeing in adolescents. A number of studies have revealed a positive relationship between psychological wellbeing and connection with nature, the theoretical basis of which is given by the concept of biophilia (Wilson, 1984). Hypothesis: the combination of strong environmental concern with high subjective wellbeing is supported by trust, sense of coherence, and nature connectedness. The sample were 207 adults (123 female). The questionnaire contained: brief measure of nature relatedness (Nisbet, Zelenski, 2013), Inclusion of nature in self (Schultz, 2002), Lexington attachment to pets scale (Johnson, Garrity, Stallones, 1992), Orientation to Life Questionnaire (Antonovsky, 1987), Methodic of examining trust / distrust to the world, to other people and to oneself. (Kuprichenko, 2008), Environmental concern scale (Kryazh, 2013), life satisfaction scale (Diener, Emmons, Larsen & Griffin, 1985), Scale of subjective wellbeing (Perrudet-Badoux, 1988). Clustering on dimensions "Environmental concern" and "Subjective wellbeing" identified five groups of respondents, in two of which was showed the highest levels of concern but significantly different levels of subjective wellbeing. Comparison of groups showed that among respondents with high environmental concern, those of them who scored high on subjective wellbeing had higher level sense of coherence, trust (p<0,001), inclusion of nature in self, nature relatedness (p<0,05), and general attachment to pets (p=0,067) than those who scored low on subjective wellbeing. Multiple regression analysis revealed that trust, sense of coherence, and inclusion of nature in self, support subjective wellbeing, neutralizing the potential negative effects of environmental concern, which is important in both contexts: conservation psychology and health psychology.
DEVELOPMENT AND EVALUATION OF A STRESS MANAGEMENT PROGRAM FOR ELDERLY PEOPLE

Konrad Reschke  
University of Leipzig (Leipzig, Germany)

Alena Garber  
Rehabilitation clinic (Bad Wildungen, Germany)

Anar Bikadamova  
Gulzat Sarbassova  
Sandugash Duanayeva  
Al Farabi University (Almaty, Kazakhstan)

The goal was the development and evaluation of a stress management program for elderly people (age 60 – 80). Stress can begin in transition phase of retirement. Psychosocial Stress depends on balance between resources and stressors and in relation to conservation of resources (Hobfoll) and proactive coping resources (Greenglas). For elderly people no specialized stress intervention programs exist. That’s way we modified the stress-management program “Mastering stress optimistically” for elderly people according to the stressors in the retirement phase of life. The program includes 10 sessions (8 fixed, 3 free electable). Content of exercises: systematic stress checkup, emotion regulation, relaxation, future orientation, communication, coping with death and dying, goal setting. The study was an intervention trial with pre-post-follow up design (formative & effect evaluation). Measures/tests were: Leipzig short questionnaire chronic stress (LKCS), Measurement of change questionnaire of behavior and experiencing (VEV), Screening scale of chronic stress (SCSS), Satisfaction with Life Scale (SWLS), Life Orientation Test (LOT), Self efficacy scale (SWE), a sense of coherence scale (SOC-L9). The participants were n= 15 retired persons (age 66 to 77, M= 71, .93 SD = 3.22). Data were analyzed by t-test and power analysis. The formative evaluation showed positive results by expert ratings and ratings of the participants for each element of training. In all dimensions the new developed training program reached high values mean = 1.7 on a five point likert evaluation scale from (1 very good – 5 very bad ). 10 persons reported significant positive changes in VEV. Main positive effect sizes were found in the evaluation of effects in the sense of coherence and life satisfaction measure. The program “Optimistic Coping the retired state” was highly accepted by the participants and evaluated positive in dimensions of evaluation. It showed a clear structure and usability, and acceptance for training-parts.
PSYCHOLOGICAL ASPECTS OF CONTEMPORARY WOMEN IN THE FACE OF CONJUGALITY: A JUNGIAN APPROACH

Ana Paula Campos Marinho Dias  
PUC- Pontifícia Universidade Católica de São Paulo (São Paulo, Brazil)

Conjugality is a complex process that goes through the "psychosocial construction" of each person and encompasses the interchange of meaningful experiences in a context common for the couple. This context would be constituted by the creation of a specific and particular field, formed by elements of the personality of each member of the couple. Jung (1925/2011), discusses marriage as a psychic relationship; not only as a social function, but as a space for the psychic development of partners. This author deepens the understanding of the aspects that hinder the love relationship, citing, among them, the unconscious connection of the young with the parents, a connection that is unfavorable to the differentiation between the individual and the family of origin, and detrimental to the development of the own identity and the other. This study aimed to investigate the psychological aspects of the conjugality of adult women and to study how the current woman deals with the expectations and difficulties that arise during the conjugal relationship, verifying which resources are used to face such difficulties. Two case studies were carried out, with the analytical psychology referential. The participants were two women aged 32 and 35 years. Both were Brazilian women belonging to the middle socio-cultural class, with a higher educational level and had lived at least one marital experience. For the data collection, a semi-structured interview with expressive technique was used. The results suggest that, for the participants, conjugality is the union between two people who wish to live together, cohabiting and building a common life history. For the participants mentioned, the development of the marital field is more important than the development of the individual field. Among the expectations identified, can relate the possibility of experiencing the affections as: love, happiness and companionship. The difficulties encountered were related to: interference from the family of origin, lack of commitment of the partner, as well as betrayal and partner violence. The results obtained serve as a parameter for the treatment and investigation, in clinical psychology, of crises in marital relationships, cases of infidelity and domestic violence, especially in relation to women.
WORK-STRESS AND SELF-EFFICACY ARE PREDICTORS OF JOB OUTCOMES AND PSYCHOLOGICAL WELL-BEING AMONG SPECIAL EDUCATION TEACHERS

Ejaz Ahmed Khan
Govt. Post Graduate College Samanabad (Faisalabad, Pakistan)

Special education means to a variety of educational and social facilities provided by the educational institutions for children with different disabilities. Teachers play significant roles in imparting the knowledge to learners and set the situation for effective learning. To effectively perform such roles, teachers must be prepared and motivated to attain positive attitudes. But they suffer from higher level of work-related stress due to over workload, role ambiguity, poor social support and inadequate working environment. Work-stress can cause strange and dysfunctional behavior at work and contribute to poor physical and mental health. The main objective of this study was to examine the relationship of work stress and self-efficacy with job satisfaction, turnover intentions and psychological well-being among teachers of special education institutions. This study is a cross-sectional survey design and the data were collected from the 130 special education teachers (N= 130). Five scales were administered on the participants. They are as Work-stress Scale (Parker & Decotiis, 1983), Self-efficacy Scale (Schwarzer & Jerusalem, 1995), Job Satisfaction & Turnover Scale (Cammann et al, 1979) and Psychological Well-being Scale (Ryff, 1995). The ethical and research protocols were strictly followed in this study. The findings revealed a positive significant relationship between work-stress and turnover intentions. While a negative significant relationship with job satisfaction and psychological well-being. Self-efficacy was positive significant with psychological well-being, job satisfaction and negative significant with turnover intentions. Female teachers were high on self-efficacy, job satisfaction and psychological well-being, and low on work-stress and turnover intentions as compared to male teachers. The findings of this study are very valuable for working teachers, researchers and administrators to enhance the working conditions in special education institutions. Further, these conclusions also elaborate the significance of self-efficacy and psychological well-being to reduce the negative impact of work-stress in the teaching profession.
APPLICATION OF A. ANTONOVSKY’S CONCEPT OF SALUTOGENESIS TO PSYCHOTHERAPEUTIC WORK WITH ELDERLY ONCOLOGICAL PATIENTS

Alena Garber  
Rehabilitation clinic (Bad Wildungen, Germany)  
Sveta Berdibayeva  
Al Farabi University (Almaty, Kazakhstan)  
Konrad Reschke  
University of Leipzig (Leipzig, Germany)

The objective of the study is application of a resource-oriented psychotherapeutic approach to elderly cancer patients. Its theoretical framework constitutes Aaron Antonovsky’s concept of salutogenesis. Research questions are focused on cases when people successfully overcome stressful situations, even if these cases are contrary to the general trend, and on finding factors contributing to stress resistance. Such analysis allows to consider illness and health on a single continuum and helps to proceed from dealing with a particular disease to searching for factors by which a person, regardless of where on the continuum he/she is located, can move to the health pole. The concept of salutogenesis was used at the rehabilitation stage of cancer disease. The experimental group of the study involved 70 cancer patients aged from 68 to 75 years (44 women). To 40 of them model of salutogenesis was offered in the form of weights. Patients filled the scales twice: first, independently, and then with the help of a therapist. With 30 other patients, group counseling was conducted on the topic “Protection factors or due to what factors a person is able to stay healthy” without providing individual counseling. 50 patients compiled a control sample. Leipzig Test for Chronic Stress (K. Reschke, G. Schröder), a questionnaire for assessing the quality of life and content analysis of weights answers reflecting A. Antonovsky’s salutogenesis model were used. At a statistically significant level was shown a decrease in the general level of stress, an increase in the assessment of the quality of life, an increase in reflexive abilities in finding one’s internal resources, an increased understanding of the physical and psychological conditions/factors contributing to health in patients for whom individual counseling was carried out. Patients who participated in the group counseling increased their understanding of physical and psychological conditions/factors contributing to health. Patients of the control group demonstrated no significant changes. The study supports application of the A. Antonovsky’s model to psychotherapeutic work with elderly oncological patients at the rehabilitation stage of disease. The next step is investigation of possibilities of this model with elderly population in general.
FOUR PILLARS OF “SUSTAINABLE” PERSONALITY AND PLANETARY HEALTH CONCEPTS: 4 E’S — ENVIRONMENT, ECONOMY, ETHICS AND EDUCATION

Liudmila Liutsko
ISGlobal (Barcelona, Spain)

Planetary Health is a new integrated approach challenging to achieve “the highest attainable standard of health, wellbeing, and equity worldwide through judicious attention to the human systems—political, economic, and social—that shape the future of humanity and the Earth’s natural systems that define the safe environmental limits within which humanity can flourish” [1]. Though the human personality and behavior is a complex construct [2], it would be beneficial for Planetary Health to form and educate a kind of “sustainable” personality that taking care of the Earth and all living organisms on it. Review and analysis of bibliography on the topic and new model proposal of “sustainable” personality. In the past (and still nowadays) economy was a compass of human activity: either via egoistical wishes to gain more material wealth, or as a technological progress in its natural evolution, which disregarded the future consequences that would lead to environmental and health problems. The previous blind technological development was seen as a “struggle” of man with nature crowned with the proud victory of the former over the latter. Environmental consciousness arose later together with changes towards sustainable progress. The role of Ethics is crucial because it considers “environmentally friendly” behavior as an example to be followed by individuals as well as by collectives: starting from saving our primary resources by strict control over use of electricity, water and private transport, limiting their use to when it is necessary only, going on to an effective waste management, then reducing contamination and damage to nature in general, and, in the end, going on to a final balanced distribution of resources (thus resolving such problems as malnutrition, hunger, wars,...) These Ethical principles, to be effective in practice, should be applied to help make conscious changes of individual behavioral patterns of the current generations and should be transmitted to the future generations via Education. Psychology of health, personality and organizational psychology should work in orientation towards a Planetary Health to achieve its goals successfully. People cannot be healthy within unhealthy environment (social and natural).

Cardiac patients frequently experience complications in cognitive functioning as a result of serious cardiac surgeries, including coronary artery bypass grafting (CABG). Recent researches have shown a wide range of cognitive disorders accompanying cardiac surgery. However, psychological factors of beneficial and detrimental consequences of coronary artery bypass surgery for cognitive functioning are less studied than its clinical correlates. For this reason, we aim at analyzing psychosocial factors of the dynamics of cognitive functions of patients with coronary heart disease (CHD) undergoing CABG. The work focuses on studying the main indicators of cognitive functioning (including active attention and concentration, verbal and nonverbal memory, psychomotor speed, and thinking abilities) and on studying the role of psychosocial factors in observed cognitive dynamics. The present study enrolled 120 patients (of average age 59.71 ± 7.32 years) who underwent coronary artery bypass grafting with standard cardiopulmonary bypass technique. The examination using a neuropsychological test battery (including WAIS, TMT-test, Stroop test, TAS, Benton test, etc.) was performed in three stages: two days before CABG, 12-14 days and three months after the surgery. Patients with CHD experience significant postoperative cognitive decline mostly in verbal memory and attention, while positive dynamics was observed in the visual and logical memory, as well as in spatial and verbal-logical thinking. A significant cognitive improvement three months after the operation occurred in visual memory, logical memory, and spatial thinking. According to the results of the study, the most important psychosocial factors of deterioration of cognitive functioning after surgery are: conflicts in family relationships, low social activity after surgery, a lower level of education, unemployment, and the pessimistic assessment of the prospects of returning to work (p<0,01). The data obtained confirm and extend the hypothesis of cognitive reserve (Stern Y., 2003), according to which environmental factors can reduce the vulnerability of individuals to the age-related cognitive decline and pathological brain processes. The obtained results allow to develop evidence-based recommendations for the rehabilitation of patients undergoing cardiac surgery. These recommendations should be primarily aimed at achieving maximum efficiency of the rehabilitation process, improving indicators of ability to work and quality of life of the patients.
THE PHENOMENON OF MANIPULATION IN PARENT-CHILD INTERACTION

Tatyana Kuzmishina
Moscow Pedagogical State University (Moscow, Russia)

The problem of manipulation between parents and children was investigated by such scientists as Alfred W. Adler and Everett Leo Shostrom at the beginning and the middle of the 20th century. It is known that both children and adults try to secretly influence on each other’s behavior. A number of researchers considers that parents by their own example teach children to manipulate. Others incline to the idea that the social situation of development forces the child to manipulate the adult. In this paper the analysis of a phenomenon of manipulation in child parental interaction in modern family is carried out. Factors, types and forms of child parental manipulations and also specifics of manipulative behavior of children of different age in family are considered.

DOES INSTITUTIONAL SOCIAL SUPPORT STRENGTHEN WOMEN’S WELL-BEING?

Vahide Ulusoy Gökçek
Zahide Tepeli Temiz
Fatih Sultan Mehmet Vakıf University (Istanbul, Turkey)

Environmental factors, as well as traits, could affect well-being. The main subject of the current research is to investigate how social support received by a non-governmental organization affects the well-being of women with low-income. The study also aims to examine the predictive role of self-efficacy, perceived social support, and coping on depression and anxiety symptoms among Turkish women of different income levels. The sample comprised 129 women were administered Ways of Coping Inventory, The Multidimensional Scale of Perceived Social Support (MSPSS), General Self-Efficacy Scale, Beck Depression Inventory, and Beck Anxiety Inventory. Contrary to expectations, impoverished women who received social support from an NGO had higher anxiety and depression, and lower perceived social support scores compared to the other group. Hierarchical regression results showed that socioeconomic status, coping, self-efficacy, and perceived social support made significant contributions to variance in depression. A higher income level, coping, social support, and self-efficacy tended to be less depressed. Meanwhile, a binary logistic regression analysis showed that the model was significant (χ²= 64.433; sd = 5; p < 0.01) indicating that self-efficacy, coping, and perceived social support have a negative relation to the probability of being anxious. The lower income was found to increase the probability to be in the anxiety category while social support was found to have a negative relation to anxiety. The traits such as self-efficacy, coping seem the most effective factors on depression and anxiety. However environmental variables such as income level and receiving social support have still presented a diminishing effect on well-being. On the other hand, an unmeasured social support network, such as gathering in mosque or women meeting, can be more effective than an institutionalized support for impoverished women.
INDIVIDUAL DIFFERENCES AND SPECIFICITY IN FACE COGNITION ABILITIES ACROSS CHILDHOOD AND ADOLESCENCE

Anastasia Petrakova  
Werner Sommer  
Humboldt-University (Berlin, Germany)  
Andrea Hildebrandt  
University of Oldenburg (Berlin, Germany)

Face perception and face memory can be considered as crucial facets of social intelligence. Psychometric research on adults indicates that individual differences in face cognition abilities cannot be entirely explained through variance in general cognitive functioning and object cognition; hence, these abilities are domain-specific. However, it is controversial, whether these abilities are specific already in early periods of life or differentiate across childhood and adolescence. In the present study we focused on this question from an individual differences perspective and tested the hypothesis of differentiation between face cognition abilities and other cognitive abilities. 338 children, adolescents and young adults, aged between 6 and 21 years, completed tasks measuring face cognition abilities (face perception and face memory), object perception, object memory, fluid intelligence and working memory. After establishing a measurement model of face cognition and general cognitive functioning for the entire age range, age-differences in this structure were explored by using Local Structural Equation Modelling (LSEM). Overall, our study supports the notion of an early maturity of face cognition abilities. Already six-year old children demonstrated adult-like face perception and memory. Further, the results indicate a strong association between face cognition abilities and general cognitive functioning in early periods of life with a tendency for dedifferentiation between these abilities. However, face versus object perception and face versus object memory became more distinct across childhood and adolescence. On a theoretical level these results imply that it is necessary to consider face perception and memory as getting increasingly distinct from perception and memory for non-face objects (content-specificity); nevertheless, the level of face cognition maturation is strongly associated with the maturation of general cognitive functioning.
THE ASSOCIATION BETWEEN DEPRESSIVE SYMPTOMS AND ALLOSTATIC LOAD IN PATIENT WITH MAJOR DEPRESSION

Kirsi Honkalampi
Taina Hintsa
Niko Flink
University of Eastern Finland (Joensuu, Finland)
Soili Lehto
University of Helsinki (Helsinki, Finland)
Anu Ruusunen
Kuopio University Hospital (Kuopio, Finland)

According to McEwen (McEwen 2003) allostatic load (AL) refers to the activation of physiological regulatory systems in response to stress and their immediate and long-term effects on the body. The cumulative effect of AL influences mental and physical well-being and all-cause mortality. Various health-related factors increase AL, but it is unclear whether same factors increase the AL in the general population and in patients with depressive disorder. The main aim of this study was to clarify whether allostatic load predicts depressive symptoms or health behaviors in patients with major depressive disorder. The study samples consisted of two cohorts of patients with depression, which were collected at different periods (DC1 1996-2001 and DC2, 2015-2019). To determine AL, we used 9-10 biological indicators, which represent cardiometabolic risk, glucose metabolism, anthropometrics and inflammation (Bizik et al. 2013). Information of health behaviors and symptoms of depression was collected by questionnaires. The mean allostatic load score was 4.23 in DC1 (SD 4.0) and 4.78 in DC2 (SD 5.0). The highest AL quartile had 6/9 (in DC1) and 6.5/10 in DC2 of AL risk score. Gender was not associated with AL. However, patients from highest quartile of AL in DC2 were significantly older (39.63 years SD 10.10 vs. 31.81 years SD 10.39, p=0.001, Cohen's d=0.76, ES=0.35) than other patients. Severity of depression was not associated with AL in depressed patients. The study produced important evidence about the overall health situation of individuals with depressive symptoms and in-depth information on the somatic health of depressed patients.
In recent decades there has been an increase on criminal behavior in women, which is due to social rather than individual change, corresponding to a socio-historical, cultural, and political process framed in the socioconstructionist perspective, the conception of power of Michel Foucault, and the different feminist contributions. The social reality is constructed by the action of the people and that therefore we must approach the understanding of this reality.

In order to respond to the question mark: "Why do women commit crimes and why do they give up crime?". The main objective was to analyze the social practices that promote crime and withdrawal, and to identify the way in which these practices take place. Qualitative study, framed in the socioconstructionist and gender perspectives. 94 women were interviewed in 4 countries: Spain, Uruguay, Mexico and Colombia, of which 81 were in prison at the time of the interview, and 13 had been in prison at some point of their lives. Their life stories were analyzed through Atlas.ti software. From the analysis of the thematic content there were found four main categories: Affective Bonds, Violence, Social Networks and Withdrawal. It was found that having suffered gender violence can be an explanatory factor of the crime, the affective bonds and the social networks can be mobilizing factors towards the crime and towards the abandonment of the same. The withdrawal is given by the interaction between the obligation / responsibility of actions, the freedom to build herself as a subject and to help others. The findings suggest that women have been incarcerated before they enter prison, as victims of gender-based violence and driven by relevant affective bonds in a patriarchal system; they fall into prison escaping from an abusive relationship, and in this escape they are oriented to the crime. The key to the withdrawal is gender equality, where men and women have the same responsibilities in the care of the other.
CAREER ADAPTABILITY OF ADOLESCENTS AND SOURCES OF SUPPORT

Bohumira Lazarova
Petr Hlado
Lenka Hlouskova
Masaryk University (Brno, Czech Republic)

Psychologists, working in the field of educational or work psychology, are often interested in career decision-making and career counselling. The paper focuses on career adaptability, which is an essential component of Career Construction Theory (Savickas, 2005). This psychosocial construct denotes the sources to cope with career tasks and challenges and suggests the possibilities of an individual to handle transitions and tasks in occupational roles. Identification and promoting career adaptability is of particular importance in adolescence, especially for students at the end of their studies, i.e. before commencing further educational pathway or working life. We present partial outputs from the research project Career adaptability of vocational upper-secondary school graduates during the school-to-work transition. One of its objectives is to find associations among selected relational variables and overall career adaptability and its dimensions, which are concern, control, curiosity and confidence. In this research, we used a larger test battery containing selected questionnaires and scales, for example, Career Adapt-Abilities Scale, Teacher Support Scale, Parent Career Behavior Checklist, Career Decision Self-Efficacy Scale, etc. We contacted students of vocational upper-secondary schools in two regions of the Czech Republic (N = 3,028 respondents, 46.5% women) using these questionnaires. In this paper, we present and discuss not only the results of the first quantitative analyses, but also the results of the verification instruments used for investigation on a sample of Czech respondents using a confirmatory (CFA) and exploratory factor analysis (EFA). Statistical modeling identified significant associations between career adaptability and parental support, as well as teacher support. The results also indicate the degree of willingness of vocational upper-secondary school students to seek expert support and counselling from different professionals. The results of the research evoke discussions about the diagnostic and intervention focus of school, educational or work psychologists, who provide support for students in their career decision-making.
COGNITIVE-BEHAVIORAL TREATMENT FOR PATIENTS WITH MILD ALZHEIMER’S DEMENTIA (CBTAC): RESULTS OF AN RCT

Simon Forstmeier  
Universität Siegen (Siegen, Germany)

Andreas Maercker  
University of Zurich (Zürich, Switzerland)

Tanja Roth  
University of Zurich (Zürich, Switzerland)

Egemen Savaskan  
Psychiatric University Hospital Zurich (Zürich, Switzerland)

About 90% of all mild Alzheimer dementia (AD) cases experience affective and behavioral symptoms. Although some research has supported the effectiveness of specific psychotherapeutic approaches for mild AD, there are only few attempts to evaluate a multi-component treatment programme. This randomized controlled trial evaluates the effect of an integrative psychotherapy approach on the health of patients with mild AD and their caregivers. The CBTAC treatment programme consists of 25 weekly sessions, including eight modules: goal setting; psychoeducation; engagement in pleasant activities; cognitive restructuring; live review; behavior management; interventions for the caregiver; and couples counselling. 50 participants and their caregivers have been randomized to either the CBT-based intervention group (CBT) or to the control group, which received treatment-as-usual (TAU). Before and after the treatment phase, participants have been assessed. Follow-ups took place at 6, and 12 months post-treatment. The primary outcome was depression in the patient with AD. The secondary outcome measures were apathy, other neuropsychiatric symptoms, functional abilities, quality of life, and quality of the relationship to the caregiver. CBT reduced depression significantly more than TAU (interaction: $F = 5.3$, $p < .05$), with a moderate-to-large effect size ($d = 0.76$). There was also a significant advantage for CBT with regard to apathy ($F = 4.7$, $p < .05$; $d = 0.71$) and quality of the relationship to the caregiver ($F = 4.3$, $p < .05$; $d = 0.77$). There was no advantage with regard to other neuropsychiatric symptoms, functional abilities, and quality of life. The results are very encouraging and stimulate an adequately powered multi-center-study.
FORMALIZED COMPUTER-AIDED HANDWRITING ANALYSIS — VALIDATION AND INTEGRATION INTO PSYCHOLOGICAL ASSESSMENT

Yury Chernov
IHS Institute for Handwriting Sciences (Zürich, Switzerland)

Claudia Caspers
Munich High School of Philosophy (Munich, Germany)

Computer-aided formalized handwriting analysis brings certain unique qualities to the psychological assessment. It provides a wide coverage of personality traits and ensures exclusion of social desirability, which is the major drawback of traditional questionnaire-based psychometric tests. It enables an improvement of the validation of handwriting analysis that is in many former studies strongly affected by subjectivity of experts. In the current paper, the authors propose a formalized approach to handwriting analysis. It is implemented by a clear and literature-based matching of handwriting signs to psychological traits by means of mathematical modelling and computer-based evaluation. This approach is realized in HSDetect system. The presented study demonstrates a 2-step-validation of the system against the popular and well-validated test 16PF-R and the method of its integration into psychological assessment. The study includes 58 test persons, each of them provided handwriting samples and took the standard 16PF-R test. The validation procedure consisted of the following steps: First step: • 16PF-R scales were modeled in HSDetect system through psychological traits according to the existing description of the test. • 16PF-R tests were evaluated. • All handwritings were analyzed according to the formal procedure with HSDetect. • HSDetect 16PF-R scale levels were calculated and compared to the test. Second step: • Correlations between handwriting signs and the test results were calculated (without HSDetect) • The direct correlations were compared to the HSDetect model and the last was updated accordingly. The evaluation proves a high agreement of handwriting analysis and the 16PF-R test for certain scales. For remaining scales the agreement was lower, but still not negative. Generally, we can speak about positive validation of handwriting analysis by using mathematical modelling and computer-based evaluation. The advantage of this experiment against previously done validation studies in this field is that it is controlled, objective, reliable and repeatable. This procedure offers an additional benefit for the use of the 16PF-R test, since the inclusion of handwriting analysis excludes unwished phenomena such as social desirability when answering questionnaires and thus increases reliability. The positive outcome of the presented method encourages us to implement it for additional psychometric tests and psychological scales.
VARIOUS PSYCHOLOGICAL FACTORS AS PREDICTORS OF QUALITY OF LIFE IN PATIENTS OF OBSTRUCTIVE SLEEP APNEA: AN INDIAN PERSPECTIVE

Kamayani Mathur
Gulzar Mirza
Gujarat University (Ahmedabad, India)

The present study aimed to investigate various psychological factors as predictors of quality of life (QOL) in obstructive sleep apnea (OSA — recurrent cessations of breath during sleep) patients. Different measures were administered maintaining confidentiality of 97 participants in the hospital using purposive sampling technique. The sample distribution revealed the existence of demographic and clinical characteristics in the considered sample of OSA patients measured on nominal (gender, clinical comorbidities, sleep apnea status) and continuous [age, body mass index (BMI — a relationship of body weight and height of a person), neck circumference (NC)]. The data was statistically analysed by using chi-square, correlation and multiple regression analysis (step-wise method). The results indicated that higher BMI and NC were associated with severe OSA symptoms. Hypertension & coronary heart disease (CHD) comorbidity in patients had severe OSA symptoms. Under stepwise regression analysis, the internal health locus of control alone (r=0.549, r2=0.301, f=40.89**) and for powerful health locus of control (r=0.691, r2=0.477, f=42.908**) was determined as a significant predictor of OSA patients QOL, in cognitive restructuring (r=0.805, r2=0.649, r2 change=0.649, f=175.400**), wishful thinking (r=0.915, r2=0.837, r2 change=0.189, f=242.135**), express emotion (r=0.935, r2=0.874, r2 change=0.037, f=214.986**), social support (r=0.939, r2=0.882, r2 change=0.008, f=171.200**) and problem avoidance (r=0.942, r2=0.887 , r2 change=0.006 , f=143.504**) were subsequently analysed as significant predictors of their QOL. The OSA patients sense of self-efficacy analytically emerged as a significant predictor of their QOL (r=0.948, r2=0.898, f=835.85**). Thus, it can be concluded that the impact of OSA symptoms on the lifestyle and emotions affected both male and female patients equally. The higher the BMI and NC, the more severe was the afflict of OSA symptoms. The clinical coexistence of obesity, hypertension, diabetes and CHD made OSA symptoms more profound. The patients’ health control beliefs, their mechanisms employed in coping and their belief in self ability to manage OSA predicted their QOL significantly. The implications of this research on OSA as a public health burden in India increased the awareness and sensitized the patients, family members, caregivers and healthcare professionals towards psycho-social functioning of these patients for better management of their health and wellbeing.
Imposter syndrome is feeling incompetent despite evidence of competence. It is characterized by the inability to internalize one’s status and success, which causes much emotional stress. People with imposter syndrome are afraid that others will eventually find out that they are frauds and thus feel that they do not belong in their academic or working environment despite objective qualifications, achievements, and accomplishments. Perfectionism has been connected to imposter syndrome through a tendency to focus on one’s inadequacies. The two key research questions of this study are as below. First, does imposter syndrome serve as a mediator between the link of maladaptive perfectionism (discrepancy) and psychological distress (depression and anxiety)? Second, does having imposter syndrome (or not) change the association between perfectionistic discrepancy and depression/anxiety? In this study, participants were 169 Russian college students. Mediating and moderating effects of imposter syndrome on the link between perfectionism and psychological distress were examined. The following measures were included: The Clance Imposter Phenomenon Scale (CIPS; Clance, 1985) was used to measure participants’ level of imposter syndrome; the Short Almost Perfect Scale (SAPS; Rice, Richardson, & Tueller, 2014) was used to measure participants’ perfectionism level; the Depression Anxiety Stress Scale-21 (DASS-21; Lovibond & Lovibond, 1995) was used to measure psychological distress. Mediation analyses indicated that imposter syndrome fully mediated the link between perfectionism and anxiety, whereas it served as a partial mediator between perfectionism and depression. A significant moderation effect of imposter syndrome was found between the link of perfectionism and depressive mood. This study adds to the layer of understanding the mechanism between how maladaptive perfectionism is linked to psychological distress. Imposter syndrome serves as a key factor that leads perfectionistic discrepancy to anxiety and depressive mood. In sum, it appears that if a person does not fall into the imposter hole, the positive link between perfectionistic discrepancy and depression no longer exists. Results of this study identifies imposter syndrome as a point of intervention to prevent depression caused by perfectionism.
IT ‘HELPS’ YOU FEEL BETTER: THE DUAL RECURSIVE PROCESSES OF FEELINGS AND OCB-I AND THE IMPORTANCE OF THE DRD4 GENE

Huiyuan Jia
Capital University of Economics and Business (Beijing, China)

Yating Chuang
National Taiwan Normal University (Taipei, Taiwan)

Lei Zheng

Xiaofei Xie
Peking University (Beijing, China)

Jiping Li
Sichuan University (Chengdu, China)

Prior research suggests that interactions exist between ‘doing good’ (organizational citizenship behavior, OCB) and ‘feeling good’ (positive affect). Drawing on social exchange theory and the conservation of resources theory, we predict that ‘feeling good’ and ‘doing good’ form a promoting-resource-gain cycle, whereas ‘feeling bad’ (physical fatigue) and ‘doing good’ form a preventing-resource-loss cycle. In addition, the 2R carriers of the DRD4 polymorphisms linked to increased dopamine signaling would strengthen the resource gain spiral. Using experience sampling data that were collected from 200 nurses for two consecutive weeks, we found that employees who engage in more OCB-I experience positive affect at time (T-1), which is followed by a payoff in the form of increased positive affect in the future. Furthermore, employees that engage in less OCB-I experience physical fatigue at time (T-1), but OCB-I is negatively associated with physical fatigue at time (T). OCB-I mediated such relations. Moreover, the mediation effect only exists when the individuals are 2R carriers of the DRD4 gene. The research illustrates the recursive processes of feelings (both psychological and physiological) and behaviors and reveals two resource spirals and their mechanisms. In addition, the results advance the understanding of genetic influences in organizational research.

TAXONOMY AND STRUCTURE OF LITHUANIAN PERSONALITY DESCRIPTORS: SELF-RATING STUDY

Ana Ivanova

Oleg Gorbaniuk
The John Paul II Catholic University of Lublin (Lublin, Poland)

Boris Mlačić
Ivo Pilar Institute of Social Sciences (Zagreb, Croatia)

The goal of the study was to develop taxonomy and structure of Lithuanian personality traits following the principles of the psycho-lexical approach. We conducted exploratory research in three steps. In the first study, two judges selected 9625 person-descriptive terms from the Dictionary of Modern Lithuanian. In the second study, six judges classified all the selected descriptors, based on the German classification system (Angleitner et al., 1990). Finally, in the third study, we performed a Principal Component Analysis followed by Varimax rotation on the 627 personality adjectives, morphemically unique type-nouns, and morphemically unique attribute-nouns in self-ratings from 506 Lithuanian students. We investigated structures with one to
ten factors. The clear support was found for one-factor structure (Desirable vs. Undesirable traits), the two-factor model (Dynamism and Social Self-Regulation), and the five-factor structure (Agreeableness, Extraversion, Intellect, Contentiousness, and Neuroticism). Structures with one up to ten factors were correlated with Big Five and HEXACO models. The findings support cross-cultural replicability of five personality trait factors.

WHAT IS HAPPENING AFTER CONJUGAL LOSS? A PERSPECTIVE FROM TURKISH ELDERLY PEOPLE

Basak Oksuzler Cabilar
Gulay Dirik
Dokuz Eylül University (İzmir, Turkey)

Loss of a spouse is a life crisis which causes a variety of challenges for bereaved people. Although it can be more difficult for older adults, may be underestimated due to considered as a developmental stage. Bereaved person tries to adjust to new life style and changes of resources, and handle several emotions related to loss. Therefore, the present study aimed to examine effects of loss, what kind of changes and emotions experienced by elderly bereaved people and whether there were gender differences in these concepts. For this purpose, 152 widows/widowers living in nursing homes were included in the current study. Four open-ended questions were asked to participants about general effects of the loss, positive and negative changes after the loss and loss-related emotions. The answers were examined independently by the researchers. Firstly, main categories were identified and scored for each participant. Then, Cohen’s kappa was used for inter-rater reliability for each question. The results revealed that four categories which are ‘disturbance of habits’, ‘started to use different coping strategies’, ‘loss of the social and economic stability’ identified under the general effects of the loss. ‘Personal growth’, ‘materially and socially positive changes’ and, ‘change of dissatisfying old order’ were determined related positive changes after the loss. Negative results of the loss categorized as ‘familial problems’ and ‘cultural hardships’ (i.e. lonely life as a woman in patriarchal society). Regret, loneliness, melancholy, depression and shock were most reported feelings by the participants. Although experienced emotions and general effects were similar between genders, challenging areas of life after the loss were different. In other words, women reported most difficulties in financial, legal issues and domestic reparation while men reported most difficulties for housework and socialization. As a conclusion, these findings point both gender roles and the cultural background for bereaved people. Therefore, it can be beneficial that interventions and governmental policy should focus on these problem areas for facilitating adjustment in bereaved person.
DO COLLEGE STUDENTS ATTITUDES AND EXPECTATIONS PREDICT FUTURE EGALITARIAN MARRIAGES?

Francine Deutsch
Madison Richards
Mount Holyoke College (Northampton, USA)

This longitudinal study examined the extent to which college women’s attitudes about gender, career, and motherhood, and their expectations of achieving an egalitarian marriage matched their actual marriages 14 years later. A total of 202 undergraduate senior women at a prestigious women’s college in the United States were randomly selected and surveyed in 2003 about their attitudes surrounding work and family (e.g., gender ideology, career commitment, motherhood ideology, importance of marrying an egalitarian spouse) and their predictions for the extent to which different egalitarian scenarios (i.e., career-oriented, family-oriented, and balanced) would characterize their lives with husbands and children in the future. All original participants were re-contacted in 2017, and 130 completed different versions of a survey about work and family, which were varied according to the participants’ marital and parental status. This study is based on the responses of 58 married heterosexual mothers who completed a survey assessing their current division of labor with their husbands, current attitudes towards gender, family, careers, spouses’ attributes, and their rated the similarity of their work/family arrangements to the egalitarian scenarios that they had considered in the first wave of data. Based on the correlates of each of the three egalitarian scenarios, models were constructed to examine the effects of participants’ attitudes in college and their predictions about their future lives had on the extent to which they saw themselves as living each version of the egalitarian scenarios. Regressions showed that the only the career-oriented egalitarian lifestyle was anticipated by college students. In general, participants’ attitudes in college did not directly predict their rated similarity to any of the egalitarian scenarios, although the more a student desired a career-oriented husband the less likely she was to have a family-oriented egalitarian marriage 14 years later. Contemporaneously, financially contributing equally was significantly related to all three egalitarian scenarios, and the rejection of beliefs about traditional motherhood was related to both family-oriented and balanced egalitarian family life. Despite the lack of direct effects of participants’ attitudes in college on achieving an egalitarian lifestyle, further research should clarify whether they have indirect effects.
POSSIBILITIES AND CONSTRAINTS IN THE USE OF COMMUNICATION TECHNOLOGIES IN SOUTH AFRICAN MIGRANT FAMILIES

Maria Marchetti-Mercer
University of the Witwatersrand (Johannesburg, South Africa)

Leslie Swartz
Stellenbosch University (Stellenbosch, South Africa)

The role of new forms of communication technologies in maintaining family relationships across distance has been increasingly explored in recent research on transnational families. The emergence of Information and Communication technologies (ICT’s) has greatly transformed these families’ abilities to stay connected despite distance. ICT’s not only allow for distant communication to take place but also enable family members to maintain relationships of care in spite of physical separation. In this paper we will explore the experiences of a number of South African families across the racial divide which were part of a larger research project exploring the burden of care of elderly people resulting from adult children emigrating from the country. The results from this qualitative study reveal that participants had rather ambiguous relationships with the technology available to them. On the one hand technology was experienced as a positive means of maintaining contact and relationships, whilst on the other hand it was experienced as somewhat alienating and lacking intimacy. Three specific areas of concern were identified. The first was developmental with older people struggling to maintain relationships with their younger grandchildren. Secondly the constant possibility of staying in contact seemed to re-inscribe the loss and not allow for proper mourning; as well as causing the inability to ever get away because one is constantly in touch. There was also salient difference between those who had emigrated and those left behind with the latter group also experienced some nostalgia for more old-fashioned means of communication such as letters and visits. Consequently, this presentation hopes to add to the larger body of knowledge that is emerging exploring the complex experiences of transnational families; as well as underscore the manifold nature of human relationships in our increasing technological world.
MAY POSITIVE AND NEGATIVE GROUP-BASED VALUES STRENGTHEN SUBJECTIVE WELL-BEING? ASSOCIATIONS WITH LIFE SATISFACTION AND IDENTITY FUSION

Fatih Özdemir
Bursa Uludag University (Bursa, Turkey)

Ashwini Ashokkumar

William Bill Swann
The University of Texas at Austin (Austin, USA)

Considerable research has proposed that there is a positive association between being a member of a social group and subjective well-being. However, this association mostly has been tested with in-group identification concept (social identity theory: identification with group-based identity) rather than identity fusion (identity fusion theory: connectedness and oneness of personal identity with group-based identity). Besides, positive or negative aspects of group-based values have been ignored. The current research aimed to investigate the relationship between identity fusion with in-group (Turkish society) and life satisfaction considering the mediating role of endorsement of subjectively positive/negative cultural values. We hypothesized that holding values of Turkish culture would mediate the effect of fusion on life satisfaction. Besides, this relationship would remain robust for positive and negative cultural values. The pilot study (Nwomen = 257, Nmen = 107, Mage = 22.24, SD = 2.80) was conducted to determine positive and negative values in Turkish culture. Sexism was commonly rated as a negative value in Turkish culture whereas relatedness (interrelational orientation) was rated as an important positive cultural value. The main study (Nwomen = 290, Nmen = 143, Mage = 21.56, SD = 2.46) was conducted to test the proposed mediational model. Participants filled out scales/questionnaires of life satisfaction, identity fusion, balanced integration-differentiation, and ambivalent sexism. Depending on one-way MANOVA findings, women presented higher scores on items representing life satisfaction and interrelational orientation than did men and reported lower benevolent and hostile sexist attitudes than did men. Zero-order correlations computed separately for male and female participants, and there were significant associations. The proposed model was tested using LISREL 9.10. There was not a significant gender difference on identity fusion with Turkish society. Therefore, gender difference was not considered in model testing process. The proposed model indicated that identity fusion with Turkish society increased interrelational orientation and benevolent sexism which in turn predicted satisfaction with life. Moreover, identity fusion with Turkish society positively predicted hostile sexism, but the association between hostile sexism and life satisfaction was not significant. Results have shed light on how deep alignment with a group may have positive outcomes for subjective well-being.
THE LEADERSHIP MOTIVATION AMONG UNDERGRADUATES

Irina Kokurina
Lomonosov Moscow State University (Moscow, Russia)

The leadership is associated with the ability to motivate and lead a group (Myers, 1997). The study period in a college or university creates profitable opportunities to reveal this ability. In our study, we relied on approaches that allow to: 1) study the leadership polymotivation; 2) provide an opportunity to see the differences between the leadership motivation and the motivation of other status positions in a group — popular, medium, unpopular. The first study was carried out in 2010 and involved 10 groups of 2nd and 3rd year students (n=157) of two Moscow university teaching management and programming faculties. Two methods were used: 1) Jacob Moreno’s sociometry measured the informal student’s status in a group related to social and class activity using four sociometric criteria; 2) Irina Kokurina’s (1990) inventory Slovar (the Dictionary) measured the ratio of six sense-making motives in the respondents’ profiles: creativity, communication, pragmatics, cooperation, competition, achievement. We determined the leaders on the fulfillment’s basis of two sociometric conditions: 1) the leader is the one who according to each of the four sociometric criteria appears in the group of the most popular; 2) the leader has a predominant position among the most popular. SPSS Statistics 17.0 was used to process the data as well as a special statistical procedure to divide the entire sample of students into three groups: popular, medium, unpopular (Kokurina, 2006). Three leaders were found among the 157 respondents. An important distinction of leaders from popular, medium and unpopular ones was the presence in the leaders’ motivation diagram of two spikes — cooperation and achievement. The competition’s motive was insignificantly more evident in the leaders’ profiles, and the creativity’s and pragmatics’s motives, conversely, showed the lowest values. The leaders’ motivation demonstrated a surprising combination of collectivism and individualism, high values of cooperation and achievement motives along with a low pragmatic’s and creativity’s level. The leaders turned out to be ‘achievers’ for the society’s benefit who were prone to competition in behalf of the group. The leading’s presence motives for cooperation and achievement among leaders in student groups was further confirmed in other studies.
In order to facilitate pro-environmental transport mode use it is important to promote acceptance for disincentives to driving and intentions to use public transport. The present study aims to investigate values, environmental beliefs and norm activation as predictors of these psychological cognitions. In addition, we examine gender differences in the psychological constructs entered into the model. A questionnaire-based survey was carried out in a randomized representative sample of the Norwegian population (n = 1043). The results showed that the model was well-suited to explain acceptance of disincentives to driving and, to a lesser extent, intention to use public transport. Biospheric values were strongly related to an elevated ecological worldview, whereas egoistic values were associated with a weaker ecological worldview. The values had indirect relations to acceptance of disincentives to driving and intention to use public transport through the ecological worldview and Norm activation model (NAM) components, but altruistic values were found to be associated with ascription of responsibility. Females reported stronger biospheric and altruistic values, and weaker egoistic and hedonic values than males. Females also reported a stronger ecological worldview and more awareness of consequences and personal norms in the NAM. Policy planners may focus on values, environmental beliefs and norm activation in order to increase the acceptance of disincentives to driving. A broad approach, which accounts for additional factors such as transport availability, spatial factors and ‘pull’ measures, may be more suitable to promote intentions of public transportation mode use.
The acquisition of trust in the police during adolescence is essential to the development of law-abiding citizenship in contemporary society. Two studies were carried out to identify the social factors that affect adolescents’ trust in the police. In Study 1, 285 13 to 15-year-old year students from a secondary school in the UK were administered the Adolescents’ Trust Beliefs in Police (ATBP) scale and measures of: (a) generalized trust beliefs in others, (b) delinquency, (c) peer friendships, and (d) cooperation with the police. Some variables were assessed at two time points across a year period. It was found that the adolescents’ trust in the police was positively correlated with generalized trust beliefs in others and cooperation with police and was negatively correlated with delinquency (all ps < .05). Regression analyses showed that the adolescents’ cooperation with police longitudinally predicted the ATBP scale ($\beta = .16, p = .017$) indicating that cooperation with police is a probable cause of their trust in the police. Also, the ATBP scores of pairs of good friends were appreciably correlated which confirmed the expectation that peer socialization contributed to adolescents’ trust in the police. In Study 2, 174 adolescents from a secondary school in a inner city of Birmingham UK, completed the ATBP scale and a standardized measure of reported parenting styles of their parents. It was found that the adolescents’ trust beliefs in the police were positively correlated with reports of their parents demonstrating an Authoritative Parenting Style ($p < .05$) which entailed setting standards and engaging in adolescent-parent communication. Across studies, it was found that the ATBP scale demonstrated validity by being composed of the expected three-factor structure (reliability, emotional trust and honesty) and acceptable reliability by attaining psychometric standards of internal consistency (Cronbach alphas > .80) and stability across a year period, $r(211) = .48, p < .001$. The research yielded support for the conclusion that adolescents’ behavioural dispositions towards the police, peer socialization, and parents’ parental styles, contributed to the adolescents’ trust beliefs in the police.
ANALYSIS OF FACTOR STRUCTURE OF PARENTAL TOLERANCE

Raisa Ovcharova
Kurgan State University (Kurgan, Russia)

In the author’s concept, parental tolerance is considered as an integral formation of the parent’s personality. It manifests itself at three interrelated levels: cognitive, emotional and behavioral and determines the subjective development of the child’s personality and his psychological well-being. The study involved 73 families with children aged 5 to 10 years. The study used a set of methods: "Conscious parenthood", "Positive parental feelings", "Parental love and sympathy", "Method of express diagnostics of the style of family education", "Method of diagnosis of general tolerance." The structure of all types of tolerance is identical with the specific content. To prove the assumption that parental tolerance is an integral formation of the personality of a parent, having a similar structure and specific content, factor analysis was used. Factorization was based on 40 variables, characterizing the structure of parental tolerance. In the factor structure of parental tolerance, 4 factors were identified, the cumulative percent of the variance of which is 54, 27%. Factor I "Emotional", covering 24, 39% of the variance, is the central factor. Significant weights in it indicators of positive parental feelings have. Factor II "Communicative tolerance“ covers 14, 07% of the variance. Significant weights in it 10 indicators have, defining different manifestations of the antipodes of tolerance. Factor III "Cognitive“ covers 8, 24% of the variance. Significant weights in it 5 indicators of conscious parenthood have. Factor IV "Behavioral“ covers 7, 56% of the variance. Significant weights in it six indicators have, relating to the style of family education and its accompanying parameters. The factor structures of fathers and mothers are similar. However, fathers have more cognitive component than mothers and less communicative tolerance and behavioral component. The factor analysis confirms the three-component structure of parental tolerance, its specific content and indicates the special role of communicative tolerance. The results of the research can be used in the psychological support of parenting in the work of practical psychologists with socially and pedagogically neglected children and their parents with manifestations of intolerant attitude towards children.
MISMATCH BETWEEN PERSONAL ATTITUDES AND PERCEIVED GROUP NORMS: NEW EXPLANATION OF GENDER DIFFERENCES IN PSYCHOLOGICAL WELL-BEING

Kamilla Khamzina
Serge Guimond
Université Clermont Auvergne (Clermont-Ferrand, France)

Research has been successful in studying gender differences in psychological well-being and happiness. However, the findings remain inconsistent. Some researchers showed that women are less satisfied than men (Pinquart & Sorensen, 2001). However, the recent meta-analysis has not revealed any significant gender differences in psychological well-being (Batz-Barbarich et al., 2018). In the present study, we propose rather to study the psychological factors that underlie gender differences in mental health. Thus, based on gender differences in self-construal (Guimond et al., 2013), a mismatch between what do people personally think on a sensitive social issue (i.e., personal attitudes) and what do they perceive about others’ beliefs (i.e., perceived group norm) was proposed as one of such mechanisms. The findings amongst a representative French population (N = 1000) confirmed our expectations. Overall, we found that women in France have a lower level of well-being than men. Moreover, the mismatch between attitudes and perceived group norm was found to be at the origins of such gender differences. Particularly, it was found that women who had positive attitudes towards the cultural diversity but perceived others as being opposed to it (i.e., mismatch) had a lower well-being than those whose attitudes matched the norm. These findings were discussed in light of gender differences in psychological outcomes and its implications for explanation of such differences.
INTERPERSONAL PROBLEMS IN RELATION TO INFLATED, DEPRECATING AND AMBIVALENT PERSONALITY BELIEFS

Miray Akyunus
Istanbul Şehir University (Istanbul, Turkey)

Tulin Gencoz
Middle East Technical University (Ankara, Turkey)

The cognitive theory of personality disorders (Beck, Freeman, Davis, & Associates, 2004) emphasizes the role of distorted beliefs in personality disorders (PDs) whereas interpersonal theory of PDs (Pincus, 2005) prioritizes the dysfunction in interpersonal relatedness. This study aims to investigate the relationship between interpersonal problems and dysfunctional beliefs associated with PDs within the framework of both theories. With the use of alternative categorization of the PDs (deprecating, inflated, and ambivalent personality beliefs) which depends on their cognitive formulations provided by the cognitive model, findings of the present study is also expected to provide a support for the cognitive model of PDs in interpersonal context. In particular, different dimensions of interpersonal problems which were assessed through the coordinates of Interpersonal Circumplex Model were expected to be associated with the proposed categories of personality beliefs. 1273 volunteer adults (398 men and 875 women) from a community sample in Turkey, between the ages of 18 and 61 (M = 26.75, SD = 7.72), participated to the study. Participants were invited to the study via an announcement shared in social network sites, in which they were acknowledged that they would get personal feedback regarding their interpersonal behaviors. Personality Belief Questionnaire (Beck & Beck, 1991) and Inventory of Interpersonal Problems Circumplex Scales (Horowitz, Alden, Wiggins, & Pincus, 2003) were used for the measurement of the variables. Three separate hierarchical multiple regression analyses were conducted to regress personality belief categories via interpersonal problem octants, after statistically controlling for the effects of demographic variables (i.e., age and gender). Results indicated distinctive associations between interpersonal problems and the personality belief categories; deprecating beliefs were associated with submissiveness; inflated beliefs were associated with domineering/controlling and intrusive/needy behaviors, and low friendliness; ambivalent beliefs were associated with domineering/controlling, cold/hostile behaviors and low intrusive/needy behaviors. The findings of the present study revealed the predictive value of specific interpersonal problems on personality psychopathology depending on the self-versus-others conceptualization.
SEPARATED AND (RE)UNITED IN ILLNESS: ROMANIAN PARENTS’ ACCESS TO CARE FOR THEIR CHILDREN WITH HEMATO-ONCOLOGICAL DISEASES

Gianina-Ioana Postavaru  
Bishop Grosseteste University (Lincoln, United Kingdom)

Adina Maris  
The Emergency County Hospital Tg Mures (Targu Mures, Romania)

Children with hemato-oncological diseases in south-eastern Europe are likely to report poorer survival rates due to access to treatment, health inequalities and medicines shortages. Although previous studies on medicines shortages in Europe found no significant impact on healthcare providers’ costs (Pauwels et al., 2015), it is unclear whether findings would align with parents’ perspectives. Romania reported the lowest health expenditure in Europe in 2014 (Vladescu, 2016). There are more than thirty paediatric cancer medicines at risk (Romanian Health Observatory, 2018), with some being permanently or temporarily removed from the market. Affordability is the main reason for perceived unmet healthcare needs. Over 70% of diagnosed children come from families with limited financial resources. To overcome direct costs that function as a barrier to living and care, an increasing proportion of parents are leaving their children behind to take up ‘temporary’ employment abroad. We sought to explore the psychosocial impact that getting access to essential care and medicines had on parents of Romanian children diagnosed with hemato-oncological diseases. Data were collected through in-depth interviews with twenty-seven parents (3 fathers; 24 mothers; age range 32-54). Data were thematically analysed using template analysis to identify key themes, particularly those relating to illness and treatment management in hospital and at home, and ways to address unmet needs. 52% of the interviewed parents were living in rural areas and in 37% of the families only one parent was employed. In five families, at least one member was working abroad. Themes emerged from the data explained (1) access to care and medicines (traveling long distances and the burden of buying medicines locally and abroad), (2) impact on families (parents’ relationship with other children at home and migration- from traditional to transnational parenting) and (3) financial implications (treatment costs and poverty). This study has identified parents’ challenges related to their responsibilities and access to care and medicines. It highlights the need of a national policy to support those families at risk and the value of family oriented services to address the unmet needs of diagnosed children, their siblings and parents throughout the treatment journey.
PROMOTING AUTONOMOUS LANGUAGE LEARNING IN PEOPLE WITH SPECIAL NEEDS: UNIVERSAL DESIGN FOR LEARNING IN THE PROJECT EN-ABILITIES

José Luis González-Castro
University of Burgos (Burgos, Spain)

Sergio Sánchez
Universidad Autónoma de Madrid (Madrid, Spain)

Elena Alcalde
Universidad Alcalá de Henares (Alcalá de Henares, Spain)

The rationale and results of the En-Abilities project (Erasmus + project 2017-1-ES01-KA204-038155) financed by the Sepie (Spanish Service for the Internationalization of Education) will be presented. This is a project conducted with partners from Ireland, Portugal, Romania Serbia and Spain. Based on the inclusion of Universal Design for Education the project has developed a comprehensive online autonomous learning tool for learners with Special Educational Needs (SEN) to communicate in English. The project intends to support people in possible situations of exclusion acquire knowledge in a specific tool (English) that may help their inclusion within society increasing their employability and social participation. We will present the main ideas of Universal Design and how it was applied to the creation of a Massive Open Online Course (MOOC) considering the requirements of an English language course for levels A1, A2 and B1. Results from a study conducted with English language teachers (n= 180) and learners with SEN (n=50) prior to the construction of the MOOC will be presented. These results show that although English language teachers have limited interaction with learners with SEN they agree that they should learn English, although this idea is qualified by the specific nature of the educational need. Our sample of English learners with SEN (visual and hearing impairments, autism, Asperger syndrome, mild intellectual disability, etc.) know and understand English with a level equivalent to an A1-A2 requirement. They fully understand the need, and want, to learn English as a way of facilitating their inclusion in society in general and the labour market in particular. The main accommodations to adapt the course to learners with SEN will also be presented. Finally, the results from a pilot test with 15 students with SEN will also be shown. Results show that learners, educational and ICT professionals were satisfied with the results of the MOOC improving their level of English and desire to keep studying and global satisfaction with the learning process.
THE RELATIONSHIPS BETWEEN THE ALEXITHYMIA AND ATTACHMENT STYLES

Burcu Erdur
Mesut Yavuz
Istanbul Aydin University (Istanbul, Turkey)

Alexithymia is a personality trait characterized by difficulties in recognizing and expressing emotions, externally thinking style, and limited imagination capacity(1). The aim of this study is to investigate the relationship between alexithymia and the attachment security. This research was conducted on 481 university students (%59 female, s=283) aged between 18 and 28. The socio-demographic data form, 20 item Toronto Alexithymia Scale (TAS-20) and Adult Attachment Style Scale were used as measures. Spearman rank order test was used to analyze the correlation coefficients between the scales. The predictability of attachment styles, age and gender on alexithymia was evaluated with binary logistic regression analysis. TAS-20 scores were negatively correlated with secure attachment scores(r=-.267). TAS-20 scores were positively correlated with an xious-ambivalent attachment scores (r=.422) and avoidant attachment scores(r=.400). The results of regression analysis indicated that anxious-ambivalent and avoidant attachment styles and gender significantly predict the alexithymia. Alexithymia personal trait increases depression, anxiety disorders, impulse control disorders, obsessive compulsive disorder and predispositions to addiction (2). It is also can lead to a decrease in social functioning due to difficulty in recognizing and expression emotions and emphatic thinking. The results of this study indicate that the therapeutic interventions focusing on the attachment security may increase the treatment success of individuals with alexithymia. References:
FAMILY PREDICTORS OF OLDER PRESCHOOLERS’ INTERPERSONAL EMOTIONAL COMPETENCE

Nadezhda Sergunicheva
Vasilenko Victoria
Saint-Petersburg State University

Preschoolers’ interpersonal emotional competence is connected with the well-being in family interaction, but it is also actual to study the compensatory mechanisms in its formation. Present research aims to found family predictors of older preschoolers’ interpersonal emotional competence, included emotional identification, empathy and expression. Parameters of parenting styles, emotional mother-child interaction, family adaptation and cohesion were considered as family predictors.

The study involved 80 mother-child dyads from Saint-Petersburg (42 boys and 38 girls from 5 to 6 years, Mage = 5 year 6 months).

Methods used were: Test «Emotional identification» and questionnaire for parents by E.Izotova, Empathy test by T.Gavrilova, «Analysis of family relationships» questionnaire by E.Eidemiller and V.Yustitskis, «Parent-child emotional interaction questionnaire» by E.Zakharova, Family Adaptation and Cohesion Scales (FACES III) by D.X.Olson, J.Portner, I.Lavi.

Regression analysis revealed that emotional identification by schematic pictures was better formed at higher indexes of unconditional acceptance of the child, deficiency of demands, prohibitions and at lower indexes of overprotection and projection of own undesirable qualities on the child (p<0,05). Emotional identification by photo is better formed at higher indexes of minimal sanctions, preference to masculine traits and at lower indexes of understanding the causes of child’s state (p<0,001) and excessive demands, prohibitions (p<0,01). Knowledge of markers of emotion’s expression (drawing of emotions) is better formed in the case of demands, obligations (p<0,01) and underdevelopment of parental feelings (p<0,05). Empathy is positively associated with mother’s ability to influence to the child’s state (p<0,01). Predictors of emotional expression weren’t revealed. Regression analysis revealed only one predictor of integral index of interpersonal emotional competence. Interpersonal emotional competence in overall is better formed at higher indexes of mother’s positive feelings in the interaction.

Thus, the unconditional acceptance of the child, the maturity of parenting styles and behavioral manifestations in emotional interaction can be regarded as resources for preschoolers’ emotional competence. At the same time the hypothesis of compensatory mechanisms in the emotional competence formation was confirmed. In the case of insufficient sensitivity of mothers, preschoolers better identify emotions by photo and better depict emotions in the drawing pictures.

Research is supported by RFBR №18-013-00990.
RUSSIAN STUDENTS’ SOCIAL REPRESENTATIONS OF HIGHER EDUCATION

Marianna Sachkova
The Russian Presidential Academy of National Economy and Public Administration (Moscow, Russia)

Galina Esina
Moscow State University of Psychology and Education (Moscow, Russia)

The main goal of the research was to study the structure and content of students’ social representations of higher education in a modern society. The total sample size was 588 students: of which 197 were secondary school students (average age of 16.7), 195 were undergraduate students (average age of 20.8) and 196 were master students (average age of 29.3). We used a number of methods for the analysis of the intragroup status including sociometry, referentometry, methodological procedure of informal power structure definition and P. Vergès methodology for the analysis of the structure of social representations. We applied the Cohen’s Kappa and Mann-Whitney U-test of statistical analysis. We tested the hypothesis that the structure of social representations of higher education had general and specific features which are correlated to the age, educational level and students’ intragroup status. All respondents’ associations were assessed by prototypical and categorical analysis with two parameters — (1) the rank of the occurrence of a separate concept; and (2) the frequency of the occurrence of this concept in the respondents’ answers. It was found that the social representations of schoolchildren, undergraduate students and master’s students differ in a number of elements and their content characteristics. The main social representations from students with different education levels had similar characteristics, however, students from universities expanded the core performance, in contrast to students of secondary schools, because of their social experiences, therefore, less “distance” to higher education as an “object”. Content analysis of representations showed that such core element of social representations as “income” (salary, money) was significant for respondents at every level of education, but for schoolchildren it was the most important, while for university students the most consistent element was “knowledge”. We discovered that the cores of high- and low-status students’ representations about education had differences in a number of elements and content orientation. The importance of the observed results is revealed through the understanding of the students’ attitude toward higher education and could be used in a variety of educational institutions to improve the efficiency of the educational services they provide.
DEALING WITH SOCIAL STRESSFUL EVENTS: THE ROLE OF EMOTION REGULATION STRATEGIES

Patricia Arriaga
ISCTE-IUL (Lisbon, Portugal)
Anabela Santos
Universidade de Lisboa (Lisbon, Portugal)

During social stressful events, the use of adaptive emotion regulation strategies is important for performance and goal-achievement. Based on the Extended Process Model of Emotion Regulation (Gross, 2015), this study examined the effects of combined cognitive reappraisal strategies (CCR: Reappraisal of emotional response and via perspective taking) in comparison to suppression (ES) of expressing emotions, on physiological, verbal and behavioral responses during a social stressful situation. Participants (N = 70) were asked to make a speech in a job interview and a mental arithmetic task in front of two juries, using the Trier Social Stress Test (TSST) protocol. Before the TSST, participants were randomly assigned to use one of two emotional regulation strategies: CCR or ES. Electrocardiogram was recorded continuously before (baseline), during the TSST, and after (recovery). Behavioral responses during the TSST were videotaped, and participants also provided emotional experience ratings before and after the TSST (e.g. anxiety, shame). Results have shown that the ES group showed higher physiological stress levels than the CCR group during the TSST (p <.001). In the ES group the physiological levels of stress increased during the TSST and the heart rate variability (HRV) reduced significantly (ps < .05), whereas in the CCR group the stress levels and the HRV values were relatively constant thought the experiment and within the normative values. Participants in the CCR group were also more satisfied with the way they regulate their emotions and with their performance during the TSST (ps < .05), although no differences were found on affective ratings. The CCR group was also perceived as more social adequate during the interview compared to the ES group (p <.05). We concluded that the combined use of cognitive reappraisal strategies, in contrast with suppression of emotions, can be appropriate strategies to manage situations that induce high social stress.

EARLY ADOLESCENTS’ ATTITUDES AND ACADEMIC ACHIEVEMENT: THE MEDIATING ROLE OF ACADEMIC SELF-CONCEPT

Alejandro Veas Iniesta
Juan-Luis Castejón
Pablo Miñano
Raquel Gilar-Corbí
University of Alicante (Alicante, Spain)

This study was designed to examine academic self-concept as a potential mediator to better understand the relations between academic attitudes and academic achievement in early adolescence. A total of 1398 high school students from Alicante, Spain (47% female, M = 12.5 years), participated in the study. Multilevel mediation analyses with Monte Carlo confidence intervals were used to measure within-subject effects at the student level (L1) and between-subject effects at the class level (L2). Academic attitudes (attitudes towards teachers and attitudes towards school) and academic self-concept were measured with validated scales, whereas academic achievement was assessed using the end-of-term grades obtained by the students in nine subjects. The results show, first, significant effects of the academic attitude constructs on the mediational and dependent variables at both the within and between levels.
Second, academic self-concept was an important mediator for all academic attitude constructs at both levels of analysis. These results highlight the importance of academic self-concept during early adolescence and suggest that academic attitudes are crucial for the future development of educational models.

THE ABILITY TO DIAGNOSIS AS A PROFESSIONAL COMPETENCE OF A SPECIALIST

Elena Sorokoumova
Sergey Elshanskij
Moscow Pedagogical State University (Moscow, Russia)

In recent years in the domestic education competence approach is declared as a priority methodology and basic paradigm. The formation of abilities and willingness necessary for successful professional activity in a specialist as a goal of education is obvious. However, the specific sets of competencies required for a specialist, presented in the existing educational standards, are not yet fully and clearly defined. The development and effective implementation of the competence approach is impossible without special studies aimed at studying both the actual content of the professional competencies requiring formation, and the possibilities and methods of such formation. In particular, there is a need for psychological research in this area, since many competencies can be considered as professional cognitive abilities. A professional diagnostic capability is needed to almost any specialist (e.g. psychologist, doctor, engineer, etc.), diagnosis in a problematic professional situation is a necessary action that helps the specialist to solve a professional task. The condition for the formation of diagnostic competencies is the ability to diagnostic thinking, which is a special form of perceptual-mental activity. By analogy with the mental operations of generalization or classification diagnosis can be viewed as a complex mental operation that integrates the following essential elements of mental activity, such as comparison, analysis, synthesis etc. At the same time diagnosis as the mental operation is present not only in professional but also in everyday life. Diagnostic competence is related to understanding. If we consider understanding as a universal operation of thinking, then diagnostics can be considered as an element of understanding. It is believed that understanding provides a connection of new properties of the object of knowledge with the already known, forms an operational sense. Therefore, for understanding (especially if we are talking about forms of understanding that require a deep understanding of the causes and consequences) it is necessary to solve a certain mental task, for which the diagnostic operation is used. Actually understanding (as a new meaning, not as a process) we can consider as a result of diagnosis (especially if we talk about causal diagnosis, diagnosis of causes).

GENERALIZED TRUST AS A FACTOR OF POSITIVE ATTITUDE OF MUSCOVITES TOWARDS CULTURAL DIVERSITY

Dmitrii Dubrov
National Research University Higher School of Economics (Moscow, Russia)

The paper is devoted to the study of the role of generalized trust for intercultural relations in Moscow. An empirical study (N=219) showed that the length of residence in Moscow is negatively associated with a positive attitude towards ethnic diversity. However, the generalized trust neutralizes this association, making it insignificant. That means that in case
of high level of generalized trust, the attitude towards cultural diversity does not depend on the length of residence in Moscow. Thus, generalized trust is an individual characteristic of a person, which, interacting with his/her experience, is able to neutralize the negative consequences of negative experience and increase the positive attitude of Muscovites towards cultural diversity. The obtained results can be explained by the fact that trust makes the boundaries between different cultural groups living in the same multicultural environment (Moscow) more pervious. This is based on the principle of social de-categorization, which implies the perception of other individuals just as individuals, regardless of their belonging to any group. That is, if an individual trusts other people, it does not matter to him/her what category other individuals belong to.

METAPHORIC IDEAS ABOUT DIFFICULT LIFE SITUATIONS AND SOCIAL FRUSTRATION AS PREDICTORS OF PERSONAL COPING STRATEGIES

Valeriya Alperovich
Southern Federal University (Rostov-on-Don, Russia)

In this article, we touch on the problem of psychosocial personal characteristics as predictors of the coping behavior within the framework of the problem-focused and emotional-focused coping theory (R. Lazarus, S. Folkman) and of the Russian coping concept (T.L. Kryukova, E.V. Kuftyak, M.V. Saporovskaya). The research objectives consisted in identifying the influence of social frustration and metaphoric images of difficult life situations on the subjects’ coping strategies as well as in identifying the distinctions of coping strategies of subjects who differ in the social frustration extent level and metaphors of difficult life situations. We discovered the dependence between social frustration, metaphors of difficult life situations and coping strategies by the use of content-analysis of metaphors, tests and methods of mathematical statistics (quartiles, regression analysis, Kruskal-Wallis H-test). The social frustration extent level has a negative impact on the selection of coping strategies “Planning”, “Exercising self-control”, “Positive reappraisal”, “Seeking social support”, on how the estimations of a difficult situation are differentiated and on the perception of its complexity. However, it has a positive impact on the choice of coping strategies “Escape-avoidance”. Negative artifact metaphors, metaphors of distinction and positive precedent name metaphors are associated with the “confrontational coping” strategy selected. Anthropomorphic metaphors are associated with the “distancing” coping strategy. Positive anthropomorphic and naturomorphic metaphors of “friends” are associated with opting for the “Seeking social support” coping strategy. Negative anthropomorphic and artifact metaphors are associated with coping strategy “accepting the responsibility”. Negative artifact metaphors are associated with choosing the “exercising self-control” coping strategy. So, a high level of social frustration is connected with low rational and adaptive coping strategies in difficult life situations. Various coping strategies are associated with different metaphors of difficult life situations and of their participants: “friends” and “aliens”. The metaphors reflect personal perception of difficult life situations based on scales “short distance-long distance”, “rational value-emotional value” and on parameters “undertaking the responsibility — placing the responsibility with others”, “stereotypical or differentiated image of the situation”. The results of the research conducted are of practical importance for psychological counseling of individuals.
RISK FOR PRENATAL DEPRESSION

Vera Yakupova
Lomonosov Moscow State University (Moscow, Russia)

Exposure to prenatal maternal depression is associated with negative child outcomes, including increased risk for poor emotional regulation, mental health problems, and cognitive, behavior or motor delays (Lebel et al., 2015). Prenatal depression is a significant predictor of the development of postpartum depression (McMahon et al., 2015). Postpartum depression in turn has a negative impact on the child’s attachment to the mother, on his or her emotional and intellectual development (Murray et al., 1999). Understanding the psychological mechanisms underlying prenatal depressive symptoms can help develop the therapeutic ways to reduce them and prevent postpartum depression. Objective: a comprehensive study of prenatal depression, the selection of risk groups for prenatal depression development. Sample: 344 Russian speaking women, 141 of them are nulliparous and 207 multiparous, from 19 to 46 y.o. (M=32 y.o.) 334 participants were married or cohabiting with the partner. 312 participants had higher education, 32 had secondary education. the data was obtained during the second and third trimester of pregnancy. We used Edinburgh Postpartum Depression Scale (EPDS), Couples Satisfaction Index (CSI), Cognitive Flexibility Scale (CFS), author’s questionnaire, including questions about well-being and expectations regarding motherhood. Based on the data obtained, we identify the risk group for the development of prenatal depression. The risk group includes women who faced health problems during pregnancy. Participants with a poor level of cognitive flexibility development demonstrate severe symptoms of depression. We found that low level of marital satisfaction is strongly associated with prenatal depression. The risk group also includes women with episodes of postpartum depression. The results obtained help developing therapeutic methods to prevent the perinatal depression development. The research was supported by the grant of Russian Fond for Fundamental Research № 18-313-00051.
INVESTIGATION OF VARIABLES AFFECTING POSITIVE AND NEGATIVE PRIMING MEASURED BY FACIAL RECOGNITION PERFORMANCE WITH DIFFERENT THRESHOLDS

Bahadir Oktay
(Isparta, Turkey)

Banu Cangöz
Hacettepe University (Ankara, Turkey)

The purpose of this study was to offer a holistic examination of certain independent variables (proportions of priming and target stimulus, congruency level, sub-threshold presentation and emotion) that have the potential of influencing both positive and negative (and semi-negative) priming, which there were controversial findings in the literature. In line with this purpose, three experiments were designed. The aim of first two experiments was to examine the influence of faces, words, and shapes on positive and negative priming under sub/suprathreshold conditions. The aim of the Experiment 3 was to examine the influence of priming stimulus on priming types in case a few of the characteristics (face and emotion on face) of the stimulus were consistent/inconsistent. The study had been conducted with a total of 150 participants equally distributed among three Experiments. In Experiment 1, 3 (Type of stimuli: Face, Shape, Word) x 3 (Type of Priming: Positive, Semi-negative, Control) x 2 (Type of Presentation: Sub-threshold, Supra-threshold) repeated measure experimental design suitable, in Experiment 2, 3 (Type of stimuli: Face, Shape, Word) x 4 (Type of Priming: Positive, Semi-negative, Negative, Control) x 2 (Type of Presentation: Sub-threshold, Supra-threshold) repeated measure experimental design suitable, and in Experiment 3, 3 (Congruency: Face Congruent, Face Non-congruent, Control) x 3 (Emotional Face Congruency: Emotion Congruent, Emotion Non-congruent, Control) x 3 (Emotion of Priming Stimulus: Happy, Angry, Neutral) repeated measures experimental design suitable ANOVA was conducted. In the experiments, the positive, negative, and semi-negative priming has been shown experimentally in terms of recognition. This finding is important in showing the continuity of the cognitive priming process. Besides, it has been found out as a result of the findings derived from Experiment 1 and 2 that the sub-threshold presentation of priming words provided better advantage than both positive and negative priming. The Experiment 3 has demonstrated that there was no difference between the face and its emotion in terms of priming in face recognition. According to findings, priming effect can be seen as a continuum from positive to negative priming. Additionally semi-negative priming condition has a role between no priming and negative priming.
COMPONENTS OF SOCIAL STATUS IN CONTEMPORARY RUSSIAN SOCIETY

Svetlana Fedotova
Tatiana Folomeeva
Lomonosov Moscow State University (Moscow, Russia)

Social status refers to the person’s position in society determined by a number of objective and subjective indicators in different scientific knowledge areas. However, different criteria are defined in the conceptions: education, position, income, property, prestige, and others. Analyzing the society’s structure throughout the mankind’s history, L. Johnson noted that the status and criteria underlying it are related to the values shared in society. In order to identify the criteria specific to the Russian society and to analyze the process of a stranger’s social status perception, we conducted a study consisting of two stages. At the first stage (n=121) we identified social representations about social status to determine the significant components of this phenomenon. At the second stage (n=98) the relationships between the social status (both social-economic and perceived) and the characteristics selected in the first stage were analyzed. According to the representations the important characteristics were: education, profession, wealth, accuracy, and others. 12 videos were selected for data collection at the second stage. For selecting videos we used the following criteria: gender, age, speaker’s social status. Respondents were offered to watch 3 videos, after each video they were asked to evaluate the speaker on a certain set of 5-point scales which were identified on the first stage, as well as to determine the profession and give a brief description of the speaker. First, there is correlation between social-economic and perceived status (r=0.41; p=0.01). We found general significant correlations of the perceived and social-economic status with the scales "education", "wealth", "confidence" and others. Characteristics were found with which connections were not established in both cases: "lazy", "civilized". Unlike social-economic status the perceived social status has significant correlations with the category "weakness", and has no correlations with the characteristics "employed", "indifferent". We can conclude that a stranger’s perception is determined by his social-economic status, as well as a number of characteristics related to it. Social status’s significant characteristics are: intelligence, confidence, achievements, sadness and others. Hereinafter we plan to expand the sample and conduct a cross-cultural study to compare the social status components and their role in stranger’s perception.
SEXUAL FANTASIES: DO THEY REALLY DIFFER ACCORDING TO GENDER AND KEEP CHANGING OVER TIME? (LATEST FINDINGS)

Tania Bianchi
British Psychological Society (Margate, United Kingdom)

Sexual fantasies are a distinctive aspect of human psychology and sexual behavior. They play a noteworthy role in boosting mood and self-esteem, relieving stress, managing anxiety and resolving traumatic experiences. The aim of this ongoing research is to assess if erotic imagery, themes and scenarios really differ according to gender and if they keep altering throughout the years under the conditioning and pressure of a more permissive, modern lifestyle. A further aim is to examine how, and if, they still relate to socio-cultural and socio-biological theories of gender roles and tendencies. This study uses a qualitative holistic approach adopting: 1. “thematic analysis” to explore the common threads for themes to emerge; 2. “discourse analysis” to reveal socio-psychological characteristics of a person and relationships with context (in ‘in-depth semi-structured interviews’); 3. “content analysis” to make inferences about the antecedents (authorship, individual traits and cultural aspect), the characteristics (e.g. styles, trends) and the consequences (e.g. effects, responses). The data have been collected in public places, at events or telematically, through questionnaires, recorded (audio and video) semi-structured interviews, telephone calls, focus groups, internet forums, a website with an email address and a Google Form, a 24-hour answering machine, and a P.O. Box. More than 300 volunteers (Italian women and men aged 19-72) have participated, so far. While some “male” and “female” fantasy stereotypes of the past still seem to hold true today, a cross-gender picture has arisen. Most women are showing an increasingly open, unrestricted and varied approach to their sexual desires, free of guilt. Themes of role reversal, dominance and submission are present in both sexes of different orientations, even though similar content can trigger different responses and have their origin in or be associated with emotional reasons and expectations of diverse nature. Sexual fantasy scenarios are adopting additional images and ideas from the current culture, popular literature and glamorous models, from show business, sports and politics, portrayed in the media. Greater openness about sex is therefore modifying the perception of what once could have been considered unusual or even “deviant” sex-scripts and, up to now, mostly hidden, denied or repressed.
THE INFLUENCE OF ORGANIZATIONAL COMMITMENT ON EMPLOYEES’S JOB PERFORMANCE: THE MEDIATING ROLE OF JOB SATISFACTION

Thi Minh Loan Le
University of Social Sciences and Humanities, Vietnam National University (Hanoi, Vietnam)

Abstract: The impact of organizational commitment on employees’s job performance has been studied extensively in the West, while few studies have been conducted in non-western countries. Moreover, there are not any studies about the effects of job satisfaction to this relationship. The purpose of this research is to study the effect of organizational commitment on job performance through the mediating role of job satisfaction. For the purpose, four hypotheses were developed, the first three predicted positive relationships between organizational commitment, job satisfaction and job performance and the last one suggested the mediating effect of job satisfaction. 547 employees in Vietnamese enterprises were surveyed. The results of the study supported all the hypotheses. Accordingly, organizational commitment had a positive impact on job performance; organizational commitment had a positive impact on job satisfaction; job satisfaction had a positive impact on job performance when organizational commitment was controlled. The strength of the relation between the organizational commitment and the job performance was significantly reduced when the job satisfaction was added to the model, suggesting the mediating role of job satisfaction. In the light of the findings, it is suggested that merely positive relationship between organizational commitment and job performance may not automatically lead an employer to achieve the outcome - job performance. Therefore, the secret of success lies in improving job satisfaction through solutions to enhance organizational commitment, thereby increase job performance. Acknowledgment: Thank NAFOSTED for the sponsorship.
THE SAMPLE IMPLEMENTATION OF THE AUTHOR’S METHOD OF STUDYING THE RELATIONSHIPS FOR MATHEMATICAL FUNCTIONS

Mikhail Basimov
Russian State Social University (Moscow, Russia)

The psychologists keep speaking about the complex nature of their subject of research, i.e. psyche (mind), but in doing so they very seldom (except, for instance, in case of psychophysiology) consider in their studies the interpretations based on results of the correlation analysis and hence the mechanistic approach, the methodology of the late 18th century. To showcase the works of an author’s method of studying statistical relations considered two dependencies from the idealized mathematical problem, where each parameter is a value from one of the 58 elementary functions in the interval, symmetric with respect of the zero with an argument even stride. The constraint force coefficients SV are normalized in such way that the value of SV=1 would be consistent with a single linear correlation R=1, got for the linear function. At first let’s show, as in the model of studying statistical relations two linear functions depend on each other. 1. Dependence of the parameter “Y=3*X” from the parameter “X” as comparative weightiness of the parameter Y for quinters on a scale X: X-1(Y=-14648);X-2(Y=-8762);X-3(Y=0); X -4(Y=+8762);X-5(Y=+14648) Factor of the connection strength=1.00 (reverse dependency=1.00) Coefficient of correlation=1.00 As the opposite example we consider the example of symmetric function dependence (parabola peak) on the linear function (Y=X^2 of X), for which the linear correlation coefficient is equal to zero, but at the same time we cannot say that the relationship between variables is absent, and it should be noted that it is very strong. 2. Dependence of the parameter “Y=-X^2” from the parameter “X” as comparative weightiness of the parameter Y for quinters on a scale X: X-1(Y=-11944);X-2(Y=+6356);X- 3(Y=+12310); X -4(Y=+6356);X-5(Y=-11944) Factor of the connection strength=1.65 (reverse dependency=0.00) Coefficient of correlation=-0.00 This is the dependence with the symmetrical maximum when the correlation is just absent. Researchers trusting the correlation analysis simply do not notice such dependence. In this case, is lost out of consideration not just the strong dependence but the dependence stronger than a linear function. Such simplest non-linear dependencies (dependencies with a maximum and a minimum, etc.) can be noted as fundamental (basic) in describing the majority of psychological phenomena and processes.
HOW TO SELECT ORGANIZATIONAL CITIZENS? USING A PERSONALITY-BASED INTERVIEW TO PREDICT OCB

Martin Kleinmann
Anna Heimann
Pia Ingold
University of Zurich (Zurich, Switzerland)

Although it is long evident that employees’ organizational citizenship behaviors (OCB) are linked to organization’s effectiveness, valid tools for selecting organizational citizens are still missing. This study explores how to identify employees with a propensity to engage in OCB and, towards this end, combines two approaches for predicting citizenship behaviors: personality assessment and structured interviews. Specifically, we developed a behavior description interview to assess the Big Five personality traits in order to predict different types of citizenship behaviors (i.e., compliance, helping, and initiative behavior). Employed interviewees (N = 223) from various occupations participated in the personality-based interview and completed a contextualized personality questionnaire in a simulated selection setting. To obtain criterion data, supervisors rated interviewees’ citizenship behaviors. Results supported the assumption that structured interview questions can be used to assess the Big Five personality traits and to predict OCB. Above and beyond other Big Five traits, interview ratings of Agreeableness explained a significant proportion of variance in helping behavior, interview ratings of Conscientiousness predicted compliance behavior, and interview ratings of Intellect/Openness predicted initiative behavior. Furthermore, interview ratings explained incremental variance in OCB over and above self-reports of the same personality constructs.
There are different methods to assess personality. Psychologists have focused specifically on self-reports of individual behavior. However, this methodology shows limitations like social desirability. Performance personality tests (also called objective tests) are a complementary methodology to study personality conceptualized as interactive styles. Objective tests need to show reliability, but also have to fulfill a series of standards: participants need to be motivated to perform the test in a natural way and the task must be easy enough to perform. But, how do we check these standards? Ability criteria can be established as the following: the proportion of correct answers of each participant in the training trials should be greater than the proportion expected merely by chance. On the other hand, motivation standard requires the establishment of a minimum of responses in each trial. We have developed an objective test to assess goal orientations: Mastery-Performance Goal Orientation Test. The aim of this study is to expose criteria to check if a test fulfills objective test standards and to verify if our MPGOT fulfills them, as well as to study its reliability. We designed MPGOT, an objective test that allows us to assess mastery and performance orientation. A sample of 464 participants completed the test. We analyzed participants’ motivation and the difficulty of the test. Motivation criteria was that each participant should make a minimum of 9 responses in each trial. The number of correct answers was greater than the number expected by chance, therefore participants fulfilled the motivation and ability criteria required by objective tests. Goal orientation variable showed a bimodal distribution. Cronbach alpha was greater than 0.90. The instrument fulfilled objective tests standards. It also showed high internal consistency. The test allows us to classify people as mastery or performance oriented along a single bipolar dimension.
CREATING POSITIVE WORK EXPERIENCES THROUGH TASK SELF-REDESIGN

Severin Hornung
Thomas Höge
Christian Seubert
Jürgen Glaser
University of Innsbruck (Innsbruck, Austria)

Denise Rousseau
Carnegie Mellon University (Pittsburgh, USA)

Humanistic management theories and positive organizational scholarship emphasize that individuals strive for meaning, fulfillment, and self-actualization in their daily work activities. Complementing the focus on "top-down" organizational interventions, current concepts of proactive behavior propose "bottom-up" processes, based on "micro-emancipatory" actions, through which employees create more pleasant, gratifying, and meaningful work experiences.

Integrating theorizing on reciprocal determination between person and environment, social embeddedness, and systemic emergence, we test a tripartite model of task self-redesign and positive work-related states of experienced meaning, affective commitment, and work-home enrichment. Postulated are interactive effects of three modes of influence: a) active use of existing potentials for task autonomy (top-down implemented work design); b) job crafting, as unauthorized and self-organized modifications of task features (bottom-up proactive job changes); and c) individual renegotiation of tasks through idiosyncratic deals (i-deals) with superiors (middle ground; bottom-up initiated and top-down authorized agreements). Survey data from a purposive sample of N=279 German-speaking employees were analyzed using confirmatory factor analysis and moderated linear regression. Independent constructs each comprised 4 items: task autonomy (α=.81), task crafting (α=.89), and task i-deals (α=.88). Analyses controlled for gender, age, and additional work characteristics (complexity: α[3]=.78; interdependence: α[4]=.81; overload: α[2]=.79). Drawing on assumptions of person-job fit and positive spillover, chosen outcomes were: meaning of work (α[6]=.94), affective organizational commitment (α[5]=.88), and work-home enrichment (α[4]=.78). Task i-deals consistently related to positive experiences (meaning: β=.25, p<.01; commitment: β=.14, p<.05; enrichment: β=.16, p<.05), autonomy had one (meaning: β=.15, p<.05), task crafting no significant main effect; a 2-way interaction between i-deals and crafting was found for affective commitment (β=.14, p<.05). Supporting our tripartite interaction model, synergistic 3-way interactions explained additional variance in all 3 outcomes (meaning: β=.17, p<.05; commitment: β=.19, p<.05; enrichment: β=.20, p<.05). Subgroup analyses in interaction plots revealed informative differential patterns. Results offer first insights into the interplay of organizationally designed, individually crafted, and interpersonally negotiated variability in work activities. Task autonomy, task-directed job crafting, and task i-deals appear to fulfill somewhat different, yet complementary roles in the self-directed creation of positive work experiences. Methodological limitations and further research needs are discussed.
ROLE OF VIRTUAL REALITY APPLICATIONS IN DRUG ADDICTION TREATMENT

Burcu Türk
Halic University (Istanbul, Turkey)

Nurcan Hamzaoglu
Istanbul Yeni Yüzyıl University (Istanbul, Turkey)

Aslı Yayak
Bursa Technical University (Bursa, Turkey)

Drug addiction in DSM-V (APA, 2013) in the diagnostic and statistical manual of psychological disorders; it is defined as the fact that people continue to use the drug even though they have a negative condition due to the use of a drug. Behind people’s addictive drug using, there are many reasons for use from pleasure to use to escape from stress and anxiety. As opposed to that to become an addict is fast and easy, to get rid of them is hard and it requires an intense and strict treatment process (Feldman, 2011). There are various treatment methods for drug addiction. Biological therapy, psychosocial treatment and behavioral approach therapy are the most preferred and functional methods in current use. In this study, literature related to virtual reality applications in drug addiction treatment which is a part of behavioral approach therapy, will be reviewed and information on the subject will be compiled. Virtual reality refers to computer-generated simulations or environments that people experience with technological applications. The aim of virtual reality is to simulate sensory information such as sound, tactile and visual inputs from the real world through artificial means. In recent years, virtual reality technology has become quite popular due to the increasing number of head-mounted displays (HMD). These virtual reality helmets are often devices that look like visors or helmets. This device abstracts the person from the visual stimuli of the real world while simultaneously immersing the person to the virtual world (Durl, Dietrich, Pang, Potter and Carter, 2018; Bordnick, Carter and Traylor, 2011). The must-have feature of virtual reality studies is that the perception of "existence" of participants in the virtual reality spatially and the feeling of being immersed in that virtual world (Durl, Dietrich, Pang, Potter and Carter, 2018). While the training for physicians and surgeons was used as an experimental simulation tool, it provided an interactive reality for psychological change. For example, in the treatment of phobias, individuals have been adapted with systematic virtual reality exposure therapies by presenting virtual worlds associated with their phobias (Jerdan, Grindle, Van Woerden and Kamel Boulos, 2018).
TEMPORAL AND PROBABILITY DISCOUNTING FOR REAL AND HYPOTHETICAL MONEY AND CIGARETTES AMONG CIGARETTE SMOKERS ACROSS DIFFERENT CULTURES

Wojciech Białaszek  
SWPS University of Social Sciences and Humanities (Warsaw, Poland)

Steven Lawyer  
Idaho State University (Pocatello, USA)

Tereza Prihodova  
Katerina Prihodova  
The National Institute of Mental Health (Prague, Czech Republic)

Delay discounting (DD) and probability discounting (PD) are commonly used behavioral-economic measures of impulsive and risky choice, but there are few cross-cultural comparisons of discounting, and none that compare patterns of DD and PD across different commodities or that compare real and hypothetical rewards across cultures. The purpose of this study was to compare patterns of DD and PD for both real and hypothetical money and cigarettes among participants in the USA and the Czech Republic. Adult smokers from the United States and the Czech Republic completed standard measures of DD and PD for hypothetical and real money (~$10USD) and cigarettes (1 pack, or 20 cigarettes). Contrary to data from the USA sample, Czech Republic participants discounted the value of real money steeper than hypothetical money, though this could be related to the relatively poor fit of the hyperbolic decay function to DD for hypothetical money in the Czech sample. Probability discounting for real and hypothetical monetary and cigarette outcomes were the same in both countries. These findings extend an important literature regarding real and hypothetical choices for different commodities using the DD and PD paradigms and suggest that there might be cultural differences in delay discounting that warrant further attention.
ON FOUR TYPES OF DEVALUATION OF OUTCOMES DUE TO THEIR COSTS: DELAY, PROBABILITY, EFFORT, AND SOCIAL DISCOUNTING

Wojciech Białaszek
Paweł Ostaszewski
SWPS University of Social Sciences and Humanities (Warsaw, Poland)

Leonard Green
Joel Myerson
Washington University (St. Louis, USA)

Discounting refers to a decrease in the subjective value of an outcome with increases in some attribute of the outcome. The attributes most commonly studied with regard to discounting are delay and probability, with far less research on effort and social discounting. While these attributes all represent costs that reduce the value of an outcome, it is as yet unclear how the extent to which they do so is related at the individual level. Accordingly, the present study compared the degree to which individual participants, 160 participants from the local community, discounted two amounts of hypothetical monetary reward on each of four discounting tasks in which the delay, probability, effort, and number of people with whom the money was to be shared were manipulated. At the group level, the larger amount was discounted less steeply than the smaller amount when delay and effort were varied, whereas the larger amount was discounted more steeply when probability and number of people were varied. At the individual (molecular) level, the correlational pattern was examined using exploratory factor analysis. A six-factor structure (with separate factors for delay and effort, and two factors each for social and probability discounting) described the relations among indifference points. At a more molar level, a two-factor structure, which corresponded to the direction of the observed magnitude effects, described the relations among area-under-the-curve measures of discounting in the eight conditions resulting from crossing the two monetary amounts with the four cost factors. We conclude that individual and group differences in discounting involving the different types of costs, despite sharing some similarities, reflect mostly separate processes and traits.
TOLERANCE, CLOSERNESS AND EMOTIONAL CO-REGULATION IN THE COUPLE LIFE CYCLE

Rozzana Sánchez-Aragón
Georgina Daniela Zepeda-Goncen
Luisa Fernanda Granillo-Velasco
National Autonomous University of Mexico (Mexico, Mexico)

Yanitza Nicole Flórez-Rodríguez
Nariño University (Nariño, Colombia)

According to the RAE (2014) tolerance refers to meanings such as: suffer, lead with patience, respect, consideration towards the opinions or behaviors of others or, as an attitude of understanding in the face of contrary opinions in personal relationships (Ferrater-Mora, 1979). In the context of couple relationships, tolerance is according to Sprecher and Fehr (2005) — a way of expressing love, care, support, understanding of the other and even sacrifice because the exigencies of common life. Therefore, the couple’s relationship has been considered as a kind of close relationship and represents an ideal scenario for emotional experience (Sánchez-Aragón, 2016), due to this, the emotional co-regulation becomes important. Particularly, the co-regulation strategies allow to each member of the couple, to influence the way to react toward the changes of everyday life (Schnitker & Emmons, 2007) that produce positive and negative emotions, and consequently in their way of relating to each other (Butler & Randall, 2013). In spite of the relevance of the tolerance in the couple relationships, there is a lack of psychological measures to evaluate it and examine its relationship with other variables of this kind of relationship. Based on this, the purposes of this research were: 1) Design and validate a measure of tolerance towards the couple, 2) Know the relationship of tolerance with the closeness and emotional co-regulation strategies, and 3) Examine the differences in these variables in couples from three different stages of the life cycle: development, maintenance and dissolution. For this, we worked with a sample of 403 heterosexual couples, whose minimum schooling was high school. The results indicate the obtaining of a valid and reliable measure with three factors: Tolerance to difference, Respect, Intolerance whose Cronbach’s Alpha coefficients were .66 to .87. Regarding the second objective, it was observed that the more tolerance and closeness the greater use of positive and less negative co-regulation strategies. Finally, it is clear that over time the relationship decreases tolerance and the use of positive co-regulation strategies, increases intolerance and the use of strategies such as indifference-aggression.
PERCEPTION OF SAFETY CLIMATE AT WORK: THE INFLUENCE OF THE ORGANIZATIONAL CLIMATE

Minh Son Pham
Academy of Journalism and Communication (Hanoi, Vietnam)

The present study focused on the impact of organizational climate on the perception of safety climate at work. Drawing from a survey of 953 employees at Vietnamese enterprises, the study found that organizational climate enhances the overall perception of safety climate at work. Regression analysis revealed that different components of organizational climate influenced perception of security climate to different extents. Particularly, the most influential predictor of perception of safety climate at work is work pressure, followed by job involvement, supervisor support, and finally co-worker support. Implications on creating a positive organizational climate and improved perception of safety climate at work were discussed, with special emphasis on work pressure.

Key words: Perception, safety climate at work, organizational climate.
COMPETENCE FOR THE UNFORESEEN: SOCIAL SUPPORT AND CONCURRENT LEARNING AS BASIC COMPONENTS OF INTERACTION UNDER RISK

Marius Herberg
Norwegian University of Science and Technology/Norwegian Defence University College (Trondheim, Norway)

Glenn-Egil Torgersen
Norwegian Defence University College (Oslo, Norway)

Torbjørn Rundmo
Norwegian University of Science and Technology (Trondheim, Norway)

This study examines the importance of certain basic educational, organizational and operational structures of interaction under risk, and how these vary with competence level within an organization. A previous study showed that preparedness for the unforeseen essentially depends on interaction. The purpose of this study is to examine whether there are any basic components that can provide further insight into how competence for interaction under risk can be developed and implemented. The first aim was, therefore, to examine the relationship between components of the basic educational, organizational and operational structures and interaction. The second was to assess whether the perceived level of interaction varies due to competence level, controlling for gender, age, and professional experience. The third aim was to determine whether level of competence group membership could be predicted by interaction, social support and the specified educational and organizational components. A questionnaire survey was carried out in the autumn of 2017. All 917 respondents were male or female employees of the Norwegian Armed Forces, based in 20 different units with different levels of competence and included commissioned and non-commissioned officers, officer cadets, and conscripts. The response rate was 87%, a total of 1050 personnel were asked to participate. The results show that social support and concurrent learning are the most important predictor of interaction. This study also shows that social support and concurrent learning combined with basic capabilities, organizational improvisation, training on decision-making, flexibility, general preparedness, and contingency plans can account for a considerable proportion of the variance in interaction. There were also significant differences in interaction, social support, and the educational, organizational and operational structures due competence level. Moreover level of competence group membership could be predicted. This study identifies components which could allow better targeting and development of the knowledge and skills applicable to interaction under risk. The results indicate that it is possible to prepare for unforeseen events by implementing social and educational measures that improve interaction. This study should be particularly relevant to those involved in handling and stabilizing unforeseen events and emergency preparedness management.
CHANGE & GROW® THERAPEUTIC MODEL FOR ADDICTION: PRELIMINARY RESULTS OF A LONGITUDINAL STUDY

Jessica Lopes
Eduardo Ramadas
Tânia Caetano
Villa Ramadas International Treatment Centre (Leiria, Portugal)

The last years have seen a paradigm shift concerning addictive disorders, regarding both its theoretical conceptualization but also its neurobiological underpinnings. It is our belief that the treatment approaches should also evolve to adapt to the current scientific knowledge. This new approaches should aim to not only stop the problematic behaviors but also intervene on well-known probable comorbid vulnerabilities such as depression and anxiety. In this first longitudinal study, the objective was to explore the impact of the Change & Grow® therapeutic model on certain pertinent psychological variables that frequently appear associated with addiction. The Change & Grow® model has been created and used by Villa Ramadas International Treatment Centre for years, with patients with chemical or behavioral addictions. The study used a repeated measures design, with the first measure occurring at the first week of treatment, and the second at the last. The psychological measurements used in this first study were: Beck’s Depression Inventory II (BDI-II), Suicide Ideation Questionnaire (SIQ), State-Trait Anxiety Inventory (STAI), and Montreal Cognitive Assessment (MoCA). Descriptive statistics were used to explore the data. Non-parametric analyses were used to study the association between variables (spearman’s correlation values) and to compare the medians between the related samples (related-samples Wilcoxon Signed Rank Test). Preliminary results include 14 (11 male and 3 female) patients that have initiated and completed treatment during 2018. Age varied between 18 and 52 years (M = 32.57, SD = 10.79) and duration of treatment between 96 and 193 days (M = 146.64, SD = 29.50). As expected, the MoCA total and memory evocation results were significantly higher at the last week of treatment. The results of BDI-II, SIQ and STAI (both state and trait) were all significantly lower at the last week of treatment. Duration of treatment did not present significant correlation values with the difference between measures for any of the studied variables. Despite the preliminary nature of the results, the Change & Grow® therapeutic model appears to have an impact on depressive symptomatology, suicide ideation and state and trait anxiety in patients admitted into treatment for addictive disorders.
EXPLORING THE ASSOCIATIONS AMONG METACOGNITIVE BELIEFS, EXPERIENTIAL AVOIDANCE AND DEPRESSIVE SYMPTOMS IN A TURKISH SAMPLE

Julide Ceren Yildirim  
Kocaeli University (Kocaeli, Turkey)

Basak Bahtiyar  
Maltepe University (Istanbul, Turkey)

Both the roles of metacognitions including maladaptive cognitive processes such as rumination or suppression; and experiential avoidance referring to unwillingness to remain in contact with negative experiences are emphasized in the development and maintenance of psychological problems. Although these mechanisms have been separately associated with depression, there is a lack of comprehensive model. Therefore, current study aimed to provide comprehensive knowledge by examining the roles of metacognitive beliefs, experiential avoidance as predictors of depressive symptoms in a Turkish sample. Data collection was carried out with 465 volunteer participants (337 females and 128 males) whose ages were ranged from 18 to 40 (M = 25.89, SD = 4.79) by administering demographic information form, Metacognitions Questionnaire-30, Multidimensional Experiential Avoidance Questionnaire and Beck Depression Inventory. In order to assess the predictors of depressive symptoms, hierarchical regression analysis via stepwise method was conducted. In the first step, age, gender and education level were entered to regression as control variables. In the second step, 5 metacognitive beliefs, namely; positive beliefs about worry, negative beliefs concerning uncontrollability of thoughts and danger, lack of cognitive confidence, beliefs about need to control thoughts and cognitive self-consciousness, were entered to the regression. After controlling the possible effects of metacognitions, 4 types of experiential avoidance, such as avoidance, distraction, procrastination, repression & denial and distress endurance were again entered via stepwise method. The result firstly revealed that as participants’ education level decreased, depressive symptoms increased. Among metacognitions, negative beliefs about uncontrollability of thoughts and danger and need to control thoughts significantly predicted depression. After controlling the effects of metacognitions, procrastination and repression & denial were positively; but distress endurance was negatively associated with depressive symptoms. These findings indicated that some forms of experiential avoidance explained more variance of depressive symptoms beyond metacognitive beliefs. Considering these experiential avoidance styles together with metacognitive beliefs seems to be important to achieve more comprehensive case conceptualization and also effective intervention for depression.
UNDERSTANDING THE CONCEPTUAL METAPHOR PEOPLE ARE ANIMALS: A COMPARATIVE STUDY OF FRENCH AND RUSSIAN LANGUAGES

Geoffrey Ventalon
Université Paris-Est Créteil (Drancy, France)

Konstantin Khomutskii
National Research University Higher School of Economics (Moscow, Russia)

Lakoff and Johnson (1980) showed that metaphor is a manner of thought. This presentation investigates the conceptual metaphor PEOPLE ARE ANIMALS in two countries, France and Russia. As animal names are often used to refer to human personality traits (Kövecses, 2002), we examine whether native language influences the understanding of animal metaphors such as “this man is a bear” and whether the associated context helps to map new animal features despite their absence in the native language. Participants had to list the features of 10 animals describing human personality traits. We then created 20 Russian (RCS) and French contextual sentences (FCS) that infer the most common property for each animal. Subsequently, 60 Russian and 60 French natives were equally divided into CSR and CSF groups. Participants had to read the sentences before attributing a feature to a man. We measured correct responses, defined as when participants identified the right features associated with the sentences. Using the MacMillan dictionary, synonyms (e.g., smart, clever) and syntactically similar responses (e.g., talkative, likes talking) were classified together. Participants were expected to find more features provided by native speakers of their country. Results showed an effect of contextual sentences F(1,116) = 4.72, p < .05, η² = .04 and interaction effect F(1,116) = 35.86, p < .05, η² = .23. For RCS, F(1,58) = 12.75, p < .05, η² = .18 Russian natives found more properties (M = 4.57, SD = 1.61) than French natives (M = 2.00, SD = 1.29) while for FCS, F(1,58) = 23.81, p < .05, η² = .29, French natives found more properties (M = 4.20, SD = 2.11) than Russian natives (M = 3.00, SD = 1.78). The interest of this study lies in its comparison of Slavic and Romance languages, which makes it innovative in contrast to previous research on English, German, Spanish, Persian, Mandarin Chinese, and Malay. Future research could envisage creating a database on the conceptualization of animals in Russian and French, including all representations and expressions.
WHAT ACCOUNT DO STRAIGHT TEEN RUSSIAN GIRLS FIND IN BOYS’ LOVE DRAWN FICTION?

Dmitry Vorontsov
Southern Federal University (Rostov-on-Don, Russia)

Global world faces the phenomenon of liking Boys’ Love Fiction (yaoi) in straight girls. The emergent interest of Russian heterosexual teens in Japanese visual arts with explicit male homoeroticism might be discussed in the perspective of gender/queer theory. Visual pleasure in watching romance and sexual relationships between androgynous male drawn characters is supposedly grounded in subconscious confrontation of an individual orientation towards liberal gender ideology with the current neoconservative normative gender policy in Russia. Seeing through lenses of individual gender construct is considered the core element of visual joy of erotic scenes in yaoi strip cartoons. To describe individual gender construct in straight teen girls identified as Boys’ Love Cartoons Fans (main group of 90 fans and control group of 50 non-fans, mean age 17±1). Methods were Survey at Google Forms with set of questionnaires – Male Role Attitudes Scale (MRAS; Pleck, Sonenstein, Ku, 1993), Gendered Personality Beliefs (Klyotsina, 2009), Masculinity/Femininity Psycho-Semantic Scale (Bessonova, 1994), self accounts on thoughts and feelings resulting from watching Boys’ Love Drawn Fiction. Visual pleasure in Boys’ Love fans is based on both identification mechanism and exclusion of homosexual context. They are most attentive to male passion, sensuality, emotionality and romanticism expressed by yaoi characters. Fans are repelled by “womanlikeness”, severity and using of violence. Watching yaoi cartoons and seeing boys in explicit carnal relations, girls feel heterosexual arose, romantic feelings, empowerment to overcome relational obstacles as well as stinging rebuke of tedium, dullness and gender disparity in normative routine heterosexual relations. Describing their femininity construct, Boys’ Love female fans significantly closer, then control group, to the traits marked as masculine in normative gender ideology (Z=-2.063, p=0.039). The constructs of perfect male and female individuals are significantly closer to the traits marked as of neutral gender (for imagined males Z= -2.994, p<0.006 and for imagined females Z= -2.449, p<0.014). Yaoi fans have significantly higher level of normative masculinity rejection (Z=-1.498, p=0.034) and do not tend to assess males through the conservative ideology. Boys’ Love cartoons make heterosexual Russian girls capable to empower their own egalitarian gender ideology confronting the neoconservative milieu.
PSYCHOSOCIAL VARIABLES AND QUALITY OF LIFE AMONG COLOMBIAN HYPERTENSIVE PATIENTS: DISCRIMINATION, SOCIAL POSITION AND THE MEDIATING EFFECT OF PERCEIVED STRESS

Susana Barradas
School of Social and Human Sciences, Universidad Externado de Colombia (Bogotá, Colombia)

Diego Iván Lucumi
Alberto Lleras Camargo School of Government, Universidad de los Andes (Bogotá, Colombia)

Diana Maria Agudelo
School of Social Sciences, Universidad de los Andes (Bogotá, Colombia)

Graciela Mentz
Anesthesiology Department, Medical School (Michigan, USA)

Research has shown an increasing prevalence of hypertension worldwide, in which low and middle-income countries are the most affected. In Latin America, including Colombia, hypertension levels are not very encouraging as well. There is evidence that discrimination and stress are related and lead to poorer health results. Also, evidence shows an association between social position and perceived stress that leads to poorer mental and physical health-related quality of life (HRQoL). Given the dearth of research in this area from Latin America, the aim of this study was to investigate the relationships between socioeconomic position, perceived discrimination, perceived stress and HRQoL of patients with hypertension. The sample consisted of 258 patients from the baseline survey of the Social Determinants and Inequities in the Control of Blood Hypertension Program (ProDSICHA). HRQoL was measured using the SF-8 Health Survey. Objective socioeconomic position was measured using these indicators: occupation, education, and socioeconomic stratification. Subjective socioeconomic position was obtained using the MacArthur Scale of Subjective Social Status (Adler & Stewart, 2007). Discrimination was measured using the PERLA questionnaire (Telles, 2014) and perceived stress was measured using the Perceived Stress Scale (Cohen, Kamarck & Mermelstein, 1983). 62.4% of the sample were women, and the mean age of participants was 58 years (SD= 6.5). Mean scores indicate an average social position perceived by the participants, and low levels of both perceived discrimination and perceived stress. Nonetheless, results showed very low levels of physical and mental health global scores. Between the HRQoL subscales, emotional role and social health showed the lowest means. Lower educational levels were significantly associated with a better perception of physical HRQoL (Coeff=-.61, p=.017). Moreover, higher socioeconomic strata (Coeff=.96, p=.016) and position occupied in the community (Coeff=.64, p<=.001) were significantly associated with a better perception of physical HRQoL. Perceived stress did not mediate the relation between predictors and HRQoL as proposed in the model. None of the variables in the model were able to explain differences in mental health levels. Further work is necessary to better understand the role of perceived stress as a mediator variable. Also, it is important to further investigate factors affecting patients’ mental health.
RELATIONSHIP BETWEEN RESISTANCE TO CHANGE AND LONELINESS OF QUEBEC UNIVERSITY STUDENTS

Loi Zedda Maude
Université du Québec à Trois-Rivières (Trois-Rivières, Canada), Haute Ecole Pédagogique du canton de Vaud (Lausanne, Switzerland)

Stéphane Thibodeau
Université du Québec à Trois-Rivières (Trois-Rivières, Canada)

Pascal Forget
Université du Québec à Trois-Rivières (Trois-Rivières, Canada)

Eric Frenette
Université Laval (Québec, Canada)

Changes are an integral part of our society including the education community (Gather Thurler, 2000). Resistance to change is known to be one of the main reasons for failures in changes (Kotter and Schlesinger, 1979). The university environment is not immune; as even students can resist changes (Barack, 2017; Oreg, 2003). This resistance not only may result in negative emotions such as resentment, stress, fear, or anxiety, but also decrease the individual’s affective commitment and performance (Armenakis et al., 2007). Loneliness is a factor affecting university students’ quality of life, as often reported in research (e.g. McIntyre et al., 2017; Ozben, 2013; Stoliker and Lafrenière, 2015). In addition, loneliness is perceived by authors as a factor that may influence resistance to change (Harvey and Broyles, 2010; Martin and McGrevin, 1990; Smith and Scott, 1990). However, to the author knowledge no studies seem to study the relationship between these two concepts. Based on these considerations, the objective of this study is to determine whether there is a relationship between loneliness and resistance to change among university students. Two hundred and ninety-four undergraduate university students participated in the study from the faculties of Physical Activity and of Education, and Schools of Business and of Engineering. The French-Canadian translation of the UCLA Loneliness Scale 3 (Lussier, 1992) and the cross-cultural validation of the Resistance to change scale (Loi Zedda, Thibodeau, Frenette and Forget, 2018) measured the concepts of loneliness and resistance to change respectively. The results reveal the existence of weak positive relationships between some dimensions of loneliness and some dimensions of resistance to change (correlations ranging from 0.19 to 0.25). These results are discussed in the light of the cognitive theory of loneliness (Perlman & Peplau, 1982) and the theory of resistance to change (Oreg, 2003).
THE STRUCTURE OF THE INTEGRAL INDIVIDUALITY OF THE SUBJECT OF DECISION MAKING

Tatyana Belykh
Saratov National Research State University.
N.G.Chernyshevsky (Saratov, Russia)

The structure of the integral individuality of a person is a multi-level system of interdependent biologically and socially determined properties. A person realizes an individual method of decision-making, which is determined by the nature of the interaction and integration of multi-level properties in the structure of individuality. Identify the features of this interaction in individuals with different severity and a different combination of risk appetite and rationality when making decisions, is the purpose of the study. The sample consisted of students "Saratov State University"- faculties of psychology and economics of 1-4 courses, in the amount of 153 people (76 boys and 77 girls). Psychodiagnostic methods aimed at studying the multi-level properties of integral individuality were used: self-efficacy test questionnaire (J. Maddux, M. Scheer in adaptation A.V. Boyarintseva), questionnaire of formal-dynamic personality properties V.M. Rusalov, questionnaire "Style of self-regulation of behavior" (V.I. Morosanova), questionnaire of research on the level of impulsivity (V.A. Losenkov), method "Self-assessment of the propensity to extreme-risk behavior" (M. Zukkerman), questionnaire "Personality factors of decision making " T.V. Kornilova, a new questionnaire of tolerance-intolerance to uncertainty Kornilova, test of frustration reactions of S. Rosenzweig in the modification N.V. Tarabrina; factor analysis using the application package "STATISTICA-8.0". Factor analysis revealed the presence of significant integration between the psychodynamic resource of the individual and his ability to self-regulate. Increasing the values of emotionalism as a property of temperament entails an increase in impulsiveness in behavior, regardless of the sample. On the contrary, increased adaptability at the level of psychodynamics, reduces impulsivity and the desire for uncertainty. At the same time, the differences are associated with different expressions of flexibility of behavior and confidence in their own success in situations of uncertainty. Decrease in rationality entails an intensification of the non-adaptive striving for difficulties, the search for new and thrill sensations, and a fixation on the obstacles that arise when frustration arises. The obtained data can be used to teach students self-regulation skills and develop their own decision-making style based on an understanding of their own natural resources in order to control impulsive behavior in a decision-making situation.
THE PROBLEM OF LIFE SELF-DETERMINATION IN THE CONTEXT OF DIGITAL TRANSFORMATIONS OF SOCIETY

Tatiana Leshkevich
South Federal University (Rostov-on-Don, Russia)

In the context of the dynamic transition to the "digital age" the problem of one’s personal meaningful regulation is particularly relevant. The influence of digital technologies on every sphere of our life is far beyond the ability of a man to master and control them. At the same time, "blindly" developing technologies gives rise to the problem of ontological uncertainty and the situation of living "on high alert." Although the problem of life self-determination involves a concrete and definite choice, people are forced to make a number of key decisions under conditions of uncertainty. The main objective of our research is to examine the contradictions of a person’s identity under conditions of the digital age. The methodological strategy includes the principle of sociocultural determination, supplemented with the innovative concept of "enactivism." The principle of sociocultural determination shows that surrounding circumstances serve as determinants of one’s life self-determination. The concept of "enactivism" indicates the effect of "the system’s involvement in the environment," and how a person, striving for self-realization, changes both himself and the configurations of existing reality.

The concepts of attractor and emergence are important methodological tools. The attractor acts as the center of attraction and as an ideal that sets behavior patterns. The emergence reveals the significance of spontaneity and demonstrates that one’s chosen behavior strategies depend on unexpected situational scenarios. Three groups of problems are considered in the article. First, rapidly developing technologies set the transpersonal mode of control and coercion and change the "type of self-regulation." Secondly, the change in the communicative basis of civilization causes a shift towards electronic forms of interaction. Cultural practices, based on literature, are pushed to the periphery. A new style of consumer behavior has arisen: on-line services, on-line communication. Thirdly, the dependence on new technologies generates a new type of "interactive" loneliness. A recluse, the so-called "hickey" or homo solus, is a lonely person who becomes an actor of the digital age. That leads us to a conclusion that under modern conditions a personal intention of "making one’s life successful" is not worthy in the absence of digital skills.
ENGAGEMENT AND ACADEMIC FLOW IN COLLEGE STUDENTS: AN EIGHT-MONTH LONGITUDINAL STUDY

Majda Rijavec
Tajana Ljubin Golub
University of Zagreb (Zagreb, Croatia)

The tendency to experience flow in an academic setting is previously found to be positively associated to cognitive and behavioral engagement, and negatively to emotional (anxious) engagement. However, whether engagement predicts longitudinal changes in academic flow is still unclear, as well as the possibility that experiencing flow can increase students cognitive and behavioral engagement and decrease anxious engagement. Using a two-wave cross-lagged panel design, the current study examined cognitive, behavioral and anxious engagement and academic flow in 308 first year students of University in Zagreb over 8 months of studying at the university. Mean age of the sample participants equalled 19.61 (SD = 2.20), and 90.6% of the sample were females. Two questionnaires were administered to assess engagement and academic flow: an adapted version of the Swedish Flow Proneness Questionnaire (SFPQ; Ullen et al., 2012) and The Academic Engagement Scale (AES; Rovan, Ljubin-Golub, & Petričević, 2016). Engagement and flow were assessed in two time waves: one month after beginning of the academic year, and then after 8 months, at the end of the academic year. Structural equation modeling was employed to test a series of competing models: stability model, direct model, reversed model and reciprocal model. Results indicated that a model with a path from different paths of engagement at the beginning of the academic year to academic flow at the end of the academic year was the most parsimonious and provided acceptable model fit, suggesting that engagement is related to increasing flow experiences. However, only direct effect from behavioral engagement on academic flow was significant. Cognitive and anxious engagement were not related to subsequent flow experiences. Also, there was little support for a relationship between flow at the beginning of academic year and engagement at the end (reversed model), suggesting that experiencing academic flow is not related to subsequent engagement. Since academic flow has been found to be related to various positive outcomes (such as achievement and well-being) these results point to the importance of behaviorally engaging students at the beginning of their studies.
THE MEDIATING ROLES OF DIFFICULTIES IN EMOTION REGULATION STRATEGIES IN THE RELATION BETWEEN PERCEIVED STRESS AND SOMATIZATION

Kerim Selvi  
Eskişehir Osmangazi University (Eskişehir, Turkey)

Özlem Bozo  
Middle East Technical University (Ankara, Turkey)

The purpose of the current study was to investigate the indirect effects of perceived stress on somatization through difficulties in emotion regulation strategies, i.e., non-acceptance of emotional responses, difficulties in impulse control, lack of emotional clarity, difficulties in terms of emotional awareness, limited access to emotion regulation strategies, and difficulties in goal-directed behaviors. The data were collected from 799 participants via demographic information form, Brief Symptom Inventory, Perceived Stress Scale, and Difficulties in Emotion Regulation Strategies. In accordance with the purpose of the study, a parallel multiple mediation analysis was conducted with 5000 bootstrap samples. The results indicated that among difficulties in emotion regulation strategies, only difficulties in impulse control and lack of emotion regulation strategies did mediate perceived stress-somatization relation. To state more precisely, as perceived stress increased, difficulties in impulse control and limited access to emotion regulation strategies increased, in turn, somatization increased. The findings suggested that the difficulties to engage in effective behaviors in dealing with the present emotions (i.e., difficulties in impulse control and limited access to emotion regulation strategies), rather than difficulties in focusing on the emotions (i.e., non-acceptance of emotional responses, lack of emotional clarity, difficulties in terms of emotional awareness), play an effective role in the association between perceived stress and somatization. Keywords: Perceived stress, somatization, emotion regulation, difficulties in emotion regulation strategies.
IMPACT OF OBJECTIVELY MEASURED PHYSICAL ACTIVITY AND BODY COMPOSITION ON EATING BEHAVIOURS IN YOUNG ADULTS

Anna Brytek-Matera  
Kamila Czepczor-Bernat  
SWPS University of Social Sciences and Humanities (Katowice, Poland)

Data from nearly two million participants shows that globally more than a quarter of all adults were insufficiently physically active in 2016 (Guthold et al., 2018). Findings regarding the influence of physical activity on eating behaviors are inconsistent: some studies found that excess physical activity may predispose to health-compromising eating behaviors, while other results reported that low-level of physical activity can affect the development of inappropriate eating behaviors (Fortes et al., 2013). The objective of the present study was to examine objectively assessed physical activity and body composition, and to determine whether physical activity and body composition are predictors of emotional eating, uncontrolled eating and restrained eating behavior in young adults. The research was conducted in natural and in laboratory settings. Thirty five participants (Mage = 26.69 ± 5.61).MBMI 23.44 ± 4.50) were asked to wear an ActiGraph accelerometer at their waist 24 h/day for 7 consecutive days as well as to complete the Three-Factor Eating Questionnaire-R18. In addition, their body composition (e.g. Body Mass Index (BMI), Waist-Hip Ratio (WHR), body fat percentage) was measured by bioelectrical impedance analysis. Regression analysis was used in order to predict eating behaviors in young adults. Low-intensity physical activity ($\beta = 0.349; p < 0.05$), sedentary behavior ($\beta = 0.369; p < 0.05$) and body fat percentage ($\beta = 0.351; p < 0.05$) were predictors of emotional eating. While, BMI ($\beta = 0.481; p < 0.01$), WHR ($\beta = 0.468; p < 0.01$) and body fat percentage ($\beta = 0.410; p < 0.05$) were factors that influenced uncontrolled eating. Finally, body fat percentage ($\beta = 0.345; p < 0.05$) had an impact on restrained eating behavior. Our findings broaden the current knowledge about the weekly physical activity patterns in young adults. Low physical activity levels increase inappropriate eating behaviors. We can suppose that moderate- or vigorous intensity physical activity may reduce overeating in order to relieve negative emotions and improve emotional flexibility. Furthermore, our study shows the need for physical activity intervention programmer to prevent emotional eating.
Mate selection is a dynamic process which depending on the changes of the individual, potential mate and the environment. According to the evolutionary social psychology studies, women’s and men’s mate selection criterias are different. While women focus on power, social status and money, men seem to focus on criterias that reflect the fertility of women, such as physical attractiveness, healthiness. Also, women prefer older partners, while men prefer their partners to be younger than themselves evolutionarily. The first objective of this study was to investigate the mate selection criteria in Turkey sample. Turkey is a country with the characteristics of both collectivist and individualist cultures and the population of young people is relatively high. The second aim of the study is to investigate whether the differences between the sexes in the mate selection criteria continue at different socio-economic levels. It is expected that the differences between the sexes will decrease according to the probability of the access to resources such as education, job. For this purpose, online data were collected from 423 heterosexual participants (female = 259, male = 164) via Mate Preference Questionnaire. This questionnaire, developed by Buss (1989) and used in many studies, was used to determine mate selection criteria of the participants. The mean age of the participants was 28.57. As a result of the analysis, women prefer 6.70 older mates than theirselves on the other hand men prefer 7.15 younger mates than theirselves. Both sexes have the highest averages in a dependable character, mutual attraction and love. However, it is seen that women pay more attention to resource indicator variables such as strong economic situation and appropriate social status, males have more importance on good cook and housekeeper, good appearance and chastity. When the data analyzed the data according to socioeconomic status categories, it is seen that there are differences between the sexes in low and middle groups in many mate selection criteria and in the higher groups the differences between the sexes are disappeared or decreased. The findings support the literature of evolutionary social psychology which will discussed in the presentation.
“MOTHER” OR “ANGEL”? INCRESSING PROSOCIAL BEHAVIOR BY USING SUBTLE PRIMES

Heyyem Hürriyetoğlu
Yasemin Abayhan
Hacettepe University (Ankara, Turkey)

Research has shown that cognitive accessibility might have important implications for social perception and behavior through subtle cognitive hints of such knowledge structures. Such subtle primes have been shown to affect a diverse set of constructs and behaviors. When the related literature is examined, it is suggested that the category of motherhood priming an altruistic nature. Furthermore, the results of the researches show that the concept of motherhood is strongly related with the concept of “compassionate love” containing feelings, cognitions, and behaviors that are focused on caring, tenderness, and a tendency toward prosocial behavior. In present research, it is expected that priming the concept of "motherhood" activates the schemes related to compassionate love which indirectly affects prosocial behavior. Thus, the main hypothesis of the study is compared to the participants in the control group who was primed with the concept of motherhood will have higher compassionate love level and this high level of compassionate love will affect their prosocial behavior tendency. The thought-listing technique developed by Cacioppo et al. (1997) was used as a priming method in this study by adopting to the concept of motherhood. Two studies were conducted by using the same priming task to assess the effect of subtle priming on compassionate love (Study I) and prosocial behavior tendency (Study II). In the first study, Compassionate Love for Humanity Scale developed by Sprecher & Fehr (2005) was used to assess the impact of priming on compassionate love. Online data were collected via Qualtrics from two hundred participants. In the second study, a helping vignette will be used to assess prosocial behavior tendency. The data will be obtained from sixty students at Hacettepe University in Social Psychology Lab. Because of the ongoing process of the second study, the results of both studies will be discussed during the presentation. It is assumed that the research has contributed to the priming methodology. Furthermore, this research has advanced our understanding of the effect of priming on social perception and behavior.
THE ROLE OF PASSION FOR WORK IN THE SECONDARY TRAUMATIC STRESS IN INTENSIVE CARE UNITS

Jennifer Elena Moreno Jiménez
Raquel Rodríguez-Carvajal
Oscar Lecuona
Eva Garrosa
Autonomous University of Madrid (Madrid, Spain)

Marisol Martínez
"Doce de Octubre" Hospital (Madrid, Spain)

Health professionals in intensive care units are constantly dealing with suffering, pain, illnesses and death of either patients or relatives. In this emotionally demanding context, it seems necessary to study the impact of these factors on intensivists, emphasizing their risk of suffering Secondary Traumatic Stress (STS). Moreover, it is important to highlight the role of passion for work of these professionals who deliberately choose, identify and enjoy working on and developing these caring tasks. The goal of the paper is to explore the Secondary Traumatic Stress (STS) and the Passion for Work in a sample of intensive care health professionals at the "Doce de Octubre" hospital in Madrid, as well as an exploration of possible predictors model of the STS. This is a cross-sectional design carried out in an intensive care unit at "Doce de Octubre" hospital in Madrid.

The sample consisted of 103 intensive care professionals and we measured demographics (gender, years of experience and position) alongside STS, passion for work, job stressors, emotional effort, empathy and self-compassion. Network and hierarchical regression analysis revealed that: a) For STS symptoms, work stressors and empathy showed a positive influence, while years of work experience show a negative influence, thus being a protective factor; but interestingly, b) for compassion fatigue (a core component of STS), years of work experience showed an opposite influence, while harmonious passion showed a negative influence; c) for shattered assumptions (another dimension for STS), emotional effort and empathy showed a positive influence. This innovative work highlights relevant insights towards preventing STS development. More concretely, work stressors, empathy and emotional effort where flagged as risk factors for STS. Nevertheless, harmonious passion and years of work experience were flagged as protective factors. However, this last variable showed ambiguous evidence, showing protective influence for STS symptoms but risk influence for compassion fatigue. We could highlight the establishment of the empirical bases on the study of STS in intensive care professionals, being a first step for more in-depth research for establishing models, and designing future intervention programs aimed to improve health professionals' wellbeing and quality care.
COGNITIVE AND AFFECTIVE ROUTES TO POSITIVE AGE STEREOTYPING: EFFECTS OF AN INTERGENERATIONAL ENCOUNTER PROGRAM

Dirk Kranz
Nicole Thomas
Jan Hofer
University of Trier (Trier, Germany)

Elderly people living in nursing homes often lack opportunities to interact with young people and to engage in a generative way (i.e., passing on knowledge and life experiences to the next generations). Young people might benefit from such generative behavior, too, as they are encouraged to reflect on and clarify their personal interests, competencies, values, and goals. Overall, generative behavior should improve young and old people’s image of the other generation. The current study explores the impact of an intergenerational generativity-focused encounter program on the elderly participants’ (nursing home residents; N = 62) view on “the young” as well as the younger participants’ (N = 59) view on “the old.” The closer the participants evaluated the intergenerational contact across the ten group sessions (ten groups with five to six old and young participants each), the more positive was their view on the other generation at the end of the program. This pre-post increase was mediated through the subjective experience of learning from each other (the cognitive route) but not the experience of warm interpersonal contact (the affective route).

WHY DO SOME COLLEGE STUDENTS LEARN LESS THAN 6-YEAR-OLDS?

Cristina Casadevante
Miriam Romero
Jose Santacreu
Autonomous University of Madrid (Madrid, Spain)

Nowadays, many students struggle with academic tasks at school even though they have not aptitude or psychological problems. Moreover, some university students also exhibit difficulties in their academic learning. Through a Category Learning Test (CLT), we assessed the level of learning and the execution patterns showed while solving the task of 466 children between 6 and 11 years old and 86 adults. We found that one-third of the children and one-third of the adults failed to learn the categories. The results showed that participants who did not learn acted more disorganized and quickly than participants who did learn the categories. Therefore, speed and organization appear to be decisive variables in category learning. Furthermore, we consider that these students could be behaving in the same way when undertaking their academic tasks and therefore might experience difficulties in overcoming them.
CONVERGENT VALIDITY OF TWO OBJECTIVE LEARNING TESTS

Cristina Casadevante
Miriam Romero
Jose Santacreu
José Manuel Hernández
Autonomous University of Madrid (Madrid, Spain)

Santacreu and Quiroga (2016) and Casadevante et al. (in press) assessed two large samples of children aged between 6 and 12 using the Category Learning Test (CLT). They found the presence of different learning groups: one-third of the participants did not learn during the task, another third did learn progressively throughout the trials and the remaining third learned quickly from the first trials. Learning in the task was related to an organized pattern of resolution and to a moderate speed response. The aim of this work is to check whether in a new and simpler learning test, the Treasure Forest Test (TFT), we find the same results. In addition, we intend to check whether learning in the TFT is related to learning in the CLT. Furthermore, we aim at analyzing whether also in this new test, the response speed and the organization are influential variables in learning. With this purpose, we assessed 85 university students using both tests. The results showed that there were no significant differences between the learning group in which the participants fitted in both tasks, meaning that those who learned in one test also learned in the other. In addition, when analyzing the FTF, we observed a high and significant correlation between learning and organization and between learning and response speed, but in this case, negative. Therefore, the response speed and the organization were also determining variables for learning while solving the FTF. We consider that these discoveries reinforce those found by the researches that used the CLT, since it is demonstrated that it is not an intrinsic phenomenon of this task.
HOW EMOTIONAL INTELLIGENCE MANIFESTS ITSELF IN CONFLICT INTERACTION PREFERENCES IN RUSSIA AND IN THE NETHERLANDS?

Elena Sinelnikova
Emperor Alexander I State Transport University (Saint-Petersburg, Russia)

Emotional intelligence as ability to process emotional information [Mayer et all, 2008] is considered one of the central predictors of conflict management styles [Gunkel et all, 2016]. Emotional intelligence is related to cooperation preferences [Schutte et all, 2001] as well as to problem-solving orientation in conflicts [Derevianko, 2009]. Meta-analyses revealed that people with high emotional intelligence are more constructive [Schlaerts et all, 2013] and productive [Jordan and Troth, 2004] in conflict management. Emotional intelligence had a positive effect on obliging, compromising and integrating in cross-cultural study [Gunkel et all, 2016]. However we still do not know how manifestation of emotional intelligence in conflict differs in different culture context. The goal of the study is to investigate how does emotional intelligence manifests in conflict interaction preferences in two culture contexts: Russia and the Netherlands. N. Schutte’s questionnaire is applied to measure emotional intelligence [Schutte et all, 1998]. Behavior conflict scenarios, composed by D.Wigboldus, E. Sinelnikova [Sinelnikova, 2015] are applied to study conflict interaction preferences. Conflict situations include violation of norms or obligations. 146 Russian students [59, 6% female, mean age 20,15] and 125 Dutch [66,4% female, mean age 21,62] students participated in the study. Emotional intelligence predicted positive preferences in constructive manifestation of feelings and position in Russian (β=0.3, R-square=0.09, p<0.001) and Dutch (β=0.249, R-square=0.062, p<0.01) sample. Russian and Dutch students with higher indicators of emotional intelligence evaluated the tactic higher than Russian and Dutch students with lower indicators of emotional intelligence. Emotional intelligence predicted proposal of cooperation in conflict in Russian sample (β=0.42, R-square=0.18, p<0.001). Russian participants with higher indicators of emotional intelligence evaluated the tactic higher than Russian participants with lower indicators of EI. Emotional intelligence predicted irony in Dutch sample (β=−0.22, R-square=0.048, p<0.05). Dutch students with lower indicators of emotional intelligence evaluated the tactics higher than Dutch participants with higher indicators of EI. The role of emotional intelligence in facilitating of constructive feeling expression is universal for both cultures. However emotional intelligence manifests in cooperation preferences only in Russia, and in negative irony preferences in the Netherlands.
Cancer care is a dynamic process that depends largely on the availability and capacity of family members to assist diagnosed patients. Despite the vital contribution to the health and wellbeing of the nations, careers’ health related needs are often omitted from healthcare services planning and delivery. Family careers have been referred to in the literature as a ‘high-need’ subgroup or ‘second order patients’, as they themselves may be living with chronic health problems and limitations in psychological functioning. This study brings a heightened awareness of the cancer diagnosis as a significant factor in understanding careers’ physical and psychological (ill) health. Data from two qualitative studies (47 participants) were collated. Data were collected through in-depth interviews with twenty seven Romanian parents of children diagnosed with hematological diseases (3 fathers; 24 mothers; age range 32-54) and in-depth interviews and two focus groups with careers residing in the East Midlands of England (4 males; 16 females; age range 37-76). Data were thematically analyzed to identify common and unique themes relating to careers’ physical and psychological (ill) health. Common themes described the experiences of isolation, shutting down own life, depression, sleep deterioration, exhaustion and careers’ needs not being addressed. Unique themes were identified in the Romanian sample, such as suicide risks, being a donor for own child and not affording medication. Adverse effects on family functioning were noted in both samples, such as: altered communication with family members, separation and difficulty to cope with other family members’ needs. Two unique consequences were highlighted by the UK (hiding own cancer diagnosis from family members) and Romanian participants (dysfunctional parenting). This study has identified careers’ health-related concerns and impact on family functioning following cancer caregiving. It highlights the need of family systems approaches to caregiving in which family members’ needs and hidden challenges throughout the illness journey should receive priority in research and clinical practice.
IMPORTANCE OF SOCIAL SUPPORT ON YOUNG ADULTS’ WELLBEING: HOW CAN COPING MECHANISMS ADVANCE LIFE SATISFACTION?

Zahide Tepeli Temiz
Vahide Ulusoy Gökçek
Fatih Sultan Mehmet Vakif University (Istanbul, Turkey)

The person’s belief in physical and emotional support that can be taken from his family, friends or people he cares about in difficult times is an important protective mechanism against stress. Studies to identify protective factors highlight that social support and coping strategies are processes that can help reduce anxiety. The main objective of the current study is to investigate how dormitory life affects subjective well-being, anxiety levels, and perceived social support. Another aim of the research is to examine predictors of life satisfaction and anxiety level of young adults. This study also aims to examine whether students’ coping strategies differ according to residency status. The sample comprised 206 university students (N=89 women, 116 men) were administered Ways of Coping Inventory, The Multidimensional Scale of Perceived Social Support, Satisfaction with Life Scale, and Beck Anxiety Inventory. As expected, there was no significant difference in perceived social support, anxiety level and life satisfaction among students staying in dormitories and living with their family/relative/friends. One-way ANOVA findings indicate that the self-confident approach, one of the active coping strategies, differs between those living with family and staying in the dormitory. The self-confident coping scores of the students living with their parents (x̄=21.92) are found to be significantly higher than those of the dormitory (x̄=20.18). Submissive and helpless styles of passive coping mechanisms also differ according to residency. Passive coping strategies are used more widely among students staying in dormitories. Hierarchical regression results showed that gender, helpless and self-confident coping, anxiety, and perceived social support made significant contributions to variance in life satisfaction scores. The most relevant variable with life satisfaction is perceived social support (r=.505). On the other hand, helpless coping is the highest predictor of life satisfaction scores (β=-.507). Dormitory life seems to provide social support to students. The level of perceived social support, self-confident coping and anxiety levels seem to affect the psychological well-being of young adults. Supportive efforts to improve coping strategies may increase subjective well-being.
INFLUENCE OF PERSONALITY TRAITS ON THE COGNITIVE STATES OF STUDENTS

Mark Yusupov
Aleksander Prokhorov
Albert Chernov
Kazan Federal University (Kazan, Russia)

Nowadays, there is a gap in the research of the relationship between cognitive psychological states and personality traits in the course of learning activities of students. The most important task in the field of psychology is the development of methods for the actualization of cognitive states, as well as the determination of their functions in the course of human activity. The influence of personality traits on cognitive states is mediated by both the intensity of learning activities and the interaction of the personality traits themselves.

The study was conducted on students of the Institute of Psychology and Education of Kazan Federal University, in total – 90 people of both sexes, aged 19–22 years. The study of cognitive states was carried out in the course of students’ learning activities: during lectures and exams.

The following techniques were used in the work: 1. Questionnaire of the temperament structure (OST) of V.M. Rusalov. 2. The five-factor personal questionnaire (The Big Five) of P. Costa and R. McCray. 3. Orientation questionnaire of B. Bass. 4. Questionnaire of cognitive states of A.O. Prokhorov and M.G. Yusupov.

It is revealed that in the everyday situation of educational activity (on the lecture) the most frequently experienced states are thoughtfulness, interest and concentration, whereas in a tense situation – mental stress, doubt and concentration. The state of concentration is typical for both situations of educational activity.

In an everyday situation, the state of thoughtfulness is observed in individuals with high self-control and prevails in friendly, open-minded and emotionally stable students with a focus on the task. Students with high social energy, social pace and focus on themselves experience the state of interest.

At the same time, in the exam situation students with increased energy, extraversion and focus on the task experience the state of mental stress. Students with high plasticity, self-control and expressiveness experience the state of concentration.

The state of concentration is equally often experienced in both situations of learning activity. Revealed the influence of self-control and social pace traits on the state of interest in the lecture and the concentration state on the exam.

The study was carried out with the financial support of the Russian Foundation for Basic Research, project No. 19-013-00325.
THE EFFECT OF DEMOGRAPHIC FACTORS ON THE LEVEL OF COMPASSION FATIGUE EXPERIENCED BY PASTORS

Michelle Renard
Robin Snelgar
Stacy Shelton
Nelson Mandela University (Port Elizabeth, South Africa)

‘Compassion fatigue’ occurs when levels of compassion gradually decrease in an individual over time, owing to intense care being expended towards others in need (Khan, Khan & Malik, 2015). Comprised of burnout and secondary traumatic stress (Stamm, 2010), its symptoms include physical and emotional trauma (Glicken & Robinson, 2013), lowered self-efficacy and confidence, hopelessness, insomnia, withdrawal, and a negative attitude towards life (Khan et al., 2015). This study aimed to answer the research question, “Do demographic variables account for variance in levels of compassion fatigue?”. Pastors were chosen because ministry is a ‘helping’ profession (Stamm, 2010) that causes pastors to experience physical and spiritual exhaustion (Krejcir, 2007), burnout, and depersonalization (Evers & Tomic, 2003; Francis, Louden, & Rutledge, 2004). Methods: This quantitative study surveyed 272 South African pastors by means of non-probability sampling. Four denominations were sampled, namely Anglicans, Catholics, Pentecostals/Charismatics, and Dutch Reformed church pastors (i.e. the ‘Nederduitse Gereformeerde’ church). The burnout and secondary traumatic stress subscales of the Professional Quality of Life Scale (PQOL) were utilized. Multivariate analysis of variance (MANOVA), one-way analysis of variance (ANOVA) and post-hoc Scheffé’s tests served as the inferential statistical tests. Ethical considerations included anonymity, informed consent and voluntary participation. The study revealed that older pastors, female pastors, and those working within the Dutch Reformed denomination experience significantly higher levels of compassion fatigue, burnout, secondary traumatic stress, compassion entrapment, vicarious trauma and/or traumatic exhaustion compared to younger pastors, male pastors and those from the remaining denominations under study (p<0.05). No significant differences across educational levels, tenure or marital status were observed (p>0.05). Work overload and emotional strain from leadership and counselling are related to compassion fatigue, congregational detachment, aggression at home and borderline alcohol abuse (Snelgar, Renard & Shelton, 2016). Tailored interventions should therefore be developed for Dutch Reformed pastors to address their spirituality and resilience. Female pastors and those over the age of 58 would benefit from heightened time in prayer, rest and meditation; and should dedicate time to connect with their families and develop healthy personal relationships, to counter the negative effects of compassion fatigue.
Non-profit organizations (NPOs) seek to benefit communities, and their employees’ motivations to contribute to social change plays an integral role in achieving this purpose (Brandi, 2012; Forbes, 2013). This study determined whether culturally diverse NPO employees are intrinsically rewarded and motivated by their work. The research question was, “Do significant differences in intrinsic rewards and motivation exist across NPO employees working within Australia, Belgium, South Africa (SA) and the United States of America (USA)?”. The quantitative questionnaire comprised of the Intrinsic Work Rewards Scale (five factors: Meaningful work; Challenging work; Flexible work; Varied work; Enjoyable work) and Intrinsic Work Motivation Scale (three factors: Personal connection to one’s work; Personal desire to make a difference; Personal desire to perform) (Renard & Snelgar, 2016; 2018). Non-probability sampling accessed 587 NPO employees distributed fairly equally across Australia, Belgium, SA and the USA. Data was analyzed using multivariate analysis of variance (MANOVA) and one-way analysis of variance (ANOVA). Responses were anonymous and informed consent was obtained. South African respondents experienced significantly higher levels of meaningful work and intrinsic motivation than Australians, Belgians or Americans, and more challenging work compared to Australians and Belgians (p<0.05). They were more personally connected to their work and held a stronger personal desire to make a difference and personal desire to perform than respondents from the remaining countries. NPO employees within developing countries might be motivated more strongly from within themselves owing to the meaningful nature of their work. SA’s struggling context of poverty alleviation, child welfare, health care and education might potentially allow them to influence communities and society in a multifaceted manner. That said, employees’ desires for valuable work should be universal in motivating them no matter in what country they work (Luthans, 2005). Further sources of motivation that might have influenced inter-country motivation differences are national culture (needs, beliefs and values); societal norms (achievements and work ethics); and environmental factors (education and legal systems) (Steers & Sanchez-Runde, 2002). A recommendation is that managers should select employees who demonstrate altruistic values and benevolent dispositions for NPOs to fulfil their prosocial missions (Grant, 2007).
ATTITUDES TOWARDS TRANS PERSONS: A COMPARISON BETWEEN MENTAL HEALTH PROFESSIONALS AND THE GENERAL POPULATION

Lefteris Patlamazoglou  
Madison Moore  
Monash University (Melbourne, Australia)

Individuals who transition from their natal sex to their preferred gender identity violate the socially constructed ideas of gender roles. This often results in experiences of fear, discrimination, and violence. The current study aimed to investigate the attitudes toward people who identify as trans by comparing the gender ideologies (as measured by heteronormative attitudes) and transphobia in mental health professionals and the general population. Several hypotheses were made, including that there would be a positive relationship between heteronormative attitudes and transphobia, that personal contact with trans persons would be a moderator of this relationship and also reduce the levels of transphobia, and that mental health professionals would exhibit lower levels of transphobia than the general population. The sample consisted of 454 Australian adults who responded to an online survey consisting of a demographic questionnaire, the Genderism and Transphobia Scale (Hill & Willoughby, 2005), the Heteronormative Attitudes and Beliefs Scale (Habarth, 2015), and a short survey regarding their personal contact with trans persons. Of the participants, 152 identified as mental health professionals (primarily psychologists, counsellors, social workers, and youth workers) and 302 identified as part of the general population. A between-groups design was employed and the data were analyzed using correlational, comparative, and moderation statistical analyses. The results indicate that mental health professionals display lower levels of transphobia than the general population, that heteronormative attitudes are positively correlated with transphobia, and that personal contact reduces transphobia. Furthermore, in contrast to previous studies, there were no observable gender differences in levels of transphobia in this sample. In the context of the existing literature, the results of this study indicate that transphobia in Australia is gradually reducing. Implications for maximizing therapeutic outcomes in psychological practice with trans persons are discussed, including implications for professional development and for inclusive approaches. Finally, suggestions for further research in the area of attitudes toward trans persons and mental health professionals are made.
A RELATIONAL MIND: CHOOSING FOR OTHERS INCREASES WEIGHT OF COMPARATIVE UTILITY

Xuesong Shang
Jingyi Lu
East China Normal University (Shanghai, China)

How to make tradeoffs between absolute and comparative utilities is a central question to social psychology and judgment and decision making. The current research investigates the differences in weight that individuals assign to absolute and comparative utilities when making decisions for themselves versus others. We propose a relational mind in choosing for others that fosters stronger preferences for immediate satisfaction from decision recipients. Given that comparative (vs. absolute) utility is more likely to promote immediate satisfaction, we hypothesize that choosing for others (vs. oneself) will increase weight of comparative utility. In study 1, 176 university students were recruited. They chose between two conflicting options either for themselves or for their friends. The results revealed stronger preferences for low-absolute-high-comparative-utility options over high-absolute-low-comparative-utility options when choosing for friends than when choosing for oneself. In Study 2, we manipulated absolute and comparative utilities orthogonally to identify which utility was influenced by decision target. One hundred and eighty-five university students were randomly assigned to one condition in a 2 (decision target: self or other) × 2 (absolute utility: high or low) × 2 (comparative utility: high or low) mixed design, where the first factor was varied between-subjects and the latter two were varied within-subjects. The results showed that choosing for others increased importance of comparative utility but did not decreased importance of absolute utility. In Study 3, 182 university students made choices that would have real consequences either for themselves or for their friends. The hypothesized self–other differences were replicated. In Studies 4 and 5, we recruited 270 and 263 university students respectively to test the underlying mechanism of this effect. The results demonstrated that self–other differences disappeared or diminished when reactions from decision recipients were not visible to decision makers or the relationship between the recipients and decision makers would be unaffected, suggesting that self–other differences in weight of comparative utility were derived from a relational mind of choosing for others. Taken together, these findings highlight interpersonal causes of self–other differences in decision making.
DOES (G) FACTOR PREDICT THEORY OF MIND ABILITIES IN SCHIZOPHRENIA?

Ozge Akgul
Burcu Verim
Berna Binnur Akdede
Koksal Alptekin
Emre Bora
Dokuz Eylul University (Izmir, Turkey)

Schizophrenia is one of the major diseases that disrupts social cognitive and neurocognitive abilities. Theory of mind (ToM) is one of the specific areas of social cognition and it is the ability to understand that others have different mental states and make inferences based on the content of such mental states (1). Nowadays, it has become an interesting area in order to examine the effects of ToM and cognition in schizophrenia. In our study, it was hypothesized that neurocognitive functions could predict the theory of mind abilities in patients with schizophrenia. The study included 47 patients with schizophrenia and 26 healthy volunteers with similar age, gender, and education level and their written and oral consents were received. In order to evaluate the theory of mind “Reading Mind in the Eyes Test-RMET” and “Hinting Task” and to assess neurocognitive abilities, neurocognitive test battery was used. The relationship between social cognitive and neurocognitive functions was investigated by Pearson correlation analysis and a Linear regression model was applied in order to predict ToM based on (g) factor. Statistically significant correlation was found between the theory of mind abilities and neurocognitive abilities in both groups. Linear regression analysis showed that general intelligence (g factor) can predict ToM abilities. In schizophrenia patients, a significant regression equation was found as (F(1,45)=8.341, p<0.006) with an R2 of 0.40 and in healthy controls the equation was (F(1,24)=6.040, p<0.022) with an R2 of 0.45. There is a consensus that basic neurocognitive processes such as attention, memory, and executive functions are necessary for social cognition (2). Theory of mind works with many basic cognitive processes and affects behavioral responses. In the light of our findings, it becomes possible to imply that general intelligence can predict ToM abilities. There is a need for interventions aimed at improving neurocognitive and social cognitive skills and minimizing the impact of the disorder. References: 1) Brune M (2006) Theory of mind-evolution, ontogeny, brain mechanisms and psychopathology. Neurosci Biobehav Rev 30 (4)437-455 2) Couture SM et al., (2006) The functional significance of social cognition in schizophrenia: a review Schizophrenia Bull 44-63.
ACADEMIC RESILIENCE AND STUDENTS' WELL-BEING

Dubravka Miljkovic
Majda Rijavec
University of Zagreb (Zagreb, Croatia)

Studies with college students found that well-being (both hedonic and eudaimonic) is positively related to various positive academic outcomes, thus making students well-being the worthwhile research topic. Since students at the university face different difficulties and challenges, the main aim of this study was to assess to what extent academic resilience contribute to their well-being. Academic resilience is defined as a capacity to overcome acute and/or chronic adversity that is seen as a major threat to a student’s educational development (Martin, 2013). The sample comprised 168 first year female university students at the University of Zagreb. Several questionnaires were administered to assess academic resilience and well-being. The Academic Resilience Scale-30 (ARS-30) — as a measure of academic resilience, based on student responses to academic adversity, has three subscales: perseverance; reflecting and adaptive-help-seeking and negative affect and emotional response (Casidy, 2016). Measures of well being included The Satisfaction With Life Scale (SWLS; Diener, Emmons, Larsen, & Griffin, 1985), Academic Satisfaction Scale (Schmitt et al., 2008), Academic Flourishing Scale (Rijavec & Ljubin Golub, 2017) and School Burnout Inventory (SBI; Salmela-Aro et al., 2009) as an indicator of ill-being. Four linear hierarchical regression analyses were conducted with academic resilience variables as predictors and well-being variables as criteria variables. Academic resilience variables explained 5 to 31% of total variance of well-being variables. Adaptive-help seeking was the only significant predictor of both life and academic satisfaction. The more students tend to seek help in the situations of academic failure, the higher is their hedonic well-being (in terms of both academic and life satisfaction). For eudaimonic well-being (academic flourishing) as well as burn-out the only significant predictor was negative affect and emotional response. The more students tend to towards negative affect and emotional response in the situations of academic failure, the lower is their academic flourishing and higher burn-out. The results of the study point to the different importance that have the specific components of academic resilience for various types of well-being and the need for students an education and training for increasing academic resilience and in turn their well-being.
THE EFFECTS OF A REHABILITATION PROGRAMME FOR YOUNG ADULTS EXCLUDED FROM WORKING LIFE. AN EVALUATION STUDY

Torbjorn Rundmo
Norwegian University of Science and Technology (Trondheim, Norway)

Kurt Gunnar Johansen
Ribø (clinic) (Saltbø, Norway)

The main aims of the current study were (1) to evaluate the effects of a rehabilitation programme for marginalised young adults with psychosocial problems who have fallen out of working life and school, (2) to examine how psychological indicators were associated with the length of the training period and occupational status after discharge from the programme, and (3) to estimate reduction in direct costs of disability benefits due to programme success. The programme is based on motivational interviewing and a problem solving focused approach. The sample consisted of participants of the rehabilitation programme (n = 65). Self-completion questionnaire data were collected in the start-up phase, the mid-phase and the terminate phase of the programme. Data collections have been carried out annually from year 2011 to 2017. The response rate was near up to 100 per cent. The results showed that the specific evaluations and satisfaction with the programme was very high. GLM with repeated measures based on EM − estimates showed self-efficacy, empowerment, well-being and the participants’ judgement of their own future prospects changed in a positive direction. Social anxiety was also reduced. A total of 48 per cent of the participants managed to get a job after discharge from the programme. Hierarchical logistic regression analysis showed it was primarily the length of the training period which explained who were included into working life. SEM-analysis showed that psychological indicators expected to be associated with the programme’s success, significantly predicted the length of the training. Short periods of training and training periods exceeding two years seemed to be associated with a lower success rate. The most ideal length of training seemed to be between 12 to 20 months. The total savings of direct costs by working life participation and avoidance of permanent disability pension may be around NOK 200 mill. (21 mill. Euro) from discharge from training until achievement age limit for retirement. The results of the study are promising when it comes to the continuation of the programme and is a supplement to an evaluation of working life success for persons previously enrolled into the programme.
SUBSTANCE ADDICTION AND LAW RELATION IN AN OBLIGATORY THERAPY PROCESS

Sinem Baltaci  
Eskişehir Osmangazi University (Eskişehir, Turkey)

Faruk Gençöz  
Middle East Technical University (Ankara, Turkey)

Despite the increasing legal regulations on the prevention of addiction, there is social discourse that subject should reach pleasurable substances and deserve them. In current study, relationship between substance addiction and law was analyzed within a therapy process within a qualitative approached based on Lacanian Discourse Analysis. In this approach, instead of analyzing the similarity and repetition of the words in the classical discourse analysis, it is focused on the contradiction, absence, time when semantic change and incoherency occur, and positions where the subject speaks related with the Other. In addition, cultural and historical configuration of speech should be considered. For this aim, three session in the therapy process that conducted with a patient who was sent to the substance addiction prevention center as a result of legal regulations were chosen. Total of 154.67 minutes audiotapes were transcribed and coded in accordance with the qualitative methodology. Accordingly, in the therapy process which carried out in the absence of trust and lack of demand (as an obligatory process of state), the power and authority positions between therapist and patient were significantly affected. Additionally, the place of addiction in the subject relations was shown more crucial issue instead of what the substance itself was. Moreover, in cases where suspicion about substance abuse becomes an object of pleasure, therapist should be mediates the analysis on suspicion, rather than being associated with the subject on this suspicion. In the last part, clinical application of substance addiction will be discussed in the light of social discourse.

FACEBOOK USE MOTIVATION AND WELL-BEING: A SELF-DETERMINATION THEORY PERSPECTIVE

Elif Gomleksiz  
Middle East Technical University (Ankara, Turkey)

Ahmet Uysal  
Stanford University (San Francisco, USA)

In the present study we investigated the association between daily Facebook use, motivation behind Facebook activities, and daily well-being from a Self-Determination Theory perspective. We hypothesized that more autonomous Facebook use would be associated positively with daily well-being, and this association would be mediated by basic need satisfaction on Facebook. Seventy-one participants completed daily records over 14 days and reported their motivation for engaging in four different Facebook activity categories, their need satisfaction on Facebook, and their daily well-being. Results showed that daily autonomous motivation for Facebook use was associated positively with daily well-being. Moreover, the association between autonomous Facebook use and well-being was mediated by need satisfaction on Facebook.
INTERPERSONAL SENSITIVITY, LONELINESS AND IMPULSIVITY AS PREDICTORS OF SMARTPHONE ADDICTION AMONG UNIVERSITY STUDENTS

Elmas Merve Malas
Fatih Sultan Mehmet University (Istanbul, Turkey)

Selma Arikan
Istanbul Medeniyet University (Istanbul, Turkey)

Besides their benefits and easiness they brought in our lives, smartphones have the potential to create problems like misuse of the phones, disruption of social relations, and risk of addiction (Gönül 2002, Kwon et al, 2013; Young, 2004). In many ways smartphone addiction is similar to internet addiction, and it contains the characteristics of other technology and behavior addictions (Cha and Seo, 2018). It seems to be a growing problem especially for the adolescents and youngsters. In this study we aimed to understand the role of interpersonal sensitivity, loneliness and impulsivity on smartphone addiction among the university students. We believe that determining the potential antecedents and risks for smartphone addiction might help the families and professional to take some precautions for this problem. With this purpose, we gathered data from 200 university students that continue their undergraduate education at the universities located in Istanbul. Smartphone Addiction Scale (Kwon, 2013) which was adapted to Turkish by Demirci et al. (2014); UCLA Loneliness Scale which was developed by Russell, Peplau and Ferguson (1978) and translated to Turkish by Demir (1989); The Interpersonal Sensitivity Measure (IPSM) of Boyce, and Parker (1989) that was validated for Turkish Culture by Doğan and Sapmaz (2012); UPPS Impulsive Behavior Scale (Whiteside and Lynam, 2001), that was translated to Turkish by Yargıç, et al. (2011); and demographic information form were completed by the participants. The multiple regression analysis showed that Interpersonal Sensitivity scores (β:.218, t:3.822 , p<.01), and Impulsivity scores (β:.191, t:2.833, p<.01) significantly predicted Smartphone Addiction Scores of university students (R²:.10, F:.8,026, p<.01). We also analyzed the predictiveness of subdimensions of these two variables on Smartphone Addiction. For Interpersonal Sensitivity, Interpersonal Worry and Dependency dimension explained the variance in Smartphone addiction scores (β:.293, t:4,308, p<.01) (R²:.09, F:.18, 556, p<.01). For Impulsive Behavior, Sensation Seeking (β:.179, t:3.149, p<.01) and Urgency (β:.591, t:10.378, p<.01) dimensions significantly predicted the smartphone addiction (R²:.469, F:.87,015, p<.01). The results indicated that interpersonally sensitive and impulsive students seemed to be more prone to smartphone addiction; and parents and psychologists dealing with adolescents can consider these variables as potential risk factors for smartphone addiction.
Dynamic Psychotherapy (DP) was developed out to overcome the traditional psychoanalysis limitations, responding to a broader demand of patients who seeking help to cope with specific problems in a short-term, such as Obsessive-Compulsive Disorder (OCD). OCD is a chronic disabling mental disorder that leads to substantial distress, functional disability and severe occupational and social impairments. Recognizing the literature gap in this field, and the improvements reported by dynamic therapists who have seen patients with OCD (Leichsenring & Steinert, 2017), a study on the treatment of these patients was conducted in order to discuss the effects of this technique. This study included two phases: (1) a systematic review in the ProQuest Psychology Journals and Web of Sciences databases with the keys words “Dynamic Psychotherapy”, “obsessive-compulsive and psychotherapy”, and “obsessive-compulsive and psychoanalysis”. The aim of this review was identifying studies on the DP, mainly regarding the mechanisms adopted in the treatment of OCD. (2) the therapeutic processes of two patients diagnosed with OCD, in order to verify and discuss the mechanisms often mentioned by literature and the effects of DP in the treatment of OCD. The identified studies in the review presented a heterogeneity of therapeutic interventions in the treatment of OCD. Regarding DP, the therapist active stance is referred as essential to encourage patient to face feared situations, identify the core conflict and address obsessive-compulsive behaviors. The both patients who were treated through DP presented similarities, such as high anxiety, feeling of guilt and inhibition of aggressive and sexual impulses. Through emotional exploration, confrontation of defensive functioning and interpretative interventions of inner conflicts, the both patients had reached awareness of their hidden feelings and experiences, as well as their symptoms and guilt feelings decreased, and they had significant improvement in their interpersonal relationships. The current study pointed DP may produce good outcomes in the treatment of OCD. Furthermore, the scarcity of research on the treatment of OCD through DP makes this study even more relevant. It is expected that these findings may encourage more empirical research on this field.
ON NONEXISTENCE OF “EXPLORATORY BEHAVIOR” IN ANIMALS

Elena Fedorovich
Elena Sokolova
Irina Semenova
Lomonosov Moscow State University (Moscow, Russia)

At the IX International Psychological Congress held in Jena in 1925, Edgar Rubin put forward the thesis, which caused great controversy in psychology: there is no attention! Now we are going to put forward the alike thesis in respect of the so-called exploratory behavior (at least, in animals): it does not exist. To be more precise: an exploration in animals is not an independent activity (or a certain kind of behavior), initiated by a specific motive (research drive, curiosity). We affirm: the so-called "exploratory behavior" of the animal is the moment of restructuring of any kind of its activity, when the previous ways of solving urgent tasks of its vital activity do not "work". This understanding of exploratory behavior allows us to resolve a number of contradictions in its research: 1) to dismiss the traditional dichotomy of "novelty" either as "objective", set from the outside environment or by the experimenter, or as determined by the subject itself on the basis of past experience thus allowing us dismissing the division of exploratory behavior into "active" and "passive" activity; 2) to dismiss the contradiction between the traditional experimental studies (taking the animal out of the natural context to demonstrate a behavioral phenomenon interesting from the theoretical point of view) and the ethological approach methodology, where the research behavior is viewed outside the context of individual development as an evolutionarily fixed (species-specific) characteristic; 3) to dismiss the false opposition of the motivational and cognitive aspects of the exploratory behavior, since in any animal activity, according to the theory of A.N. Leontyev, the motivational and operational-technical components always exist in inseparable unity. Like Rubin, we prove and illustrate our thesis with specific studies of animal behavior.
EXAMINATION OF THE RELATIONSHIP BETWEEN PERCEIVED PARENTING AND CONFLICT TACTICS: THE ROLE OF EMOTION REGULATION

Zümrüt Bellur Mübarek
Gaziantep University (Gaziantep, Turkey)

Güleycan Akgöz Aktaş
Mersin University (Mersin, Turkey)

According to the existing evidence from the related literature, perceived parenting styles during childhood are associated to depression, internalization and externalization problems, aggression, deficits in emotion regulation, emotional and behavioral adjustment problems and partner violence. The aim of the current study was to examine whether emotion regulation strategies and emotion regulation difficulties effects the relationships between conflict tactics and perceived parental rejection/coldness, parental warmth/acceptance, parental overprotection.

The study was conducted with 296 participants (202 female, 94 male), from Mersin province, whose ages ranged between 18 and 40. All participants completed the Demographic information sheet, Parental Bonding Instrument (PBI), Emotion Regulation Questionnaire (ERQ), Difficulties in Emotion Regulation Scale (DERS), and Revised Conflict Tactics Scale CTS2). Data was analyzed via SPSS 21.0.

It was assumed that, the effect of perceived low parental care/warmth and high overprotection on being the victim of violence in romantic relationships for female participants and on being the perpetrator of violence in romantic relationships for male participants will be mediated by emotion regulation difficulties and negative emotion regulation strategies. The results of the current study did not meet our expectations. One of the reasons for this could be the number of participants (was lower than the planned number). Another reason could be the age of the participants. As the age of the participants increases the possibility of being exposed to partner violence for women and perpetrating partner violence towards women for men also increases. The mean age of the participants for the current study was found to be respectively low (26.82 for women, 26.85 for men). We assumed that high parental control will be perceived as a negative thing (as it is perceived in other cultures) and will effect emotion regulation strategies and also will be associated with emotion regulation difficulties. But especially for female participants perceived paternal overprotection/control was perceived as a positive thing and it was negatively correlated with being exposed to sexual coercion. We are plannig to reach more and older participants. After reaching at least 300 participants for each group (male and female) the analyses will be repeated with lisrel.
THE EXAMINATION OF THE ASSOCIATION BETWEEN META-EMOTIONS AND PSYCHOLOGICAL SYMPTOMS

Adalet Duman  
Turkish-German University (Istanbul, Turkey)

Basak Bahtiyar  
Maltepe University (Istanbul, Turkey)

Meta-emotions are conceptualized as beliefs, attitudes and feeling towards one’s own emotions. Although the adverse influence of negative affect and perceived stress on psychological well-being has been empirically validated; the role of meta-emotions in this relationship still needs to be clarified. Therefore, the aim of current study was to investigate the predictor role of meta-emotions on psychological symptoms in a Turkish Sample. For data collection, 506 volunteer participants (313 female, 203 male) whose aged were between 18 and 50 (M = 26.49, SD = 6.65) completed demographic information form, Meta-Emotion Scale, Positive and Negative Affect Scale, Perceived Stress Scale and Brief Symptom Inventory. In order to assess the associates of psychological symptoms level (as dependent variable), a hierarchical regression analysis via stepwise method was conducted. As control variables, age, gender and education level were entered into regression in the first step. Then, perceived stress, positive and negative affect were entered in the second step. After controlling possible effects of stress and affects, lastly, positive (e.g. interest, compassionate care) and negative (e.g. anger, contempt/shame, suppression) meta-emotions were entered in the third step. The results revealed that age and education level explained 5% variance of psychological symptoms. In addition, negative affect and perceived stress were expectedly associated with increase in psychological symptoms. After controlling the effects of stress and affect, negative meta-emotions significantly predicted psychological symptoms. In other words, the association between meta-emotions and psychological symptoms was significant beyond the influence of other variables such as perceived stress and negative affect. These findings emphasize the role of negative emotional reactions towards primary emotions on psychological well-being. In addition to primary emotions, considering meta-emotions in clinical settings may provide more effective intervention methods.
GUIDING STARS AND RISING SUNS: PSYCHOTHERAPY SUPERVISION FOR THOSE WHO HELP CHILDREN AND ADOLESCENTS

Chetna Duggal
Tata Institute of Social Sciences (Mumbai, India)

Supervision is an integral element of psychotherapy training and practice. Supervision not only affords a space for therapists and counsellors to build knowledge and understanding about client concerns, plan intervention and handle crisis, but also helps reflect upon their experiences, understand emotions more deeply, identify mistakes and learn from them. While supervisory support is critical to all trainees and practitioners, this paper focuses on supervisors of therapists and counsellors practicing child and adolescent psychotherapy to serve children, adolescents and families. Considering that the development of the practice of supervision of child and adolescent psychotherapy in LMICs, has not been adequately complemented by a body of research that documents it, the paper will aim to present an overview of child and adolescent psychotherapy supervision in an LMIC context like India. The paper will present unique challenges faced while supervising child and adolescent psychotherapy work across diverse contexts such as schools, hospitals, care homes, and the community, along with outlining the specific competencies and skills that supervisors can help supervisees develop to work in these contexts through a range of creative, reflective and experiential methods. The paper will further throw light on the role of context-sensitive, rights-based, and strengths-based approaches and the need to integrate them in child and adolescent psychotherapy supervision.

SITA IN CYBERSPACE: THE INTERNET AND INDIAN WOMEN

Rathna Isaac
Parivarthan Counselling Training and Research Centre (Bangalore, India)

India is the second largest internet user in the world, with almost 1/3rd of the population accessing the net through mobile phones. It is traditionally a collectivist society where women in particular are restricted in their freedom of expression and movement. The present study aims to examine the interaction between the digital world and the lived experience of women in therapy. The study uses a case series method for an in-depth look at five women clients and the role the internet played in the emergence, evolution and resolution of their clinical issues. Results were derived through a qualitative analysis of case notes, spanning over two years of integrated therapy. Revealed the following themes: 1. The interaction with self-image and self-esteem through Facebook /Instagram comparisons, particularly among the young. 2. Decreasing dependence on close relationships, leading to a sense of isolation at home. 3. The impact on relationships through the use of dating apps and Whatsapp communications. 4. Building emotional connections with the larger community for otherwise isolated individuals. 5. The empowerment of women through access in ideas and information. The results are discussed in terms of the positive and negative impacts of internet access and use; their implications for therapists dealing with individual clients as well as society at large.
INTERRELATIONSHIPS OF DECISION-MAKING COMPONENTS WITH PERSONALITIES OF STUDENTS FROM A MEDICAL UNIVERSITY

Tatyana Ryabova
Kazan State Medical University (Kazan, Russia)

Implementation of Federal State Educational Standards of Higher Education requires from medical universities the training of specialists with a wide spectrum of competencies, the formation of a doctor capable of setting and solving scientific problems corresponding to priority, innovative fields of clinic development. A group of first-year students consisting of the winners and prize awardees of Olympiads, as well as those who passed the universal state exam with 100% score was formed at Kazan Medical University within the framework of implementing the pilot project “A unified system of the doctor’s scientific education in the field of physical and mathematical sciences”. The first-year students of the faculty of General Medicine (25 persons studying in “the project” group and 78 students from other learning groups combined into a control group) became the participants of our study. The aims of the study were: first, to reveal differences in trait profiles, characteristics and components of decision-making in students of the project and control groups; second, to trace a connection of decision-making components with personality measures in both groups. We used such techniques as “Melbourne Decision-Making Questionnaire” adapted by T.V. Kornilova, “The motivation for achieving success” by T. Elerse, methods of evaluating the students’ scientific potential, and others. The study materials were processed by computer program SPSS 20. A motivational component of decision-making was found to be dominating in students of the project group (Student t-test was applied). They strive for success, self-development, are inclined to plan their future, they are active and responsible. Differences in relationships between the components of decision-making and personal traits for the groups understudy (Spearman’s rank correlation coefficient was applied) were found. The analysis of obtained data allowed making a conclusion that a communicative component was leading in decision-making by students of the control group (the largest number of interrelations), and a volitional component of decision-making was leading in students of the project group. Findings of the study allowed revealing correction zones, which can be eliminated, when working with students, and also making a conclusion of specificity of the personal traits’s structuralizing and student decision-making.
The simultaneous announcement of a death and a request for organ donation is a probable traumatizing event for the family of the deceased and can lead its members to develop disabling emotional disorders. To synthesize the results of studies about the psychological repercussions of the request for organ donation/recovery on the deceased's family. We followed the methodology of the Preferred Reporting Items for Systematic Reviews and Meta-analyses (PRISMA). PubMed, Embase, CINAHL, PsychINFO, and Web of Science were systematically consulted by ad hoc algorithms, through December 2017. The studies were identified according to the following criteria: (a) original articles published in English, French, Spanish, or Italian in a peer-reviewed journal; (b) qualitative, quantitative, and mixed-methods studies (all research designs); (c) sample constituted of families and healthcare proxies authorized by the decedent to approve organ recovery; (d) studies about the experiences of families and/or about the psychological repercussions (depression, PTSD, bereavement, grief reactions, emotional status) after a request for organ donation. The quality assessment of each study, the data extraction and the synthesis have been realized. Results We identified 38 studies from 15 countries. 1723 family members were included. Two qualitative themes were clearly shown. The first was the short-term psychological repercussions, which included factors such as emotional conflict, the experience of the shock of the death, as well as the disturbing communication. This can create ambivalence at the level of awareness of reality. The second theme was the long-term psychological repercussions, which included repeated thinking about the organ request and the decision made. The quantitative results included variable rates of depression (from 10% to 30%) and posttraumatic stress disorder (PTSD) from 3 to 26 months after the death. The explorations of the emotional state of family members after the request and after any donation varied quite widely. This systematic review showed that symptoms of anxiety and depression can develop within this population at variable frequencies. The qualitative analysis enabled us to understand the genesis of these disorders. The establishment of psychological follow-up after the death may make it possible to prevent these kinds of consequences.
The concept of job crafting has garnered remarkable interest. Exemplifying proactive organizational behavior, job crafting refers to situational and cognitive changes in task or relational work boundaries, enacted by individuals to recreate their work experience in a more personally satisfying, motivating, and meaningful way. Accordingly, employees engage in job crafting to develop their work designs and occupational identities, reflecting active pursuit of self-actualization, growth, and meaning at work. Building on previous research, this study tests a model of individual, interpersonal, and organizational antecedents and positive work-related motivational states as outcomes situation-directed task and self-directed cognitive crafting. Survey data of N=1196 (79.7% response rate) telecommunications employees from China were analyzed using confirmatory factor analysis and structural equation modeling. Antecedents were measured with abbreviate scales (3x3 items). A 2-dimensional scale on task and cognitive job crafting (2x4 items) was developed in this study. Empowerment was assessed with an established instrument (4x3 items). A structural model, in which the two forms of job crafting partially mediated between antecedents and empowerment dimensions, displayed close fit. Individual growth need strength and intellectual stimulation by one’s leader related positively to task (β=.32, p<.01; β=.11, p<.05) and cognitive crafting (β =.40, p<.01; β=.12, p<.01). Exposure to organizational constraints predicted task (β=.14, p<.01), but not cognitive crafting. Controlling for direct effects of independent variables, task crafting related to control-oriented empowerment dimensions of self-determination (β=.14, p<.01) and impact (β=.18, p<.01), but not meaning or competence. Conversely, cognitive crafting showed positive effects on person-oriented facets of meaning (β=.22, p<.01) and competence (β=.32, p<.01), but not self-determination or impact. Controlling for gender, age, tenure, and education did not affect results. Job crafting resembles a micro-emancipatory form of self-management, through which workers expand opportunities for self-determination and influence, develop self-efficacy, and find meaning in their work. The concept enriches research on work design, leadership, coping, work motivation, and job attitudes. Managers should appreciate job crafting as a strategy employees use to motivate themselves and improve their quality of working life. Enabling effective and functional crafting strategies offers a promising approaches to enhance worker well-being, motivation, and performance.
CHILDREN WITH MIGRATION BACKGROUNDS IN RUSSIAN ELEMENTARY SCHOOLS: TEACHER ATTITUDES AND PRACTICES

Ilshat Gafurov  
Chulpan Gromova  
Rezeda Khairutdinova  
Kazan Federal University (Kazan, Russia)

One of the most significant issues that schools all over the world face today is the ways teachers respond to an increasing diversity. The study was informed by the tripartite model of multicultural competence, with awareness of personal biases a necessary component, together with knowledge of different cultures, and skills to work with students from diverse backgrounds. The paper presents results of qualitative descriptive studies that help to understand how school teachers in Russia treat migrant children, how they solve the problems of adaptation of migrant children. The purpose of this study was to determine: a)Educational practices used by primary school teachers when working with migrant children; b)Relationship between practices and attitudes of teachers. Empirical data were collected through interviews. The participants were informed that a conversation was being recorded. They were also warned that the study was voluntary, absolutely anonymous, no personal data was disclosed. Consent was received from 20 teachers. The findings were analyzed using directive content analysis (Graneheim & Lundman, 2004). The analysis was deductive according to the categories of practices and attitudes identified in the literature review, and enriched inductively to identify variation within these categories. Studying practices is an essential part of preparing future teachers for the work in a multicultural classroom. For language and academic support teachers mostly use individual work. In order to create a friendly classroom climate and environment teachers have productive conversations with students, organize multicultural events for the whole school or just for an individual class. The majority of teachers have positive attitudes toward migrant children. In most cases positive attitudes lead to high expectations for their academic achievements. Conceptual orientation of teacher attitudes toward cultural diversity is mostly pluralistic. Positive attitudes, high academic expectations and conceptual orientation toward pluralism are favorably reflected in teachers’ practice.
DRIVING DECISIONS OF YOUNG AND OLD DRIVERS — DRIVING SELF-REGULATION

Derya Azık
Türker Özkan
Middle East Technical University (Ankara, Turkey)

The aim of this study is to investigate the relationship between driving self-regulation (i.e., strategical, tactical, and life-goal) and aberrant driver behaviors (i.e., violations, errors, and lapses). 120 old and 138 young, a total of 258 active drivers participated and filled Revised version of Advanced Decisions and Patterns of Travel Scale (Molnar, et al, 2013) and Driver Behavior Questionnaire (DBQ) (Reason et al., 1990; Lajunen, & Özkan, 2004). The results showed that tactical self-regulation was negatively related to ordinary violations scores, while strategical self-regulation was positively related to ordinary violations, errors, and lapses for older driver sample. For younger drivers, aberrant driving behaviors were negatively predicted by tactical self-regulation while errors and lapses scores were positively predicted by strategical self-regulation. These results indicate that contrary to general belief, self-regulatory practices might not be always related to safer travel and the type of self-regulation plays an important role. Moreover, interestingly while self-regulatory practices mostly studied for older drivers, safety benefits of these practices (especially tactical level) might be higher for younger driver population. Thus, the role of different type of driving self-regulatory decisions and possible drawbacks should be taken into account before encouraging the drivers to adopt self-regulation strategies.
CAN CONCEPT MAPPING FACILITATE VERBAL DIVERGENT THINKING?

Xu Xiaobo
Pang Weiguo
East China Normal University (Shanghai, China)

It is well established that creativity can be stimulated by expanding the breadth of knowledge activation. As a graphical tool that typically used for organizing and representing conceptual knowledge, concept mapping also has the potential to increase the flexibility of thought process. Therefore, it is interesting to investigate whether concept mapping could increase individuals’ creativity performance. Three studies were conducted to systematically explore this research question. As a first step, study 1 investigated the relationship between individuals’ concept mapping ability and their creativity performance. Thirty-seven female university students (mean age = 21.25, SD = 2.20) were asked to complete a concept mapping task and an alternative uses task (AUT, a widely used creativity measurement). The results revealed that, among the four indices of concept mapping ability (propositions, hierarchies, cross-links, and examples), only cross-links were positively associated with AUT performance. Then, by means of experimental manipulation, study 2 examined whether cross-links were the critical elements by which concept mapping facilitated creativity performance. Thirty-three undergraduates (28 girls, mean age = 20.73, SD = 2.72) were asked to complete a reading comprehension task (control condition), to draw a concept map without cross-links (CM condition), and to draw a concept map with cross-links (CMC condition). The results revealed that, compared with R and CM condition, participants got higher AUT scores under CMC condition. Lastly, study 3 further examined whether dissociative ability (as a indicator of breadth of knowledge activation) mediated the relationship between concept mapping ability and AUT performance. Thirty-three undergraduates (26 girls, mean age = 19.55, SD = 2.53) were required to complete a concept mapping task, a dissociation task and an AUT task. The results uncovered that, dissociative ability fully mediated the relationship between cross-links and AUT fluency. Taken together, the present research indicated that: 1) cross-links were the critical elements by which concept mapping facilitated creativity performance; 2) the process of characterizing new cross-links could expand the breadth of knowledge activation, and thus facilitated creativity outputs. Implications and future directions were discussed in detail.
OPPORTUNITIES AND LIMITATIONS OF INTERGROUP ADAPTATION
PLATFORM FOR SOLVING PROBLEMS OF MULTICULTURAL ORGANIZATIONS

Aleksandr Bulgakov
Russian State University for the Humanities (Moscow, Russia)

The possibilities and limitations of the author’s concept of intergroup adaptation in organizations as a platform for managing multicultural organizations are considered. Using the example of research in 6 construction companies (n = 260 people), trade union organizations of 4 universities and 7 schools (n = 629 people), police departments (n = 315 people, of which police officers — 180 people, victims 70 people, suspects — 65 people) showed the possibility of using the 3-D model "matrix of the landscape of intergroup adaptation", the model of involvement in the union of different-generation groups, the model of the action of intergroup adaptation mechanisms of participants in the criminal process. All intergroup adaptation models optimize the management of organizations. The limitations of using the platform are revealed: difficulties in measuring indicators of intergroup adaptation process, complexity of perception by managers of the convergence of interpersonal and intergroup phenomena. The models are built in a single design, they highlight the criteria, indicators, diagnostic methods necessary for solving managerial tasks. The landscape matrix carries with it both the positive potential of time-tested traditions, values, relationships, and the negative, destructive or illusory. The matrix works on the principle of the physical crystallization process. This metaphor of the landscape matrix explains the reasons for the harmonization of intergroup interactions in an organization in terms of needs, abilities, and limitations of employees and managers. Hence, the target of managerial impact: communication, organization resource management, job design, work time, team collaboration, community ergonomics, virtual organizations, telecommuting and quality management. Generalized results show the possibility of visualizing the psychological landscape of a multicultural organization by identifying the complex, often latent factor structure of the phenomenon under study in the context of a complex interaction of groups, organizations, environments. The management of intergroup adaptation in an organization is implemented through the technology of competences, the technology of team formation, the actualization of group identity, the training of managers and employees of self-regulation in intergroup adaptation situations.
A STUDY OF FACEBOOK SOCIAL COMPARISON ON WELL-BEING: NARCISSISTIC TENDENCY AS MODERATOR

Fu-Rung Yang
Chih-Fen Wei
University of Taipei (Taipei, Taiwan)

Jih-Hsin Tang
Taipei University of Business (Taipei, Taiwan)

In recent years, researchers have become increasingly interested in the effects of Facebook use on the individual's well-being. Many researchers agree that Facebook use influences the individual's well-being; however, whether Facebook use increases or decreases well-being is under debated. The purpose of this study was to investigate the relationship between college students' Facebook use on well-being from the perspective of social comparison with narcissistic tendency as the moderate variable. Exploring how narcissistic tendency moderate the well-being of social comparison domain (agency vs. communion) and social comparison direction (upward vs. downward) were related. Firstly, a pretest study with 211 college students were used to assess the reliability and construct validity of scales. Secondly, a pilot study which consisted of 126 college students was used to assess the usefulness of experimental situations of Facebook social comparison domain (agency vs. communion) and directions (upward vs. downward) were related. Finally, 324 college students were invited to participate the official experiment and fill out Facebook usage behavior scale, narcissistic tendency scale, right after they finish viewing Facebook profile by experimental design. In the end, they were referred to complete self-esteem scale and life satisfaction scale. The quantitative analysis of the questionnaires was conducted through descriptive statistics, Pearson correlation and hierarchical regression to indicate the direction and relationship between the variables. The results show that there were interaction effect on agency and lower narcissistic tendency (β=.35, p<.01), communion and higher narcissistic tendency (β=.33, p<.01). Narcissistic tendency was associated with longer usage(r=.12, p<.05) and more number of friends(r=.20, p<.01). The findings of the study were stated below: 1. While browsing Facebook profiles, college students in Taiwan arose "assimilation" effect, well-being goes up after upward social comparison, and goes down after downward social comparison. 2. Narcissistic tendency moderated social comparison domain and social comparison direction. Individuals with low narcissistic tendency on Facebook agency comparison showed "assimilation" effect; individuals with high narcissistic tendency on Facebook communion comparison showed "assimilation" effect. 3. Narcissistic tendency was associated with the individual's Facebook usage behavior significantly. Students with higher level of narcissistic tendency demonstrated longer usage and more number of friends.
EFFECTS OF INDIVIDUALISM-COLLECTIVISM ON LEADERSHIP STYLE PREFERENCES IN DIFFERENT CONTEXTS: MEDIATING ROLE OF RIGHT-WING AUTHORITARIANISM

Asli Göncü Köse
Çankaya University (Ankara, Turkey)

Right-Wing Authoritarianism (RWA) is defined as an adherence to conventional norms and values, uncritical submission to authorities, and aggressive feelings toward people violating the norms (e.g., Altemeyer, 1981, 1998). RWA is associated with personal values as well as work values and attitudes such as preference for leadership styles; although its link to the latter was focus of very few research. The present research included two studies and aimed to (a) reveal effects of two main cultural tendencies, namely, individualism and collectivism on employees’ preferences for paternalistic, transformational, task-oriented, and relationship-oriented leadership styles (Study 1); (b) investigate the mediating effect of RWA as a relatively stable attitudinal characteristic in the links between individualism/collectivism orientations and leadership style preferences in business contexts (Study 1); (c) test the proposed model which was partially supported by findings of the Study 1 in another study in which the context of leadership was politics (Study 2). In Study 1, data was collected from 182 full-time employees and in Study 2, data was collected from 178 full-time employees. Both models provided good fit to the data and also revealed the main effects of the context on the proposed relationships. The findings of the Study 1 revealed that, employees’ vertical individualism and vertical collectivism tendencies were positively associated with RWA, whereas horizontal individualism was negatively associated with RWA. Employees’ RWA, in turn, positively predicted their preferences for paternalistic and task-oriented leadership styles in business contexts. However, the paths from RWA to preferences for relationship-oriented and transformational leadership styles were not significant. The results of the Study 2 revealed that, when the context of leadership was politics, vertical collectivism was positively associated with RWA and horizontal individualism was negatively associated with RWA. In turn, RWA was positively related to preferences for paternalistic leadership style and it was negatively related to preferences for transformational leadership style. The findings are suggested to have important theoretical implications for research on leadership and effects of cultural orientations on leadership processes as well as research on RWA and will be discussed in terms of theoretical and practical implications along with suggestions for future research.
DOES A FOUR-DAY GROUP PSYCHOTHERAPY TRAINING CHANGE PSYCHOTHERAPISTS’ UNDERSTANDING OF GROUP PROCESSES?

F. Isil Bilican
Istanbul Medeniyet University (Istanbul, Turkey)

This study investigated the role of a didactic and experiential group psychotherapy training on psychotherapists’ awareness of group psychotherapy processes. The role of activity level of psychotherapists on awareness of group psychotherapy processes was also investigated. It was expected that participants’ awareness regarding group processes would increase after receiving a group psychotherapy principles training. It was expected for participants who were more active in the inner circle of the fishbowl to show more changes on the group process measures compared to the those who were observers in the outer circle in the experiential section of the training. The participants received a four day American Group Psychotherapy Association accredited Group Psychotherapy Principles Training. Fifty psychotherapist participants were administered the Group Climate Questionnaire (GCQ, MacKenzie, 1983) and Curative Climate Instrument (CCI, Fuhriman, Drescher, Hanson, Henrie, & Rybicki, 1986). The findings showed that the participants scored higher on the Engagement subscale of the GCQ post training (M=4.39, SD=.77), compared to the pre-training scores (M=3.74, SD=.69), t=.46, p=.00. There were no significant changes on the Conflict, and Avoidance subscales of the GCQ. There were no significant changes on the Cohesion, Insight, and Catharsis subscales of the CCI post training. There was no significant effect of activity level of the participants on the GCQ and CCI scores. The findings suggested a four day group psychotherapy training increased awareness about the constructive therapeutic work processes in the group. The findings suggested therapist training by observation was as effective as active involvement in this study. Findings regarding the relationship between history of individual and group therapy practice, personal therapy, supervision, and group process measure scores will be discussed.
THE DIALECTICS OF HIGH PERFORMANCE: WHY HIGHLY INVOLVED INDIVIDUALS MAY BENEFIT LESS FROM SUPPORTIVE HUMAN RESOURCE PRACTICES

Seubert Christian
Severin Hornung
Thomas Höge
Jürgen Glaser
University of Innsbruck (Innsbruck, Austria)
Matthias Weigl
University of Munich (Munich, Germany)

Following research on high-performance work systems (HPWS), integrated bundles of complementary human resource (HR) management practices promote job attitudes and behaviors considered instrumental for organizational performance. Especially so-called high-involvement and high-commitment practices allegedly are mutually beneficial for employers and employees. However, some studies give rise to concerns that the realization of performance improvements comes at a human cost. Specifically, highly involved individuals may expend overtaxing effort in pursuing intrinsically motivating work tasks, exhibiting a pattern of self-regulated work intensification with detrimental effects on occupational health. To assess the validity of these concerns, this study examines moderating and mediating roles of job involvement between perceived supportive HR practices and work ability. A large-scale survey study was conducted among German municipal employees (N=11871). Two empirically distinct HR practice bundles (6 items each) were extracted from a commercial best employer survey, namely, empowering management style (ω[6]=.89) and decent working conditions (ω[6]=.74). Job involvement was measured with another set of 6 items (ω[6]=.88). Subjective work capacity was assessed with the work ability index (ω[7]=.81). Linear regression analyses were performed, controlling for gender, age, disability, organizational tenure, employment level, supervisor position, and occupational field. Both empowering management style (β=.18, p<.01) and decent working conditions (β=.31, p<.01) predicted higher levels of work ability. Job involvement acted as a partial mediator between HR bundles and work ability (β=.12, 95%-BootCI [.11,.13], β=.09, 95%-BootCI [.08,.10]). Further, a consistent pattern of buffering two-way interactions of HR bundles with job involvement (β=.02, p<.05, β=.04, p<.01) as well as an attenuating three-way interaction of job involvement, empowering management style, and decent working conditions (β=.03, p<.01) was found. These results confirm an ambiguous role of employee-oriented HR practices, providing evidence for diminished work ability under conditions of high employee involvement combined with extensive organizational use of either or both HR practice bundles. Paradoxically, in the context of HPWS, motivating effects of employee-oriented HR practices may facilitate self-endangering over-engagement, resulting in self-imposed work intensification and diminished work ability. Potentially harmful side-effects of motivationally driven productivity gains require constant monitoring as well as specific health-promoting interventions to protect workers’ long-term health and performance capacity.
GAINS OBTAINED AFTER A THREE-DAY EMOTIONAL INTELLIGENCE TRAINING

F. Isil Bilican

Emotional intelligence (EI) was defined as an ability to recognize and regulate one’s own and others’ emotions. Goleman (2001) suggested EI involved four major domains: Self-awareness, self-management, social awareness, and relationship management. EI was noted to promote a successful personal and professional life (Goleman, 2016). EI has been considered as an ability that can be developed through practice. This study explored the role of an intensive three-day training program on the EI skills. Emotional intelligence, difficulties in emotional regulation, reflective functioning, and psychological symptoms were assessed pre and post training. The participants were of 18 males and females from six European countries. Schutte Self-Report Emotional Intelligence Scale (SSEIT), Difficulties in Emotional Regulation Scale, Symptom Checklist 90-R, Reflective Functioning Questionnaire were administered pre and post training. The findings showed there was a significant decrease in difficulties in emotional regulation from pre-training (M=77.89, SD=14.93) to post-training (M=75.81, SD=16.77), F(1,13)=5.09, p=.04, ηp2=.28. There were no significant changes in emotional intelligence, reflective functioning, and psychological symptoms. The findings suggested that duration of the EI training might effect changes gained through the training. More robust findings might require lengthy trainings.
THE INFLUENCE OF HEALTH AND MANAGEMENT SUPPORT ON THE DYNAMIC INTENTION-TO-RETIRE PROCESS

Christina Cregan

University of South Australia (Adelaide, Australia)

Our objective is to investigate the influence of employee health and management support on changes in intention to retire. An accepted retirement age is becoming a 'thing of the past' and individual intentions to retire develop over time. Organisations need to understand this process to plan for the future. Our major research question is: do employee health and management support affect the dynamic intention-to-retire process? We use social selectivity theory (Lockenhoff & Carstensen, Journal of Personality, 2004; Carstensen, Science, 2006) to develop hypotheses. From this lifespan motivation perspective, priorities change as individuals come to appreciate a 'sense of ending'. Personal goals shift from information-gathering and network-building to regulating emotional states by focussing on close relationships. This is manifest in the intention-to-retire process as a move from career furtherance to eventual labour market exit. We surveyed 495 mature-age employees in Australia over a three-year period (2011-2013). Longitudinal data were collected in three surveys. Participants were aged between 50 and 75 (mean 53 years), 66% were male. They worked in a wide variety of jobs and industries with 57% employed in managerial/professional work. Using two different regression techniques for analysis of time-based data (Raudenbush, Annual Review of Psychology 2011; Mitchell, Burch & Lee, Journal of Organizational Behavior, 2014), we examined the influence of time-varying health and fixed management support on time-varying intention to retire. In both regressions, a three-way interaction coefficient was significant. Growth curve regression showed that, with low management support, good health has an increasingly positive influence on intention to retire as time goes by. Bayesian slope analysis showed that, with low management support, employees with good health over the whole period report the greatest increase in intention to retire. These findings suggest that, without management support, intention to retire increases most for those whose health might afford them the greatest enjoyment of retirement and the company of social familiars. Implications are that if managers want to retain such employees they should establish strong support practices for all mature-age workers, thereby constraining the intention-to-retire process of the healthy.
A salient topic in the societal discourse, precarious employment is often used in an indiscriminate fashion in a variety of contexts to vaguely denote a preliminary and insecure work situation. Due to the multi-facetted nature of the concept, various authors have proposed different sets of dimensions. As a consequence, a generally agreed-upon definition is currently lacking. Although the topic has been the subject of considerable investigation in sociology, contributions from the field of psychology remain scarce. Our study contributes to the development of a psychological perspective on this topic by reviewing existing conceptualizations and creating a comprehensive measure of subjective experiences associated with precarious employment. As a result of our literature review, we identified the multidimensional concept by sociologists Klaus Dörre and colleagues as one of the most comprehensive definitions of precarious employment. Following this approach, we defined precarious employment as deficiencies that arise from the conditions of employment on five dimensions: reproductive—material (income below a cultural minimum standard as defined by society), social—communicative (social discrimination at the workplace), legal—institutional (exclusion from safety standards and social security systems), status and recognition (deficits in reputation and appreciation), and meaningful—subject-related (loss of meaning and in work lack of identification with the employment). We identified similarities to well-established concepts of work psychology (e.g., job insecurity, social support, effort-reward imbalance, meaning in work). We then constructed the SEWP scale (subjective experience of work-related precariousness) and tested it in two validation studies (n1=268, n2=216). Experiences of precarious employment related to lower levels of organizational citizenship behavior and psychological well-being, and higher levels of workplace deviance and somatic complaints. Perceived precarious employment exhibited incremental validity over and above job insecurity, social support, job rewards, and meaning in work. Results suggest that the measure allows for an economic, reliable, and valid assessment of subjective experiences of precarious employment. By promoting a comprehensive definition and providing a corresponding measure, we wish to facilitate researchers’ efforts in conducting empirical research on precarious employment, its antecedents and consequences.
PROBLEMATIC INTERNET USE IN ADOLESCENTS: ASSOCIATION WITH ADOLESCENT PERSONALITY, QUALITY OF LIFE ADOLESCENTS, AND PARENTING STYLES

This research is motivated by several studies of intensive Internet use in adolescents. Reports from several studies explain that dependence on the Internet for teenagers can have negative consequences, for example for the quality of their lives and in the school domain. It is important to identify the factors associated with this problem to give the adolescents right direction and appropriate support concerning Internet use. This research investigates the associations between personality, parenting style, and Internet Addiction. This study was conducted in Indonesia, with 1112 middle school students in the city of Medan, Indonesia aged 12-15 years. The participants answered a series of questionnaires that measured the following dimensions: The Indonesian short version of the Internet Addiction Test (IAT) to measure Internet Addiction; Parenting Styles and Dimensions Questionnaire (PSDQ) to identify parenting style of the parents; The Big Five Questionnaire for Children (BFQ-C) to measure the dimension of personality; and The Pediatric Quality of Life Inventory to measure the level quality of life. The results indicated that a positive relationship between the neuroticism dimension of the personality and the IAT scores, albeit there is a negative relationship with the conscientiousness. The IAT scores also correlated with the quality of life of adolescents. There are variations in the effect of parenting styles on the level of Internet Addiction in adolescents. The results of this study concluded that adolescents with neuroticism tend to become more dependent on the Internet, unlike those of adolescents with conscientiousness. The recommendation from this study is to prevent the development of problematic Internet uses in adolescents with a high level of neuroticism. Parents can reduce these risks, for example by talking with their child about Internet use and by making rules which have to be followed.
DO OUR EYES MIRROR OUR THOUGHT? AN EYE-TRACKING STUDY ON INFLUENCE OF CONVERGENT-DIVERGENT THINKING ON EYE MOVEMENT PATTERN

Research shows goal-directed thinking influences eye gaze fixation. However, how various thought processes influence our eye-movement is not well examined. Since divergent thinking involves coming up with novel alternatives and unconventional answers, therefore, it may require visually scanning surroundings in greater detail. This research examines how convergent/divergent thinking influence eye-movement. Two experiments of repeated measure design (N= 28 in each), both involving an 'alternate uses' task for divergent thinking and a 'remote association' task for convergent thinking are conducted. Stimuli are presented on eye-tracker(Tobi TX300). Experiment 1 involves participants responding by looking on-screen stimulus, whereas experiment 2 uses blank screen paradigm. Results of both the studies show that convergent thinking participants were comparatively more engrossed in looking at the objects whereas divergent thinking participants also looked comparatively more into the rest of the screen. In addition, results show participants involved in divergent thinking made temporally longer eye fixations towards the screen. We found that people involve in divergent suggesting has more scatters eye gaze; they go beyond the specified objects and scan more aggressively their visual surroundings. Since convergent thinking requires specific solutions, therefore, it does not allow the thinker to think out-of-the-box, and hence focuses eye gaze more on objects. The result implies that thought processes and visual scanning are related. That reflects by changing the visual surroundings, providing more information/objects or less information/objects, we can make ourselves/others to involve in divergent thinking or convergent thinking.
THE CONCURRENT AND PROGRESSIVE VALIDITY ANALYSIS OF TRIARCHIC PSYCHOPATHY MEASURE IN ADOLESCENTS SAMPLE

The Triarchic psychopathy model was proposed by Patrick, Fowles, and Krueger (2009). The model was operationalized with Triarchic Psychopathy Measure (TriPM) (Patrick, 2010). To assess the convergent and predictive validity of the TriPM in a sample of 159 Lithuanian juvenile offenders number of measures was used: Short-Term Assessment of Risk and Treatability: Adolescent Version (START:AV) (Viljoen, Nicholls, Cruise, Desmarais, & Webster, 2014), Subtypes of Antisocial Behaviour Questionnaire (STAB) (Burt & Donnellan, 2009), Criminal Sentiments Scale — Modified (CSS-M) (Shields & Simourd, 1991), Sense of Coherence Scale (SOC) (Antonovsky, 1987). Subsequently, in the three-month follow-up period information related to juveniles’ misbehaviours was collected. The results of the research showed significant correlations with TriPM scales scores, and these relationships were consistent with results reported for Lithuanian adults offenders (Selbom, Laurinavičius, Ustinavičiūtė, Laurinaitytė, 2018). The TriPM scales were associated with concurrent measures in an expected direction, the effect sizes varied from small to large. The results of AUC for several forms of misconduct in a three-month period confirmed predictive validity of the TriPM scales: Meanness scores were associated with an occurrence of aggressive behavior, Disinhibition with unauthorized absence, Boldness — with alcohol use. The results of our research findings provide support for the validity of the TriPM in juveniles.
INTERPERSONAL DISTANCE AFFECTS SOCIAL JUDGMENTS OF FACES

Yue Qi
Yuwei Sun
Feng Du
Xun Liu
Chinese Academy of Sciences (Beijing, China)

Physical distance is a natural shield protecting people from threats. When objects get closer, people will keep vigilant on the objects and adjust their behavior accordingly. The interpersonal distance also affect human behavior in the social interaction. The current study aims to examine whether interpersonal distance could modulate facial trustworthiness judgment. The present experiment was designed to test whether interpersonal distance with physical distance cue can modulate facial judgments. Here, image size was employed as a proxy of distance. The face photos would be presented in at one of the four image sizes groups, to simulate the visual angels of faces at four different viewing distances. 45 participants were told to rate trustworthiness for each face photo with their gut feelings. And they were explicitly told that the image size indicated the distance between themselves and face photos. The results showed a significant main effect of distance indicating that the smaller face photos were judged as more trustworthy compared with the larger ones, $F (3,132) = 4.17, p = .007, \eta^2_p = .086$. In the current research, participants judged the larger faces as less trustworthy than the smaller faces, indicating the effect of distance on facial trustworthiness judgment.
LINKS OF MOTIVATIONAL TENDENCIES AND SELF-ESTEEM WITH SOCIAL MEDIA ADDICTION AND MODERATING EFFECTS OF RELATIONSHIP STATUS
